Electrometric Titrations with Mercury Perchlorate. I. M. Kolthoff (*Z. anal. Chem.*, 1922, **61**, 332—343).—Chlorides, bromides, or iodides may be titrated with mercury perchlorate solution, the end-point of the titration being determined with accuracy by electrometric means even in very dilute solutions, but the method cannot be applied to mixtures of these salts. The method is also trustworthy in the case of thiocyanates, cyanides, ferrocyanides, formates, acetates, monochloroacetates, lactates, benzoates, and salicylates, but it cannot be used for trichloroacetates owing to the ready hydrolysis of the mercury compound, or for the salts of polybasic aliphatic acids. The mercury perchlorate solution is prepared by saturating perchloric acid with mercuric oxide. W. P. S.

Detection of Fluorine. B. Fetkenheuer (*Wiss. Veröffentl. Siemens-Konzern*, 1922, **1**, [3], 177).—The substance is heated with sand and a few c.c. of sulphuric acid at 90° in a test-tube. On shaking the tube, the presence of fluorine is shown by the acid collecting into oily drops, which appear not to wet the surface of the glass. With 2 grams of substance, 0·01% of fluorine may be detected after heating for one minute. Insoluble fluorides such as aluminium fluoride must first be fused with sodium carbonate and sand; the fused mass is then heated as above with sulphuric acid. A. R. P.

The Colour of Iodine Solutions at Low Temperature. Jean Piccard and E. Herrmann (*Helv. Chim. Acta*, 1922, **5**, 625—626).—The brown colour formed by iodine in solvents containing oxygen has been suggested as a qualitative test for oxygen (this vol., ii, 389), in absence of other elements or groups of an unsaturated character such as tervalent nitrogen. It has been observed that very dilute solutions of iodine in hydrocarbons such as light petroleum, which are violet at the ordinary temperature, become brown at lower temperatures, in the neighbourhood of −20°. When the iodine concentration is increased beyond a certain value, about 1 mg. in 10 c.c., however, the colour change does not take place. It is shown that the brown colour is due to an impurity in the commercial light petroleum, and that it does not appear with carefully purified specimens. The phenomenon can be reproduced by addition of a small quantity of alcohol to the pure light petroleum, or to toluene, chloroform, and other solvents. E. H. R.

Rapid Estimation of Sulphur. LUIGI LOSANA (*Giorn. Chim. Ind. Appl.*, 1922, **4**, 297—299).—The method previously described (this vol., ii, 582) gives accurate results with pyrites, copper pyrites, and other mineral sulphides, ultramarine, adulterated white lead, cement, various rocks, sulphates of copper, sodium, etc., naphtha, anthracene, coke, ichthyol, "saccharin," ebonite, and caoutchouc. T. H. P.

Determination of Sulphur in Vulcanised Rubber. J. W. W. DYER and AMY R. WATSON (*J. Soc. Chem. Ind.*, 1922, **41**, 251—252).—Methods are described for the estimation of free and combined sulphur in vulcanised rubber. These are as follows. (*a*) Combined sulphur. The sample (0·5—3·0 grams) is added to 30—40 c.c. of nitric acid (*d* 1·42) in a suitable flask and the reaction started by gentle heating; subsequently the mixture is heated to the boiling point and boiling continued until the liquid is clear. Pure powdered potassium permanganate is now added, about 0·25—0·5 gram at a time, and the heating continued between additions. The addition of permanganate is continued until finally a small black precipitate remains; this requires generally about 2 grams of permanganate. The contents of the flask are poured into a dish and evaporated to dryness, taken up with 10 c.c. of concentrated hydrochloric acid, and again evaporated to dryness. The residue is treated with water, made up to 100 c.c., and made just acid to methyl-orange at the boiling point. The sulphur is then precipitated as barium sulphate. (*b*) Free sulphur. To 50—60 c.c. of acetone, 0·5—1 gram of material is added and the free sulphur extracted. To the extract 0·5—1 gram of powdered permanganate is added, the mixture shaken, and kept at the ordinary temperature for thirty minutes. If the purple colour disappears a little more permanganate is added. The acetone is then distilled off on the water-bath and the brown residue heated at 100—110° for a short time. About 3—5 c.c. of hydrochloric acid (*d* 1·16) is added for each gram of permanganate used, and the solution heated until colourless. It is then diluted a little and filtered, the filtrate is made up to 100 c.c., and ammonia cautiously added until the solution becomes yellow and slightly turbid. It is then made just acid and precipitated while boiling with 4—5 c.c. of *N*/2-barium chloride solution. Both methods give results which are in good agreement with those obtained by the Carius method. J. F. S.

Quantitative Micro-analysis of Mixtures with Special Reference to Organic Ultimate Analysis. A. BENEDETTI-PICHLER (*Z. anal. Chem.*, 1922, **61**, 305—331).—The author describes the advantages of micro-chemical methods, points out the importance of obtaining representative samples in dealing with very small quantities of substances, and gives instances of the application of the methods and their limits of accuracy. W. P. S.

Volumetric Estimation of Carbon and Hydrogen in Organic Compounds. JOSEF LINDNER (*Ber.*, 1922, **55**, [*B*], 2025—2031).—The substance is burnt in the usual manner and the products of its combustion are passed over a substance which by its hydrolysis gives hydrogen chloride and thence into a known volume of standard barium hydroxide solution. The latter is titrated with *N*/10-hydrochloric acid in the presence of phenolphthalein; the carbon dioxide is subsequently removed after addition of an excess of hydrochloric acid and the resulting solution is again titrated with barium hydroxide. With *N*/10-solutions and burettes of 50 c.c. capacity, the analysis is conveniently performed with 20 mg. of material.

The most suitable substance for hydrolysis is chloronaphthyloxychlorophosphine, which may contain chloronaphthyltetrachlorophosphine: it is decomposed by water in accordance with the equations:

$$C_{10}H_6Cl{\cdot}PCl_4+H_2O=C_{10}H_6Cl{\cdot}POCl_2+2HCl;$$
$$C_{10}H_6Cl{\cdot}POCl_2+2H_2O=C_{10}H_6Cl{\cdot}PO(OH)_2+2HCl;$$
$$C_{10}H_6Cl{\cdot}PO(OH)_2+C_{10}H_6Cl{\cdot}POCl_2=2C_{10}H_6Cl{\cdot}PO_2+2HCl.$$

It is prepared by passing chlorine into molten naphthyldichlorophosphine until three atomic proportions of the gas have been absorbed. It is not a well-defined individual. Hydrogen chloride is freely and quantitatively evolved when a current of moist air is passed through the molten material. It is, however, convenient to depress its melting point to some extent by a preliminary regulated treatment with moist air. The material prepared in this manner somewhat readily evolves considerable amounts of readily volatile acid products, which must be removed by protracted exposure to a current of dry air; the elimination of acid is thereby ultimately reduced to a small amount, for which a correction can be applied, but the presence of the acid has the drawback that the sharpness of the end-point in the ultimate titration is diminished.

Test analyses show that the method gives accurate results, which, however, are somewhat low for hydrogen, the source of error most probably lying in the uncertainty of the correction for the acidic products evolved spontaneously from the phosphorus compound. H. W.

Absorption of Carbon Monoxide by Acid Cuprous Chloride Solution in the Presence of a Reducing Agent. ALFRED KROPF (*Z. angew. Chem.*, 1922, **35**, 451—452).—The rate of absorption of carbon monoxide by acid cuprous chloride solution is increased by the addition of stannous chloride to the solution. The stability of the solution is improved by the use of a slight excess of stannous chloride (cf. Krauskopf and Purdy, A., 1920, ii, 267). J. S. G. T.

Comparison of Colorimetric and Electrometric Estimations of Hydrogen-ion Concentrations in Solutions containing Carbon Dioxide. GLENN E. CULLEN and A. BAIRD HASTINGS (*J. Biol. Chem.*, 1922, **52**, 517—520).—Contrary to the results obtained by Evans (A., 1921, ii, 271), the colorimetric and electrometric methods for the estimation of the hydrogen-ion concentration of solutions containing carbon dioxide yield identical results, provided precautions are taken to prevent the loss of carbon dioxide. E. S.

Estimation of Small Amounts of Potassium by the Lindo-Gladding Method. WILLIAM HAZEN (*J. Assoc. Off. Agric. Chem.*, 1922, **5**, 456—460).—In the estimation of potassium by the Lindo-Gladding method, the use of 90% alcohol for washing gives better results than 80% alcohol, and when working with small amounts of potassium salts and high accuracy is desired, it is advisable to use the stronger alcohol for washing after the ammonium chloride treatment as well. The lower results obtained by using the weaker alcohol do not appear to be due to the sodium salts which may be present, as has been suggested, as equally low results are obtained in the absence of sodium salts. As, however, it takes a longer time to wash out the ammonium salts with 90% alcohol, it is preferable to use 80% alcohol for the second washing in ordinary fertiliser work, where the percentage error arising from this will not be very serious, as the samples generally contain relatively high amounts of potassium. G. F. M.

Identification of Cæsium and Rubidium. JOHN MISSENDEN (*Chem. News*, 1922, **124**, 362).—The spectroscope affords the best means of distinguishing cæsium from rubidium; the former shows two bright blue lines (4557 and 4592) in the blue portion of the spectrum, whilst rubidium has two lines (4200 and 4237) in the violet and two other lines (7953 and 7810) in the red. The salts of the two metals resemble each other generally, but there is a considerable difference in the solubility of the two nitrates; 100 parts of water at 3·35° dissolve 11 parts of cæsium nitrate and 79·9 parts of rubidium nitrate. W. P. S.

Hydrotimetric Precision and Aqueous Preparation of the Standard Soap Solution. ED. JUSTIN-MUELLER (*J. Pharm. Chim.*, 1922, **26**, 18—21).—Clark's method as modified by Boutron and Boudet is used, but a standard soap solution of only one-tenth the strength is recommended. It is prepared by dissolving 3·5 grams of white Marseilles soap in 200 c.c. of boiling water and then making the volume up to 900 c.c. This solution is diluted, if necessary, until 24 c.c. of it corresponds exactly with 40 c.c. of a 0·025% solution of calcium chloride or of a 0·059% solution of barium nitrate. W. G.

Estimation of Calcium in Natural Phosphates. R. MEURICE (*Ann. Chim. Analyt.*, 1922, [ii], **4**, 198).—The phosphate is treated with mineral acid, the silica removed, and iron and aluminium removed as phosphates. The filtrate is neutralised with ammonia, treated with 20 c.c. of 20% hydrochloric acid, and 30 c.c. of 4% ammonium oxalate. The solution is warmed and 10% ammonium acetate solution added at a rate of about 30 drops per minute. A granular precipitate of calcium oxalate is thus obtained, and is collected, washed, and ignited as usual. Test analyses carried out on known quantities of calcium in the presence of large excess of phosphate and magnesium sulphate gave very accurate results. H. C. R.

Estimation of Magnesium and Alkalis in Minerals. L. H. BORGSTRÖM (*Hyllningsskrift tillägnad Ossian Aschan*, 1920, 118—123).—The precipitation of magnesium hydroxide is best effected with piperidine, a little of which should also be added to the washing water. Lawrence Smith's method for the separation of magnesium from alkalis in silicate analysis is the most satisfactory. CHEMICAL ABSTRACTS.

Colorimetric Method for the Estimation of Small Amounts of Magnesium. A. P. BRIGGS (*J. Biol. Chem.*, 1922, **52**, 349—355).—The method described is similar to that of Hammett and Adams (cf. this vol., ii, 587). E. S.

Estimation of Magnesium in Blood, Plasma, and Serum. W. DENIS (*J. Biol. Chem.*, 1922, **52**, 411—415).—The method is essentially the same as that of Briggs (preceding abstract) and of Hammett and Adams (this vol., ii, 587). E. S.

Magnesium Compound of 8-Hydroxyquinoline. CARL TH. MÖRNER (*Pharm. Zentr.-h.*, 1922, **63**, 399—402; cf. Griebel, A., 1921, ii, 606).—If an aqueous solution of 8-hydroxyquinoline (sulphate) is treated with a suspension of magnesium hydroxide, the latter goes into solution and a lustrous, sulphur-yellow precipitate of the magnesium compound of 8-hydroxyquinoline is formed. The precipitate is also given by "magnesia mixture." The precipitate is microcrystalline and consists of hexagonal platelets. The reaction takes place only in alkaline solution and is sufficiently sensitive to detect 1 part of magnesium in 25,000. The precipitate contains 6·25—6·29% of magnesium and approximates to the formula $(C_9H_6ON)_2Mg,4H_2O$. The compound is also formed by the action of 8-hydroxyquinoline on magnesium ammonium phosphate. The reaction thus permits the separation of magnesium from phosphate in ammoniacal solution. Its use as a dry antiseptic is suggested. G. W. R.

Lead. I. Estimation of Minute Amounts of Lead in Biological Material. L. T. FAIRHALL (*J. Ind. Hyg.*, 1922, **4**, 9—20).—The ash is dissolved in dilute hydrochloric acid, the solution neutralised to methyl-orange with sodium hydroxide, and then slightly acidified with hydrochloric acid. Lead is precipitated as sulphide, the washed precipitate dissolved in 2—5 c.c. of concentrated nitric acid, and boiled to expel hydrogen sulphide. After neutralising with sodium hydroxide and slightly acidifying with acetic acid, an excess of potassium chromate is added, and the solution boiled. The precipitate is dissolved in hydrochloric acid, and an excess of potassium iodide is added to the solution, which is titrated with 0·005*N*-sodium thiosulphate solution. For biological materials, the method appears to be accurate to ±3%. CHEMICAL ABSTRACTS.

Colorimetric Estimation of Manganese in Steels, Alloys, and Ores. J. HESLINGA (*Chem. Weekblad*, 1922, **19**, 302—303).—The ordinary method of oxidising to permanganate in acid solution is unsatisfactory when iron is present, because of the yellow colour of iron salts. A simple and accurate estimation may be made by employing the compound H_2MnO_3, which in alkaline solution gives a yellowish-brown to dark brown coloration.

One hundred to 200 mg. of material are dissolved in a suitable acid, and the solution is diluted and treated with excess of powdered zinc oxide, made up to 100—200 c.c., and filtered. The zinc oxide precipitates the tervalent metals and copper completely after a few minutes' shaking at the ordinary temperature. The filtered solution is poured into a burette, and allowed to fall into a solution containing hydrogen peroxide (3%) and excess of potassium hydroxide (10%) until a suitable colour is obtained; this is matched by means of a standard manganese solution. Several titrations are carried out in succession, adding more of the unknown solution, and matching the colour by means of the standard. Addition of only 0·02 mg. of manganese is easily detected.

Lead does not interfere if excess of potassium hydroxide is employed; if nickel and/or cobalt are present, potassium cyanide is added during the titration. Accurate results are readily obtained when the manganese content is not greater than 20%. S. I. L.

Estimation of Chromium in Metals. WILLI LOFFELBEIN (*Chem. Ztg.*, 1922, **46**, 679).—Chromium is estimated in nickel bronzes and similar alloys by removing the heavy metals from a solution of the alloy with hydrogen sulphide, treating the oxidised filtrate with a slight excess of ammonia, collecting, igniting, and fusing the precipitate with sodium peroxide, acidifying the filtered solution of the melt with hydrochloric acid, adding potassium iodide, and titrating the liberated iodine with sodium thiosulphate solution. A. R. P.

Rapid Method for the Estimation of Chromium in Nickel–Chromium Steel. WILHELM HILD (*Chem. Ztg.*, 1922, **46**, 702—703).—The chromium is oxidised to chromic acid in a sulphuric acid solution of the steel by means of potassium permanganate, the excess of which is destroyed with manganese sulphate. The chromic acid is then estimated by addition of an excess of standard ferrous sulphate solution and titration with permanganate or dichromate [cf. *J. Soc. Chem. Ind.*, 1922, **41**, 671A.] A. R. P.

Estimation of Small Amounts of Molybdenum in Tungsten. DOROTHY HALL (*J. Amer. Chem. Soc.*, 1922, **44**, 1462—1465).—Small amounts of molybdenum may be estimated in tungsten by converting the molybdenum into xanthate, extracting this with chloroform, and converting into sulphide and oxide. The method consists in dissolving 1 gram of the sample in a mixture of nitric and hydrofluoric acids and evaporating with sulphuric acid. The yellow oxides are dissolved in sodium hydroxide solution and transferred to a 200 c.c. separating funnel, acidified with sulphuric acid, and the solution diluted so that 1 c.c. contains about 0·1 mg. of molybdenum. The volume is then made up to 150 c.c., 0·5 gram of potassium xanthate and a few drops of 1 : 3-sulphuric acid are added and the mixture is shaken thoroughly. About 10 c.c. of chloroform are then added and the whole is shaken for several minutes. The highly-coloured chloroform layer settles at the bottom and is run into a second funnel for washing. The original solution is repeatedly treated with potassium xanthate, acid, and chloroform until the chloroform layer is colourless, each portion of chloroform solution being added to the first. The chloroform solution of molybdenum xanthate is washed with water several times, run into a 150 c.c. beaker, and evaporated to dryness. The residue is heated and converted into a mixture of oxide and sulphide. This is dissolved in nitric acid, evaporated with sulphuric acid, and precipitated as molybdenum sulphide by passing hydrogen sulphide into the hot molybdenum solution made alkaline with sodium hydroxide. The solution is then slowly acidified with dilute sulphuric acid and the precipitate filtered, washed with hot water, and carefully ignited to oxide. The results are easily reproducible and trustworthy, and the method is good for mixtures containing small amounts of molybdenum. J. F. S.

Rapid Analysis of Ferro-tungsten. LUIGI LOSANA and ENRICO CAROZZI (*Giorn. Chim. Ind. Appl.*, 1922, **4**, 299—301).—Ferro-tungsten is readily dissolved in 50% nitric acid solution containing a little hydrofluoric acid, subsequent treatment with concentrated sulphuric acid resulting in the elimination of the hydrofluoric acid and precipitation of the tungsten as tungsten trioxide, which may be either weighed as such or estimated volumetrically (cf. *J. Soc. Chem. Ind.*, 1922, **41**, 671A). T. H. P.

Electrometric Titration of Uranium with Potassium Permanganate and Potassium Dichromate. D. T. EWING and E. F. ELDRIDGE (*J. Amer. Chem. Soc.*, 1922, **44**, 1484—1489).—When solutions of uranyl sulphate, reduced with zinc, are titrated electrometrically with potassium permanganate or when solutions of uranium chlorides similarly reduced are titrated with potassium dichromate, a change in the oxidation potential occurs when the tervalent uranium is all oxidised to the quadrivalent condition, and a second change occurs when the latter is all oxidised to the sexavalent condition. Thus the total amount of uranium may be calculated. A third change of potential is observed when iron is present, and this represents the point where all the ferrous iron is converted into ferric iron. The determination is carried out with apparatus of the usual type, except in the form of the titration vessel, since it is necessary to prevent the free access of air. The titration cell is a glass vessel fitted with a cover which has six holes bored in it. Through the holes pass a tube for leading in carbon dioxide, a platinum electrode, the connecting tube of a calomel cell, a stirrer fitted with a mercury seal, the tip of the burette, and the mouth of a Jones reductor. All the tubes passing through the cover are fitted tightly. The method of procedure adopted is as follows: (a) *Estimation of uranium by permanganate.* Ten c.c. of a solution of uranium as sulphate (containing about 0·013 gram U_3O_8 per c.c.) are added to 40 c.c. of sulphuric acid solution *A* (2 c.c. conc. acid, 88 water) and warmed at 80—90°. Carbon dioxide is passed through the titration cell to remove the air, and the uranium solution slowly passed through the Jones reductor into the cell, the reductor being finally rinsed with 50 c.c. of sulphuric acid *A*. The final solution at this stage has a volume of 100 c.c., contains 2 c.c. of concentrated sulphuric acid, and is brown. The stirrer is set in motion and the permanganate slowly added. The *E.M.F.* rises slowly at first and then jumps to a steady value which represents the point at which all the tervalent uranium has been converted into the quadrivalent condition and the solution has become green. Continued addition of permanganate does not affect the *E.M.F.* noticeably until the second end-point is reached, and here the *E.M.F.* jumps rapidly. At this point, the whole of the quadrivalent uranium has been converted into the sexavalent condition. The volume of permanganate used between the first and second end-points is equal to the theoretical amount of oxidising agent required to oxidise uranium from the quadrivalent to the sexavalent condition. Hence from this quantity the total amount of uranium present, no matter what its state of oxidation provided that none of it is sexavalent, can be calculated. (b) *Estimation of uranium and iron with permanganate.* The process is carried out as above; the first and second end-points give, as before, the quantity of uranium. After the uranium has all been oxidised to the sexavalent condition, the oxidation of the ferrous iron commences and when this has been completed the third end-point is observed. Hence the volume of permanganate required to carry the *E.M.F.* from the second to the third end-point is equivalent to the amount of iron present. (c) *Estimation of uranium by dichromate.* The process is carried out exactly as in the first case, and two end-points are obtained which have the same significance as in the other cases, but the slope of the second end-point is not so clear as in the other cases. All methods yield excellent results. J. F. S.

The Estimation of Small Quantities of Gold as Colloidal Gold by the Colorimetric Method. J. A. MULLER and A. FOIX (*Bull. Soc. chim.*, 1922, [iv], **33**, 717—720).—Small quantities of gold may be rapidly and accurately estimated colorimetrically after separation from other metals, provided that the concentration of the gold is not greater than 1/40 mg. per c.c., and that the colloidal particles are of the same size in the two solutions to be compared. The latter condition is realised by precipitation in identical circumstances. The presence of vanadium leads to inaccurate results. H. J. E.

Separation of Palladium and Platinum by means of Dimethylglyoxime. C. W. DAVIS (*U.S. Bur. Mines, Repts. Investigations,* 1922, No. 2351).—The weighed metals are dissolved in a little aqua regia, the solution is evaporated to dryness, the residue moistened with a drop of hydrochloric acid, diluted with cold water, and dimethylglyoxime added with constant stirring until no further precipitate is formed. After keeping for a few minutes, the voluminous precipitate is collected on a filter, well washed with cold water, and ignited, first in air and finally in hydrogen to obtain pure palladium. The method was tested with quantities of each metal ranging from 0·15 to 11 mg., and the greatest divergence in five analyses was 0·03 mg.

CHEMICAL ABSTRACTS.

A Micro-modification of Benedict's Method for the Estimation of Reducing Sugar in Urine. MILLARD SMITH (*J. Lab. Clin. Med.*, 1922, 7, 364—368).—The modification, like the original method, is applicable only to urines containing not less than 0·17% of sugar. Exactly 1·0 c.c. of Benedict's solution is run from a pipette into a special test-tube, 0·2—0·7 gram of anhydrous sodium carbonate is added, and a pebble or piece of quartz. Urine is slowly added to the mixture, maintained at the boiling point, from a Mohr pipette, graduated to read directly the percentage of sugar present. CHEMICAL ABSTRACTS.

Critical Study of Bang's Method for the Estimation of Reducing Substances in Blood. HENRI LABBÉ, F. NEPVEUX, and MÉNÉLAS NOMIDIS (*J. Pharm. Chim.*, 1922, [vii], **26**, 49—63).—Bang's micro-titrimetric method for the estimation of reducing sugars in blood, consisting in oxidising with iodic acid the cuprous oxide produced by reduction by about 100 mg. of the blood absorbed in blotting paper and clarified, and estimation of the excess of iodic acid by titration with thiosulphate in presence of an alkali iodide, gives satisfactory results provided the following points are attended to. All the reagents used must be absolutely pure. Notably the potassium chloride and uranium acetate used for preparing the clarifying solution should be specially purified, and the iodate is preferably prepared by oxidising potassium iodide with permanganate. Mercuric sulphate, or alcohol, or Patein's reagent was found to give inferior results as clarifying agents, as they all retain a quantity of sugar, and at the same time partly compensate for this by allowing a certain amount of reducing substances originating from the albumin to remain in solution. Bang's reagent exhibits these faults in a much less marked degree. The heating of the clarified blood with the iodate–copper solution should be continued for exactly four minutes, and heating by means of a current of steam generated under constant well-defined conditions in a 1500 c.c. flask containing a constant level of water is to be preferred to direct heating, as experiments showed that the method of heating had a considerable influence on the results. The errors should not on the average exceed 5% if all the above precautions are taken, and the estimation of a large number of samples to which known weights of invert-sugar had been added gave a mean of 97% of the added sugar actually found. G. F. M.

Acetol. I. A New Test for Carbohydrates. Oskar Baudisch and Harry J. Deuel (*J. Amer. Chem. Soc.*, 1922, **44**, 1585—1587).—The test depends on the production of acetol from carbohydrates. An aqueous solution of the carbohydrate (0·1 gram in 100 c.c.) is treated with solid sodium hydrogen carbonate (5 grams) and distilled nearly to dryness. With the carbohydrates which are more readily attacked, the solution in the distilling flask very quickly turns brown, and the distillate has a sweet odour. The residue in the flask after distillation has a strong typical caramel odour. The distillate is treated with *o*-aminobenzaldehyde (30 mg.) and enough potassium hydroxide solution to give a distinctly alkaline reaction; after addition of a piece of porous plate, it is evaporated over a free flame to about 1/3 volume, cooled, and acidified with hydrochloric acid. Then solid sodium hydrogen carbonate is added until the solution is alkaline to litmus. The presence of acetol is shown by a strong blue fluorescence, which can be seen in daylight, but more readily in light of short wave-lengths such as that yielded by the iron arc. To confirm the test, the 3-hydroxy-2-methylquinoline may be extracted by shaking the solution several times with alcohol-free ether; the ethereal solution is dried with sodium sulphate, and the solvent removed. The colourless, needle-like crystals of 3-hydroxy-2-methylquinoline which remain dissolve readily in a little alcohol, and the fluorescence shows up strongly after the addition of water to the alcoholic solution. The sensitiveness of the reaction has not been determined except for dextrose, with which quantities as small as 5 mg. give a positive result.

The test is shown by arabinose, xylose, ribose, lyxose, dextrose, fructose, mannose, galactose, glucosamine, lactose, sucrose, maltose, and dextrin, but not by acetoacetic acid, glycerol, β-hydroxybutyric acid, lactic acid, starch, or glycogen.

The formation of 3-hydroxy-2-methylquinoline when treated with *o*-aminobenzaldehyde and potassium hydroxide appears to be a specific reaction of acetol; it is not given by pure methylglyoxal, aldol, acetone, acetaldehyde, ethyl acetoacetate, crotonaldehyde, or ethyl alcohol. H. W.

Estimation of the Cellulose Content of Wood and other Raw Materials by the Action of Chlorine and Carbon Tetrachloride. E. Heuser and H. Casseus (*Papierfabr., Fest-u. Auslandheft*, 1922, 80—93; cf. A., 1921, i, 708; Frank, D.R.-P. 323936).—1·2 to 1·5 Grams of material of medium fineness are shaken with 50 c.c. of a saturated solution of chlorine in carbon tetrachloride for one to two hours, and the fibre is collected on a filter and washed successively with carbon tetrachloride, alcohol, and water. The lignin chloride is then dissolved out with a 2% solution of sodium sulphite, the residue washed with water, dried, and weighed. The product, which contains 3—3·5% of pentosan and 0·04—0·05% of ash, has a copper number of 0·8—0·91 as compared with 3·14—3·23 by the older method. The yield of pure cellulose was 56%. Chemical Abstracts.

Estimation of α-, β-, and γ-Cellulose. OPFERMANN (*Paper*, 1921, **28**, 19—25).—The cellulose content of the pulp is estimated as follows: 10 grams of pulp are covered with 50 c.c. of mercerising liquid (17—18% sodium hydroxide) and allowed to stand for thirty minutes. The fibre mass is then rubbed with 50 c.c. of water, filtered on a Buchner funnel with a fine cotton filter, and carefully sucked dry. The residue is washed with cold water until the wash-water no longer has an alkaline reaction; this usually requires ten to twelve washings, 50 c.c. of water being used each time. Finally, the α-cellulose is washed with hot dilute acetic acid, then with hot water (six to eight times), dried, and weighed. β-Cellulose is estimated by adding concentrated acetic acid to the alkaline filtrate until a marked acid reaction is produced, when β-cellulose separates in a finely divided state, and the colour of the brown filtrate becomes considerably lighter. To assist coagulation, the precipitate is heated on the water-bath at 100° until it settles. It is filtered on a fine cloth filter, washed six to eight times with hot water, transferred to a porcelain dish, dried, and weighed. γ-Cellulose is estimated by difference.

CHEMICAL ABSTRACTS.

Determination of the Iodine Value of Aliphatic and Aromatic Unsaturated Compounds. D. HOLDE (*Chem. Umschau*, 1922, **29**, 253—254; cf. this vol., ii, 533).—Attention is directed to the different behaviour of the Hanus reagent with simple aliphatic oils such as sesame oil and mineral oils containing unsaturated cyclic structures. In the first case, even with varying excess of iodine, constant values are obtained, whilst in the second case variable values far above the theoretical are obtained with more or less considerable excess of the reagent. This is due to the rupture of bridge structures, and in certain circumstances the behaviour of an oil with excess of the Hanus reagent can be utilised to determine whether cyclic unsaturated compounds are present.

G. F. M.

The Sulphuric Acid Test for Liver Oils. J. C. DRUMMOND and A. F. WATSON (*Analyst*, 1922, **47**, 341—348).—The substance present in liver oils which is responsible for the well-known purple coloration with sulphuric acid was found in the following species: Man, horse, ox, pig, cat, monkey, rabbit, guinea pig, chicken, duck, pigeon, rat, mouse, frog, shark, cod, haddock, ling, coal fish, dog fish, sprat, and skate. The substance appears to be a normal constituent of the liver, and is not derived from the bile or from products of autolysis or putrefaction. Evidence is presented to show that it is probably derived from the food, although an examination of the stages in the food of the cod did not reveal its ultimate origin with certainty. The chemical nature of the substance has not been ascertained. It forms a low proportion of the unsaponifiable fraction, is not cholesterol, and probably not a member of the lipochrome pigments. It is thermo-stable in the absence of air or oxygen, but is rapidly destroyed by oxidation. The few properties of the substance which are known, as well as the available data regarding its distribution in natural products, show certain resemblances to the unidentified dietary unit known as vitamin-*A*; and, without assuming the identity of the two factors, it is suggested that the association may be of some significance. The colour test cannot be regarded as specific for liver fats, although they usually give the most intense reactions. The body fat and fat from other organs of animals, especially if they have been fed on liver oils, may give the reaction.

H. C. R.

Chemical and Physiological Investigation of the Fats and Lipoids of the Blood. II. The Kumagawa–Suto Method of Estimation of Lipoids. P. LEMELAND (*Bull. Soc. Chim. biol.*, 1922, **4**, 300—321; cf. A., 1921, i, 633).—In the Kumagawa–Suto method, errors occur which are due to oxidation of the unsaturated acids during the heating and drying processes, and to loss of volatile constituents of the total unsaponifiable matter. The author promises to describe a new technique for the estimation.

E. S.

Estimation of Small Quantities of Furfuraldehyde Colorimetrically. PAUL FLEURY and GABRIEL POIROT (*J. Pharm. Chim.*, 1922, [vii], **26**, 87—96).—Small quantities of furfuraldehyde may be estimated colorimetrically with an accuracy of about ±1% by means of the blue coloration which is formed in acidic medium with orcinol in a suitable solvent, preferably acetic acid, and is intensified by the presence of traces of iron. The reagents required are hydrochloric acid (*d* 1·19) containing 20 mg. of iron as ferric chloride per litre; glacial acetic acid containing 1 gram of orcinol in 1600 c.c., and a standard solution of furfuraldehyde containing 1 gram in 10 litres of 1% acetic acid. One c.c. of the standard solution or of the solution to be estimated is mixed with 4 c.c. of the acetic acid–orcinol solution and 5 c.c. of the hydrochloric acid, and warmed for one minute in a water-bath. After keeping for thirty minutes, the maximum coloration is developed, and comparison is made with the standard in a Duboscq colorimeter. The reaction has a sensibility of about 4 mg. of furfuraldehyde per litre.

G. F. M.

New Analytical Applications of Nessler's Reagent. Characterisation of Ketones; Estimation of Aldehydes. J. BOUGAULT and R. GROS (*J. Pharm. Chim.*, 1922, **26**, 5—11).—Certain ketones, such as acetone, methyl ethyl ketone, *cyclo*hexanone, trimethyl*cyclo*hexenone, acetophenone, and *p*-methoxyacetophenone, give with Nessler's reagent in the cold a yellowish-white precipitate which dissolves in acid or on the addition of potassium cyanide with liberation of the ketone. This reaction may be used for the detection of acetone in urine, by suspending a small capsule, containing 10 c.c. of Nessler's reagent, over 200 c.c. of urine, previously acidified, the whole being covered by a bell-jar. The time required for the formation of a precipitate varies inversely as the concentration of the acetone in the urine.

Certain aldehydes react quantitatively with Nessler's reagent according to the equation $R\cdot CHO+H_2O+2I=2HI+R\cdot CO_2H$, the iodine coming from the mercuric iodide. To a known volume of the aldehyde solution, corresponding with 0·01—0·05 gram of the aldehyde, is added an excess (about 30 c.c.) of Nessler's solution, and 10 c.c. of sodium hydroxide solution. The mixture is well shaken, and after some time is neutralised with hydrochloric acid. A known volume of standard iodine solution is added, and then the excess of iodine is titrated back with standard thiosulphate solution. It is necessary to make a control estimation on the sodium hydroxide. Accurate results were obtained with formaldehyde, furfuraldehyde, benzaldehyde, and piperonaldehyde, but the method is not satisfactory for vanillin or acraldehyde.

W. G.

The U.S.P. Test for Acetone in Alcohol. J. W. E. HARRISSON (*J. Amer. Pharm. Assoc.*, 1922, **11**, 16).—Some zinc salts and antimony compounds interfere with the test, which depends on the development of a violet colour in presence of sodium hydroxide and sodium nitroprusside. The best test consists in the addition of 1 c.c. of potassium hydroxide solution to 5 c.c. of the ethyl alcohol, followed by a solution of iodine in potassium iodide until coloration occurs; heat must not be used. A precipitate is obtained immediately if 0·25% of acetone is present.

CHEMICAL ABSTRACTS.

Analysis of Camphor Preparations. MAURICE FRANÇOIS and ÉMILE LUCE (*J. Pharm. Chim.*, 1922, [vii], **25**, 500—507).—Tincture of camphor (French Codex) contains 10 grams of camphor dissolved in 90 grams of 90% alcohol, and should have α +6·5° in a 200 mm. tube. The optical rotation varies somewhat with the strength of the alcohol, but, provided that the alcoholic concentration is correct, a lower rotation than that mentioned will indicate a deficiency in the camphor content or that artificial (inactive) camphor is present. The optical rotation of camphor decreases slightly with increase of temperature and in alcoholic solution the value decreases considerably for a decrease in the alcoholic concentration. For instance, in absolute alcohol camphor has α_D +43·0°, and in 90% alcohol α +39·66°. To ascertain whether a low value for the optical rotation of a sample of tincture of camphor is due to deficiency in camphor or to the presence of artificial camphor, 50 c.c. of the sample are evaporated under a bell-jar over sulphuric acid, the crystalline residue is dried for a further forty-eight hours over sulphuric acid, and its optical rotation then determined in alcoholic solution; natural camphor has α_D +43°. The alcoholic strength of tincture of camphor may be ascertained from the specific gravity, allowance being made for the fact that each 1% of camphor present increases the specific gravity by 0·00116.

W. P. S.

Estimation of Cyanogen. HIDEKICHI YANAGISAWA (*J. Pharm. Soc. Japan*, 1922, 369—377).—The method is based on the conversion of cyanogen into ammonia. A cyanogen compound is heated with dilute sulphuric acid in a sealed tube at 200° during four hours; after cooling, the product is transferred to a Kjeldahl flask, and after making alkaline with sodium hydroxide, the ammonia is distilled into *N*/4-sulphuric acid; the excess is titrated with *N*/4-ammonia as usual. K. K.

Comparison of Methods for the Estimation of Urea. J. CARRA (*Biochim. terapia sper.*, 1921, **8**, 225).—A comparison of various methods for the estimation of urea shows that a gravimetric method based on the formation of a compound of 1 mol. of carbamide and 2 mols. of xanthydrol is extremely exact. The urease method is also excellent. CHEMICAL ABSTRACTS.

Influence of Sodium Fluoride on the Estimation of Urea by the Xanthydrol Method. M. POLONOVSKI and C. AUGUSTE (*Compt. rend. Soc. Biol.*, 1922, **86**, 1027—1028; from *Physiol. Abstr.*, 1922, **7**, 214).—The presence of sodium fluoride renders the results obtained by this method too high. This is probably due to the liberation by the acetic acid of hydrofluoric acid. The error may be avoided by the removal of the fluoride by calcium acetate. W. O. K.

Microchemical Detection of Tryptophan in the Plant. FRITZ KRETZ (*Biochem. Z.*, 1922, **130**, 86—98).—Tryptophan can be detected in plant-tissues by Fürth's modification of Voisenet's reaction, if the tissues be preserved in a silica gel by soaking in sodium silicate and subsequent addition of concentrated hydrochloric acid. Tryptophan is found in moulds and richly in the embryonic tissues of higher plants and in all other parts containing protein. H. K.

Uric Acid. I. Examination of the Variables in the Folin and Wu Uric Acid Method. II. A Modification of the Folin and Wu Uric Acid Method. GEORGE W. PUCHER (*J. Biol. Chem.*, 1922, **52**, 317—327, 329—334).—Using Folin and Wu's method (A., 1919, ii, 308) for the estimation of uric acid in blood, only 75% of added uric acid was recovered. When, however, the solution was heated before filtering the coagulated proteins, a recovery of 93% was obtained. E. S.

Rapid Estimation of Uric Acid in Urine. E. VAILLANT (*Ann. Chim. Analyt.*, 1922, [ii], **4**, 178—180).—The liquid is titrated with a standard iodine solution made by dissolving 3·78 grams of re-sublimed iodine and 15 grams of potassium iodide in a little water and diluting to 1 litre. Two c.c. of this solution oxidise 0·005 gram of uric acid (to alloxan and urea). The analysis is carried out by measuring into a small tube 2 c.c. of iodine solution and 1 c.c. of carbon disulphide and allowing the urine to fall a drop at a time from a burette, shaking the tube after each addition, until the carbon disulphide becomes first pale rose and then colourless. The uric acid content per litre of urine is then calculated by dividing the number of c.c. used into 5. Sugar and small amounts of albumin do not interfere; larger amounts of albumin should be removed by heating to coagulate and then filtering. If the urine is alkaline, a few drops of acetic acid are added; if it contains crystals of uric acid, it is warmed until they dissolve and the analysis is conducted at 25—30°. A. R. P.

Direct Estimation of Uric Acid in Urine. STANLEY R. BENEDICT and ELIZABETH FRANKE (*J. Biol. Chem.*, 1922, **52**, 387—391).—The same reagents are employed as in the method for blood (this vol., ii, 405). To 10 c.c. of the diluted urine (containing 0·15 to 0·30 mg. of uric acid) are added 5 c.c. of the sodium cyanide solution and 1 c.c. of the arsenophosphotungstic acid reagent. After five minutes, the mixture is diluted to 50 c.c. and the colour compared with a standard containing 0·2 mg. of uric acid similarly diluted to 50 c.c. Owing to the larger amount of uric acid present in urine than in blood, it is unnecessary to heat the solution. Of the other constituents of urine, albumin appears to be the only one which interferes with the reaction. This may be removed, if present, by coagulation by heat in the presence of a drop of acetic acid. E. S.

Rapid Estimation of Quinine Salts. S. G. LIVERSEDGE and F. W. ANDREWS (*Pharm. J.*, 1922, **109**, 92—94).—Quinine in quinine salts is rapidly estimated by dissolving the alkaloidal salt in 20 c.c. of *N*/5-sulphuric acid, a known excess of *N*/2-sodium hydroxide is then added and the liberated quinine extracted with ether saturated with water, and subsequently the excess of alkali titrated with *N*/5-sulphuric acid, using phenolphthalein as indicator. The amount of acid originally combined with quinine is thus determined, whence the percentage of quinine or quinine salt is obtained by calculation. If boric acid is present, hæmatoxylin is used as indicator. G. F. M.

Estimation of Small Quantities of Atropine in Blood-serum. H. C. VAN DER HEYDE (*J. Lab. Clin. Med.*, 1922, **7**, 280—287).—Atropine was estimated in 1 c.c. of serum in maximum concentrations of 0·5%. Proteins are first precipitated with absolute alcohol, the precipitate being washed several times with absolute alcohol, and the alcoholic filtrates evaporated to dryness. The residue is treated with a small quantity of water and the solution filtered from fats on a microfilter. The dilution is then determined in which Mayer's reagent (potassium mercury iodide) will just give a precipitate, and compared with control solutions of known dilution. CHEMICAL ABSTRACTS.

Method for the Separation of Strychnine from Quinine. NORMAN EVERS (*Pharm. J.*, 1922, **109**, 90—91).—A practically quantitative separation of strychnine from quinine is achieved by taking advantage of the fact that chloroform extracts strychnine hydrochloride from strongly acid aqueous solutions, but does not remove quinine hydrochloride under similar conditions. The solution of the mixed alkaloids is acidified with hydrochloric acid to make it about 2*N*, and is extracted with five successive quantities of 50 c.c. each of chloroform. The chloroform extracts are united, concentrated to 50 c.c., shaken with dilute aqueous ammonia, and evaporated to dryness. The residue is almost pure strychnine, and the quinine is extracted from the residual acid solution with chloroform after rendering alkaline in the usual way. G. F. M.

Detection of Thymine in the Presence of Sugar. HARRY J. DEUEL and OSKAR BAUDISCH (*J. Amer. Chem. Soc.*, 1922, **44**, 1581—1584).—A modification of the method, described recently by Johnson and Baudisch (this vol., ii, 238) for the detection of thymine, is given which makes it applicable in the presence of sugar. For this purpose, the thymine is precipitated as the mercury salt by the addition of saturated mercuric chloride solution (10 c.c.) and sufficient sodium hydroxide solution to make the mixture distinctly alkaline. The precipitate is separated by means of a centrifuge, and, after pouring off the supernatant liquid, it is thoroughly mixed with about 100 c.c. of distilled water and again centrifuged. It is then suspended in water (100 c.c.) and decomposed with hydrogen sulphide; the precipitated mercuric sulphide is filtered and excess of hydrogen sulphide is removed by boiling the filtrate. The remaining liquid is cooled and made up to 100 c.c. Oxidation of the thymine is effected by treating the solution with sodium hydrogen carbonate and ferrous sulphate in the presence of air and the test is completed as described previously. Thymine in quantities of 10—15 mg. may readily be detected in the daylight, whilst as small a quantity as 1 mg. may be detected by the use of the iron arc light. H. W.

Recognition of Proteins and Derivatives by Colour Reactions. M. A. RAKUSIN (*Biochem. Z.*, 1922, **130**, 268—281).—The author has examined a large number of animal and vegetable proteins, ferments, and toxins in respect of their behaviour towards eight colour reagents, namely, biuret, Millon's, xanthoprotein, Liebermann's, Adamkewitsch's, Molisch's, Pettenkofer's, and Ostromysslenski's, and the behaviour towards the sulphur reaction of Vohl and Rakusin. Each protein corresponds with a definite complex of reactions. H. K.

Estimation of Small Amounts of Albumin in Urine. G. GÉRARD (*Bull. sci. pharmacol.*, 1921, **28**, 466—467; from *Physiol. Abstr.*, 1922, **7**, 158—159).—Ten c.c. of urine are placed in each of two test-tubes. One is warmed and a few drops of trichloroacetic acid are added, giving the usual turbidity when albumin is present. To the other there is added drop by drop officinal spirit of peppermint. The tube and contents are shaken after each drop is added, and the turbidity of the two tubes is compared. When the opacity of both is alike, the test is completed. The author has found that 1 drop of the alcohol used is equivalent to 0·04 c.c. of albumin. No results are given. W. O. K.

The Differential Precipitation of the Proteins of Colostrum and a Method for the Estimation of the Proteins in Colostrum. PAUL E. HOWE (*J. Biol. Chem.*, 1922, **52**, 51—68).—When cow's colostrum is precipitated by addition of successive small quantities of sodium sulphate, a precipitation curve is obtained which shows three "critical zones" at which increases in the concentration of sodium sulphate cause only small increases in the amount of protein precipitated. These zones occur at concentrations of 13·5—14·5, 17·4—18·4, and 21—22% of sodium sulphate. Up to concentrations of 13·5% euglobulin is precipitated, between 14·5 and 17·4% a mixture of caseinogen and ψ-globulin I is obtained, whilst the precipitate produced between 18·4 and 21% is termed ψ-globulin II. After removal of euglobulin, caseinogen may be precipitated separately by addition of either acetic acid or alum. Total precipitation, including albumin, is effected by means of trichloroacetic acid. By combining these precipitations with Kjeldahl estimations on the filtrate before and after precipitation, a method for the estimation of the proteins of colostrum and of milk is developed (cf. Woodman, A., 1921, i, 625).

E. S.

Estimation of Globulins in Blood-serum. R. R. HENLEY (*J. Biol. Chem.*, 1922, **52**, 367—375).—Two methods are described. In the first, the globulins are precipitated by saturation with magnesium sulphate and the non-globulin nitrogen is estimated in the filtrate. The difference between this and the total nitrogen gives the globulin nitrogen. In the second method, the globulins are precipitated by half saturation with ammonium sulphate, filtered, dissolved in salt solution, and again precipitated. The precipitate is once more dissolved in salt solution and the globulins are finally precipitated by boiling, one or two drops of 10% acetic acid being added if necessary. The precipitate is then filtered on to a tared, hardened filter-paper, washed, dried at 100°, and weighed. The results obtained by both methods vary slightly according to the dilution employed, but are otherwise in agreement with those obtained by Cullen and Van Slyke's method (A., 1920, ii, 398).

E. S.

New Method for the Detection of Bile Pigments. AL. IONESCU and C. POP (*Bul. Soc. Chim. Romania*, 1922, **4**, 20—26).—The following method is recommended as a quick and satisfactory means of detecting bile pigments in urine. To 10 c.c. of the urine are added 2 c.c. of a 0·5% solution of albumin and a few drops of 10% acetic acid. The mixture is boiled and filtered. The precipitate is washed with water and to it on the filter-paper is added one drop of a mixture of 4 c.c. of 6% potassium dichromate and 1 c.c. of 20% sulphuric acid. If the urine contains bile pigments the yellow precipitate turns a green or bluish-green colour. The depth of the colour depends on the amount of pigment present. The reaction is characteristic and very sensitive and is not given by other normal or abnormal urinary pigments. W. G.

Estimation of Bilirubin in Human Serum. The Ehrlich-Pröscher Reaction. J. S. THANNHAUSER and E. ANDERSEN (*Deut. Arch. klin. Med.*, 1921, **137**, 179—186; from *Chem. Zentr.*, 1922, ii, 425).—The colorimetric method of Hijmans van den Bergh, in which, after precipitation of protein from serum by means of ethyl alcohol, bilirubin is directly combined with diazobenzenesulphonic acid, is considered to be inexact owing to precipitation of a portion of the bilirubin by ethyl alcohol and also owing to the coloration obtained differing from that of the test solution. The latter difficulty can be avoided by the presence of excess of mineral acid. Directions are given for the estimation of bilirubin in different sera. G. W. R.

Estimation of Trypsin. A Modification of Gross's Method. SOTARO KAI (*J. Biol. Chem.*, 1922, **52**, 133—136).—The relative strengths of trypsin are estimated by measuring the time taken by equal amounts of each to digest 25 c.c. of a casein solution, the time of digestion being inversely proportional to the concentration of trypsin. The end-point of digestion is determined by adding a sodium hydroxide–acetic acid solution to test portions withdrawn from time to time, no precipitate being produced when digestion is complete. By arbitrarily choosing one preparation as standard, the concentrations of others may be expressed in terms of this. E. S.

Acidosis. XVIII. Estimation of the Hydrogen Carbonate Concentration of the Blood and Plasma. DONALD D. VAN SLYKE (*J. Biol. Chem.*, 1922, **52**, 495—499).—Two methods are described. In the first, total carbon dioxide is estimated by Van Slyke and Stadie's method (this vol., ii, 78) and P_H either electrometrically or colorimetrically by Cullen's method (following abstract). The hydrogen carbonate concentration is then calculated from the equation $[BHCO_3]=[CO_2]/(1+10^{P_{K_1}-P_H})$, which is derived from $[H^{\cdot}]=K'.[H_2CO_3]/[BHCO_3]$, $P_{K'}$ being the negative logarithm of K'. The second is a titration method. One c.c. of plasma is treated with 5 c.c. of $0{\cdot}01N$-hydrochloric acid and shaken in a 100 c.c. round flask to remove carbon dioxide. It is then brought back to the original alkalinity by the addition of $0{\cdot}01N$-sodium hydroxide, phenol-red being used as indicator and 1 c.c. of the original plasma as standard. Sodium chloride solution (0·9%) is used for the preparation of the standard acid and alkali, and also for the dilution, where necessary, of the plasma. Special precautions must be observed to prevent loss of carbon dioxide from the standard. E. S.

Acidosis. XIX. Colorimetric Estimation of the Hydrogen-ion Concentration of Blood Plasma. GLENN E. CULLEN (*J. Biol. Chem.*, 1922, **52**, 501—515).—The hydrogen-ion concentration of diluted plasma or serum is estimated colorimetrically at 20° by comparison with Sörensen's phosphate standards, using phenol-red as indicator, and is then converted into that for undiluted plasma at 38° by use of an empirical factor. The latter has been determined by direct comparison of colorimetric with electrometric estimations, and has been found to be constant for plasma of the same species. It is different, however, for plasma of different species and also for plasma and serum of the same species. The success of the method depends on the use of a technique, which is described in the original, to prevent the loss of carbon dioxide during both the preparation of the plasma and the estimation. E. S.

General and Physical Chemistry.

The Reflexion of *X*-Rays by Crystals. R. DARDORD (*J. Phys. Radium*, 1922, [vi], **3**, 218—220).—When *X*-rays are reflected from a cylindrical crystalline surface, such as may be obtained by bending a sheet of mica, the analogy between the reflexion of *X*-rays and light becomes closer; the only difference is that the reflexion of the former is selective. An image of a rectilinear source of *X*-rays may be obtained from a cylindrical surface and received on a photographic plate. The theory of the formation of the image is discussed and this verified experimentally. W. E. G.

Errors arising in the Measurement of Unsymmetrical Spectrum Lines. T. R. MERTON and D. N. HARRISON (*Proc. Roy. Soc.*, 1922, [*A*], **101**, 431—434).—One of the most serious sources of error in the measurement of the spectrum lines by juxtaposition of an arc spectrum is the drift of the spectrum across the plate due to either mechanical displacement or changes in the temperature of prism or grating. The methods frequently employed to reduce these errors are not satisfactory for unsymmetrical lines. It is shown that the position of the maximum of an unsymmetrical line in the case of a uniform drift lies at the intersection of the intensity distribution curves at the beginning and the end of the exposure, and hence in the comparison with symmetrical lines, errors amounting to a large fraction of the displacement may easily occur. For this reason, the spectra of gases at low pressures, in which the lines are known to be symmetrical, are to be preferred as standards of wave-length. W. E. G.

Atomic Hydrogen and the Balmer Series Spectrum. R. W. WOOD (*Phil. Mag.*, 1922, [vi], **44**, 538—546).—From the investigation of the hydrogen spectrum developed by an electric discharge in long vacuum tubes containing hydrogen (A., 1921, ii, 665), it is concluded that the secondary spectrum is emitted by the hydrogen molecules, the Balmer series by the atoms. The latter series has been extended to the 20th line by abolishing the secondary spectrum and the faint continuous background of illumination and employing a sufficiently long exposure. It appears extremely probable that the part played by water vapour in enhancing the development of the Balmer series consists in supplying a "poison" (oxygen) to the catalysing wall of the discharge tube, thus permitting a high concentration of atomic hydrogen in the tube under the action of a heavy discharge. With a feeble discharge, the secondary spectrum predominates, as atomic hydrogen is not formed sufficiently fast to overtake the catalysing power of the tube wall. The whiteness of the discharge when the discharge tube is immersed in liquid air, observed by Merton, is due to the increased catalysing power of the wall at low temperatures. The catalysis theory is likewise applicable to explain the characteristic spectrum developed when air or nitrogen is admitted to the discharge tube containing hydrogen, and the more complete development of the Balmer series in the solar corona and probably in nebulæ. The wave-lengths of the components of the doublet H_γ were found to be 4340·494 and 4340·435 I.Å. J. S. G. T.

The Emission Spectrum of Monatomic Iodine Vapour. ST. LANDAU-ZIEMECKI (*Phil. Mag.*, 1922, [vi], **44**, 651—656).—The band spectrum of iodine vapour at low temperatures showed distinct maxima at λλ 422, 404, 395, 387, 380, 373, 368, 363, 340, 325, 323, 320, 319, 312, 310, 306, 304, 302, and 299 μμ. The band spectrum became gradually fainter and the line spectrum developed as the temperature was raised. At 960—1000°, corresponding with almost complete dissociation of the iodine molecules, the band spectrum disappeared entirely and was replaced by the line spectrum, due to atomic iodine vapour, and consisting of wave-lengths 4868, 4769, 4680, 4324, 4132, 4100, 3384, 3281, 3081, 2879, 2593, 2583, and 2566 Å. Of these, λ 3281 Å. is certainly new. It is concluded that the band spectrum originates in the molecule, and the line spectrum in the atom. J. S. G. T.

The Spectrum of Helium in the Extreme Ultra-violet. THEODORE LYMAN (*Nature*, 1922, **110**, 278—279; cf. Fricke and Lyman, A., 1921, ii, 362).—When an improved apparatus is used, the line at 584·4 is of very great strength, and is accompanied by three new lines at 537·1, 522·3, and 515·7, of which the intensities decrease with the wave-length in a manner strongly suggesting a series relation. The spacing of these lines on the frequency scale is identical with that of the first four lines in the singlet principal series. The line at 584 is therefore regarded as the first member of a principal series, *oS*—*mP*. The wave-lengths of the new lines, however, are not in complete agreement with the accepted values of the resonance and ionisation potentials. A. A. E.

Some Spectrum Lines of Neutral Helium derived theoretically. LUDWIK SILBERSTEIN (*Nature*, 1922, **110**, 247—248).—Owing to the prohibitive nature of the general problem of three or more bodies, Bohr's quantum theory can account only for those spectrum lines which form a series of the simple Balmerian type, that is (apart from *X*-ray spectra of the higher atoms), only those of atomic hydrogen and ionised helium. An attempt is therefore made to obtain a special solution to the problem in the case of neutral helium, the spectrum of which, containing some 105 lines, has not been accounted for theoretically. Assumption that the nucleus and the two electrons are always collinear with each other, the latter describing two equal and oppositely situated ellipses round the former, is evidently erroneous, since the corresponding formula does not cover a single observed line of helium. On the other hand, assumption that the mutual perturbation of the two electrons is negligible yields a spectrum formula which covers about forty lines of the spectrum of neutral helium, and will probably be found to cover fifty more lines. It therefore appears that the electrons within the atom do not repel each other even with a small fraction of the force usually attributed to them. Lithium appears to yield similar, although less striking results. It is concluded that the field of force of a bound electron is entirely engaged by the nucleus, at least in the case of helium and probably lithium, but possibly also in that of the higher atoms. A. A. E.

Spectrum Lines of Neutral Helium. W. M. HICKS (*Nature*, 1922, **110**, 309).—The constitution of the secondary spectrum of hydrogen may be examined by a method similar to that used by Silberstein (preceding abstract) for helium. Practically the whole of this spectrum depends on the sequence of the Balmer series. If $f(m)$ denote the mth sequent, the wave-length of any line is of the form $\Sigma k_m f(m)$, where the k_m are positive or negative integers. The spectrum is a kind of linkage spectrum in which the usual links are replaced by the separations between the successive lines of the primary, namely, 5331·57, 2467·75, etc. In Silberstein's theory, as in all orbital theories, the two electrons are considered to be moving independently, and each to pass between two of its corresponding paths; if, however, the combined change of energy is radiated, these two events must be simultaneous. A. A. E.

Ionisation in the Solar Atmosphere. HENRY NORRIS RUSSELL (*Astrophys. J.*, 1922, **55**, 354—359).—Barium is much more highly ionised in the sun than sodium, although their ionisation potentials are the same. The absorption of photospheric radiation by atoms in the solar atmosphere tends to increase the degree of ionisation, both directly, by shifting an electron into a position from which its removal is easier, and indirectly, when enhanced lines are absorbed, by getting the ionised atoms into states in which they are probably less likely to combine with electrons. The case of lithium, however, is anomalous. Barium lines and enhanced rubidium lines in the solar spectrum are tabulated. The ionisation potential of manganese (7·6 volts) agrees well with the value predicted from the behaviour of its lines in the solar spectrum. A. A. E.

The Spectrum of Glucinum and its Noteworthy Relation to the Spectrum of Aluminium. L. C. GLASER (*Ann. Physik*, 1922, [iv], **68**, 73—88).—Employing the arc or spark between electrodes of glucinum, the author has investigated the spectrum of the metal in the visible and ultra-violet regions. The line spectrum observed confirms, with certain limitations, the previous measurements of Rowland and Tatrall. In the region λλ 5500—4900 Å., no lines, apart from those constituting part of the band spectrum, attributable with certainty to glucinum, were observed. The line spectrum observed was constituted of λλ 4607 ?, 4600 ?, 4572, 4486·7 ?, 4277·8 ?, 4263·6 ?, 4216·0, 4079·0, 3994·0, 3936·0, 3909·3, 3891·0. A more accurate measurement of the strongest line, λ 4572, gave the result 4572·73±0·0098 Å., in terms of the normal international iron spectrum. Attention is directed to certain analogous physical features characterising the production of the band spectra of glucinum and aluminium. The wave-lengths of the constituent bands in the spectra of both elements are tabulated, and it is remarked that there is considerable agreement between the respective first differences of wave-lengths of successive lines in corresponding bands in the two spectra. Deslandre's rule is true only as a first approximation. Attention is also directed to the approximate constancy of certain numerical values calculated from the wave numbers of the heads of the bands λλ 4708 and 4842 in the case of the glucinum and aluminium spectrum, respectively. It is concluded that the atomic structures of glucinum and aluminium, so far as the emission of their band spectra is concerned, are the same. J. S. G. T.

The Band Spectra of Cadmium. ERIK HULTHÉN and ERNST BENGTSSON (*Compt. rend.*, 1922, **175**, 423—426).—Two systems of bands have been measured at λ=4500 and λ=4300 and their structures studied. The results show that the bands of the elements zinc, cadmium, and mercury can be embodied in the same expressions, and the constants of the series in the bands of cadmium are given. W. G.

A Continuous Spectrum from Mercury Vapour. C. D. CHILD (*Astrophys. J.*, 1922, **55**, 329—344; cf. A., 1921, ii, 3).—A continuous spectrum identical with the fluorescence spectrum is emitted in addition to the ordinary line spectrum when (*a*) the temperature of the vapour is above 120° and below 300—400°, depending on the pressure, (*b*) the pressure is above 1 mm., (*c*) the current density is low, (*d*) very little air or other contaminating gas is present. Ionisation of the vapour is not, however, necessary. It is suggested that the carriers of the spectrum are molecules consisting of two or more atoms, which emit the fluorescence spectrum as a result of excitation by ultra-violet radiation λ 2536 emitted by atoms struck by electrons with energies corresponding with at least 4·9 volts. The ionisation potential for mercury appears to vary with the temperature, reaching a minimum at about 140°. Above 120°, mercury vapour reacts with air to form a dark compound; the reaction is associated with the appearance of the continuous spectrum. A continuous spectrum of sodium, much fainter than the line spectrum, has also been observed.

A. A. E.

The Lanthanum Violet Bands and the Associated Lines. JUNZÔ ÔKUBO (*Sci. Rep. Tohoku Imp. Univ.*, 1922, **11**, 95—104).—The edges of the bands in the violet and green regions of the lanthanum spectrum consist of closed doublets, and the edges of these are determined accurately in order to seek a relation between the band and line spectra. The best conditions for observing the bands and diffused lines are obtained when the temperature of the arc is low, or by using lanthanum as the negative electrode with a moderate current; under these conditions, the sharp lines are comparatively faint. It was found that one pair of double lines exists nearly midway between the corresponding heads of each series of bands, and another between the heads of successive series so that the bands are not independent of each other. By the introduction of the quantum theory, the conclusion is drawn than the lanthanum violet bands are emitted as a consequence of the molecular rotation when line emission takes place in the atom, thus accounting for the double structure of the bands.

W. E. G.

The Arc Spectra of Gallium and Indium. H. S. Uhler and J. W. Tanch (*Astrophys. J.*, 1922, **55**, 291—301).—By the use of a concave grating with 590 lines per mm. and a radius of curvature of 640 cm., accurate determinations were made of the wave-lengths for air and the vacuum wave numbers of twenty-three gallium lines and thirty-four indium lines, λ 4511 to λ 2170. All the gallium lines and twenty-eight of the indium lines were found to belong to the two subordinate series, for each of which from five to eight terms were identified. Four indium lines, previously supposed to be single, were resolved. An attempt to obtain the absorption spectrum of indium vapour gave only the two strongest lines, λ 4511 and λ 4102. A. A. E.

Optical Experiment Demonstrating the Bragg Method of Crystal Analysis. Bilfried Quarder (*Physikal. Z.*, 1922, **23**, 350—352).—An optical analogue to the distribution of intensities in the various orders of X-ray spectra reflected from the 1, 1, 1, planes of sodium chloride or the 1, 0, 0 planes of zinc sulphide is afforded by the use of a photographic grating consisting of equally spaced, alternately thick and thin lines. By reducing the grating aperture, broadening of the lines occurs, a result analogous to the broadening of the lines in the X-ray spectrum, occurring on powdering the diffracting crystals, as observed by Debye and Scherrer (A., 1917, ii, 437). J. S. G. T.

Spectra of X-Rays and the Theory of Atomic Structure. IV and V. D. Coster (*Phil. Mag.*, 1922, [vi], **44**, 546—573).—In continuation of previous work (A., 1922, ii, 491), the author has investigated the L-series of the characteristic X-ray spectra of the rare elements from lanthanum (atomic number 57) to lutecium (atomic number 71). In general, the lines for these elements are much sharper than those for elements of lower atomic number, and most of the stronger lines are accompanied by fairly intense satellites. Measurements have been made of a great number of lines which may be arranged in a simple diagram and are conveniently referred to as diagram lines, a number of non-diagram lines, and some absorption discontinuities. The measured frequencies of the diagram lines are in agreement with results to be anticipated from Bohr's theory of the successive development of the shells of electrons in the various atoms. Most of the non-diagram lines lie on the short wave-length side of an intense diagram line, and the difference of frequency between the two lines is approximately proportional to the atomic number of the element.

A theoretical discussion is given of the origin of the non-diagram lines and of the fine structure of the absorption discontinuities. In criticism of the views of Wentzel (this vol., ii, 249) in this connexion, experimental results have been obtained showing that the assumption of the successive ionisation of the inner shells of the atom is untenable, and that part of the non-diagram lines are emitted by atoms which have lost more than one electron at the same time by the impact of a single high-speed β-particle. An explanation is given of the origin of some non-diagram lines lying on the long wave-length side of diagram lines, and it is suggested that these lines should appear both in the emission and in the absorption spectra. J. S. G. T.

Analysis of the Electronic Structure of the Elements. A. DAUVILLIER (*J. Phys. Radium*, 1922, [vi], **3**, 221—251).—The author has investigated the *L*-series of lines in the characteristic *X*-ray spectra of uranium, gold, platinum, iridium, osmium, tungsten, and antimony, and the *K*-lines in the spectra of copper and molybdenum (cf. A., 1921, ii, 669; this vol., ii, 43, 101, 559). The numbers of observed lines have been at least doubled, and owing to the correction of certain errors, it is shown that Sommerfeld's theory is applicable to the calculation of the frequencies of these lines. The results have been applied to determine the energy levels of the atoms of most of the elements and afford a complete qualitative explanation of their absorption spectra; they have likewise been correlated with the ionisation potentials of certain gases and metallic vapours, by the application of the quantum hypothesis. The numbers of electrons in the various corpuscular layers of the respective elements have been calculated, and it is shown that the number n of such electrons is related to the quantum number τ characterising the layer by the equation $n=2\tau^2$. A theory is advanced to account for the complex structures of the *K* and *L* series of lines in the *X*-ray spectra of the light elements, and these spectra are, by the aid of the theory, correlated with the corresponding spectra of the elements in the visible region. The variation of atomic volume and chemical valency of the elements, as shown by the periodic table, is also at least partly explained by the theory developed. J. S. G. T.

The Absorption Spectrum of Potassium Vapour. SNEHAMOY DATTA (*Proc. Roy. Soc.*, 1922, [*A*], **101**, 539—547).—The principal series lines in the absorption spectrum of potassium vapour have been measured up to $m=42$ (compared with $m=24$ previously). Satisfactory agreement is shown between the measured frequencies and those calculated by the series formula $p_1(m)=35008{\cdot}480-109736{\cdot}1/(m+1{\cdot}29667-0{\cdot}06154/m)^2$, except for $m=3$ and $m=39$ to 42. The value for $m=3$ is abnormal, and the latter values receive a possible explanation along the lines of Sommerfeld's assumption of the occurrence of collisions between the electrons emitted from the atom and other electrons or atoms. The first seven members of the principal series have been resolved, compared with five previously. New absorption lines, first appearing at 20 mm. pressure, and apparently not corresponding with known lines in the emission spectrum, were found at higher pressures. The combination lines $1s—2d$ and $1s—3d$ were found to be absorbed, the first as a pair, confirming the presence of a satellite to the lines of the diffuse series. The appearance of these absorption lines contradicts the selection principle. J. S. G. T.

Absorption of Potassium Vapour in the Associated Series. A. L. NARAYANA and D. GUNNAIYA (*Nature*, 1922, **110**, 250).—Traces of absorption occur at about 1100°. In the diffuse series, distinct traces of absorption have been detected; the bands 5780, 5340, 5300, and 5100 apparently correspond with 5782, 5340, 5323, and 5100 of $(2p—m.d)$. A. A. E.

Absorption of Light by Sodium and Potassium Vapours. GEORGE R. HARRISON (*Proc. Nat. Acad. Sci.*, 1922, **8**, 260—263).—Vapour density alone determines the development of the continuous absorption spectrum of sodium vapour. No visible effect is attributable to hydrogen present in pressures up to 400 mm. of mercury. Absorption begins at the last resolved line of the principal series. No definite break in the continuous absorption spectrum was observed, but the absorption decreases rapidly with decreasing wave-length, the region λ 2200 Å. being one of the most transparent regions studied. With unsaturated sodium vapour, the band spectrum is much weaker than the line and continuous spectra. It is suggested that the bands are due to loose molecular aggregates. Fluorescence, which was marked in saturated vapour, disappeared on superheating the vapour. The continuous absorption spectrum of potassium vapour resembled that of sodium. J. S. G. T.

The Absorption and Fluorescence Spectra of Benzene. VICTOR HENRI (*J. Phys. Radium*, 1922, [vi], **3**, 181—211).—The ultra-violet spectrum of benzene has been studied over pressures ranging from 0·01 to 65 mm. At the low pressures the absorption bands are resolved into a series of narrow bands, about 0·15 Å. apart, which fuse very readily on passing a certain limited pressure. They are distributed in eight groups, of which only five are visible at 0·01 mm. More than 350 bands have been counted.

The application of Bohr's theory to the study of these band spectra permits of their classification into four series, each band being given by an equation of the form $1/\lambda = A - B + na - (pb + p^2b') + \alpha(m^2 - q^2)$, in which A, B, a, b, b', and α are constants and n, p, m, and q whole numbers. The intensities of the heads of the bands are greatest for $p=0$ and diminish rapidly as p increases, which is in agreement with the theory. The coefficients deduced from the results of the ultra-violet absorption are available for the calculation of the infra-red absorption spectra of benzene. The terms A and B are due to electronic movements and do not enter into the frequency of the infra-red absorption bands, for which a simple formula is deduced, $1/\lambda = an - bp$; the agreement between the calculated and experimental values is very satisfactory. The moment of inertia of the benzene molecule ($I = 1{\cdot}45 \times 10^{-38}$) is derived from the value of the constant α and compared with that calculable from the crystal models of benzene derivatives deduced by Bragg.

The ultra-violet spectra of liquid benzene and its solutions correspond closely with the spectra of the vapour, except for a slight shift towards longer wave-lengths. On dilution, the specific effect of the solvent becomes more marked, the bands widen and move towards the red; this effect, which is analogous to the Stark effect, may be due to the action of an intense electric field of the solvent molecules. The displacement does not bear any relation to the dielectric constant of the solvent. The fluorescent spectrum of liquid benzene consists of six bands, which are excited by monochromatic light of wave-lengths lying within the benzene absorption bands *D*, *E*, *F*, *G*, and *H*; lines which correspond with the *A* and *B* absorption bands do not excite any fluorescence. The molecules absorbing the monochromatic light do not return to their original state on the emission of the fluorescent light, and the fluorescent bands lie towards the red with respect to the absorption bands. When the vapour of benzene is subjected to a high frequency discharge, a new absorption band appears (λ=2750·5 Å.).
W. E. G.

The Ultra-violet Absorption Spectra of Dihydric Phenols. F. W. KLINGSTEDT (*Compt. rend.*, 1922, **175**, 365—367).—The quantitative study of the absorption spectra of dihydric phenols in hexane solution has given new results. Diagrams of the normal spectra of phenol, resorcinol, catechol, and quinol are given. These show that *m*- and *o*-derivatives yield results similar to those obtained with phenol, whilst the *p*-compound possesses a series of eight distinct bands in place of three exhibited by the other substances. This is a general result, as shown by the spectra of other benzene derivatives. The spectra are considerably modified by the solvents used, especially by alcohol; the authors consider that, as alcohol has been used for much work on absorption spectra, the observations should be repeated with hexane solutions. H. J. E.

Phosphorescent Zinc Sulphide containing Copper. B. GUDDEN and R. POHL (*Ann. Physik*, 1922, [iv], **68**, 154—156).—Wilde has recently investigated the variation of the dielectric constant of phosphorescent zinc sulphide containing copper due to illumination, a phenomenon previously studied by the authors and by Molthan. Briefly, the results indicate that the increase in the value of the dielectric constant due to illumination is a maximum at about 140°. The effect is small at high temperatures. Temporary fluctuations of the effect at all temperatures, and for all exciting wave-lengths, is correlated with the luminosity of the phosphorescent substance. Regarding the phenomenon as originating in certain centres of excitation surrounding the relatively few copper atoms present, it follows that the effect must decrease with increasing temperature, and increase to a limiting value with decrease of temperature. The occurrence of the experimentally determined maximum at 140° is explained by assuming that the mobility of the electrons within the excited centres diminishes as the temperature is reduced, an assumption which is in accord with other experimental results. The failure to detect the effect in other varieties of these phosphorescent substances is regarded as a matter of accuracy of measurement. J. S. G. T.

Fluorescence, Photochemical Action, and Einstein's Law. FRITZ WEIGERT (*Z. Physik*, 1922, **10**, 349—351).—A theoretical paper in which the author criticises Perrin's theory of fluorescence (cf. A., 1918, ii, 418; 1919, ii, 177). The part played by oxygen in the photochemical change of most fluorescent substances demonstrates the independence of the fluorescence and the sensitivity to light. For example, an oxygen-free solution of fluorescein is stable to light. The photochemical reaction velocity decreases with increasing partial pressure of oxygen, whereas the brightness of the fluorescence is unaffected. The experiments of Wood and Pringsheim are to be explained along these lines: Einstein's law cannot be applied to these photochemical processes, since under the most favourable conditions 200 energy quanta are necessary for the absorption of one molecule of oxygen by the fluorescent substance. W. E. G.

Ionisation of Potassium Vapour by Light. R. C. WILLIAMSON (*Proc. Nat. Acad. Sci.*, 1922, **8**, 255—260).—By employing a jet of hot potassium vapour, directed into a cool vacuum chamber and traversed by a pencil of light derived from a mercury arc in quartz, evidence has been obtained of the ionisation of potassium vapour by light. The limiting long wave-length (λ 2856 Å.) of the exciting radiation can be calculated from the ionising potential V by the quantum relation $Ve=h\nu$. Below this limit, the ionising power of the radiation increases continuously as the wave-length decreases. J. S. G. T.

Rise of γ-Ray Activity of Radium Emanation. F. P. SLATER (*Phil. Mag.*, 1922, [vi], **44**, 300—304; cf. this vol., ii, 13).—Curves are given showing the rise of γ-ray activity from pure radium emanation when enclosed by lead and aluminium of varying thicknesses. The fraction of the ionisation due to radium-*B* when in radioactive equilibrium with radium-*C* has been deduced by trial for thicknesses of lead up to 20 mm. The data have been utilised in deducing the absorption coefficients of the heterogeneous γ-radiation from radium-*B*. W. E. G.

The Distribution of Radioactive Substances in Solutions. HILARY LACHS and MATHILDE WERTENSTEIN (*Physikal. Z.*, 1922, **23**, 318—322).—In alkaline or neutral solutions of polonium, radium-*D*, radium-*E*, and radium, allowed to remain for a period of hours, the radioactivity exhibited at various depths increases as the depth increases. In acid solutions, the radioactivity is very approximately uniformly distributed throughout the solution. No conclusive results were obtained with solutions of radium-*A*, -*B*, and -*C*. The effects are attributed to the presence of minute particles, derived from the air or the vessel, in the solutions, the radioactive material being adsorbed by these particles. The results are applied to explain the low values obtained by Paneth for the diffusion coefficient of polonium in neutral and alkaline solution, and of thorium-*B* in alkaline solution. J. S. G. T.

The Disintegration of Elements by α-Particles. (SIR) E. RUTHERFORD and J. CHADWICK (*Phil. Mag.*, 1922, [vi], **44**, 417—432).—The nature of the particles ejected from various elements by bombardment with swiftly moving α-particles (cf. A., 1921, ii, 293), has been investigated by determining the deflexion of the particles in a magnetic field. The results show that the particles ejected from aluminium, phosphorus, and fluorine consist of positively charged hydrogen nuclei. The same is also probably true of boron and sodium. The ranges of the particles ejected, in the forward and backward directions, from nitrogen, aluminium, boron, fluorine, sodium, and phosphorus have been more accurately determined. In all cases, hydrogen particles were ejected in all directions, and the maximum range in the backward direction was less than in the forward direction. The maximum ranges, in cms. of air, of the ejected particles, in the forward and backward directions, respectively, were found to be: boron, 58 and 38; nitrogen, 40 and 18; fluorine, 65 and 48; sodium, 58 and 36; aluminium, 90 and 67; and phosphorus, 65 and 49. Only in the case of nitrogen was the maximum range of the ejected particles in the backward direction much less than that of free hydrogen particles. No particles of range greater than 30 cm. of air, in the forward direction, were ejected from either lithium or glucinum, and there was no evidence of the ejection of long range particles from magnesium, silicon, or chlorine. Of the series of elements from hydrogen to potassium hitherto examined, the active elements (those from which hydrogen nuclei are ejected) are odd-numbered in the order of atomic number in the regular sequence 5, 7, 9, 11, 13, 15. The atomic masses of the active elements are expressed by $4n+a$, where n is a whole number, and $a=3$ for all except nitrogen, for which $a=2$. With the exception of boron, which has two isotopes, the active elements are pure elements. The results indicate that neither lithium nor chlorine has any lightly bound satellites in its nuclear structure. The hydrogen satellite of nitrogen is relatively close to the main nucleus. The nuclei of even light elements are very complex systems, and it is difficult to advance any simple rule to account for the wide difference in structure of successive elements.

J. S. G. T.

Temperature Coefficient of Electromotive Force of Galvanic Cells and the Entropy of Reactions. ROSCOE H. GERKE (*J. Amer. Chem. Soc.*, 1922, **44**, 1684—1704).—The *E.M.F.* of a number of electrolytic cells has been determined at a number of temperatures and the following values of the *E.M.F.* of the cell at 25° and the temperature coefficient are recorded: $Ag|AgCl|HCl(N)|AgCl|Cl_2$ (1 atm.), $E=1{\cdot}1362$ volts, $\Delta E/\Delta T=-0{\cdot}000595$ volts/degree; $Hg|HgCl|HCl(N)|Cl_2$ (1 atm.), $E=1{\cdot}0904$ volts $\Delta E/\Delta T=-0{\cdot}000945$; $Ag|AgCl|KCl(N)|HgCl|Hg$, $E=0{\cdot}0455$,

$\Delta E/\Delta T=0·000338$; $Ag|AgCl|HCl(N)|HgCl|Hg$, $E=0·0455$, $\Delta E/\Delta T=0·000337$; Pb(cryst.)$|Pb(OAc)_2(2N)|Pb(Hg)$, $E=0·0057$, $\Delta E/\Delta T=0·000021$; Pb(stick)$|Pb(OAc)_2|Pb(Hg)$, $E=0·0057$, $\Delta E/\Delta T=0·000015$; $Pb(Hg)|PbCl_2|HCl(N)+PbCl_2|AgCl|Ag$, $E=0·4843$, $\Delta E/\Delta T=0·000202$; $Pb(Hg)|PbCl_2|HCl(N)+PbCl_2|HgCl|Hg$, $E=0·5299$, $\Delta E/\Delta T=0·000129$; Tl(stick)$|Tl(OH)|Tl(Hg)$, $E=0·0027$, $\Delta E/\Delta T=0·000020$; $Tl(Hg)|TlCl|NaCl(N)+HCl(0·001N)TlCl+AgCl|Ag$, $E=0·7766$, $\Delta E/\Delta T=-0·0000794$; $Pb(Hg)|PbI_2|Pb(ClO_4)_2(0·218M)+HClO_4|PbI_2|I_2$, $E=0·8936$, $\Delta E/\Delta T=-0·000042$; $Pb(Hg)|PbI_2|KI(N)|PbI_2+AgI|Ag$, $E=0·2078$, $\Delta E/\Delta T=-0·000189$; and $Pb(Hg)|PbI_2|KI(0·1N)AgI|Ag$, $E=0·2135$, $\Delta E/\Delta T=-0·000173$. The free energy, ΔF_{298}, the entropy change, ΔS_{298}, and the change of heat content, ΔH_{298}, have been calculated from the *E.M.F.* measurements and the temperature coefficients of a number of reactions. The following are recorded: $Ag+HgCl=AgCl+Hg$; $\Delta F=-1050$ Cal., $\Delta S=7·80$ Cal./degree, $\Delta H=1275$ Cal.; Pb(cryst.)$=Pb(Hg)$, $\Delta F=-263$, $\Delta S=0·97$, $\Delta H=26$; Pb(stick)$=Pb(Hg)$, $\Delta F=-263$, $\Delta S=0·69$, $\Delta H=-57$; Pb(solid)$=Pb(Hg)$, $\Delta F=-263$, $\Delta S=0·74$; $\Delta H=-42·4$; Pb(solid)$+2AgCl=PbCl_2+2Ag$, $\Delta F=-22612$, $\Delta S=-8·58$, $\Delta H=-25170$; Pb(solid)$+2HgCl=PbCl_2+2Hg$, $\Delta F=-24717$, $\Delta S=6·70$, $\Delta H=-22720$; Tl(cryst.)$+AgCl=TlCl+Ag$, $\Delta F=-17975$, $\Delta S=-1·08$, $\Delta H=-18296$; Pb(solid)$+I_2=PbI_2$, $\Delta F=-41501$, $\Delta S=-1·20$, $\Delta H=-41859$; Pb(solid)$+2AgI=PbI_2+2Ag$, $\Delta F=-9852$, $\Delta S=-7·98$, $\Delta H=-12231$; $Hg+\frac{1}{2}Cl_2=HgCl$, $\Delta S=-21·80$; and $Ag+\frac{1}{2}Cl_2=AgCl$, $\Delta S=-13·73$. The third law of thermodynamics has been submitted to a most rigorous test and discrepancies found earlier by Lewis and Latimer (this vol., ii, 471) have been reduced tenfold. Assuming the validity of the third law, the entropies of chlorine and iodine have been calculated and the following values recorded: $\frac{1}{2}Cl_2$, $S_{298}=27·1$; $\frac{1}{2}I_2$, $S_{298}=13·5$.

J. F. S.

Electric Kataphoresis of Metallic Protein Compounds obtained by Treatment with Powdered Metals. A. BENEDICENTI and S. REBELLO-ALVES (*Arch. intern. pharmacodynamie*, 1922, **26**, 297—316).—In shaking a solution of egg-albumin or of blood-serum with powdered metals the metals become attached to the proteins and the properties of the latter change. They become coloured, their reactions are altered, they are not coagulated by heat, and resist putrefaction. The "fixation" of the metals is independent of the reaction of the protein solution and of its gas and salt content. The metals in this combination lose their ionic properties and are not dialysable. Metals vary in their power to combine with proteins: cobalt, copper, and iron combine to a greater extent than do aluminium and lead. Powdered oxides of the metals do not combine with proteins. By passage of an electric current through an alkaline solution of the metallic protein compound, the protein particles become negatively charged and move towards the positive electrode, carrying with them the fixed metal. In an acid solution the protein particles become negatively charged, move to the cathode and a part of the metal is deposited on the electrode. At the chemically neutral (? isoelectric) point a protein coagulum forms, which gradually changes into a membrane upon which the fixed metal deposits. Boiling or heating a metallic protein solution to 50—60° changes profoundly its electrophoretic properties. It is suggested that the thermolability of sera, the fixation of metals by certain organs and their elimination, etc. depend on the formation of metastable protein compounds and on changes in the chemical equilibria of these compounds.

CHEMICAL ABSTRACTS.

Kataphoresis of Water in Organic Liquids. A. GYEMANT (*Z. physikal. Chem.*, 1922, **104**, 74—88).—The kataphoresis of drops of water and aqueous solutions of acids, bases, salts, and dyes in aniline, guaiacol, and benzonitrile has been measured by a microscopic process. In the case of guaiacol (less in aniline and still less in benzonitrile), it is found that water and aqueous solutions of inorganic electrolytes do not migrate at all or at best only very slowly, whilst solutions of salts which furnish organic ions possess a considerable kataphoric velocity. The sense of the direction is exactly that which would be expected from the kataphoresis of the same organic liquids in the corresponding aqueous solutions. In the case of organic kations, the water drops are negatively charged towards the organic medium and with organic anions positively charged. Some cases have been found which point to the assumption that only a portion of the total potential (ϵ), the so-called ζ-potential, is determinative of the kataphoresis. Thus, for example, it is found that drops of aqueous solutions of hydrochloric acid and aluminium chloride in benzonitrile are positively charged, although when benzonitrile emulsifies in the solutions it is positively charged; this phenomenon finds its explanation in the ζ-potential. The smaller velocity of migration of drops of aqueous solutions of electrolytes cannot be directly explained by the assumption that in these cases the ζ-potential in the organic liquid is much smaller. Probably it is to be explained by the inorganic ions being much less solvated in organic liquids than the organic ions. The Helmholtz formula for the velocity of kataphoresis cannot be directly applied to a water emulsion in organic liquids.

J. F. S.

Thermo-compression and Thermo-addition. MAURICE DELEUER (*Bull. Assoc. Chim. Sucr.*, 1922, **39**, 477—480).—A theoretical paper in which the conditions under which the equations, moist vapour+moist vapour=superheated vapour, and superheated vapour+superheated vapour=moist vapour, are true are discussed.

J. F. S.

Determination of Specific Heats at Low Temperatures. FRANZ SIMON (*Ann. Physik*, 1922, [iv], **68**, 241—280).—The accuracy of determination of specific heats of substances at low temperatures devised by Nernst and Schwers (A., 1914, ii, 336), has been considerably increased by using a larger calorimeter designed so that the amount of liquid hydrogen employed is not unnecessarily increased. Determinations have been made and the values tabulated of the respective specific heats of quartz glass, christobalite, " Lindemann " glass, mercury, ammonium chloride, dextrose, cuprous iodide, glycerol, and keton-resin (" Ketonharz," D.R.-P. 309224), at temperatures ranging from 15° Abs. to the ordinary temperature. The T^3- law, expressing the value of the molecular heat divided by the number of atoms in the molecule, by the relation $c_p=6{\cdot}94\times10^{-6}T^3$, where T is the absolute temperature, is very closely obeyed by ammonium chloride, for temperatures between 20° and 32° Abs. Anomalous values of the specific heat of ammonium salts are due to a transformation occurring within a certain range of temperature—from about 140° Abs. to 243° Abs. in the case of ammonium chloride. The sudden drop in the value of the atomic heat of glycerol when the temperature is reduced just below 180° Abs. is correlated with the softening of the substance at this temperature. In the case of cuprous iodide, values of the free energy calculated by means of Nernst's theorem are in agreement with experimentally determined values. The values of the energy liberated by the combustion of dextrose at various temperatures are tabulated. The value of A, the free energy of the reaction in Nernst's relation, is 704,500 cals. at 290° and 706,700 at 310° T. It is shown that the value of the specific heat of complex bodies at different temperatures can be represented by the Nernst interpolation formula consisting of the sum of the Debye and Einstein functions. The number of the latter functions is small compared with the number of the former. The general characteristics of the variation with temperature of the atomic heats of complex bodies is discussed from the point of view of atomic vibrations, and it is shown why, in many cases, Berthelot's principle affords a close approximation to the energy relations involved. J. S. G. T.

A New Physico-chemical Law. HAWKSWORTH COLLINS (*Chem. News*, 1922, **125**, 81—83, 97—98).—From tables of the atomic weight and specific gravity of the elements, and the specific gravity and heat of formation of a number of molecules, the relative volumes of the elements in combination and the heat of formation of the elements when combining to form molecules are deduced. The values calculated never differ more than 1% from the observed values. It is also shown that the heat of formation of each element is proportional to the product of the atomic weight and the change of volume. By change of volume is meant the difference between the volume of the element in the solid state at 15° and the volume of the element in combination with others at 15°. J. F. S.

Heat of Crystallisation of Quartz. RAMES CHANDRA RAY (*Proc. Roy. Soc.*, 1922, [*A*], **101**, 509—516).—The heat of crystallisation of quartz has been determined by measuring the respective heats of solution of silver sand and silica glass in hydrofluoric acid. The following values were obtained for the specific heat of aqueous hydrofluoric acid solutions containing the respective percentages by weight of hydrofluoric acid: 10%, 0·908; 20%, 0·838; 30%, 0·756; 34·6%, 0·724. The mean values of the heats of solution in hydrofluoric acid per gram-molecule of silicon dioxide were found to be: silica glass, 37·24 Cal.; silver sand, 30·29 Cal. The heat of crystallisation of quartz, represented by the difference, is therefore 6·95 Cal. per gram-molecule. This value agrees with that calculated from Tschernobaeff and Wologdine's results, but is much higher than those obtained by Mulert (2·21) (A., 1912, ii, 626) and Wietzel (2·32), (A., 1921, ii, 504). The discrepancy is attributed to the effect of prolonged grinding in reducing part of the substance to the vitreous condition. The calculated value of the heat of crystallisation at 900° is 6·50 Cal. per gram-molecule. At 1300—1400°, the value is not much different from that at ordinary temperature. J. S. G. T.

Separation of Liquid Mixtures by Centrifuging. Robert S. Mulliken (*J. Amer. Chem. Soc.*, 1922, **44**, 1729—1730).—In an earlier paper (this vol., ii, 492) the author showed thermodynamically that the same separation of isotopes should be obtainable by centrifuging a liquid as a gaseous mixture, at a given speed. The same result was stated to be true for ideal solutions in general. The latter statement is now shown to be incorrect. The result depends not only on the ideality of the solutions, but also on equality of the vapour pressures and of the atomic or molecular volumes of the constituents. These conditions are fulfilled in few cases except that of a mixture of isotopes. J. F. S.

Viscosity and Molecular Dimensions of Sulphur Dioxide. C. J. Smith (*Phil. Mag.*, 1922, [vi], **44**, 508—511).—By Rankine's method, the author has determined the viscosity of sulphur dioxide to be $1·253\times10^{-4}$ C.G.S. units at 18·0°, and $1·630\times10^{-4}$ at 100·0°. The value of Sutherland's constant calculated therefrom is 416, and the corresponding value of the viscosity at 0°, extrapolated by Sutherland's formula, is $1·168\times10^{-4}$ C.G.S. units. The value of the mean collision area, calculated from the results by Chapman's formula, is $0·94\times10^{-15}$ sq. cm. with a possible error of 2 or 3%.
J. S. G. T.

Viscosity and Molecular Dimensions of Gaseous Carbon Oxysulphide. C. J. Smith (*Phil. Mag.*, 1922, [vi], **44**, 289—292).—The viscosities of carbon oxysulphide have been determined at 15° and 100° by the method described by Rankine and Smith (cf. A., 1921, ii, 694, 696; this vol., ii, 549). The values obtained were $\eta_{15}=1·200\times10^{-4}$ C.G.S. units, and $\eta_{100}=1·554\times10^{-4}$ C.G.S. units; and by extrapolation from Sutherland's formula $\eta_0=1·135\times10^{-4}$ C.G.S. units. The mean area which the molecule presents in mutual collision is $A=1·06\times10^{-15}$ cm.^{2}. W. E. G.

Measurement of the Pressure of "Surface Fluids": Oleic Acid. A. Marcelin (*Compt. rend.*, 1922, **175**, 346—348).—In order to measure the pressure exerted by thin layers of liquid resting on the surface of a second liquid, the author has constructed a "surface manometer" which is sensitive and capable of rapid measurement. In the case studied, the addition of successive small quantities of oleic acid to the surface of water contained in a vessel results in a corresponding increase of pressure until a limiting value is reached, at which point a portion of the acid is floating as a drop of oil on the surface. This "surface saturation pressure" is comparable with the maximum tension of saturated vapour; it characterises the equilibrium between the "surface fluid"—a two-dimensional phase—and the same substance in a three-dimensional phase. At the equilibrium point, pressure on the surface liquid results in condensation into drops, and conversely. A further series of experiments was made in which the quantity of oleic acid was insufficient to cover the entire surface of the water. By surface compression, the pressure which is initially zero increases slowly at first, then more rapidly tending towards the saturation limit, and on allowing the surface liquid to expand, its pressure decreases in the inverse sense. If curves are drawn representing these pressures as functions of the surfaces, the second curve falls below the first; the two meet asymptotically, and the whole is of the same type as the curves of magnetic hysteresis. It is also shown that there is no limit to the extension of the surface liquid; this apparently corresponds with the limitless expansion of a gas. H. J. E.

The Properties and Molecular Structure of Thin Films. III. Expanded Films. N. K. Adam (*Proc. Roy. Soc.*, 1922, [*A*], **101**, 516—531).—In continuation of previous work, the author has investigated the effect of temperature on thin films of fatty acids spread on surfaces of distilled water, a phosphate solution, a dilute solution of hydrochloric acid, and of sodium hydroxide. At a certain temperature, dependent both on the nature of the substance in the film and on the composition of the solution, the films expand along the surface. The phenomena observed are discussed at length and the attempt is made to correlate the behaviour of such expanded films with that of a gas, the barriers on the surface over which the film is expanded representing the walls of the containing vessel in the case of the gas. The "gas" equation for the expanded films is of the Van der Waals's type, the *b* term, however, representing twice and not four times the area of the molecules, and the *v* term being replaced by the area of the film. It is shown that expanded films are one molecule thick, and that the molecules are probably arranged vertically, that is, they do not lie flat on the surface. It is shown that the steady increase in the expansion temperature with length of chain constituting the compound probably arises owing to the lateral attraction of chains lying side by side. The bearing of this result on the crystal structure of fatty acids and their esters is discussed. There appears to be no *a priori* reason for the view that lateral adhesion between the molecules prevents the films dissolving. Conclusions previously reached (this vol., i, 424) regarding the structure of *cis*- and *trans*-acids are now considered to be incorrect. J. S. G. T.

Electric Endosmose. ALVIN STRICKLER and J. HOWARD MATHEWS (*J. Amer. Chem. Soc.*, 1922, **44**, 1647—1662).—The rate and direction of the endosmotic flow of acetone, amyl alcohol, nitrobenzene, pyridine, benzaldehyde, *n*-butyl alcohol, furfuraldehyde, *iso*propyl alcohol, and *o*-nitrotoluene have been determined, using a modified form of Briggs's apparatus (A., 1917, ii, 236; 1918, ii, 214). The influence of the addition of acids, bases, and salts on the endosmosis has also been investigated. An adsorption orientation hypothesis has been suggested to explain the establishment of the original charge at the surface of contact of the membrane and solvent. This states that the molecules of the solvent, on adsorption, are orientated on the membrane surface producing a charge by their polarity. If dissociated molecules are present, they affect the membrane charge by specific adsorption of the ions produced. This does not eliminate adsorption, but suggests a more comprehensive view of the mechanism for the establishment of the original charge. The experiments show that the permeability of the membrane is an important factor in determining endosmotic flow, and that it is possible to use and duplicate membranes of filter-paper when using organic solvents. The rate of endosmosis is not quite a linear function of the voltage applied when this is varied over a wide range. Briggs's results (*loc. cit.*) as to temperature effects with water have been confirmed with non-aqueous solvents. The valency rule does not hold with the non-aqueous solvents investigated, and the order of adsorption of ions and their relative adsorption varies with the solvent employed. The concentration curve exhibits a maximum with non-aqueous solvents and the flow at low concentrations is in the same direction as that of the pure solvent. The addition of water to non-aqueous solutions changes the endosmosis in the direction it would manifest in pure water, the first additions showing the greatest effect. The direction of endosmosis is not determined by the dielectric constant ratio, although this is probably a measure of the magnitude of flow. The Hofmeister series is not consistent when considering endosmotic effects in non-aqueous solvents.

J. F. S.

Dependence of the Adsorption by Charcoal on the Quantity of Charcoal and the Nature of the Adsorption Isothermal. A. FODOR and B. SCHÖNFELD (*Kolloid Z.*, 1922, **31**, 75—80).—The adsorption of acetic, lactic, and tartaric acids by various amounts of animal charcoal from solutions of various concentration has been determined. It is shown that with sufficiently dilute solutions of these substances and with a sufficient quantity of adsorbent the index $1/n$ of the adsorption equation approaches and reaches unity in the same way as was previously shown to be the case for amino-acids, polypeptides, and some carbohydrates (A., 1921, ii, 21). In sufficiently dilute solutions the value of n is very sensitive to changes in the amount of charcoal employed in the sense stated above. In less dilute solutions the value of n is practically independent of the amount of charcoal used. The

$(c_0-c)-w$ curves, where w is the amount of adsorbent and (c_0-c) the quantity adsorbed, are parabolic and convex to the w axis and are steeper the greater the initial concentration, c_0, and the smaller w is. The $c-w$ curves are also parabolic but concave to the w axis, the concavity being greater the larger c_0 and the smaller w. From this behaviour it is concluded that the expression $dc/dw=nc/w$ is correct, and interprets the adsorption equation $x=k'(c_0-x)^{1/n}$ or $x^n=k(c_0-x)$. In keeping with this interpretation of the index n, the rôle of this quantity in catalytic and fermentation processes is discussed. J. F. S.

The Adsorption of Ions. JNANENDRA NATH MUKHERJEE (*Phil. Mag.*, 1922, [vi], **44**, 321—346).—A critical résumé of the literature on the adsorption of ions in which the author applies his theory of the origin of the charge of a colloidal particle and its neutralisation by electrolytes (cf. this vol., ii, 198). The characteristic form of the adsorption isotherm, obtained when the ions are multivalent or complex, is explained on the basis of the greater chemical activity of the complex anions over that of the simple kations. It is assumed that the electrostatic attraction of the surface on the kation is less than the chemical affinity acting on the anion. With increasing concentration of electrolytes, the charge on the surface will decrease until a balance is reached between the chemical adsorption of the anion and the electrical adsorption of the kation. The second maximum is due to a balance between the electrical adsorption of the kation and anion. A theory of the action of acids and alkalis on the surface is developed for (1) an inert surface, and (2) a chemically active surface : preferential adsorption of one ion. The maximum charge due to acids gives a measure of the hydration of the surface. The conception of the chemical adsorption of the anion is applied to ionic equilibria on the surface of colloids and to the interchange of kations in the soil. W. E. G.

The Connexion between Hydrolysis and Adsorption. W. MOELLER (*Z. Leder- u. Gerb.-Chem.*, 1922, **1**, 160—165, 183—188; cf. *ibid.*, 1921, **1**, 47; *Collegium*, 1920, 109, 152, 209, 267).—An investigation of the swelling and hydrolysis of gelatin in hydrochloric, acetic, lactic, and butyric acids yielded results similar to those with hide powder. Hydrolysis products with organic acids are adsorbed by the intact gelatin. With mineral acids hydrolysis, and with organic acids adsorption predominates.

CHEMICAL ABSTRACTS.

Free Energy of Gaseous Molecules with any [possible] Partition of Velocities. MAX PLANCK (*Sitzungsber. Preuss. Akad. Wiss. Berlin*, 1922, 63—70).—A theoretical paper in which the question is raised and discussed as to whether or no the free energy of a mixture of similar gaseous molecules is made up additively of the free energies of the individual groups of velocities, when the partition of velocities is anything possible and the internal energy is in accord with the temperature. It is shown that the above question must be answered in the affirmative. It is also shown that in the diffusion of two molecular systems similar in all respects except that of velocity, the reduction of the free energy is independent of the difference in the velocities. Further, in connexion with the foregoing, it is shown how this case explains the so-called Gibbs paradox, despite the fact that the velocity is a continually changing quantity. J. F. S.

Diffusion and Intertraction. C. G. SCHONEBOOM (*Proc. Roy. Soc.*, 1922, [*A*], **101**, 531—539).—The phenomenon of "pseudopodial" intertraction was originally observed by Wright, when blood-serum was run slowly on to an aqueous solution containing from 5 to 8% of common salt. The upper fluid is carried down into the lower, and the lower rises into the upper. The phenomenon may be observed with all inorganic and organic compounds soluble in water, provided the difference in specific gravity of the two solutions is not too great and the solutions do not react chemically. Surface tension alone is concerned in the production of the phenomenon, size of molecule and water of hydration exerting no influence. Distinction is drawn between the processes of "pseudopodial" intertraction and "simple" intertraction, a process intermediate between the former and the process of diffusion.
J. S. G. T.

Preparation and Use of Collodion Osmometers. WILLIAM BROWN (*Ann. Bot.*, 1922, **36**, 433—439).—Details are given for the preparation and use of collodion thimbles for osmotic experiments. They are adapted for comparative rather than for absolute measurements. G. W. R.

Ionic Properties and Chemical Facts. IV. Lattice Energy and the Work of Ionisation of Inorganic Compounds. H. G. GRIMM (*Z. physikal. Chem.*, 1922, **102**, 113—140; cf. this vol., ii, 127, 483, 635).—A theoretical paper in which the author has collected and calculated the necessary data for comparing the regularities of the heat of formation of inorganic substances, and for showing the connexion between the heat of formation with the ionic properties, charge, radius, and structure. The lattice energy and work of ionisation have been calculated or approximated for about one hundred inorganic substances from the newer experimental data and where this is not available the differences of the lattice energy have been measured and the variation thus determined. J. F. S.

Ionic Properties and Chemical Facts. V. Connexion between Heat of Formation, Lattice Energy, and the Ionic Properties. H. G. GRIMM (*Z. physikal. Chem.*, 1922, **102**, 141—168; cf. preceding abstract).—The connexion between the heat of formation, lattice energy, ionic radius, ionic structure, and ionic charge has been investigated. It is shown that, in opposition to the heat of formation, the lattice energy of solid substances and the work of ionisation of gaseous substances, so far as these are known, are definitely related to the ionic properties, charge, structure, and radius. The lattice energy and work of ionisation decrease with increasing radius both with anions and kations when the ions compared have the same number of exterior electrons. The characteristic gradation of the ionic radii is in general reproduced in the gradation of the lattice energy. The difference between the lattice energies of compounds of two outwardly similarly constructed kations or anions with a common anion or kation with the same exterior sheath, decreases with increasing radius of the common ion. Compounds which contain kations with eighteen exterior electrons have considerably greater lattice energies than compounds with the corresponding kation of the same period which have only eight electrons. The haloids of kations with eighteen or twenty exterior electrons show a much smaller dependence of the lattice energy on the halogen-ion radius than the haloids of kations with eight exterior electrons. In all cases investigated the series $U_{H^+} > U_{Li^+} > U_{Na^+}$ is true, where H^+ has 0, Li^+ has 2 and Na^+ has 8 exterior electrons. The empirical relationship $(U_{(SiX'_4)} - U_{(SiX''_4)})|4 > (U_{(AlX'_3)} - U_{(AlX''_3)})|3 > U_{(NaX')} - U_{(NaX'')}$ is shown to be true, where U represents the work of ionisation of the substance in the brackets and X′ and X″ are halogens. A similar expression is also true for boron and lithium haloids. These relationships can be deduced when heteropolar linkings are assumed for all the substances concerned. The haloids of carbon and the halogen-substituted hydrocarbons do not follow a relationship corresponding with that followed by ions containing the helium sheath. This indicates, as also do preliminary and approximate calculations on the models of BH_3 and CH_4, that the carbon compounds concerned do not possess a polar linking. Making use of Born's cycle, many of the known regularities of the heat of formation of solid substances and of dissolved substances as well as the exceptions to the regularities can be investigated. The gradation of the heat of formation by the variation of a single ion of the compound can be attributed to the variation of three thermochemical quantities which depend on the ionic properties in the simplest manner. The periodicity of the heat of formation of oxides and chlorides can, in the neighbourhood of the maxima and minima, be explained by similar analysis. J. F. S.

Effect of Sucrose on the Activities of the Chloride- and Hydrogen-ions. J. W. CORRAN and W. C. McC. LEWIS (*J. Amer. Chem. Soc.*, 1922, **44**, 1673—1684).—The effect of the addition of sucrose on the activity of the chloride-ion in 0·1*N*- and 0·5*N*-solutions of potassium chloride solutions has been investigated by means of the cell $Ag|AgCl|KCl(c_1)||KCl(c_2)+\text{Sucrose}|AgCl|Ag$. It has been found that the increase in activity could be accounted for by simply taking account of the decrease in the total water present in the solutions; that is, the potassium- and chloride-ions are soluble in the water of hydration of the sucrose. The effect of sucrose on the activity of the hydrogen-ion in 0·1*N*-hydrochloric acid has also been investigated, making use of the assumption of MacInnes (A., 1919, ii, 385) of the independent activity of the chloride-ion in solutions of chlorides of the same concentration.

It is shown by means of a comparison between the hydrogen-ion activities obtained in the present experiments, and the values obtained with a hydrogen electrode, that the hydrogen electrode measures the hydrogen-ion activity and not the geometric mean of the activities of the hydrogen-ion and the accompanying anion.
J. F. S.

Ionisation Constant of Hypochlorous Acid: Evidence for Amphoteric Ionisation. WILLIAM A. NOYES and THOMAS A. WILSON (*J. Amer. Chem. Soc.*, 1922, **44**, 1630—1637).—The electrical conductivity of dilute solutions of hypochlorous acid and mixtures of nitric acid and hypochlorous acid at 25° was measured, using a flowing electrolyte, with the object of testing the view of Stieglitz (A., 1902, ii, 66) that hypochlorous acid is an amphoteric electrolyte. The results show that the value k_a is $6{\cdot}70\times10^{-10}$, the value of k_b for hypochlorous acid is too small to be determined by the change in the conductivity of $0{\cdot}0001N$-nitric acid when hypochlorous acid is added to it. When a current of air is passed through a solution of hypochlorous acid, chlorine monoxide and not the acid escapes. This indicates the presence of positive chlorine-ions in such a solution and confirms the amphoteric ionisation of the acid; $HClO \rightleftharpoons H^{\cdot}+ClO'$; $HClO \rightleftharpoons Cl^{\cdot}+OH'$. If the Lewis-Langmuir hypothesis is accepted, it requires an interpretation consistent with these facts. J. F. S.

State of Aggregation and Liquid Crystals. O. LEHMANN (*Z. physikal. Chem.*, 1922, **102**, 91—101).—In a recently published work ("Die Aggregatzustände") Tammann has questioned the existence of liquid crystals because they do not fall into the scheme of states of aggregation. The author, therefore, has repeated the evidence on which the existence of the liquid crystal state of aggregation is based. J. F. S.

Glass Suspensions produced by Rubbing Glass Walls with Glass Rods. ROBERT FRICKE (*Kolloid Z.*, 1922, **31**, 80—81).—Moderately concentrated glass suspensions may be prepared by rubbing the sides of a test-tube with a glass rod. These suspensions are alkaline to phenolphthalein and have a normality of the order 1/1000 which increases on keeping the suspension. They generally settle completely in twenty-four hours, but the settling is more rapid if electrolytes are added. The particles are negatively charged and wander to the anode on the application of an electric current. Examined in the ultramicroscope, the particles are seen to have diameters varying between 20 μ and $0{\cdot}5$ μ.
J. F. S.

A New Apparatus: The Nephelectrometer. I. NEWTON KUGELMASS (*Compt. rend.*, 1922, **175**, 343—345).—Changes in the degree of aggregation of a colloidal solution may be observed quantitatively by measuring variations in the degree of transparency. This is effected by allowing light of weak intensity from a constant source to fall on a sensitive thermopile after traversing a vessel containing the solution. The apparatus is standardised by taking a series of readings after filling the vessel with distilled water. The author has used the apparatus in order to observe the coagulation of fibrinogen and the results obtained are expressed numerically. H. J. E.

Nephelometric Effect of Colloidal Systems of Different Size of Particles. H. BECHHOLD and F. HEBLER (*Kolloid Z.*, 1922, **31**, 70—74).—The connexion between the turbidity and size of the suspended particles has been examined nephelometrically in the case of suspensions of barium sulphate in various mixtures of ethyl alcohol and glycerol. The degree of dispersion of the suspensions varied from 2·5 μ to 4 $\mu\mu$. The results show that for suspensions containing the same amount of barium sulphate but of varying degrees of dispersion, the turbidity increases from 2·5 μ downwards. The maximum turbidity is reached with particles of about 800 $\mu\mu$ for white light, that is, in the region of the extreme red. Further reduction of the size of the particles caused the turbidity to decrease strongly. It is in this region that Rayleigh's law holds. By the term turbidity is to be understood the effect, observed with the nephelometer, which is brought about by the diffraction of the light by the disperse phase. A method is described whereby the diameter of submicrons and amicrons may be determined if a comparison turbidity of a substance with particles of known diameter is available. J. F. S.

Turbidity Standard. H. BECHHOLD and F. HEBLER (*Kolloid Z.*, 1922, **31**, 132—137).—The authors have prepared an easily reproducible and fairly stable standard turbidity and a sol suitable for use as a standard in work on turbidities and suspensions. They characterise as standard turbidity one which contains 1/1000 mol. of barium sulphate; this is prepared by mixing 1/500 mol. of hydroxylamine sulphate dissolved in glycerol with an equal volume of 1/500 mol. barium chloride also dissolved in glycerol. The precipitate is chiefly made up of particles 2·5 μ in diameter. The standard sol is characterised as a turbidity which contains 1/200 mol. of barium sulphate; this is prepared by mixing barium chloride and magnesium sulphate dissolved in a mixture of glycerol (6·5) and *iso*butyl alcohol (1·5). This is three times as turbid as the standard turbidity and can be made of the same turbidity by mixing with glycerol containing 15% of *iso*butyl alcohol. The standard sol consists of primary particles of not more than 90 $\mu\mu$ diameter. The standard sol is stable and constant for at least six months, whilst the standard turbidity is not trustworthy after eight days. J. F. S.

Theory of the Mechanical Synthesis of Colloids. F. SEKERA (*Kolloid Z.*, 1922, **31**, 137—147).—The theory of the production of colloids in Plauson's colloid mill is briefly as follows. The mechanical grinding process bursts the active molecular compounds in the interior of the solid substance and produces particles of colloidal dimensions. From the surface of these particles the residual valencies tend to cause an aggregation of the small particles, so that secondary to the dispersion an aggregation process is taking place. To retard or prevent the aggregation, the residual valencies are saturated by the addition of an electrolyte which produces salt complexes and charges the particles. J. F. S.

Dielectric Constants of Colloidal Solutions. J. Errera (*Kolloid Z.*, 1922, **31**, 59—64).—A method for measuring the dielectric constants of colloidal solutions, based on the Nernst condenser method is described and has been used to measure the dielectric constant of vanadium pentoxide sols. It is shown that a solution containing 14 per thousand has a dielectric constant of 400 in comparison with that of water of 81. This high value is not obtained with the freshly prepared sol, but appears only after long preservation. Thus a freshly prepared sol gave a value 74·7 which in seventeen days had risen to 94·8. The value given above was for a sol which had been kept for five years. The dielectric constant shows a characteristic dilution curve and a definite dependence on the temperature, current density, and the potential amplitude. The dielectric constant obtained is doubtless connected with the well-known double refraction of this sol.

J. F. S.

An Experimental Test of Smoluchowski's Theory of the Kinetics of the Process of Coagulation. Jñanendra Nath Mukherjee and B. Constantine Papaconstantinou (*Phil. Mag.*, 1922, [vi], **44**, 305—320).—According to the theory of Smoluchowski (cf. A., 1917, ii, 297), the successive stages in the coalescence of a colloidal solution are always the same and depend only on the time, and thus any property of the sol that varies continuously can be utilised to fix a definite stage in the coalescence. If his equations hold, all curves showing variations in the physical properties of the colloidal solution should be similar. Previous experimental work in which ultramicroscopical measurements have been made has yielded inconclusive data, possibly owing to difficulties inherent in the methods of measurement. The authors have tested the views of Smoluchowski by measurements of the changes in colour of gold sols on the addition of an electrolyte (cf. T., 1920, **117**, 1563). Since the absorption coefficient in the red region varies continuously with the coagulation, the attainment of a definite value of the absorption coefficient for a fixed wave length (683 $\mu\mu$) is taken as representing a definite stage in the coalescence. Experimental values of the absorption coefficients for the addition of several concentrations of potassium chloride, potassium nitrate, and barium chloride have been previously given (*loc. cit.*), and it is shown that the ratios of the times required to reach the same absorption coefficient are independent of the time or the stage of coalescence. The data thus supply the best evidence so far recorded in favour of the theory of Smoluchowski; T in his equations is a constant in the case of the gold sols within the limits of coagulation studied. The percentage of successful collisions between the colloidal particles increases rapidly with increase in concentration of electrolyte and varies markedly with changes in temperature. W. E. G.

Colloidal Solutions of Carbon in Water. P. C. L. THORNE (*Kolloid Z.*, 1922, **31**, 119—132).—The author briefly summarises the literature on the formation of colloidal solutions of carbon and discusses the results obtained. An account is given of the preparation of colloidal solutions of carbon by the dispersion of charcoal anodes in the electrolysis of solutions of ammonia, sodium hydroxide, and dilute acids; similar experiments were carried out with graphite electrodes. A stable carbon sol may be prepared by the electrolysis of a solution of ammonia for six hours between two carbon electrodes with an anode current density of 0·6—1·2 amperes/cm.^{2} and a voltage of 220. On filtering, the solution had a concentration 0·145*N* of ammonia and gave a residue of 0·034 gram per 100 c.c. This residue was insoluble in water, but redissolved in a dilute solution of ammonia; the excess of ammonia may be removed by boiling and the sol is then more stable than one which has been dialysed and still contains 0·039*N* ammonia. The ammonia-free sol is deep black in layers greater than 1 cm. thick and in thinner layers brown, and is made up of particles of about the same size as those of metallic sols. The influence of electrolytes on the sol has been investigated and the number of millimols. necessary to coagulate 1000 c.c. of the dialysed sol found to be: hydrochloric acid, 60; sodium hydroxide, 290; ammonium hydroxide, >9000; sodium chloride, 450; barium chloride, 0·5; and aluminium chloride, 0·3. These quantities are very similar to those required to coagulate a platinum sol. Similar experiments have been carried out with graphite sols and results of the same kind obtained. The most marked difference between the carbon sols and the graphite sols is that of colour, the former being brown and the latter black. An analysis of the dried sol shows that it is not a pure carbon sol which has been dealt with, but a mixture, the composition being C, 66·61%; H, 1·99%; O, 15·25%, insoluble and incombustible residue (probably silica), 16·15%. J. F. S.

Electrical Properties of Silicic Acid Sols. OTTO LÖSENBECK (*Koll. Chem. Beihefte*, 1922, **16**, 27—46).—A number of experiments are described on the influence of silicic acid sols on the electrical conductivity of solutions of hydrochloric acid, and on the kataphoresis of the sol both pure and in the presence of hydrochloric acid of various concentrations. It is shown that the electrical conductivity of hydrochloric acid solutions of concentrations up to 0·01*N* is considerably reduced by the presence of silicic acid sol. This reduction does not take place instantaneously, but the amount of decrease increases with time according to a function of *e*, that is, the decrease is at first rapid and then continuously slower until it becomes asymptotic and a limiting value is approached. From the measurements of the migration velocity of the silicic acid particles under a known potential fall, the contact potential has been calculated by means of Smoluchowski's theory. It is shown that the particles of a pure silicic acid sol are negatively charged and that the charge is steadily reduced by the addition of hydrochloric acid until the isoelectric point is reached. With further addition of acid the sign of the charge changes and the charge increases until the positive value is greater than the original negative value. The silicic acid particles are shown not to be uniform. The contact potential of the particles determined in different concentrations of the same preparation shows that this quantity is dependent on the concentration of the sol, in the sense that the isoelectric point of different sols lies at greater concentrations of hydrochloric acid the greater the concentration of the sol. The observed results are explained by the assumption that the silicic acid particles are saturated with hydrochloric acid, like a sponge, and that this is taken up slowly. The hydrogen-ions are expelled from these sponges with a definite tension, so that the contact potential between particle and solution may be approximately represented by the Nernst formula. J. F. S.

Colour of Photochlorides and Colloidal Silver. II. KARL SCHAUM and THEODOR MARX (*Kolloid Z.*, 1922, **31**, 64—70; cf. A., 1921, ii, 506).—In a previous paper (*loc. cit.*) the authors describe the presence of faintly illuminating red particles in silver sols of medium dispersion; these particles do not conform to Mie's theory. The authors now show that the red particles do not exist and the red colour observed was due to a contrast with the many green particles present. A method of determining the true colours of the colloidal particles in the presence of other particles is described. Previous attempts to reverse the order of colours obtained in photographic intensification by reduction failed, but it is now shown that a complete reversal may be obtained as follows. A blue silver sol is mixed with an equal volume of 10% gelatin solution and allowed to solidify, then a concentrated solution of ammonium hydroxide, potassium cyanide, or sodium thiosulphate is poured on to it and allowed to diffuse. After several days the following range of colours is observed, commencing at the top of the tube: colourless, yellow, orange, red, reddish-violet, bluish-violet, and blue. The action of electrolytes in definite amounts on silver sols is to produce definite colours. Thus in the case of magnesium sulphate and silver sols, 2 c.c. of the sol when treated with the following quantities of $N/20$-magnesium sulphate gives the colours indicated: 0 c.c., yellow; 0·10 c.c., orange; 0·20 c.c., red; 0·25 c.c., purple; 0·30 c.c., reddish-violet; 0·50 c.c., bluish-violet; and 1·50 c.c., blue. Similar changes were also obtained with ammonium chloride, sodium chloride, and potassium sulphate. J. F. S.

Behaviour of Carey Lea's Silver Sol towards Electrolytes and Hydrophilic Colloids. H. FREUNDLICH and E. LOENING (*Koll. Chem. Beihefte*, 1922, **16**, 1—26).—Carey Lea's silver sol behaves as an entirely hydrophobic sol, and since its particles are negatively charged the valency of the kations and the adsorbability are of most importance in its coagulation. The dependence of the coagulation value on the concentration of silver micellæ is bound up with the valency of the kations. The coagulum has a quite different appearance when it is produced by univalent kations from that produced by bi- and ter-valent kations. Hydrophilic colloids such as saponin and gum arabic exert a protective action at all concentrations. This action increases strongly with the concentration of the hydrophilic colloid in the coagulation by tervalent kations, less strongly with bivalent kations, and weakly with univalent kations. This is explained by the fact that with the tervalent kations much smaller concentrations are necessary, so that the displacing action of the protective colloid is made more noticeable. Other hydrophilic colloids such as gelatin and caseinogen in smaller concentrations coagulate the silver sol, but above a definite concentration exert a protective action; this concentration increases with the concentration of the silver micellæ in the sol. The coagulation with small concentrations is, in the main, similar to the coagulation of acid gold sols by hydrophilic sols investigated by Gann (A., 1917, ii, 21). In neither case need complete coagulation occur, and an increase in the sensitiveness is brought about, that is, the metallic sol which contains small quantities of the hydrophilic colloid, is more sensitive toward electrolytes than the pure sol. Coagulation and increase in the sensitiveness by means of hydrophilic colloids are due to the fact that the sols of the hydrophilic colloids contain ions. In the case of the negative metallic sols, the colloid kations are operative and coagulate in the same manner as other kations. The silver sol is not discharged in solutions of colloids such as gelatin and caseinogen which are concentrated enough to exert a protective action, but here it is negatively charged. This is explained by the assumption that the amphoteric ions of gelatin lie with their positive ends toward the silver particles and the negative ends toward the interior of the solution. The above explanations are in keeping with the facts, that gelatin behaves in a protective but non-coagulating manner toward an alkaline gold sol, because even in alkaline solutions it contains too few colloidal kations; on the other hand, clupein sulphate, a protamine salt, which contains definite colloidal kations, coagulates an alkaline gold sol strongly. J. F. S.

Influence of Temperature on the Coagulation of Colloidal Gold. H. LACHS and STEPHANIE GOLDBERG (*Kolloid Z.*, 1922, **31**, 116—119).—The time required for the coagulation of gold sols prepared in various ways by a constant amount of sodium chloride has been determined at temperatures up to 70°, and in this way the influence of temperature on the rate of coagulation ascertained. The results show that the influence of temperature corresponds with that demanded by Smoluchowski's hypothesis, namely, that the coagulation time is inversely proportional to the absolute temperature. The sensitiveness, toward temperature changes, of the coagulation of colloidal gold is very much smaller than that of chemical reactions. J. F. S.

The Kinetics of the Coagulation of Proteins by Heat. HEINRICH LÜERS and MAX LANDAUER (*Z. angew. Chem.*, 1922, **35**, 469—471).—The velocity of coagulation of the plant albumin, leucosin, was determined by the direct weighing of the coagulum produced at intervals during the reaction. The change of hydrogen-ion concentration during the reaction was very slight. It was concluded that the coagulation occurs in two stages; a chemical denaturation process followed by a colloidal phenomenon of coagulation, which is a flocculation of the denatured protein particles. The denaturation of the leucosin particles was shown to be a chemical reaction of the first order. The temperature coefficient of the denaturation in a medium of p_H 6·09 and at temperatures between 52·90° and 57·05° was 1·47 per 1°. A. G. P.

Is the Gelatin–Gum Arabic Coagulation a Chemical or a Colloid-chemical Process? F. W. TIEBACKX (*Kolloid Z.*, 1922, **31**, 102—103).—A discussion of the coagulation of gelatin–gum arabic mixtures by acids, alkalis, and salts, from which it is shown that the coagulation is a mixed process which can be regarded as in part of a chemical nature and in part of a colloid-chemical nature. J. F. S.

Influence of Substituents on Various Chemical Reactions. SVEN BODFORSS (*Z. physikal. Chem.*, 1922, **102**, 40—53).—It has been shown previously (A., 1918, i, 229) that a number of substituted aromatic aldehydes react with bromoacetophenone in the presence of sodium ethoxide according to the equation:

$$\mathrm{Ph{\cdot}CHO + CO{\cdot}Ph{\cdot}CH_2Br \longrightarrow CO{\cdot}Ph{\cdot}}\underset{\diagdown O \diagup}{\mathrm{CH{\cdot}CH}}\mathrm{{\cdot}C_6H_5}$$

, whilst others do not react in this way. The aldehydes which react all contain a negative substituent and those which do not may be brought to react by substituting such a negative group in them. It is now shown that the acids produced from the aldehydes which react are stronger than those produced from the aldehydes which do not react. The relationship between the reactivity of the aldehydes and the strength of the corresponding acid has been investigated. The strength of a number of substituted benzoic acids has been determined from conductivity measurements and the dissociation constant compared with the values for other acids found in the literature. The following newly determined values of K at 25° are recorded: 3-nitroanisic acid, $1{\cdot}9\times10^{-4}$; 3-bromoanisic acid, $7{\cdot}2\times10^{-5}$; cumic acid, $5{\cdot}2\times10^{-5}$; piperonylic acid, $4{\cdot}5\times10^{-5}$. A further series of experiments has been carried out to ascertain the relationship between the maximum work of a given type of reaction and the nature of the substituting group. The reaction chosen is represented by the equation $\mathrm{H+AgBz(solid)=HBz(solid)+Ag}$ and the maximal work of this reaction has been calculated from *E.M.F.* measurements of cells of the type $\mathrm{Ag|AgBz,HBz(solid)|HBz(solid)|H_2}$ and $\mathrm{Ag|AgBz(solid)||HBz(solid)|Quinhydrone|Pt.}$ at 25° (cf. Biilmann, A., 1921, ii, 372). The following values of the *E.M.F.* (π), the maximum work (*A* cal.), and the dissociation constant, respectively, are recorded: 5-nitrosalicylic acid, 0·066, 1520, $8{\cdot}9\times10^{-3}$; salicylic acid, 0·087, 2010, $1{\cdot}0\times10^{-3}$; *m*-nitrobenzoic acid, 0·109, 2510, $3{\cdot}5\times10^{-4}$; 3-nitroanisic acid, 0·135, 3110, $1{\cdot}9\times10^{-4}$; anisic acid, 0·144, 3320,

$3{\cdot}2\times10^{-5}$; *m*-nitrocinnamic acid, 0·145, 3340, $8{\cdot}3\times10^{-5}$; *o*-chlorobenzoic acid, 0·147, 3390, $1{\cdot}3\times10^{-3}$; benzoic acid, 0·154, 3550, $6{\cdot}7\times10^{-5}$; *p*-nitrobenzoic acid, 0·160, 3690, $4{\cdot}0\times10^{-4}$; 3-bromoanisic acid, 0·163, 3760, $7{\cdot}2\times10^{-5}$; and piperonylic acid, 0·165, 3800, $4{\cdot}2\times10^{-5}$. The above results show that generally the maximum work decreases with increasing dissociation constant. The cases where this relationship is not strict are probably to be explained either by the formation of hydrates by the silver salts or by the formation of acid silver salts. J. F. S.

Equilibrium in Heterogeneous Systems. JA. K. SYRKIN (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1921, **4**, 161—165).—Investigation of the reaction $CaSO_4+Na_2CO_3=CaCO_3+Na_2SO_4$ with concentrations ranging from 0·01 to 0·002 gram-mol. per litre and thus corresponding with widely varying degrees of dissociation of the component salts, shows that the reaction does not conform to the law of equilibrium, the " constants " of the reaction exhibiting wide divergences. The reaction is reversible, the reversibility, that is, the proportion of non-reacting molecules, amounting to 58% at the ordinary temperature and at low concentrations. At 7°, scarcely any action occurs. The value of the reversibility at 38° is similar to that at 18°, probably owing to the solubility of calcium sulphate being at a maximum at 38°. The reversibility is a function of the concentration and increases with dilution, the more rapidly at low temperatures.

Thus, with reactions involving the formation of a new phase, the laws of equilibrium are incomparably more complex than with homogeneous reactions. At present, the dependence of the reversibility on the concentration is expressible only by an empirical relation of the form $Z=1+ac+bc^2$. . . . T. H. P.

The Equilibria in Aqueous Solutions of the Alkali Metal Bisulphites. EDWARD CHARLES CYRIL BALY and ROBERT ARTHUR BAILEY (T., 1922, **121**, 1813—1821).

Equilibria and Reaction Velocities. W. F. BRANDSMA (*Chem. Weekblad*, 1922, **19**, 318—322).—The treatment of reaction velocities based on molecular collisions of substances in the gaseous state or in dilute solution becomes difficult when the course of a reaction is not expressed by a simple equation, and experimental results do not agree with theory. The conditions leading to equilibrium may be regarded from two points of view, the first dealing with the forces involved, that is, the energy units, and the second with space factors, that is, with entropy units. The factors deduced from the first vary inversely with the absolute temperatures, and so determine the temperature coefficients; the entropy factors are independent of temperature.

This division is of great importance in organic reactions, since the theoretical treatment can take due account of both energy and space factors. S. I. L.

Theory of the Velocity of Chemical Reactions. J. N. BRÖNSTED (*Z. physikal. Chem.*, 1922, **102**, 169—207).—A theoretical paper in which the laws of the velocity of chemical reactions are considered. It is shown that chemical reactions between neutral molecules, or between neutral molecules and ions, are normal, that is, they follow very closely the law of mass action and are insensitive or only slightly sensitive to the addition of a neutral salt. Reactions between ions are abnormal, that is, the velocity constant is to a high degree dependent on the concentration of the reacting ions and on the concentration of an added neutral salt. For thermodynamical reasons, the concentrations or osmotic partial pressures in the ordinary kinetic reaction equations are to be replaced by the activities, and the equations are then true when the activities alone are changed. The reaction determinative of the velocity in a chemical change consists of the formation of an unstable critical complex in the sense put forward by Marcellin (A., 1915, ii, 328). The electrical charge of the complex is the sum of the charges of the reacting molecular species. The regularities and exceptions mentioned above are to be explained by the assumption that the velocity is inversely proportional to the activity coefficient of the critical complex, and that this is influenced by changes in the salt concentration in the same way as the ordinary ions. The data concerning the activity coefficients necessary for calculating the anomalies in the velocity are most easily obtained from solubility determinations of sparingly soluble salts in solvents containing dissimilar ions. The dependence of the activity coefficient on the concentration, obtained in this way, for the ions of various types makes it possible to calculate the extent of the neutral salt action, that is, the kinetic anomalies for the various types of reactions. On the basis of the foregoing, the following theoretical result is obtained. In reactions between ions of the same sign the salt action is positive, that is, the velocity is increased by an increasing salt concentration. In reactions where the reacting ions have opposite signs, the salt action is negative, that is, the reaction is retarded by increasing salt concentration. These theoretical results have been applied to a large number of chemical reactions in solution and for the greater number found to be confirmed, in some cases quantitatively. The kinetic and static anomalies may be removed by employing a concentrated solution of an indifferent salt as solvent. J. F. S.

Velocity of Decomposition of Crystalline Substances. A. Sieverts (*Z. physikal. Chem.*, 1922, **102**, 89—90).—An answer to Hinshelwood and Bowen (this vol., ii, 628; see also this vol., ii, 360; A., 1920, ii, 743; 1921, ii, 443). J. F. S.

Mechanism of the Reduction of Permanganate and its Physico-chemical Foundation. III. Reaction between Manganate and Formic Acid. Josef Holluta (*Z. physikal. Chem.*, 1922, **102**, 32—39; cf. this vol., ii, 448, 628).—The velocity of the reaction between sodium manganate and sodium formate has been determined at temperatures varying between 27·4° and 22·6°, with constant concentrations of manganate and hydroxyl-ion and also with varying concentrations of all constituents. The results show that the reaction as measured is of the second order, and is to be represented by the equation $MnO_4'' + HCO_2' + 2H_2O = Mn(OH)_4 + CO_3'' + OH'$. Intermediate stages therefore do not need to be taken into account in the mechanism of this reaction. J. F. S.

Dependence of the Velocity of Alkaline Hydrolysis of Esters on the Constitution of the Alcohol. I. L. SMITH and HUGO OLSSON (*Z. physikal. Chem.*, 1922, **102**, 26—31).—The alkaline hydrolysis of propyl acetate and *iso*propyl acetate by 0·1145*N*-sodium hydroxide has been determined at 20°. The reaction constants are found to be 4·23 and 1·263, respectively, giving as the ratio between the propyl and *iso*propyl esters the value 3·4, a value which is very near the value (3·2) found by Menschutkin for the ratio of the rates of formation of the two esters.

J. F. S.

Catalysts and Chemical Equilibrium. J. F. DURAND (*Bull. Soc. chim.*, 1922, [iv], **31**, 759—762).—The conclusions drawn by Clarens (this vol., ii, 436) with regard to the effect of catalysts on the equilibrium of a system are criticised. H. J. E.

Catalytic Formation of Water Vapour from Hydrogen and Oxygen in the Presence of Copper and Copper Oxide. ROBERT N. PEASE and HUGH S. TAYLOR (*J. Amer. Chem. Soc.*, 1922, **44**, 1637—1647; cf. this vol., ii, 148).—The catalytic combination of hydrogen and oxygen in the presence of metallic copper (produced by the reduction of copper oxide in hydrogen at 150—200°) has been investigated over the temperature range 100—200°, using gaseous mixtures containing up to 5% of oxygen. The results show that combination is practically complete at 200°, and is just measurable at 100°. In nearly all cases, copper oxide is formed simultaneously with water. After the oxygen is shut off and pure hydrogen alone passed over the catalyst, the oxide so formed is reduced at a greater rate than that of the formation of water while the oxygen is passing. Between 130° and 100°, the rate of oxidation of the copper and the rate of reduction of the oxide so formed, as well as the catalytic activity, suffer a marked reduction. At 130°, with oxygen equivalent to 10 milligrams of water passing in five minutes, the rate of formation of water passes through a maximum to a steady minimum value. The above results are satisfactorily explained by assuming that the combination takes place mainly as a result of the alternate oxidation and reduction of the catalyst, the reduction reaction being complicated by the known inhibitory influence of free oxygen on that reaction. J. F. S.

Catalysis of Hydrogen Peroxide by Finely Divided Platinum. The Influence of Inhibitants. EDWARD BRADFORD MAXTED (T., 1922, **121**, 1760—1765).

Bohr and Langmuir Atoms. (SIR) OLIVER LODGE (*Nature* 1922, **110**, 341).—In view of the difficulty of explaining molecular combination in terms of electrical attraction between revolving electrons composing the peripheral parts of an atom (in accordance with the demands of spectroscopic observations) rather than in terms of a static arrangement (more suited to the facts of chemical combination), it is considered that the idea of electrical attraction between the atoms as the major chemical force should give place to that of the interlacement of the magnetic fields which inevitably accompany rapidly revolving electric charges. A. A. E.

The Neuburger Nuclear Model. F. PABLO VALERAS (*Physikal. Z.*, 1922, **23**, 304—305).—The relative merits of the Neuburger (cf. this vol., ii, 208, 365) and Meitner (cf. *ibid.*, ii, 15) models are discussed and an objection is raised to the latter model since it cannot be applied to the nuclei of boron^{10}, boron^{11}, nitrogen, or fluorine. The Neuburger model is unsatisfactory, since it requires the existence of *iso*helium nuclei. The author proposes a new model in which the nuclear formulæ are given by $F_k = n\alpha + pH^+ + v\beta$ which takes account of all known atoms. W. E. G.

The Neuburger Nuclear Model. LISE MEITNER (*Physikal. Z.*, 1922, **23**, 305).—A reply to Pablo Valeras (preceding abstract), pointing out that the new model is not in agreement with radioactive phenomena. W. E. G.

The Neuburger Nuclear Model. MAXIMILIAN CAMILLO NEUBURGER (*Physikal. Z.*, 1922, **23**, 305—307).—A reply to F. Pablo Valeras (cf. preceding abstracts). The assumption of the existence of the *iso*helium nucleus is useful in explaining the structure of Gl^9 which cannot be expressed by the new model. A schematic representation is given of the structure and genesis of some of the lighter atoms. W. E. G.

The Stability of Atom Nuclei, the Separation of Isotopes, and the Whole Number Rule. WILLIAM D. HARKINS (*J. Franklin Inst.*, 1922, **194**, 165—211; cf. A., 1915, ii, 543, 544, 814; 1920, ii, 479, 541).—The author has pointed out that of the first twenty-seven elements except hydrogen the atomic weights are very close to whole numbers on the basis of O=16, and those of which the atomic weights are multiples of 4 are much closer to whole numbers than the others. The simple explanation is that all the elements are intra-atomic compounds of hydrogen and that whilst in molecular compounds the latter has the atomic weight 1·0078, in these much closer combinations it has the atomic weight 1·000. Those atoms of which the atomic weights are divisible by 4 are regarded as being built up of α-particles which are known to be the nuclei of helium atoms. A system of notation denoting the electronic structure of the atoms has been introduced; for example, "Oxygen=16" is written $p_{16}e_{16}$ as a compound of 16 positive and 16 negative electrons. This is further elaborated to show the number of α-particles (α) present in the nucleus, and negative electrons in the nucleus are differentiated from those in the planetary system. The nuclei of elements of even atomic number can be represented as built up in this way of α-particles alone or with "cementing" negative electrons, usually two in number. Those of odd number cannot be so represented but need the introduction usually of a "proton-electron" group, p_3e_2.

From a consideration of the composition of meteorites, the earth's crust, and the radioactive series, the conclusion is drawn that the elements of even atomic number are much more stable than those which are odd. The atomic numbers of the five undiscovered elements are all odd. The stability is attributed to the great stability of the α-particle in the nucleus. The special relativity theory is used to explain the loss in weight of the four hydrogen atoms ($4\times 1\cdot0078$) which form the helium atom ($4\cdot000$), and the energy freed by this loss is shown to be $6\cdot708\times 10^{11}$ cals. per gram-atom of helium formed. This theory is also applied to the calculation of weight losses in radioactive disintegrations, and it is shown that an experimental determination of the loss of mass of radiothorium over a period of three years would be a check on the validity of the theory. A. C.

Model of the Ionised Hydrogen Molecule. W. PAULI, jun. (*Ann. Physik*, 1922, [iv], **68**, 177—240).—A mathematical investigation of the conditions determining the stability of a model representing the motion of an electron under the influence of two positively charged nuclei, at rest and in equilibrium, a structure illustrating the ionised hydrogen molecule H_2^+ met with in positive rays. The analysis is based on an application of the quantum theory, and the extension of Bohr's correspondence principle to impacts between atoms or molecules and free electrons. Various orbits are investigated. Of quantised orbits symmetrical with regard to the medium plane bisecting at right angles the line joining the nuclei, that of minimum energy is characterised by three quantum numbers, 0, 1, 1, and fills up in a uniform manner the space contained within an ellipsoid of revolution. The possibility of the existence of a stable unsymmetrical quantised orbit remains for the present open. Consideration of the value of the ionisation potential of the hydrogen molecule indicates that the structure of the ionised hydrogen molecule is essentially meta-stable, and it is concluded that its real normal representation consists of an electron moving in a circular orbit in the medium plane between the nuclei, and characterised by conditions of stability and energy similar to those of the earlier Bohr model of the helium atom. Preliminary remarks are made concerning the application of the theory to the band emission spectrum of the ionised hydrogen molecule.

J. S. G. T.

The Mathematics of the Dicyclic Colour Theory, and a New Theory of the Structure of the Nitrogen Atom. JAMES MOIR (T., 1922, **121**, 1808—1813).

The Distribution of Electrons around the Nucleus in the Sodium and Chlorine Atoms. W. LAWRENCE BRAGG, R. W. JAMES, and C. H. BOSANQUET (*Phil. Mag.*, 1922, **44**, 433—449).—The distribution of electrons in the atoms of sodium and chlorine has been determined by measuring, by the method of X-ray analysis, the reflecting power per unit volume of the units constituting a crystal of sodium chloride. The experimental results indicate that the sodium atom comprises seven electrons arranged on a shell of radius 0·29 Å. and three electrons on a shell of radius 0·76 Å. The chlorine atom comprises ten electrons arranged on a shell of radius 0·25 Å., five electrons on a shell of radius 0·86 Å., and three electrons on a shell of radius 1·46 Å. Alternatively, the results are interpreted by continuous curves in which the electron density is plotted as ordinate against the corresponding distance of the electron from the centre of the atoms as abscissa. Considerable agreement is found between the experimentally determined values of the distribution factor *F* and those calculated for an atom of the type proposed by Bohr and comprising two electrons describing circular one-quantum orbits of radius 0·05 Å., four electrons describing two quantum circular orbits of radius 0·34 Å., and four electrons describing two-quantum elliptical orbits of semi-major axis 0·42 Å. The principal source of error in the conclusions arises owing to lack of information as to the part played by "extinction" in affecting the intensity of *X*-ray spectra. The results indicate that there cannot be, either in the sodium or chlorine atom, an outer shell of eight electrons. Eight electrons revolving in circular orbits of the same radius are equally inadmissible. J. S. G. T.

The Molecular Structure of Carbon Oxysulphide and Carbon Disulphide. A. O. RANKINE (*Phil. Mag.*, 1922, [vi], **44**, 292—300).—The mean collision areas of molecules of carbon oxysulphide and carbon disulphide are calculated from certain assumptions based on the Lewis-Langmuir theory of valency (cf. A., 1921, ii, 192, 584). The electronic configuration in carbon oxysulphide is the same as that of an arrangement of argon and neon atoms in the sequence neon–neon–argon, and that of carbon disulphide corresponds with the sequence of inert atoms argon–neon–argon. The radii of the outer electron shells of atoms possessing the electronic configurations of neon and argon are 0·65 Å. and 1·03 Å., respectively, and the radii of the collision spheres of argon and neon atoms are 1·15 Å. and 1·44 Å., respectively. For the purpose of intermolecular encounters, the molecules consist of overlapping spheres the centres of which are separated by 1·30 Å. for neon–neon and 1·68 Å. for the argon–neon combination, and of which the radii are the collision radii of argon and neon atoms. The mean collision area of carbon oxysulphide should lie between the limits $1{\cdot}00\times10^{-15}$ cm.^{2} and $1{\cdot}09\times10^{-15}$ cm.^{2} and of carbon disulphide between the limits $1{\cdot}23\times10^{-15}$ cm.^{2} and $1{\cdot}37\times10^{-15}$ cm.^{2}. In the former case, the agreement between the results of this examination and the value obtained by Smith (cf. this vol., ii, 686) is striking. In the latter case, comparison is not yet possible. W. E. G.

Valency Theories of Organic Chemistry. F. HENRICH (*Jahrb. Radioaktiv. Elektronik.*, 1922, **19**, 1—38).—An historical account of the theory of valency leading up to a discussion of the modern views of Kossel, Hinsberg, J. Stark, Pauli, and Vorländer on the valency of organic compounds. W. E. G.

The Electron Theory of Valency as Applied to Organic Compounds. JULIUS STIEGLITZ (*J. Amer. Chem. Soc.*, 1922, **44**, 1833—1834).—An addendum to a previous communication (this vol., ii, 560).

The rupture of the union of two carbon atoms by oxidation, involving the loss of two electrons by one of the atoms or jointly by both, takes place with particular ease when two neighbouring carbonyl groups are present in the molecule. In this case, there are no exposed valencies, but the structure is undoubtedly highly polar. Thus oxalic acid may be formulated,

$$\begin{array}{c}\mathrm{H^{+-}O^{-}{}^{+}_{+}C^{+}_{+}{}^{-}_{+}C^{+}_{+}{}^{-}_{-}O^{-+}H} \\ \mathrm{{}^{-}O^{-}{}^{-}O^{-}}\end{array}$$

, and the high polarity of the field surrounding the carbon atoms evidently loosens the union between the two and exposes the electrons held by them somewhat in the same manner, but not to the same extent, as in the case of actual ionisation in a similar field. Similar considerations are applied to cyanogen and to dicarbonyl derivatives in general. H. W.

Lecture-room Demonstration of Atomic Models. LOUIS V. KING (*Phil. Mag.*, 1922, [vi], **44**, 395—400).—Atomic models are described in which a number of steel spheres or soft iron rods are arranged in a strong alternating magnetic field. A simple form of the model consists of a coil of copper wire carrying alternating current over which is placed a large watch glass. Steel bearing-balls are used as magnetic elements. Since the spheres repel each other with a force varying as the inverse fourth power of the distance and the attraction to the centre varies as the distance, symmetrical stable groupings of the spheres are formed. When two coils are employed, mercury is used as a floating surface for the steel balls. The system of spheres may be set in oscillation by external magnets, giving a good illustration of the internal vibrations in the atom. The motion of molecules of a gas or the Brownian movement may be illustrated by employing short cylinders of iron or steel wire, which undergo violent movements if the field is suddenly applied. An experimental model illustrating the Rutherford atom may be constructed with two coils. Lengths of steel wire placed axially to the coils are used to make up the nucleus. Arrangements suitable for the demonstration of hydrogen or helium atoms are described. W. E. G.

Technical Sedimentation Analysis. I. FRIEDRICH-VINCENZ VON HAHN and DOROTHEA VON HAHN (*Kolloid Z.*, 1922, **31**, 96—101).—The authors describe an apparatus, which is a slight modification of Ostwald and Hahn's two-limbed coagulation measurer, by means of which a rapid and accurate knowledge of the size of particles of commercial powders may be obtained. This apparatus has been employed to determine the relative size of the particles of a number of commercial preparations of soot and lamp-black. As a control of the results obtained with this apparatus, the older methods of differentiation have also been used, and it is shown that exactly similar results are obtained by all methods, but that the new method is handier, more rapid, and more accurate (cf. this vol., ii, 205). J. F. S.

Gas Generator with Washing Apparatus. ROBERT MÜLLER, KOMANDIT-GESELLSCHAFT (D.R.-P. 346325; from *Chem. Zentr.*, 1922, ii, 978).—The apparatus consists of a conical flask fitted with a stopper which contains the essential features of the device. This consists of a tube, furnished with a funnel at the upper end and terminating in a trap at the lower end, through which the liquid used in generating the gas is introduced. The gas after generation passes through a washing apparatus of annular cross section fixed concentrically with the upper part of the tube. G. W. R.

Inorganic Chemistry.

Solubility of Sulphur in certain Organic Liquids. R. DELAPLACE (*J. Pharm. Chim.*, 1922, [vii], **26**, 139—140).—The solubility of sulphur in chloroform, carbon tetrachloride, benzene, toluene, and ether was determined at various temperatures ranging from 13° to 24°. The divergence of the results from those obtained by earlier workers is attributed in some cases to the slowness of saturation, twelve hours' continuous agitation being necessary to obtain saturated solutions in toluene and benzene, for example. From the results, which are given in tabular form, the following figures for the weights of sulphur dissolved in 100 grams of solvent, are abstracted: in chloroform at 15°, 0·874 gram; in carbon tetrachloride at 15·5°, 0·645 gram; in toluene at 20°, 1·857 grams; in benzene at 15°, 1·582 grams; in anhydrous ether at 13°, 0·188 gram. G. F. M.

Autoreduction of Sulphurous Acid. GEORGE MACDONALD BENNETT (T., 1922, **121**, 1794—1795).

Some Properties of Selenium Oxychloride. II. VICTOR LENHER (*J. Amer. Chem. Soc.*, 1922, **44**, 1664—1667; cf. A., 1921, ii, 256).—Selenium oxychloride is extremely hygroscopic and the very greatest precautions must be taken in preparing the anhydrous material. The presence of small quantities of water increases the electrical conductivity enormously, and its reactivity towards carbonates is largely dependent on the amount of water present. The best qualitative test for the presence of water in selenium oxychloride makes use of cobalt carbonate. When cobalt carbonate which has been dried at 200° for three hours is sealed up with anhydrous selenium oxychloride, no action of any description occurs, but if the merest trace of water is present the oxychloride becomes blue and if the tube is sealed a pressure of carbon dioxide is set up. The dry carbonates of calcium, strontium, copper, nickel, cobalt, and ferrous iron are unattacked by anhydrous selenium oxychloride, whilst the dry carbonates of barium, lithium, and magnesium slowly evolve carbon dioxide and that of zinc much more rapidly. The fused carbonates of sodium and potassium react readily with anhydrous selenium oxychloride with the development of a large amount of heat. Sulphur dioxide is without action on boiling anhydrous selenium oxychloride, but in the presence of water selenium is precipitated. Dry hydrogen sulphide in contact with selenium oxychloride produces a reddish-brown colour, after which hydrogen chloride is evolved and yellow selenium sulphide produced. At the same time, heat is developed which dissociates the sulphide into sulphur and red selenium. Liquid hydrogen disulphide reacts vigorously with selenium oxychloride in the cold, producing the same products as hydrogen sulphide. Carbon monoxide has no action on selenium oxychloride. Iodic acid, iodine pentoxide, and potassium iodate with selenium oxychloride give at first chlorine and then iodine chloride. Periodic acid with the oxychloride evolves chlorine and, when warmed, iodine chloride. Potassium bromate with selenium oxychloride in the cold gives chlorine followed rapidly by a mixture of bromine and chlorine. Selenium oxychloride warmed with potassium persulphate evolves chlorine, but in the presence of sulphuric acid the evolution occurs in the cold and with effervescence. Telluric and selenic acids evolve chlorine when gently warmed with the oxychloride. The metals tungsten, tantalum, and titanium are only slightly attacked by selenium oxychloride after long treatment at high temperatures. Phosphorus reacts with selenium oxychloride at low temperatures to form phosphoric oxide, selenium monochloride, and selenium tetrachloride. Selenium oxychloride dissolves readily in carbon tetrachloride, but after a time reaction takes place with the formation of selenium tetrachloride and carbonyl chloride. Gliadin, zein, glutenin, elastin, and albumin are readily attacked and dissolved by selenium oxychloride. J. F. S.

Selenium Oxybromide. VICTOR LENHER (*J. Amer. Chem. Soc.*, 1922, **44**, 1668—1673).—Selenium oxybromide is best prepared by adding to pure sublimed selenium dioxide the calculated amount of fused selenium in a flask fitted with a rubber stopper through which passes a dropping funnel and a safety tube filled with fused calcium bromide. The flask is cooled to 0° and the amount of bromine necessary to convert the metal into tetrabromide cautiously added in small quantities. The mixture is then warmed until the whole of the oxide has dissolved to form the oxybromide. Selenium oxybromide is a reddish-yellow solid, m. p. 41·5—41·7°, b. p. 217°/740 mm. with considerable decomposition, d^{50} 3·38. The product decomposes so readily on heating, that it cannot be purified by distillation even under reduced pressure. It has an electrical conductivity at 40—50° of 6×10^{-5} ohms^{-1}. Water converts it slowly into selenious and hydrochloric acids. It dissolves in carbon disulphide, chloroform, benzene, toluene, and xylene, and the fused material is miscible in all proportions with these solvents. Carbon tetrachloride dissolves it readily, but the fused material dissolves only to the extent of 6%, and on heating the solution for several days carbonyl chloride is evolved and selenium tetrabromide formed. Selenium oxybromide is a very active chemical reagent. Sulphur reacts readily with it in the cold with the evolution of sulphur dioxide; selenium dissolves in it to form the monobromide. Yellow phosphorus explodes with the solid, whilst red phosphorus takes fire with the solid and burns. Iodine dissolves in large quantities in selenium oxybromide, whilst chlorine displaces bromine. Silicon and carbon are not attacked. Sodium reacts explosively with the oxybromide, producing the bromide and selenium monobromide, whilst potassium reacts even more violently. Mercury, arsenic, antimony, tin, bismuth, iron, calcium, copper, lead, silver, molybdenum, thallium, gold, platinum, and zinc are all attacked, forming the metallic bromide and selenium monobromide. Zinc dust burns in the oxybromide; aluminium and magnesium are only slightly corroded after heating for a week at 100° in the oxybromide. Cadmium, chromium, nickel, cobalt, tungsten, and tantalum are not attacked when heated for ten days at 100°. The oxides of mercury, silver, calcium, and sodium react energetically with selenium oxybromide, those of arsenic, tin, and tellurium less energetically, and those of columbium, tantalum, vanadium, thorium, titanium, zirconium, and uranium are unattacked after heating for several days at 100°. With most carbonates, the anhydrous oxybromide reacts only sluggishly even on heating, but in the presence of moisture the reaction is vigorous. The commoner sulphides react with the oxybromide with the development of heat, forming metallic bromides and selenium monobromide. Potassium chlorate liberates bromine from the oxybromide, but potassium perchlorate, permanganate, dichromate, and chromium trioxide are without action on it. When dry air is bubbled through the oxybromide at 60°, bromine is set free, due to a primary dissociation into the dioxide and tetrabromide followed by a secondary dissociation of the tetrabromide into bromine and the monobromide. Sulphur dioxide and carbon monoxide are without action on the oxybromide, and hydrogen sulphide causes a slight decomposition. J. F. S.

Production of Colourless Glass in Tank Furnaces with Particular Reference to the Use of Selenium. I. A. COUSEN and W. E. S. TURNER (*J. Soc. Glass Technology*, 1922, **6**, 168—181).—Numerous small melts at 1380° and 1440° showed that not more than 0·09% of iron oxide in a glass could be effectively decolorised by selenium or sodium selenite. The greater corrosive action of the salt-cake on the pot and its action on the selenium at high temperatures rendered more decoloriser necessary for batches containing this ingredient than for those with soda ash alone. Experiments showed the distinct formation of sodium selenite from selenium when dropped on to fused sodium sulphate. In a batch containing only soda ash and no salt-cake, sodium selenite was much more effective than selenium in decolorising. Reheating the glasses only changed the tint of those which had been over-decolorised, and then only when heated between 525° and 550°. A. C.

Limits for the Propagation of Flame at Various Temperatures in Mixtures of Ammonia with Air and Oxygen. ALBERT GREVILLE WHITE (T., 1922, **121**, 1688—1695).

Acetone in Commercial Ammonia. J. BOUGAULT and R. GROS (*J. Pharm. Chim.*, 1922, **26**, 170—171).—In many cases in which ammonia is used as a reagent in the presence of iodine, the formation of small quantities of iodoform is observed. An explanation of this fact was put forward by Guérin (A., 1909, i, 126), but this is set aside by the authors, who show that iodoform results from the presence of acetone. The quantity of acetone was found to vary from 0·01—0·5 gram per litre in the different samples examined, and it has been found in so-called "pure ammonia for analysis" in addition to the commercial product. It is pointed out that the use of ammonia in testing for acetone in physiological products is liable to give misleading results. H. J. E.

Viscous Properties and Molecular Dimensions of Silicane. A. O. RANKINE and C. J. SMITH (*Proc. Physical Soc.*, 1922, **34**, 181—186).—The authors have determined experimentally the viscosity of gaseous silicon hydride at 15° and 100°, and on the assumption that Sutherland's law holds for this gas over the whole temperature range concerned the viscosity at 0° has been extrapolated. The data have been used to calculate the mean collision area presented by the silicon hydride molecule in the gaseous state. The experimental method employed was the same as that previously described (A., 1921, ii, 694). The following numerical data are recorded: viscosity in C.G.S. units $\times 10^{-4}$, 0°, 1·078; 15°, 1·134; 100°, 1·436; Sutherland's constant, (c), 229; mean collision area of the molecule, (A), $0·989 \times 10^{-14}$ cm.^{2}. Using these data, an attempt is made to determine the structure of the silicon hydride molecule in relation to those of other gaseous hydrides the molecules of which have equal numbers of extra-nuclear electrons. J. F. S.

Effect of Magnesia on the Resistance of Glass to Corroding Agents and a Comparison of the Durability of Lime and Magnesia Glasses. VIOLET DIMBLEBY, CONSTANCE M. M. MUIRHEAD, and W. E. S. TURNER (*J. Soc. Glass Technology*, 1922, **6**, 101—107).—Magnesia glasses appear to possess a slight advantage over lime glasses as regards corrosion by water; they show no advantage in the case of hydrochloric acid, and are decidedly inferior as regards their resistance towards alkaline solutions. W. P. S.

Crystal Structure of Potassium. L. W. MCKEEHAN (*Proc. Nat. Acad. Sci.*, 1922, **8**, 254—255).—Determination by the X-ray method of the crystalline structure of potassium cooled to −150° in a current of air shows that the atoms of the metal are arranged in a body-centred cubic lattice with $a = 5·20 \times 10^{-8}$ cm. The

corresponding value of the density is 0·92 gram/cm.^{3} compared with the commonly accepted value of 0·862 gram/cm.^{3}. The difference is probably partly attributable to the imperfect crystallisation of samples previously examined. The observed crystalline structure does not persist as the temperature rises to about 20°.
J. S. G. T.

Symmetry and Crystal Structure of Sodium Hydrogen Acetate. Ralph W. G. Wyckoff (*Amer. J. Sci.*, 1922, [v], **4**, 193—198).—Cubes (*d* 1·402) having the composition $NaH(C_2H_3O_2)_2$ were obtained by the long digestion of fused sodium acetate, glacial acetic acid, and acetic anhydride. The *X*-ray analysis (reflexion spectra and Laue photographs) gives a unit cube of edge 15·98 Å.U. containing twenty-four chemical molecules. The space group is probably T_h^7. L. J. S.

Symmetry and Crystal Structure of Zinc Bromate Hexahydrate. Ralph W. G. Wyckoff (*Amer. J. Sci.*, 1922, [v], **4**, 188—192).—Good crystals having the composition $Zn(BrO_3)_2,6H_2O$, mostly octahedral in habit, are formed by the slow cooling, or slow evaporation, of solutions. Reflexion *X*-ray photographs were obtained from the octahedral face, and Laue photographs through both octahedral and cube faces. These show an absence of planes of symmetry. From the various alternative arrangements, the space group T_h^6 is selected. The unit cube contains four chemical molecules and has length of edge 10·31 Å.U. L. J. S.

Chemical Method of Separating the Isotopes of Lead. Thomas Dillon, Rosalind Clarke, and Victor M. Hinchy (*Sci. Proc. Royal Dublin Soc.*, 1922, **17**, 53—57).—The authors have attempted to effect a separation of the isotopes of lead by means of the Grignard reaction. Lead chloride prepared from some residues recovered from the manufacture of mesothorium was treated with lead tetraethyl and the reaction represented by the equation $2PbCl_2+4MgRX=R_4Pb+2MgCl_2+2MgX_2+Pb$ carried out. The lead tetraethyl and metallic lead remaining constitute two fractions which are used separately in a repetition of the process. The process was carried out twice and the atomic weight of the lead in the tetraethyl from one and the lead residue in the other process was then determined by the method employed by Soddy and Hyman (T., 1914, **105**, 1402). The relative values 207·1 and 207·4 were obtained, thus indicating that the above reaction furnishes a possible method of separating isotopes and that the chemical properties of isotopes although similar are not identical. J. F. S.

The Mass-spectrum of Iron. F. W. Aston (*Nature*, 1922, **110**, 312—313).—The mass spectrum of iron, examined as iron pentacarbonyl mixed with carbon dioxide, is characterised by a strong line at 55·94±0·05, and possibly a very faint line at 54.
A. A. E.

The Constitutional Diagram of the Iron–Carbon System based on Recent Investigations. Kôtarô Honda (*Sci. Rep. Tohoku Imp. Univ.*, 1921, **11**, 119—129).—In a previous communication with Murakami (cf. A., 1921, ii, 699), it is shown that the graphitisation of iron always takes place after solidification of the fusion, the formation of graphite being due to the catalytic action of carbon monoxide on the solid cementite, just below the eutectic point, 1130° to 1100°. This being the case, the graphite lines on the usual double iron–carbon diagrams must be omitted. The shape of the solidus curve is frequently given incorrectly; according to the principles of thermodynamics, this curve, like the liquidus curve, should be bent upwards. In a discussion of the allotropic transformations of the various forms of iron, it is concluded that the α—β transformation is not a sudden change of phase, but a progressive change beginning from the lowest temperatures and ending at about 790°, the amount of change being dependent on the temperature. The magnetisation of iron is not accompanied by changes in the atomic configuration as in the case of allotropic change, but is a consequence of a gradual alteration in the energy of the atoms with rise in temperature. This transformation is represented by a dotted line passing through 790° for pure iron and 775° at 4% of carbon. Similarly, the cementite transformation is progressive and extends from the lowest temperature up to 215°. The break in the heating curve of cast iron observed by Ruer (A., 1921, ii, 198) is not evidence of the existence of a graphite eutectoid. W. E. G.

Crystal Structure of Iron and Steel. II. Arne Westgren and Gösta Phragmén (*Z. physikal. Chem.*, 1922, **102**, 1—25; cf. this vol., ii, 152).—Röntgen photographs of iron wire at 800°, 1100°, and 1425°, obtained by the Debye and Scheerer method, show that iron within the so-called β and δ regions similarly to α-iron has a space-centred cubic lattice, whilst iron in the γ-iron region has a face-centred cubic lattice. The characteristic fact is therefore that the transition which occurs at 900° (A_3) is reversed at 1400° (A_4). The γ-iron lattice of austenite steel is extended by the dissolved carbon. It is found that a steel containing 1·98% of carbon possesses a larger iron lattice when it is quenched at 1100° than at 1000°, also that the α-iron lattice in martensite appears to be somewhat extended by the carbon. The homogeneous lattice region within the α-iron in martensite is shown to be extremely small. A steel containing 0·80% of carbon which has been quenched at 760° is shown to be practically amorphous. Debye photographs of cementite and spiegeleisen crystals are identical. By means of Laue photographs and an investigation of the interferences of a spiegeleisen crystal rotating in a Debye camera, it is shown that cementite belongs to the rhombic system and has an axial ratio 0·670 : 0·755 : 1. The dimensions of the elementary parallelopiped are 4·53, 5·11, and 6·77 Å.U., respectively. The unit crystal contains four molecules of Fe_3C, from which it follows that the specific gravity of cementite is 7·62. J. F. S.

The System Chromium Trioxide–Sulphur Trioxide–Water. LIONEL FELIX GILBERT, HAROLD BUCKLEY, and IRVINE MASSON (T., 1922, **121**, 1934—1938).

Rôle of Chromates in Electrolysis for Chlorate. A. V. PAMFILOV (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1921, **4**, 113—117).—Chromate plays a triple part in the electrolytic production of chlorate in an acid solution. (1) It acts as a "buffer" salt, regulating automatically the kinetic acidity of the liquid. (2) It forms a film on the cathode and thus prevents reduction of the hypochlorite formed as an intermediate product, and (3) this film protects the cathode from disintegration and hence allows the platinum electrodes to be replaced by those of metals more readily accessible, such as copper. These effects of chromate are specific and are not exhibited by any other compound. T. H. P.

The Adsorption of Uranium-*X* and its Isotope, Thorium, by Basic Ferric Acetate. ANDREW CHARLES BROWN (T., 1922, **121**, 1736—1743).

Zirconium Ferrocyanide and Ferricyanide. F. P. VENABLE and E. O. MOEHLMANN (*J. Amer. Chem. Soc.*, 1922, **44**, 1705—1707).—When solutions of potassium ferrocyanide are added to solutions of zirconyl salts, white precipitates are obtained which are unstable in the air and of varying composition. The precipitates are basic zirconium ferrocyanides and the composition depends on the extent to which the hydrolysis has proceeded. Thus, a freshly prepared solution of zirconyl chloride gives a substance of the formula $ZrO(OH)_2,(ZrO)_2Fe(CN)_6$ and a solution which has been boiled gives a precipitate of the composition $9ZrO(OH)_2,2(ZrO)_2Fe(CN)_6$. Potassium ferricyanide gives no precipitate with freshly prepared solutions of zirconyl chloride, but on boiling the mixture the very basic compound

$$21ZrO(OH)_2,2(ZrO)_3Fe(CN)_6$$

is precipitated. J. F. S.

The Chemical Properties of Mesothorium. II. D. YOVANOVITCH (*Compt. rend.*, 1922, **175**, 307—309).—A concentrated solution of the chlorides of barium and radioactive elements was treated with hydrochloric acid in the cold. The precipitated barium chloride carried down with it mesothorium-*I*, thorium-*X*, and radium, leaving mesothorium-*II*, radiothorium, and the active residue in solution. By this process, repeated at intervals, mesothorium-*II* was obtained in the acid solution, nearly pure and practically free from barium. The final purification of mesothorium-*II* was carried out by repeated co-precipitation with salts of iron or aluminium, and further by reprecipitation as hydroxide. To eliminate radiothorium a trace of thorium was added and later removed by means of hydrogen peroxide. Thorium-*C* and thorium-*B* were removed by precipitation with lead and bismuth, which in turn were removed as sulphides. Mesothorium-*II* in solution with elements of the cerium group was fractionally precipitated as oxalate hydroxide, and as the double sulphate. Mesothorium-*II* in the presence of lanthanum and praseodymium appeared in greater quantity in the early fractions, but when mixed with neodymium and samarium was more concentrated in the last fractions. In the fractionation of the double nitrates of the rare earths and ammonium, mesothorium-*II* tends to accumulate with lanthanum rather than with samarium.

A. G. P.

Crystal Structure of Germanium. N. H. KOLKMEIJER (*Proc. K. Akad. Wetensch. Amsterdam*, 1922, **25**, 125—126).—In continuation of previous work (A., 1921, ii, 200), the author has investigated the crystal structure of germanium, by the powder method. The structure, deduced from the observations, resembles that of the diamond, the lattice parameter *a* being equal to 5·61 Å., compared with the value 5·594 Å. deduced from the value of the density and atomic weight, taking Avogadro's number equal to $6{\cdot}062 \times 10^{22}$. As modifications of carbon, silicon; germanium, and tin resembling the diamond in structure are known, whilst the same is not true of titanium, zirconium, and thorium, it is concluded that carbon and silicon are more closely associated with the elements of group IV*b* than with those of group IV*a*. J. S. G. T.

The Anode Oxidation of Gold. I. Anode Oxidation of Gold in Sulphuric Acid. FR. JIRSA and OT. BURYÁNEK (*Chem. Listy*, 1922, **16**, 189—194).—A detailed examination is made of the oxidation of a gold anode in dilute sulphuric acid. The product obtained is shown to be auric hydroxide, which loses a molecule of water on keeping over phosphoric oxide, giving the compound AuO(OH), and this, on further dehydration, yields the oxide Au_2O_3. It was observed that ozone is evolved during the passage of the current, and the amount produced per ampere-hour for various concentrations of acid is determined. The yields of hydroxide obtained with different currents and acid concentrations are also measured.

The solubilities of auric hydroxide, both freshly prepared and stale, and prepared both electrolytically and by hydrolysis, are determined for different concentrations of sulphuric acid, and from these results it is concluded that the product of solution is auric sulphate, and not the compound $Au(OH)SO_4$. R. T.

Mineralogical Chemistry.

The Composition and Calorific Power of Coal from the Deeper Strata of the Kenadza (Algerian) Mine. A. FOIX (*Bull. Soc. chim.*, 1922, [iv], **31**, 813—816).—Coal from the deeper workings differs from that obtained nearer the surface by reason of its greater proportion of ash, nitrogen, and sulphur. The heat of combustion is about 8·255 calories per gram. H. J. E.

Colloidal Phosphates. CARL ELSCHNER (*Kolloid Z.*, 1922, **31**, 94—96).—The author describes the colloidal formation of a clay found in the Fanning Islands which contains no silicates but is chiefly made up of calcium phosphates and organic materials. The mineral *naurite* is stated to be formed from a jelly-like mass containing tricalcium phosphate with uric acid and purine derivatives, which through the action of nitrifying bacteria has lost its organic matter and formed a substance of the composition $3(Ca_3P_2O_8),Ca(OH)_2,xH_2O$. Another mineral, *meyersite*, found in the Hawaii Islands, is described. This is an aged gel of the composition $AlPO_4$, 66·33%; $FePO_4$, 2·52%; H_2O, 26·10%; and is to be distinguished from variszite, $AlPO_4,2H_2O$. It is lighter in colour and is particularly characterised by its banded structure. The mineral is formed by the decomposition of lava by the constituents of guano. J. F. S.

Olivine from Lithosiderites. P. CHIRVINSKII (*Bull. Soc. franç. Min.*, 1921, **44**, 170).—Olivine isolated from the pallasites of: I, Ahumada; II, Finmarken (*d* 3·366); III, Mt. Dyrring; and IV, Molong, gave:

	SiO_2.	FeO.	MnO.	MgO.	CaO.	Total.

IV.	39·32	13·13	trace	47·70	trace	100·15

L. J. S.

Cyprine and Associated Minerals from Franklin, New Jersey. J. VOLNEY LEWIS and LAWSON H. BAUER (*Amer. J. Sci.*, 1922, [v], **4**, 249—251).—Sky-blue, granular to fibrous cyprine (a variety of idocrase), which was apparently homogeneous, was found on microscopical examination of thin sections to enclose about 33% of rounded grains of willemite. Analysis I gives, after deducting willemite, the figures under II agreeing approximately with the composition of idocrase. Associated with this mineral is pale pink, cleavable to coarsely fibrous rhodonite (var. bustamite), which gave analysis III; brown, granular garnet—the polyadelphite variety of andradite (analysis IV); also phlogopite, felspar, etc.

	SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	MnO.	ZnO.	CuO.	CaO.	MgO.	H_2O.	Total.

Analytical Chemistry.

Refractometric and Interferometric Quantitative Analysis. J. Bečka (*Z. physiol. Chem.*, 1922, **121**, 288—299).—The author has extended the observations of de Crinis (A., 1920, ii, 700) on the use of the refractometer for the analysis of solutions so as to make it more generally applicable. He has also described the use of the interferometer for more dilute solutions. The experiments have special reference to urine analysis. H. K.

Recovery of Solvents from Extracted Substances. A. B. Pichler (*Chem. Ztg.*, 1922, **46**, 698).—In the ordinary method of extracting substances in a Soxhlet apparatus a considerable quantity of the solvent is retained by the extraction thimble and its contents, particularly if the latter are of a bulky nature; this solvent may be recovered by transferring the thimble, at the end of the extraction, to a large flask and, when a suitable number of thimbles have thus been collected, submitting them to distillation. To recover solvent from a single thimble, the latter may be transferred to a tube which fits on to the lower end of the Soxhlet apparatus and the solvent then distilled into and collected in the Soxhlet apparatus. W. P. S.

Apparatus for Measuring the Hydrogen-ion Concentration of a Solution. André Kling and A. Lassieur (*Ann. Chim. Analyt.*, 1922, [ii], **4**, 232—238).—A further description of the electrometric method previously reported (this vol., ii, 234). G. F. M.

Colorimetric Estimation of Hydrogen Peroxide. M. L. Isaacs (*J. Amer. Chem. Soc.*, 1922, **44**, 1662—1663).—A rapid method of estimating the concentration of hydrogen peroxide colorimetrically based on the method described by Denigès (A., 1890, 1185) and Crismer (A., 1892, 381) is worked out and fully described. About 30 c.c. of water, 10 c.c. of a 5% solution of citric acid, and 1 c.c. of the unknown hydrogen peroxide are placed in a 50 c.c. graduated flask and, after mixing, 1 c.c. of a 10% solution of ammonium molybdate is slowly added. Water is then added to make the volume 50 c.c. and the whole well shaken. The yellow colour develops at once and the solution is then compared with a standard potassium chromate solution (0·4 gram/litre) in a Dubosq colorimeter. When the standard is set at 20 the quantity of hydrogen peroxide is given by $x=0{\cdot}05467/y$, where y is the colorimeter reading and x the number of grams of peroxide in the 50 c.c. of solution. The results obtained by this method compare extremely favourably with those obtained by direct titration with potassium permanganate. J. F. S.

The Error in Estimating Chloride by Bang's Micro-Method. Richard Prigge (*Biochem. Z.*, 1922, **130**, 442—447).—The sources of error in this method have been examined and full details of the technique required for the greatest exactitude are given. H. K.

Micro-analyses by Bang's Methods. I. LUDWIG PETSCHACHER (*Biochem. Z.*, 1922, **131**, 116—123).—The estimation of chlorides by microanalysis in drops of blood gives sufficiently accurate results, but the estimation of dextrose and residual nitrogen is not sufficiently accurate. H. K.

Colorimetric Estimation of Blood Chlorides. M. L. ISAACS (*J. Biol. Chem.*, 1922, **53**, 17—19).—The method is applicable to the tungstic acid blood filtrates and depends on the conversion of silver chromate into sodium chromate by the action of the blood chlorides. Excess of silver chromate (about 0·05 gram) is stirred into 10 c.c. of the blood filtrate previously neutralised by addition of a small quantity of magnesium carbonate. After centrifuging, the supernatant liquid (plus washings) is clarified by the addition of 1 c.c. of a 2% ammonium hydroxide solution, and diluted to 25 c.c. The colour is then compared with a potassium chromate solution which has been standardised by means of a solution of sodium chloride in the above manner. E. S.

Estimation of Chlorine in Tissues. O. M. PICO and J. MURTAGH (*Compt. rend. Soc. Biol.*, 1922, **86**, 405—406; from *Chem. Zentr.*, 1922, ii, 922).—The tissue is dissolved in concentrated sodium hydroxide solution and the proteins are precipitated by phosphotungstic acid. The chlorine is estimated in the filtrate by the method of Austin and Van Slyke. G. W. R.

Detection of Iodates in Potassium Iodide according to the French Codex, 1908. LACHARTRE (*J. Pharm. Chim.*, 1922, [vii], **26**, 134—138).—The test for iodates in potassium iodide described in the Codex lacks precision, and takes no account of the influence of such factors as the strength of the iodide solution, the amount of acid added, the duration of the reaction, etc. The following method is suggested. A 10% solution of the iodide in distilled water is prepared, and to 10 c.c., 3 c.c. of chloroform and 5 drops of glacial acetic acid are added. After shaking for thirty seconds, the chloroform, examined immediately after separation, should not be coloured. Performed in this manner, the limit of sensitiveness of the test is 0·08 part of iodate per 1000, which is considered to be all that is required for a reasonably pure product. The presence of copper in small quantities, for example, 0·0015 part per 1000, has no effect on the reaction with a perfectly pure iodide, but it appreciably accelerates the development of the iodine coloration when traces of iodate are present. The amount of copper in ordinary distilled water is, however, too small to have any effect on the reaction in either case. G. F. M.

Detection and Estimation of Fluorides. N. K. SMITT (*Bull. Bureau Biotech.*, 1922, 176—178).—Greeff's volumetric method for the estimation of fluorides (A., 1913, ii, 975) may be simplified somewhat by the use of an alcoholic solution of ferric chloride. The presence of fluoride in neutral solution may be detected by adding a little ammonium thiocyanate solution and then ferric chloride solution drop by drop; in the absence of interfering substances, rapid disappearance of the colour of the ferric thiocyanate indicates the presence of fluoride. Even insoluble fluorides, such as that of calcium, may be similarly detected if the substance is vigorously ground in a mortar with thiocyanate and ferric chloride solutions. A colorimetric method for estimating traces of fluorides, based on the above reaction, is also described. [Cf. *J. Soc. Chem. Ind.*, 1922, Oct.] T. H. P.

The Estimation of Oxygen in Organic Compounds. H. TER MEULEN (*Rec. trav. chim.*, 1922, **41**, 509—514; cf. Boswell, A., 1913, ii, 334).—The substance to be analysed is heated in a current of pure hydrogen and the resulting gases are passed first over metallic nickel in the form of thin wire and secondly over nickelised asbestos. The function of the former is that of transforming the decomposition products of the substance into compounds which are suitable for hydrogenation, which reaction occurs in the presence of the latter. With proper precautions, all the oxygen is transformed into water and weighed as such; but as a portion may remain as carbon dioxide, a second absorbent is required to obviate error due to incomplete transformation. Analyses carried out by this method have yielded satisfactory results, details of which are given. Halogens and sulphur act as poisons to the catalyst; the method is therefore not applicable to substances containing these elements. As calcium chloride is used to absorb the water formed in the reaction, nitrogenous substances may not be dealt with by this method on account of the ammonia which they yield on hydrogenation. H. J. E.

Estimation of Sulphides by Oxidation by means of Ferric Sulphate. P. P. BUDNIKOV and K. E. KRAUZE (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1921, **4**, 157—159).—The method described is based on the reactions $3Na_2S+Fe_2(SO_4)_3=3Na_2SO_4+2FeS+S$ and $2FeS+2Fe_2(SO_4)_3=6FeSO_4+2S$, the ferrous sulphate thus formed being estimated by titration with permanganate solution. If the ferric sulphate is used in aqueous solution, it undergoes hydrolysis, whereas in presence of acid the sodium sulphide may be attacked with loss of hydrogen sulphide. These difficulties are avoided by adding sodium carbonate or hydroxide, and by acidifying, only after the oxidation, with phosphoric acid. Manganous sulphate is added prior to the titration. The method is applicable to calcium and zinc sulphides, but not to sulphides of copper, lead, silver, etc., which are insoluble. T. H. P.

Estimation of Non-protein Nitrogen by means of Ultrafiltration. M. RICHTER-QUITTNER and H. HOENLINGER (*Wiener Klin. Wochschr.*, 1921, **34**, 24).—Twenty c.c. of blood plasma or serum are diluted ten to twenty times with distilled water and filtered through a Buchner funnel and membrane (Zsigmondy and Jander, A., 1919, ii, 520), the non-protein nitrogen being estimated in the filtrate by Kjeldahl's or Pregl's micro-method.

CHEMICAL ABSTRACTS.

The Triketohydrindene (Ninhydrin) Reaction as a Quantitative Colorimetric Method for the Estimation of Amino-acid Nitrogen. H. Riffart (*Biochem. Z.*, 1922, **131**, 78—96).—The ninhydrin reaction is suitable for the estimation of amino-acid nitrogen if certain precautions are taken. All the amino-acids with free amino-groups examined, except histidine, give at P_H 6·976 the same standard colour if the solutions be equal in amino-acid nitrogen content, say, 10 mg. or less per litre. This result is obtained by taking 2 c.c. of such a solution, neutralising with $N/400$ alkali to P_H 6·976 by comparison with phosphate standards and methyl-red, adding 2 c.c. of phosphate solution of the same P_H and 1 c.c. of 1% ninhydrin solution, and heating for thirty minutes in the boiling-water-bath. The solutions are then diluted to 100 c.c. and estimated colorimetrically. Histidine gives the standard colour at P_H 6·24, thus involving a small error where mixtures of amino-acids contain this acid. Some amines and ammonium salts also give the colour reaction, but only in concentrations higher than 15 mg. per litre. H. K.

Estimation of Phosphorus in Minerals and in Coke Ash by a Colorimetric Method. Georges Misson (*Bull. Soc. Chim. Belg.*, 1922, **31**, 222—225).—The phosphorus to be estimated is obtained in solution as phosphate, and it is essential that the solution should be free from chlorine. Potassium permanganate is added, followed by a solution of sodium peroxide in dilute nitric acid. After addition of ammonium vanadate, the solution is boiled and treatment with ammonium molybdate produces the colour which is compared with the standard tint. Three modifications of the method are given, (*a*) for minerals of small phosphorus content, 0·01—0·20%; (*b*) for minerals of greater phosphorus content, 0·20—2·50%; (*c*) for coke ash, together with details of the procedure in each case. A comparison of the results with those obtained by gravimetric methods shows that they are substantially in agreement, but the colorimetric method gives somewhat lower results for a phosphorus content of 1·7% and upwards.

H. J. E.

Modification of the Bell-Doisy Phosphate Method. A. P. Briggs (*J. Biol. Chem.*, 1922, **53**, 13—16; cf. A., 1920, ii, 769).—In the modification described, the coloration produced in acid solution, which is more stable than that in alkaline solution, is used for the estimation. The blood or plasma is diluted with 3 volumes of water and 1 volume of 20% trichloroacetic acid, shaken vigorously for a few seconds, and filtered after ten minutes. To 5 c.c. of the filtrate (corresponding with 1 c.c. of plasma), 2 c.c. of the molybdate solution, 1 c.c. of a 20% sodium sulphite solution, 1 c.c. of the quinol solution, and water to bring the volume to 10 c.c. are added. After thirty minutes, the coloration produced is compared with a standard. In the presence of the sodium sulphite reagent a blue coloration is obtained which is more intense than the green coloration produced in its absence. The method is applicable to urine. E. S.

Estimation of Lipoid Phosphoric Acid ("Lecithin") in Blood by Application of Bell and Doisy's Method for Phosphorus. F. S. Randles and Arthur Knudson (*J. Biol. Chem.*, 1922, **53**, 53—59).—An alcohol-ether extract of blood or plasma is prepared according to Bloor's procedure (A., 1918, ii, 452). An aliquot part of this is evaporated, treated with sulphuric and nitric acids, and heated until the latter acid is completely driven off. Phosphoric acid is then estimated in the clear solution by Bell and Doisy's method (A., 1920, ii, 769). Disturbance of the final solutions produces bubbles which interfere with the reading. The solutions should therefore be left in the colorimeter cups for five minutes before making the comparison. E. S.

Conductometric Titration of Hydrofluosilicic Acid. Naotsuna Kanô (*J. Chem. Soc. Japan*, 1922, **43**, 556—560).—Using two adjustable parallel platinum plates as electrodes, the author has carried out the conductometric titration of hydrofluosilicic acid. When a mixture of 100 c.c. of water and 170—200 c.c. of 95% alcohol was used as solvent for the 0·138*N*-acid, the titration was conducted with sodium hydroxide solution as well as with potassium hydroxide solution without causing hydrolysis of the acid. K. K.

Critical Examination of Methods commonly used in Determining the Durability of Glass. W. E. S. Turner (*J. Soc. Glass Technology*, 1922, **6**, 30—45).—The methods investigated involved (1) the testing of the surface of glass vessels, (2) the use of plates, disks, or slabs of glass, (3) the treatment of the glass in the form of powder, and (4) the autoclave test. Whilst there are uncertainties in the results obtained by any of the methods, it is not difficult to distinguish qualitatively a good glass from a poor one. It is suggested that, in absence of a satisfactory general test, the tests should be made on plates of the glass or on the powder, preferably the latter. W. P. S.

New Apparatus for Estimation of Carbon Dioxide in Air. Henrik Lundegårdh (*Biochem. Z.*, 1922, **131**, 109—115).—The author has modified the Pettenkoffer method by replacing the flask by a zinc vessel in the form of a beaker with detachable cover, and fitted with three tubes to facilitate withdrawal and entry of solutions. A larger apparatus is also described on similar lines, suitable for use in the open. H. K.

Estimation of Gases in Metals. Harold Lester Simons (*Chem. and Met. Eng.*, 1922, **27**, 248—249).—A weighed quantity of the metal is introduced into a specially designed apparatus which is then exhausted by means of a Toeppler pump. Mercury is allowed to siphon over into the flask containing the metal and the whole is heated until the latter dissolves. The evolved gases are first examined spectroscopically in a Geissler tube, then transferred to the usual gas apparatus, and the quantity of each constituent estimated in the usual manner. [Cf. *J. Soc. Chem. Ind.*, 1922, 714A.] A. R. P.

Estimation of Small Quantities of Sodium in Aluminium and Alumina. R. GEITH (*Chem. Ztg.*, 1922, **46**, 745).—The precipitation of aluminium hydroxide by even a very slight excess of ammonia is invariably not quite complete and the traces in solution are weighed with the sodium chloride. By electrolysis of a nearly neutral solution of aluminium chloride or sulphate containing iron, magnesium, calcium, and sodium salts as impurities, all the sodium may be deposited in a mercury cathode as amalgam whilst the bulk of the other metals are precipitated as hydroxides in the solution and the chlorine escapes as gas from the carbon anode. In a suitably arranged divided cell the mercury is made the cathode in the inner compartment and the anode in the outer, which contains dilute neutral sodium chloride solution and a nickel rod dipping into the mercury and forming a voltaic couple. The sodium then redissolves as hydroxide in the salt solution and its amount may be estimated by titration. The current required for the method is 0·15 ampere at 3·5 volts for two to three hours. [Cf. *J. Soc. Chem. Ind.*, 1922, 714A.] A. R. P.

A New Method of Qualitative Separation of the Alkaline-earth Metals. MICHEL POLONOVSKI (*Bull. Soc. chim.*, 1922, [iv], **31**, 806—810).—The separation is based on the differences in solubility of the sulphites and thiosulphates of the three metals in ethyl alcohol–water mixtures. The carbonates as precipitated in the group are dissolved in acetic acid, and the solution is boiled and neutralised with ammonia. After addition of ethyl alcohol, the barium is precipitated by alcoholic sodium thiosulphate. A small proportion remains in solution; this is separated, after filtration, by addition of potassium sulphate, but not of sufficient concentration to precipitate any strontium. The strontium is then separated as sulphite by excess of alcoholic sodium sulphite or as sulphate by excess of potassium sulphate. The solution is then acidified with very dilute acetic acid and the calcium precipitated by ammonium oxalate. The concentrations of the reagents required to effect the separation are given, also the proportions in which they are to be used. H. J. E.

Approximate Volumetric Estimation of Barium. MICHEL POLONOVSKI (*Bull. Soc. chim.*, 1922, [iv], **31**, 810—813; cf. previous abstract).—The separation of barium from strontium and calcium as thiosulphate may be utilised as a means of volumetric estimation by using excess of a standard sodium thiosulphate solution which contains ethyl alcohol. After allowing the mixture to remain for twenty-four to thirty-six hours to obtain as complete a precipitation of barium thiosulphate as possible, the solution is filtered and the excess of the reagent estimated. The quantity of barium present is thus found by difference. A correction is necessary by reason of the slight solubility of barium thiosulphate; this is applied by a formula given by the author, as the temperature at which the precipitation takes place and the percentage of alcohol present are factors which influence the result. H. J. E.

Use of Amalgams in Volumetric Analysis. V. Estimation of Iron, Titanium, Uranium, and Methylene-blue. SUETARÔ KIKUCHI (*J. Chem. Soc. Japan*, 1922, **43**, 544—550; cf. A., 1921, ii, 596, 714; this vol., ii, 519, 529).—After the reduction of mixed solutions of two metals with liquid zinc- or cadmium-amalgam, their differential titration with two standard oxidising solutions was studied. A mixture of ferric oxide and titanium dioxide is titrated with potassium permanganate and iron alum, using ammonium thiocyanate as an indicator after reduction with zinc amalgam. They are quantitatively oxidised with iodine in the presence of sodium tartrate. Combining this reaction and that with iron alum, they can also be differentially titrated. A mixture of ferric oxide and uranium trioxide is titrated with potassium permanganate and iron alum, after reduction with cadmium amalgam in warm solution and in the presence of carbon dioxide. A mixture of titanium dioxide and uranium trioxide is titrated with potassium permanganate and iodine solutions, after reduction with cadmium amalgam in warm solution. Quadrivalent uranium is not oxidised by excess of iodine in the presence of sodium tartrate. After a mixed solution has been oxidised with potassium permanganate, it is reduced with the amalgam and titrated differentially with iron alum or iodine. A definite quantity of titanic sulphate is reduced to tervalent titanium salt by the amalgam; methylene-blue is added at 60—70° until the solution is tinged with blue, and then it is titrated. The purity of Kahlbaum's methylene-blue B extra was 82·96%, and that of Merck's methylene-blue B.B, 85·07%. K. K.

Use of Amalgams in Volumetric Analysis. VI. Electrometric Titration of Iron, Molybdenum, Uranium, Vanadium, and Titanium. NAOTSUNA KANÔ (*J. Chem. Soc. Japan*, 1922, **43**, 550—556; cf. preceding abstract).—Solutions of iron alum, ammonium molybdate, uranyl sulphate, vanadic acid, and titanium sulphate are reduced with zinc amalgam, separated from the amalgam, connected to the platinum and calomel electrodes, and their *E.M.F.* estimated, the standard solution of potassium permanganate meanwhile being gradually added. In these estimations, the volumes of the solution should be maintained as small as possible. In the case of titanium, a slight deficiency of the permanganate solution is first added, then excess of iron alum solution to oxidise tervalent titanium, and the solution then titrated with the permanganate solution. A mixture of iron and titanium can be electrometrically titrated with the permanganate solution, two break-points in the *E.M.F.* curve showing the end points. K. K.

Estimation of Tin in Bearing Metals. JOSEF NÁGEL (*Chem. Ztg.*, 1922, **46**, 698).—One gram of the metal turnings is dissolved by boiling in a flask with 100 c.c. of hydrochloric acid and 3 grams of potassium chlorate; after all free chlorine has been expelled, the solution is diluted with 30 c.c. of water, 7 grams of sodium chloride are added, and, after the addition of a strip of nickel having

an area of about 10 sq. cm., the solution is boiled for one hour. The stannic chloride is thus reduced to stannous chloride, whilst the antimony is deposited as flakes on the nickel plate. After the solution has been cooled in an atmosphere of carbon dioxide, the stannous chloride is titrated with standardised iodine solution.
W. P. S.

The Volumetric Estimation of Antimony and Tin in Red Brass. FRANZ JOHANN MÜCK (*Chem. Ztg.*, 1922, **46**, 790).—The alloy is dissolved in nitric acid and the precipitated stannic and antimonic acids are collected, washed, and dissolved in hot sulphuric acid and potassium sulphate. The cooled solution is treated with 0·5 gram of tartaric acid, 180 c.c. of water, and 7 c.c. of hydrochloric acid and the antimony estimated by titration with permanganate. The solution is then boiled with a further 30 c.c. of water, 60 c.c. of hydrochloric acid, and 2—3 grams of metallic antimony, and the tin is estimated by titration with iodine [cf. *J. Soc. Chem. Ind.*, 1922, Oct.].
A. R. P.

Decomposition and Analysis of Monazite. P. WENGER and P. CHRISTIN (*Ann. Chim. Analyt.*, 1922, [ii], **4**, 231—232).—The hitherto published methods for the attack of monazite are either long and delicate, or else leave large quantities of the rare earths undissolved. By the following method the whole of the mineral can readily be brought into solution. About 1 gram of the finely ground material is heated for five hours with 5 c.c. of sulphuric acid (*d* 1·84) at 230°. The resulting pasty mass is gradually poured into iced water, when all but a small residue passes into solution. This residue is collected on a filter and again heated with sulphuric acid, a little hydrofluoric acid being added to volatilise the silica. The residue in the crucible is then melted with six parts of sodium carbonate. On addition of water, the tantalum passes into solution, and any slight residue which still may remain will be zirconia, which is rendered soluble by fusion with potassium hydrogen sulphate. In the subsequent analysis the precipitation of the rare earths by oxalic acid should be conducted at 55° in a solution containing 0·15—0·75% of sulphuric acid and with an excess of 3% of oxalic acid. At this temperature the precipitation may be considered quantitative for yttrium, thorium, cerium, and didymium. Lanthanum oxalate, being the most soluble, is not completely precipitated, and 50 c.c. of the solution under the above conditions would retain 0·0011 gram of lanthanum in solution.
G. F. M.

The Use of Hanuš's Method for the Determination of the Iodine Figure of Mineral Oils. JAN HLADKÝ (*Chem. Listy*, 1922, **16**, 207—211).—The method of Hanuš, whereby the iodine figure of mineral oils and bitumens is determined by means of a solution of iodine bromide in carbon tetrachloride, is examined. It is found that the reagent does not depreciate as rapidly as those used in the methods of Hübl and of Wijs (E. Graefe, *Petroleum*, 1905, **12**, 631), and that the difference produced in the iodine figure by increasing the time allowed for reaction is smaller than for the above methods. The concentration of the reagent, and the reaction temperature are not of great importance, whilst it is essential that the quantity of oil used is such as to leave a large excess of reagent after interaction. The presence of small quantities of water does not appear to affect the reaction. A further advantage of this method is that it permits the use of carbon tetrachloride, a universal solvent for the bitumens. The accuracy attainable is, for oils of a low iodine figure, from 1 to 2 units. R. T.

The Iodine Values of Aliphatic and Aromatic Unsaturated Compounds. D. HOLDE [with P. WERNER, IDA TACKE, and C. WILKE] (*Chem. Umschau*, 1922, **29**, 185—188).—In the case of oleic acid anhydride and erucic acid, the iodine values found by the Hanuš method or by the Hübl-Waller method agree with the calculated values. Cholesterol, however, yields an iodine value of 73 to 77 by the Hübl method and phytosterol a value of 50 to 68, according to the time of contact (five to forty-eight hours); when estimated by the Wijs method, the iodine value of these two substances is identical, namely, 135. A similar difference in values obtained by the two methods has also been noticed in the case of certain mineral oils. W. P. S.

A New Method for the Detection of Methyl Alcohol. REINO HÄMÄLÄINEN (*Acta Soc. Med. fennic.* "*Duodecim.*," 1921, **3**, 1—6; *Ber. Ges. Physiol.*, **11**, 262—263; from *Chem. Zentr.*, 1922, ii, 918).—Formaldehyde from the oxidation of methyl alcohol by potassium permanganate in ethyl alcohol–sulphuric acid solution is detected by addition of methyl violet–sulphurous acid decolorised by oxalic acid; a dark- to light-blue coloration is formed. G. W. R.

Estimation of the Alcohol Content of a Solution. A. LÉVÊQUE (*Bull. Sci. Pharmacol.*, 1921, **28**, 549—554; from *Chem. Zentr.*, 1922, ii, 819).—The method of Rosset (A., 1921, ii, 598) is applied, using for miscibility temperature determinations, menthol, aniline sulphate, and phenol. G. W. R.

Estimation of Glycerol by the Dichromate Method. J. KELLNER (*Z. deut. Oel-Fett Ind.*, 1922, **42**, 345; cf. this vol., ii, 399).—Complete oxidation of glycerol by dichromate is effected only when sulphuric acid, *d* 1·230, is employed. Sodium chloride, if present in the glycerol, should be removed by treatment with lead acetate and silver oxide, since chlorine is evolved even with sulphuric acid, *d* 1·1. CHEMICAL ABSTRACTS.

Chemical Reaction of Phenol. ANGELO BELLUSSI (*Arch. Farm. sperim. Sci. aff.*, 1922, **33**, 190—191).—When 2 c.c. of 2% phenol solution is gently heated on a water-bath with a small crystal of ammonium phosphate or arsenate and a few drops of 3% hydrogen peroxide solution, a pink or cherry-red coloration appears after a few seconds, the phenol evidently undergoing oxidation. The same coloration is obtained, only far more tardily, when the phenol solution is heated with hydrogen peroxide or even alone, so that the action of the ammonium phosphate or arsenate is catalytic in nature. T. H. P.

Causse-Bonnan's Method for the Estimation of Dextrose. H. J. Lemkes and L. M. Lansberg (*Pharm. Weekblad*, 1922, **59**, 936—939).—It is confirmed that the results obtained vary considerably with the time occupied in titration. Attempts to get uniform results by substituting sodium for potassium compounds were unsuccessful. The white precipitate obtained at the end of the titration was found to contain Cu 23·05, Fe 11·2, K 21·55, (CN) 32·0, and water of crystallisation about 12·5%, but no empirical formula could be deduced. S. I. L.

Modification of Bang's Method for the Estimation of Sugar in the Blood. Z. Ernst and St. Weiss (*Wiener klin. Wochschr.*, 1921, **34**, 174—175).—The blood sample of 0·115 c.c. is aspirated by means of a calibrated capillary pipette which is attached to a 15 c.c. flask, and the pipette is rinsed into the flask by aspirating through it Bang's diluting salt solution. The stopper and pipette are removed, the flask is filled with the salt solution to the mark, the contents are mixed, filtered and 13 c.c. of the filtrate, corresponding with 0·1 c.c. of blood, are analysed by Bang's method (A., 1918, ii, 278). Instead of the filtration, a centrifuge may be employed. Chemical Abstracts.

The Estimation of the Total Oxygen-combining Power of the Blood in the Van Slyke Apparatus. Christen Lundsgaard and Eggert Möller (*J. Biol. Chem.*, 1922, **52**, 377—378).—The blood is saturated with oxygen after, instead of before, introduction into the apparatus. The remainder of the estimation is then carried out by the modified method of Van Slyke and Stadie (this vol., ii, 78). E. S.

Qualitative and Quantitative Demonstration of Blood in Urine. A. Johannessen (*Ugesk. Læger*, 1921, **83**, 1613; from *Physiol. Abstr.*, 1922, **7**, 280).—The reagent recommended is prepared by adding 1 gram of phenolphthalein and 25 grams of potassium hydroxide to 100 c.c. of distilled water and then boiling with 10 grams of zinc dust until decolorised. After filtration, an equal volume of 96% alcohol is added. This solution keeps for six months. Immediately before use 1 c.c. of hydrogen peroxide is added to each 9 c.c. Equal volumes of the reagent and the suspected urine are mixed; if blood is present up to 1 in 20,000 or 1 in 30,000 a pinkish-red colour is formed. With blood in water, a positive reaction is obtained with dilutions as high as 1 in 500,000. Copper, even in traces, interferes with the test. E. S.

General and Physical Chemistry.

Influence of Pressure on the Refractive Index of some Organic Liquids. F. Himstedt and Irma Wertheimer (*Ann. Physik*, 1922, [iv], **67**, 395—406).—The experimental arrangement of Röntgen and Zehnder was used, together with the Loewe-Zeiss interferometer. The refractive index and *dn/dp* were found for the following liquids, bromobenzene, chlorobenzene, nitrobenzene, chloroform, dichloroethylene, pinene, and hexane, and from these the compressibilities were calculated from the Newton, Beer, and Lorentz formulæ. The discussion of these values is postponed until the compressibilities of these liquids have been determined experimentally. W. E. G.

The Establishment of the International System of Normal Wave-lengths. Friedrich Müller (*Z. wiss. Photochem.*, 1922, **22**, 1—20).—Wave-lengths of the carbon, iron, and nickel spectra were accurately measured and are tabulated. Methods of measurement and precautions taken are given. W. T.

Fine Structure of the Red Hydrogen Line. Otto Oldenburg (*Ann. Physik*, 1922, [iv], **67**, 253—277).—Previous measurements of the Zeeman effect for H_α disagree among themselves and with the Sommerfeld quantum theory of fine structure. The divergences are shown to be mainly caused by errors arising in the photography of the spectrum from an echelon grating, and in the measurement of narrow diffuse bands. The true separation of H_α in the absence of a magnetic field, and at the temperature of liquid air, was obtained by resolution of the intensity curve into two Gauss curves. The value obtained was 0·140 Å. ±0·008, whereas the measured distance between the two maxima was about 5% smaller. In weak fields (3500 gauss) the anomalous partial fusion of the *p*-components observed by Erochin was confirmed, but was shown to be due to a widening of the lines, without any appreciable alteration in the distance between the two components. At 18000 gauss, the two lines run together to form a single line which is narrower than the original doublet.

For weak fields, the Zeeman effect for the *s*-component is normal, but the widening of the lines at higher fields leads to the disappearance of the fine structure. Since the lines of H, He^+, and Zn, which are most sensitive to the Stark effect, also become diffuse in a magnetic field, it is possible that an unexpected Stark effect was present. However, this is unlikely, since no appreciable change in potential along the capillary tube was observed under the influence of the magnetic field. Also the widening of the lines caused by the Stark effect disappears on the application of a magnetic field. The Zeeman effect for small magnetic fields is normal, but the fusion of the fine structure components observed in the higher fields is in opposition to the Sommerfeld theory.

W. E. G.

The Balmer Series of Hydrogen. E. GEHRCKE and E. LAU (*Ann. Physik*, 1922, [iv], **67**, 388—394).—Measurements of the fine structure of the Balmer series have been made at the temperature of liquid air, by means of a Lummer-Gehrcke interference spectroscope. The differences between the frequencies of the H_α, H_β, and H_γ doublets were, respectively, $\Delta\nu . 10^{-9}=8\cdot69$, 8·78, 8·74. These values were independent of the time of exposure, so that no error due to the contraction of the gelatin of the photographic plate could have occurred. A considerable deviation occurs between these values and the theoretical fine structure constant, 10·95, of Sommerfeld. It is shown that this deviation from theory is not explained by the additional hypothesis of Sommerfeld, which states that each line of the doublet is composed of a number of sub-components. The experimental results are also in poor agreement with the theory of Silberstein. It is remarkable that the mean figure for $\Delta\nu$ is that derived by Lenz from the Abraham assumption of stationary electrons. W. E. G.

Series and Other Regularities in the Spectrum of Manganese. MIGUEL A. CATALÁN (*Phil. Trans.*, 1922, 223A, 127—173).—The flame-arc, arc, and spark spectra of manganese have been photographed, using a Littrow spectrograph giving a linear dispersion of 16 Å. per mm. at λ 6300 and 5·5 Å. at λ 4700, a similar instrument with quartz prism giving a linear dispersion of 12 Å. per mm. at λ 4000, 4·5 Å. at λ 3000, and 2 Å. at λ 2300, and a concave grating ruled with 14438 lines per inch giving a normal dispersion of 5·5 Å. per mm. in the first order. It is shown that the flame, arc, and spark spectra of manganese, like those of other elements, are formed of two classes of lines, some belonging to the neutral atom and some to the ionised atom (Mn^+). In the spectrum of the neutral atom, triplet series and combination lines have been found. The series follows a Hicks formula with the Rydberg constant "*N*" and may be classified as follows: (*a*) A system of four triplets (sharp, diffuse, principal, and fundamental, the last two being rather doubtful), analogous to the ordinary triplet systems of series in the alkaline earths. (*b*) A system of three narrower triplet series (sharp, diffuse, and principal) which have strong analogies with the single line systems of series in the alkaline earths. (*c*) Another system of still narrower triplets (sharp, diffuse, and principal) which is parallel to the preceding system, the shift number being $C=10967\cdot75$. The intercombination lines, $1S-1p_2$ and $1S-1p_3$ (λ 5394·677 and λ 5432·555), between the first two systems are found as two lines very prominent at low temperatures, and losing very much of their intensity at high temperatures. The ionisation and resonance potentials of manganese have been calculated from the term 1S and from the wave number of the line $1S+1p_2$. The values obtained are 7·4 volts and 2·3 volts, respectively. The lines of ionised manganese, enhanced lines, also form triplets. The data do not permit of the series being traced, but there is evidence that they include a system of triplets (sharp, diffuse, and principal), and also another system of narrower triplets, corresponding with the single line systems in the alkaline earths, as in the case of the neutral atom. Each diffuse triplet, in neutral and ionised atom alike, is formed of nine lines, giving five *d* terms in contrast to the six lines giving three *d* terms which are found in the more familiar diffuse triplets of the alkaline earths. In the spectra of both the neutral and the ionised atom there are certain groups of prominent lines having the same character and showing similar variations with changes of temperature. The lines of each group are related by very exact numerical separations, and these lines are denoted by the term *multiplet*. It is pointed out that similar multiplets exist in the spectra of the neutral atoms of magnesium, calcium, barium, strontium, ionised aluminium, scandium, yttrium, and lanthanum, and neutral atoms of silicon and chromium, and that they may represent a form of regularity present in the spectra of many elements, and serve to indicate the most probable nature of the series in the spectra where the actual series have not been traced. The spectrum of manganese is discussed in connexion with the position of manganese in the periodic system. It seems most probable that the neutral atom of manganese has two electrons in the outermost ring, and that when this atom loses an electron, thus becoming ionised, another electron from the next ring comes out to take its place in the outermost ring, which again contains two electrons. This mechanism would account for the similarity of the neutral and ionised manganese atoms. J. F. S.

Ultra-red Characteristic Frequencies of the Silicates. CLEMENS SCHAEFER and MARTHA SCHUBERT (*Z. tech. Physik*, 1922, **3**, 201—204; cf. this vol., ii, 179).—Since crystals containing CO_3 and similar groups show selective reflection which is characteristic of the group, and varies in a simple manner with the type of crystal, an analogous phenomenon was sought in the case of the silicates. The reflecting power of thirteen silicates was observed throughout the range 1 to 20 μ, and twelve of these showed maxima near 10 μ and 18 μ. These maxima were complicated, varying greatly from one substance to another, and could not be correlated with the crystal structure in the simple manner noted in connexion with other groups such as CO_3, ClO_3, etc. One specimen, analcite, lacked the maximum of greater wave-length. Two specimens containing the group SiO_4 showed no particular similarity in their reflexion curves. CHEMICAL ABSTRACTS.

The Regularities of Ultra-red Spectra and the Failure of the Classical Dispersion Theory. CLEMENS SCHAEFER (*Ann. Physik*, 1922, [iv], **67**, 407—419).—A theoretical paper. In the absorption spectra of polyatomic gases, a simple relationship occurs between the various bands. In diatomic gases, the band with short wave-length is almost exactly the octave of the band with long wave-length. Similar octaves are present in the absorption bands of solid substances. An explanation is put forward based on the assumption that the molecular vibrations are asymmetrical, which supports the quantum theory and is opposed to the classical theory of dispersion and absorption. W. E. G.

Absorption of Light by Sulphur at Various Temperatures. MITSUHARU FUKUDA (*Mem. Coll. Sci. Kyōtō*, 1921, **4**, 351—354).—The absorption spectrum of a layer of sulphur 0·3 mm. thick, prepared by heating the element slowly until melted, extends from the ultra-violet up to λ 0·408 μ at 0°, and extends a further 2 μμ towards the red end for every 10° rise of temperature up to 300°. No discontinuity, such as might be anticipated from the view of Kellas as to the constitution of the sulphur molecule (T., 1915, **113**, 903), was observed in the absorption spectrum at about 160°. The absorption spectrum of plastic sulphur depends on the initial temperature to which the sulphur is heated during its preparation. The higher this temperature, the further does the absorption extend from the ultra-violet towards the red end. J. S. G. T.

Absorption of λ 5460·97 Å. by Luminous Mercury Vapour. J. C. MCLENNAN, D. S. AINSLIE, and (MISS) F. M. CALE (*Proc. Roy. Soc.*, 1922, [*A*], **102**, 33—45).—It has been shown that when the radiation constituting the green line of mercury is passed through moderately luminous mercury vapour the main component and the components No. +1, $\Delta\lambda=0·0086$ Å. and No. −1, $\Delta\lambda=-0·0087$ Å. can be strongly absorbed. No marked absorption by luminous mercury vapour was observed in the case of the other nine components of the green line. Of the nine members constituting the magnetically resolved green line, it was found that the central undisplaced member was the only one that could be markedly absorbed by luminous vapour. It is also shown that absorption by luminous mercury vapour of the light constituting the green line in the mercury spectrum affords a means of clearly and easily demonstrating the existence of the components of the line with separations $\Delta\lambda=+0·0182$ Å. and $\Delta\lambda=-0·021$ Å., that is satellites Nos. +2 and −2. Some considerations are presented in support of the view that the components of the green line of mercury, for which $\Delta\lambda=+0·0182$ Å., +0·0086 Å., −0·0087 Å., −0·021 A., and zero, may originate in atoms of the element having, respectively, the atomic weights 197, 198, 202, 204, and 200. J. F. S.

The Absorption of Mercury Vapour. J. FRANK and W. GROTRIAN (*Z. tech. Physik*, 1922, **3**, 194—197).—To test the theory that the absorption bands of mercury vapour are due to diatomic molecules, the absorption of the band at 2540 Å. was observed in superheated vapour. A sample saturated at 200°/20 mm. was observed at temperatures up to 1200°. The strength of the band was found to decrease with increasing temperature. A second sample, saturated at 240°/35 mm., showed greater absorption at low temperatures, but became nearly transparent at 1200°. This behaviour confirms the belief that the band is due to the molecule which is dissociated at high temperatures. From the rate of variation of absorption with temperature, it is concluded that the work required for dissociation is of the order of one Cal. The number of molecules involved in the absorption is remarkably small, even at the lowest temperatures, where the partial pressure of molecules is less than 10^{-5} mm. CHEMICAL ABSTRACTS.

A Simple Method for the Measurement of Ultra-violet Absorption. CHR. WINTHER, BAGGESGAARD-RASMUSSEN, and E. SCHREINER (*Z. wiss. Photochem.*, 1922, **22**, 33—46).—The photographic method of Merton (T., 1913, **103**, 124) for the quantitative measurement of absorption has been adopted for the ultraviolet. An improved fluorometer has been constructed for extinction measurements of certain wave-lengths and the accuracy of the instrument has been tested by thermo-electric controls. The quantitative photographic method was employed for the investigation of the nitrates of potassium and silver, the results differed from those obtained by qualitative methods. W. T.

The Emission of Light by Atoms. K. FÖRSTERLING (*Z. Physik*, 1922, **10**, 387—392).—Previous experimental observations require that the light emitted by excited atoms is coupled with the atom in a continuous manner. This is contrary to the views of Sommerfeld, and in agreement with those of Mie. An external magnetic or electrical field does not appear to exert any effect on light free in the ether. Thus, if the emitted light is discontinuous, such fields should exert no effect on the radiated energy once it has left the electron. Those atoms in which the electrons have returned to an inner quantum orbit, after emitting the energy of excitation, should not show the Stark effect. The emitted light should be unchanged by the action of an electrical field and Stark, in his experiments, should have observed the unchanged line. For the *p*-components of H_α, H_γ, and H_δ and for the *s*-component of H_δ this was shown not to be the case. On this account, the assumption is made that the electron in its passage from the initial to the final orbit should give up its light continuously to the ether. If the assumption of the spherical wave, and the correspondence principle of Bohr, are still maintained, it would appear necessary to postulate some new energy form in the atom. W. E. G.

The Luminescence of Gas in the Electrodeless Discharge: The Induction Spectra of Cæsium and Rubidium. M. L. DUNOYER (*J. Phys. Radium*, 1922, **8**, 261—292).—The vapours of cæsium and rubidium, when surrounded by a high frequency electromagnetic field, emit a brilliant luminescence at 100—300°. Rubidium vapour gives a feeble luminosity at the ordinary temperature, but no light can be detected from cæsium vapour below 90°. The colour of the luminescence of the saturated metallic vapour undergoes a sudden change at certain temperatures. It is uncertain to what extent this is due to an increase in density of the vapour. At the lowest temperatures, the induction spectra are very rich in lines, but the principal and secondary series are absent. At higher temperatures, all the cæsium and most of the rubidium lines which occur in the spark spectra appear, and are present in great intensity. The secondary series are, however, completely absent, and only a few lines from the flame and arc spectra are to be found in the induction spectra of these metals. The ionised atoms are believed to be the source of the induction spectra, and not the emission of an electron by the Bohr mechanism. Such ions should resemble the atoms of the rare gases, and points of resemblance should occur between the induction spectra of the two groups of elements. W. E. G.

The Luminescence of Decomposing Ozone. Max Trautz and Walter Seidel (*Ann. Physik*, 1922, [iv], **67**, 527—572).—No chemiluminescence is observed when a carefully purified mixture of ozone and oxygen is heated to 400°. On the admission of coal gas to this mixture, light is emitted at the ordinary temperature, frequently with the formation of a mist. Purified air, carbon dioxide, and hydrogen do not give rise to this effect. Carbon monoxide when mixed with ozone produces chemiluminescence at temperatures above 150°, and a band of light is emitted between the wave-lengths 400 and 560 $\mu\mu$. This spectrum is independent of the thickness of the radiating gas.

The light emitted by mixtures of carbon monoxide and ozone is measured by means of an argon-filled rubidium cell. By a streaming method, it was shown that the amount of light is proportional to the product of the concentrations of the two gases; thus $\Delta a=K_1[CO][O_3]/1+K_2[O_3]/t$, where Δa is the electrometer deflexion, K_1 and K_2 are constants depending on the velocities of two simultaneous reactions, and t is the time of streaming for 50 c.c. of gas. These conclusions were confirmed by a study of the reaction in a stationary gas mixture. The velocity of emission of light obeys the second order law, and the deviations which were observed are probably due to irregularities in the temperature of the gas mixture. The velocity of emission increases with increase in temperature, but the total quantity of light emitted increases to a limiting value. The law of constant light summation propounded by Lenard for phosphorescent substances (*Heidelb. Akad.*, 1912, A, 5 Abh.) applies equally well to the chemiluminescence from the mixture of carbon monoxide and ozone, the quantity of light being independent of both the velocity and the temperature. The presence of indifferent gases such as nitrogen or carbon dioxide is without effect on the emission of light. The conclusion that the reaction is of the second order is supported by the observations of Angerer (A., 1921, ii, 257) on the decomposition of N_3. W. E. G.

Catalysis. XVI. Radiation as a Factor in Thermal and Photochemical Reactions. N. R. Dhar (*Z. anorg. Chem.*, 1922, **122**, 151—158).—The author has studied the velocity of certain chemical reactions in tropical sunshine and found that the light rays accelerated the reaction in all cases, more particularly so in the case of those reactions with a high temperature coefficient. The paper concludes with a brief review of the radiation hypothesis. W. T.

The Effect of Colloids on Silver Bromide Emulsions. ROBERT SCHWARZ and HEINRICH STOCK (*Z. wiss. Photochem.*, 1922, **22**, 26—32).—The influence of catalysts on the photochemical decomposition of pure silver bromide has been investigated, the amount of decomposition being determined by the method previously described (A., 1921, ii, 614). Platinum sol delays the inversion point and solarisation. Silver and silicic acid sols act as positive catalysts, whilst aluminium hydroxide has a negative effect. Ferric hydroxide and stannic acid coagulated the emulsion. W. T.

The Photochemical Reduction of Titanium Salts. A. BENRATH and A. OBLADEN (*Z. wiss. Photochem.*, 1922, **22**, 65—71).—The sulphate and oxalate of titanium were not reduced by ethyl alcohol on long exposure to light, whereas the chloride reacted violently. For quantitative work, ethyl alcohol was an unsatisfactory reducing agent owing to the formation of hydrogen peroxide. Mandelic and lactic acids were found to be suitable, and measurements were carried out with the former, which was the more powerful reducing agent. The temperature coefficient of the reaction for 10° was found to be 2·21. The reaction obeyed the law of mass action, and was found to be bimolecular. Chlorides decreased the velocity, probably owing to the decrease of ionisation of the tetrachloride. W. T.

Elimination of Carbon Dioxide from Organic Compounds. VI. The Action of the Light of the Electric Arc on Aqueous Oxalic Acid Solutions in Presence of Ferric, Chromic, and Mercuric Chloride, of Uranyl Acetate, and of Iodic Acid. HERMANN KUNZ-KRAUSE and PAUL MANICKE (*Ber. Deut. pharm. Ges.*, 1922, **32**, 209—216; cf. this vol., i, 6).—Many observations are recorded on the action of sunlight in decomposing aqueous solutions of oxalic acid, but none on the effect of artificial light. Experiments have been made on the decomposing effect of the light from an electric arc on oxalic acid in presence of a number of "catalysts." In presence of ferric chloride, 61·7% of the oxalic acid was decomposed into carbon dioxide in sixteen hours, the reaction being represented by the equation $H_2C_2O_4+Fe_2Cl_6=2FeCl_2+2HCl+2CO_2$. When chromic chloride was used, no decomposition occurred, but ammonium oxalate was oxidised in presence of mercuric chloride, the latter being reduced to mercurous chloride. The decomposition of oxalic acid was also promoted by uranyl acetate and by iodic acid, in the latter case with formation of free iodine. So far as qualitative experiments show, sunlight and the arc light are equivalent for the decomposition of oxalic acid in presence of the above substances. E. H. R.

Chemistry of Actinometers. A. BENRATH, E. HESS, and A. OBLADEN (*Z. wiss. Photochem.*, 1922, **22**, 47—64).—The mercuric chloride–ammonium oxalate actinometer was found to be trustworthy within narrow limits only. The ferric chloride and the oxalic acid–uranyl acetate actinometers were found to be in good agreement. Electrolytes retard the reduction of ferric chloride and the decomposition of oxalic acid. The authors argue that the added electrolytes have no influence on the photochemical reaction, but decrease the dissociation of the iron salt and the oxalic acid, and they draw the conclusion that the ferric ion and the oxalate ion are photochemically active, whilst the undissociated molecules are inactive. W. T.

The Photoelectric Effect of the Alkaline-earth Phosphors. KARL GÖGGEL (*Ann. Physik*, 1922, **67**, 301—319).—The relation between the photoelectric effect and the wave-length of the exciting light have been studied for CaBiα and SrBiα phosphors (cf. Lenard and Saeland, A., 1909, ii, 283). In order to maintain the phosphor in a condition of least excitation, it was illuminated simultaneously by the exciting radiation, and by either green or red light. On account of the low conductivity of the phosphor as compared with the metals, the photoelectric effect of these substances increases more slowly than the intensity of the exciting light. The normal photoelectric effect becomes appreciable at the violet end of the visible spectrum, and increases rapidly with decrease in wave-length. In addition, in the region of the wave-length of the phosphorescent light, selective effects are observed, which are especially large in the presence of green light. In the case of the CaBiα phosphor, the maxima for the photoelectric effect correspond exactly with the maxima of phosphorescence, but a shift of the photoelectric effect towards the red occurs with the SrBiα phosphor. The normal phosphors show a much greater photoelectric effect and phosphorescence than the decinormal phosphors. This is associated with the larger number of small phosphorescence centres in the normal phosphor. Phosphors when destroyed by pressure in the presence of light, become coloured, show practically no phosphorescence, and give the normal photoelectric effect. When destroyed in the dark, however, a much larger effect is obtained which decreases with time. It is suggested that this is caused by the destruction of the closed chain compounds forming the phosphorescence centres, into molecules containing free valency electrons. The magnitude of the photoelectric effect is proportional to the amount of the colouring of the phosphor.

The *d*- and *u*-emission of phosphorescent light is accompanied by the separation of electrons, whereas the *m*-emission, the fluorescence, is not accompanied by a photoelectric effect, and hence is not a consequence of electron emission. The electrons emitted from a phosphorescence centre do not necessarily return to the same centre or by the same path. W. E. G.

β-Ray Spectra and their Connexion with γ-Radiation. LISE MEITNER (*Z. Physik*, 1922, **11**, 35—54).—By means of a more precise investigation, it is shown that the thorium-*B* line, which was previously and erroneously classified as a line belonging to the L_2 ring (this vol., ii, 416), in reality belongs to a second γ-radiation group, as was indicated by Ellis (A., 1921, ii, 422). Measurements of thorium-*C* and thorium-*C''* confirm those of von Baeyer, Hahn, and Meitner (A., 1911, ii, 567) as to the existence of a group of

β-rays of velocity about 95% that of light, which Ellis (*loc. cit.*) was unable to find, and, further, these measurements show that on using the exact energy of the K-disintegration of thallium some of these lines must be interpreted otherwise than was done by Ellis. Very exact experiments with radium-D which have been controlled by photometric registration show that the three L levels found by Ellis are not present in radium-D; one only could be found and that is the L_2 level. It is concluded from the above-mentioned results and those of Ellis for radium-B that in the excitation of the characteristic radiation by γ-radiation proceeding from the nucleus of the atom itself practically only the L_2 level is affected, in contrast to the relationships in the excitation by Röntgen rays from outside the atom. An attempt is made to explain this result on the basis of the unsymmetrical atomic configuration postulated in Bohr's hypothesis. The criticism of the author's interpretation of the β-change put forward by Ellis is discussed, and it is shown that this interpretation is in keeping with the experimental facts.

J. F. S.

Wave-lengths of γ-Rays. LISE MEITNER (*Naturwiss.*, 1922, **10**, 884; from *Chem. Zentr.*, 1922, i, 1352—1354; cf. this vol., ii, 416).—The lattice of crystals is too coarse for the determination of the wave-length of hard γ-rays. Primary β-rays from the disintegration of an atomic nucleus have in the simplest case uniform velocity, and energy corresponding with this velocity. The β-radiation may either pass out of the atom with unchanged velocity or else γ-rays may originate in the nucleus from the β-rays, having the same energy and the relation $E_\beta=h\nu_\gamma=hc/\lambda_\gamma$ (1) holds. The resultant γ-radiation detaches K-, L-, and M-electrons from the atom in which it originates and the energy of this secondary radiation is equal to the energy of the γ-radiation, less the energy used for disintegration or $h\nu_\gamma=E^k{}_\beta-E_k$ (2), where E_k is the energy used in detaching K electrons. E_β and $E^k{}_\beta$ may be determined from the deviation of the β-rays in a magnetic field, and E_k from the K, L, and M absorption wave-lengths obtained by the lattice method. Applying equations (1) and (2), the author found the wave-length of the γ-rays from thorium-B to be $5{\cdot}2\times10^{-10}$ cm., those from radium $6{\cdot}6\times10^{-10}$ cm., and those from radium-D $2{\cdot}9\times10^{-9}$ cm. The shortest wave-length obtained by this method was that of the γ-rays from thorium-C'', namely, $2{\cdot}45\times10^{-10}$ cm., approximately one-fifth of the wave-length of the shortest characteristic Röntgen rays. γ-Rays of even shorter wave-length may be expected to occur. The γ-rays originating from the nucleus may in some circumstances have a greater wave-length than the corresponding K-series. In the case of radium-D where the wave-length of the K series is $1{\cdot}385\times10^{-9}$, the γ-rays cannot set free any K electrons.

G. W. R.

Excitation and Ionisation Potentials of Neon and Argon. G. HERTZ (*Proc. K. Akad. Wetensch. Amsterdam*, 1922, **25**, 179—187).—The excitation potentials of argon and neon have been determined by plotting the number of electrons which have a velocity below a definite small value (in the present experiments that below the velocity corresponding with 0·2 volt) against the applied tension. In this way, the excitation potentials are shown as sharp maxima in the curves. This method is unsuitable for measuring the ionisation potential, and a new method for measuring this quantity has been employed. The results show that, starting from the value 20·45 volts as the lowest excitation potential of helium, two pronounced excitation potentials are found at 17·35 and 19·15 volts for neon. The ionisation potential of neon is found to lie at 22·2 volts. In the case of argon, excitation potentials are found at 12·25 and 13·7 volts and the ionisation potential at 16·0 volts. It is shown in the case of neon that the values found are in harmony with the optical measurement of the spectrum, and, further, there is no room in the series spectrum for a resonance potential of 11·8 volts and ionisation potentials at 16·7 and 20 volts, as found by Horton and Davies (A., 1919, ii, 210), neither did the author find any indication of a resonance potential or ionisation potentials at the values stated. In the case of argon, a comparison with the series spectrum is not possible, but assuming that the argon spectrum is constituted similarly to the neon spectrum, then calculating from the observed excitation and ionisation potentials, the following mean values for the first groups of the terms are to be expected: $0{\cdot}5s=130000\pm1000$, $1{\cdot}5s\sim30400$; $2p\sim18600$, and higher terms <10500. J. F. S.

Chemical Reactions induced by the Corona Effect in Circuits traversed by Continuous Currents. C. MONTEMARTINI (*Gazzetta*, 1922, **52**, ii, 96—97).—The corona discharge is capable of effecting the following reactions: Formation of ozone from air; decomposition of carbon dioxide into carbon monoxide and oxygen; synthesis of ammonia from its elements; formation of carbon dioxide and hydrogen from carbon monoxide and water vapour; formation of hydrogen cyanide from acetylene and nitrogen; formation of formaldehyde from carbon dioxide and hydrogen; formation of benzoic acid from carbon dioxide and benzene vapour; decomposition of hydrogen sulphide into its elements and the inverse reaction; decomposition of hydrogen antimonide and its synthesis from its elements. T. H. P.

Resistance Temperature Coefficient of Concentrated Solutions of Sodium in Liquid Ammonia. CHARLES A. KRAUS and WALTER W. LUCASSE (*J. Amer. Chem. Soc.*, 1922, **44**, 1941—1949).—The resistance temperature coefficients of concentrated solutions of sodium in liquid ammonia have been measured from the saturation point up to $V=5{\cdot}02$ and at temperatures from the boiling point of liquid ammonia down to −60°. Near the saturation point, the temperature coefficient of sodium in liquid ammonia has a value approximately 0·066%. With decreasing concentration, the temperature coefficient increases markedly, passing through a maximum value of approximately 3·6% at $V=1{\cdot}1$ and then decreasing to a value of approximately 1·55 at dilutions above 4·0 litres per atom. Taking into account the earlier work on the temperature coefficient of more dilute solutions, it is evident that the temperature coefficient passes through a minimum value. From the form of the curve at high concentrations, the temperature coefficient is seen to be approaching a negative value at high concentrations, although this value is not actually realisable, since the saturation point of the solution is reached. At the highest concentrations the solutions of the metals in liquid ammonia closely resemble metallic alloys. At lower temperatures, the temperature coefficient increases markedly at higher concentrations. As the concentration decreases, the influence of temperature on the coefficient decreases, and at a dilution $V=5{\cdot}3$ the coefficient is relatively independent of temperature. From previous work on the influence of temperature on the temperature coefficient of more dilute solutions, it is clear that the influence changes sign, since at low concentrations the coefficient increases markedly with increasing temperature. J. F. S.

Effect of Substitution on the Free Energy of Oxidation-reduction Reactions. I. Benzoquinone Derivatives. VICTOR K. LAMER and LILLIAN E. BAKER (*J. Amer. Chem. Soc.*, 1922, **44**, 1954—1964).—The oxidation reduction potentials of the substituted deriatives of quinone–quinol mixtures have been determined at 25°. The method consisted in adding the quinone to a measured volume of buffer solution, removing the oxygen by nitrogen, and then reducing a portion of the quinone to quinol with titanium chloride solution and measuring the potential of the mixture against a calomel electrode, using gold or platinum electrodes. Other measurements were made starting with the quinol and oxidising it with potassium dichromate. The concentration of hydrogen ions was also measured in each solution. The cells measured were therefore of the types: $Hg\,|\,Hg_2Cl_2,KCl(sat)\,||\,Q+QH_2(yM)+H^{\cdot}(xM)/Pt$; and $Hg\,|\,Hg_2Cl_2,KCl(sat)\,||\,H^{\cdot}(xM)\,|\,H_2(1\ atm.)Pt$. The following values of the normal potentials and the reduction of free energy in the various cases are recorded: bromo-*p*-benzoquinone, 0·7151 volts, 138·0 kilojoules; chloro-*p*-benzoquinone, 0·7125, 137·5; *p*-benzoquinone, 0·6990, 134·9; toluquinone, 0·6454, 124·6; *p*-xyloquinone, 0·5900, 113·9; *p*-thymoquinone, 0·5875, 113·4; dimethoxy-*p*-benzoquinone, 0·5139, 99·2; naphthaquinone, 0·4698, 90·7. The effect produced by the substitution of the various groups is discussed in the light of the positive–negative rule of Michael. The validity of the method of work adopted has been established by (1) the constancy and reproducibility of the potentials under widely varying concentrations and following anodic or cathodic polarisation, (2) the use of different electrodes, (3) the agreement of the *E.M.F.* with those obtained by the method of pure mixtures, and (4) the approach of the equilibrium from both sides. The *E.M.F.* values are reproducible to 0·2 milli-volt. J. F. S.

Stability of Phthalate Solutions as Standards in Hydrogen-ion Work. C. J. WOOD and P. P. MURDICK (*J. Amer. Chem. Soc.*, 1922, **44**, 2008—2009).—An answer to the criticisms of Oakes and Salisbury (this vol., ii, 468), who have shown that phthalate solutions when measured against a hydrogen electrode a drift of the *E.M.F.* is observed (cf. also Merrill, this vol., i, 326). The authors have repeated their measurements with a 0·2*M*-solution of potassium hydrogen phthalate, which are shown to agree with those of Clark ("Determination of Hydrogen Ions," Baltimore, 1920). It is therefore contended that potassium hydrogen phthalate may be obtained in a sufficiently pure state to give constant potentials with the hydrogen electrode. J. F. S.

An Electrolytic Current Intensification Effect, A New Electrolytic Displacement Effect, and the Connexion between Electrolysis and the Emission of Electrons in a Vacuum. III. D. REICHINSTEIN and M. ROTHSCHILD (*Z. physikal. Chem.*, 1922, **102**, 209—234; cf. A., 1921, ii, 729, this vol., ii. 112).—A continuation of previous work. It is shown that the new displacement effect makes clear the mechanism of electrolytic detectors with a subsidiary source of current. It is shown experimentally that in such detectors the mechanism does not depend on a conversion into direct current, but that these detectors act as current intensifiers; the ratio of the direct current energy brought into existence by an alternating current to that of the alternating current itself may be greater than eighty-eight. An account is given of a new condenser commutator effect. A new electrolytic detector is described which does not make use of an external subsidiary current; this is characterised by the fact that in the absence of an alternating current it has an *E.M.F.*=0. An electrical current is capable of bringing about a reaction in an electrolyte without making any use of the migrations of the ions. When the new intensifier is connected with a source of alternating current, it intensifies the entering current one thousand times, consequently the intensifier and detector can be directly connected with the antennæ which collect high frequency undamped oscillations.

J. F. S.

The More Recent Conception of Electrolytes. IV. The Dissociation State of Acids of Medium Strength, especially Dichloroacetic Acid in Water and in Salt Solutions. ERLING SCHREINER (*Z. anorg. Chem.*, 1922, **122**, 201—235).—Pure dichloroacetic acid was prepared and was found to be dimorphous with m. p. 12·15° and 13·25°, $d_{15}^{15}=1·5727$. The *E.M.F.* of this acid was measured in aqueous solutions as well as in 0·2 molar solutions of potassium chloride, sodium acetate, and magnesium sulphate. The quinhydrone electrode was used (Biilmann, A., 1921, ii, 372). The conductivities of the acid and its sodium salts were also measured. Assuming the activity constant of the hydrogen ion to be 0·2, that of the dichloroacetate ion was found to be 0·37. Calculations based on the *E.M.F.* measurements and on the conductivity measurements were in complete agreement with the general law of mass action. W. T.

Chromate Electrolysis with Diaphragms. A. LOTTERMOSER and KURT FALK (*Z. Elektrochem.*, 1922, **28**, 366—376).—When sodium chromate is electrolysed in a two or three compartment cell, the current yields of sodium dichromate and sodium hydroxide theoretically possible depend on the composition of the solutions originally present in the anode and cathode compartments. It was shown by Müller and Sauer (A., 1912, ii, 1037) that if the anolyte is a solution of sodium chromate and the catholyte one of sodium hydroxide, the yields are lower than they are when sodium chromate is used in both compartments. Their conclusions are now confirmed by extended observations on two compartment cells of the above types and on three compartment cells (*a*) with sodium hydroxide as the catholyte and sodium chromate in the other two compartments, and (*b*) with chromate in all three. The best yields of dichromate are obtained under the last conditions, as circumstances are then the least favourable for the migration of hydroxyl-ions into the anode compartment. The paper concludes with a mathematical discussion of the possible yield obtainable with these types of cell both with and without taking account of the influence of diffusion. [See *J. Soc. Chem. Ind.*, 1922, 857A.]

E. H. R.

Thermal Expansion of Concentrated Salt Solutions. Robert Meyer (*Physikal. Ber.*, **3**, 149; from *Chem. Zentr.*, 1922, i, 1214—1215).—The thermal expansions of aqueous solutions of sodium nitrate, potassium nitrate, zinc sulphate, and potassium carbonate, saturated at 20—70°, were measured at temperatures up to 90°. The coefficient of expansion of concentrated solutions increases with rise of temperature, but whilst in the case of water the rate of increase of the coefficient of expansion decreases smoothly with rise of temperature, the curves obtained for concentrated salt solutions are irregular and show points of inflexion the positions of which depend on the concentration of the solution. G. W. R.

Approximate Rule for the Specific Heats of Gases and Vapours. Rudolf Mewes (*Z. Sauerstoff Stickstoff Ind.*, 1922, **14**, 26; from *Chem. Zentr.*, 1922, i, 1129—1130).—From the formulæ $cp_t=cp_0(1+\gamma)^t$ and $cp_t/cp_0=(c'p_t/c'p_0)^n$ the specific heat of a substance can be calculated for all temperatures. Values are given of log $(1+\gamma)$ and n, respectively, for a number of gases and vapours. The values of log $(1+\gamma)$ are simple multiples of each other, whilst the values of n are simple integers. G. W. R.

The Specific Heats of Gases with Special Reference to Hydrogen. Christopher Kelk Ingold and Edith Hilda Usherwood (T., 1922, **121**, 2286—2291).

The Isotherms of Nitrogen, Oxygen, and Helium. L. Holborn and J. Otto (*Z. Physik*, 1922, **10**, 367—376).—The isothermals of oxygen and nitrogen at temperatures of 0°, 50°, and 100°, and at pressures up to 100 atm., and of helium from 50 to 100 atm. have been determined (cf. A., 1915, ii, 743; 1921, ii, 15). The coefficients are given for the equations $pv=A+Bp+$

Cp^2, and $pv=(pv)_0(1+B'/v+C'v^2)$; the pv values for helium may be expressed by a linear relationship.

		A.	$B\ 10^3$.	$C\ 10^6$.	$B'\ 10^3$.	$C'\ 10^6$.
Nitrogen...	0° :	1·00057	−0·58100	4·76327	−0·57070	4·58106
	50° :	1·18368	−0·02500	3·80816	−0·03281	4·79200
	100° :	1·36682	+0·36057	3·15102	+0·35016	4·98088
Oxygen ...	0° :	1·00130	−1·30143	0·46452	−1·27335	4·07229
	50° :	1·18456	−0·63543	0·27755	−0·62750	3·26394
	100° :	1·36782	−0·20357	0·22571	−0·20149	3·02964
Helium ...	0° :	0·99930	+0·69543	—	+0·69565	0·50594
	50° :	1·18223	+0·68887	—	0·68797	0·51689
	100° :	1·36518	+0·66804	—	0·67453	0·53306

Amagat's *pv*-values for 100 atm. are greater by 0·7% for nitrogen and 0·3% for oxygen, and the results of Kamerlingh Onnes and Hyndman for oxygen are, at the lower pressures, about 0·4% greater and, at the higher pressures, about the same amount smaller. The *pv*-values for air have been calculated for air from those for oxygen and nitrogen: the differences between these and the experimental values for air are within the error of the observations, except at 0° and 50° for the higher pressures. W. E. G.

Thermodynamic Treatment of the Possible Formation of Helium from Hydrogen. RICHARD C. TOLMAN (*J. Amer. Chem. Soc.*, 1922, **44**, 1902—1908).—A theoretical paper in which it is shown that by combining the older ideas as to the possible formation of helium from hydrogen with the newer ideas as to the entropy of monatomic gases, it becomes possible to subject the reaction 4H=He to complete thermodynamical treatment. The equilibrium constant calculated from this treatment shows that hydrogen should combine practically completely to form helium at all temperatures below a million degrees and pressures above 10^{-100} atmospheres. The conflict between this conclusion and the mutual presence of hydrogen and helium under solar, stellar, and terrestrial conditions has been discussed. Of the various possibilities presented for reconciling the thermodynamic conclusion as to equilibrium constant and the facts, the author regards the following as most hopeful; (1) the reaction to form helium from hydrogen is an extremely slow one even at 20000°, (2) hydrogen consists of a mixture of isotopes one of which has an atomic weight nearly unity, and (3) helium is decomposed in the sun and stars by the action of an extremely short wave-length radiation which is so penetrating as not to be in temperature equilibrium with the helium affected. J. F. S.

Correlation of Entropy and Probability. GEORGE A. LINHART (*J. Amer. Chem. Soc.*, 1922, **44**, 1881—1886).—In a recent paper (this vol., ii, 257), the author has put forward two equations, the one $S=C\infty/K\,.\log C\infty/(C\infty-C)$, connecting entropy and probability, and the other; $C=C\infty\,kT^K/(kT^K+1)$, connecting specific heats and temperature. The validity of the former equation was substantiated for eighteen substances and the latter equation by a single example. In the present paper the second equation has been shown to hold for the specific heat of all substances which have been measured by the thermo-electric methods. The results calculated for thirty-one substances agree with the experimental values in many cases better than the individual experiments agree with one another. Only in the case of ice and silver iodide is the agreement poor, and here it is shown that the specific heat data are quite erroneous. J. F. S.

The Relation of Melting Point to Boiling Point. R. LORENZ and W. HERZ (*Z. anorg. Chem.*, 1922, **122**, 51—60).—The ratio of the absolute melting point to the normal boiling point has been calculated for 412 elements and compounds (inorganic and organic).

No. of cases.	Ratio.	No. of cases.	Ratio.	No. of cases.	Ratio.
1	0·198	118 between	0·5—0·599	25 between	0·8—0·899
14 between	0·3—0·399	99 ,,	0·6—0·699	26 ,,	0·9—0·999
66 ,,	0·4—0·499	61 ,,	0·7—0·799	2 above	1·0

The mean of all the ratios (A) was found to be 0·62, or taking only those shown to occur more frequently (4, 5, 6, 7) the mean (B) was 0·5946. The following are the quotients for the different categories examined. Elements (A) 0·5583, (B) 0·4542. Inorganic compounds (A) 0·7183, (B) 0·6857. Organic compounds (A) 0·5839, (B) 0·5745. W. T.

Fused Salts. W. HERZ (*Z. Elektrochem.*, 1922, **28**, 390—391).—It has been shown that at the critical temperature the refractive index of non-associated liquids is a constant, 1·126 (A., 1921, ii, 529, this vol., ii, 97). From the measurements of Meyer and Heck of the molecular refractions of fused potassium and sodium nitrates (this vol., ii, 241), the critical refractive indices have been calculated and are, respectively, 1·136 and 1·138. It appears probable, therefore, that the requirements of the theory are fulfilled by fused salts. The critical densities, calculated from the law of corresponding states, are, respectively, 0·599 and 0·612. The boiling points of the alkali fluorides calculated by Lorenz and Herz from the surface tensions (this vol., ii, 261) are compared with the values found by von Wartenberg (this vol., ii, 146). The agreement is good except in the case of cæsium fluoride. The critical pressures of the alkali fluorides, chlorides, bromides, and iodides are now calculated from the known relation between surface tension at the boiling point and critical pressure, $\gamma_s=0{\cdot}427p_k$. The values obtained are probably minimum values. They are used to calculate the constant of Cederberg's vapour pressure formula. When the differences between melting and boiling points of the alkali haloids are compared, regular variations are found as the atomic weight of the metal or halogen increases. E. H. R.

The Vapour Pressure of some Salts. III. H. VON WARTENBERG and O. BOSSE (*Z. Elektrochem.*, 1922, **28**, 384—386).—Continuing the work previously described on the vapour pressures of salts (this vol., ii, 156), the following new data have been obtained. Silver chloride, m. p. 449°, b. p. 1554°, $\log p=-44257/4{\cdot}571T+$

5·298. Cuprous chloride, m. p. 430°, b. p. 1367°, $\log p = -19258/4{\cdot}571T + 2{\cdot}573$. Cuprous bromide, m. p. 483°, b. p. 1345°, $\log p = -19075/4{\cdot}571T + 2{\cdot}5794$. Cuprous iodide, m. p. 588°, b. p. 1293°, $\log p = -19257/4{\cdot}571T + 2{\cdot}690$. Lead chloride, m. p. 498°, b. p. 954°, $\log p = -28518/4{\cdot}571T + 5{\cdot}085$. Lead bromide, b. p. 916°; $\log p = -28180/4{\cdot}571T + 5{\cdot}183$. Lead fluoride, m. p. 818°, b. p. 1292°, $\log p = -39425/4{\cdot}571T + 5{\cdot}510$. Thallous chloride, m. p. 430°, b. p. 806°; $\log p = -25108/4{\cdot}571T + 5{\cdot}093$. Thallous bromide, m. p. 456°, b. p. 815°, $\log p = -25164/4{\cdot}571T + 5{\cdot}059$. Thallous iodide, m. p. 440°, b. p. 824°, $\log p = -25168/4{\cdot}571T + 5{\cdot}021$. Thallous fluoride, b. p. 298°, $\log p = -25152/4{\cdot}571T + 9{\cdot}639$. The thallous salts are abnormal in that the iodide has the highest boiling point and the fluoride the lowest. No vapour pressures of barium chloride, calcium chloride, calcium bromide, and boric anhydride could be measured at the highest attainable temperature, 1536—1546°. The opinion previously expressed that the fluorides form double vapour molecules is now withdrawn, an experimental error having been detected. The dissociaton temperatures of the following acid fluorides were determined: lithium hydrogen fluoride, below 200°; sodium hydrogen fluoride, about 270°; potassium hydrogen fluoride, 310—440°; cæsium hydrogen fluoride, 500—600°; rubidium hydrogen fluoride, 550—670°. E. H. R.

Calorimetric Determinations. P. E. VERKADE (*Chem. Weekblad*, 1922, **19**, 389—393; cf. this vol., ii, 474).—The Third Conference of the International Union of Pure and Applied Chemistry, held at Lyon, June—July, 1922, recommended for the standardisation of calorimetric bombs the use of pure benzoic acid, prepared by the Bureau of Standards at Washington, and tested calorimetrically before issue; this special material is obtainable from the Bureau of the Institut International d'Etalons physicochimiques at Brussels (The University, Rue des Sols). The other materials generally employed are reviewed, and the values given for the heats of combustion criticised. Pending exact determination of the mechanical equivalent of heat, which will permit of electrical measurements for standardisation, the Brussels benzoic acid should be used for all thermo-chemical determinations. The heat of combustion accepted by the Conference is 6324 cal. per gram weighed in air at 15° (6319, weighed in a vacuum). S I. L.

Apparatus for the Rapid Determination of the Specific Gravity of Small Amounts of Liquid. ERICH WIEDBRAUK (*Z. anorg. Chem.*, 1922, **122**, 167—170).—Water and the liquid in question are contained in two communicating U-tubes which also communicate with a manometer, the heights of the liquids which balance various pressures are measured, and hence the specific gravity is calculated. W. T.

Kinetic Theory of Adsorption. D. C. HENRY (*Phil. Mag.*, 1922, [vi], **44**, 689—705).—A theoretical paper in which a kinetic theory of adsorption of gases has been developed by means of assumptions derived from Langmuir's conception of a unimolecular layer. Equations for the adsorption isotherm and isostere are deduced which are in keeping with experimental results. A method is suggested for applying these equations to adsorption from solution, and the results are compared with experimental data. A theoretical derivation of the well-known exponential formula is given which attributes a theoretical significance to the index $1/n$, which is in qualitative agreement with experimental data.

J. F. S.

Adsorption of Activated Sugar Charcoal. I. F. E. Bartell and E. J. Miller (*J. Amer. Chem. Soc.*, 1922, **44**, 1866—1880).—The adsorption of methylene-blue, a basic dye of the electrolyte type, by activated ash-free sugar charcoal has been investigated. The results show that this adsorption is partly, if not entirely, hydrolytic in character. Ash-free sugar charcoal will completely adsorb a certain maximum amount of methylene-blue from solution and still leave the solution neutral. During this process of adsorption a considerable quantity of hydrochloric acid is set free which is readily and completely adsorbed. Adsorption of quantities of methylene-blue greater than the above-mentioned maximum results in the liberation of hydrochloric acid which is not subsequently removed from solution by adsorption. The contradictory results obtained by previous investigators who have used blood charcoal as adsorbent have been reproduced with pure sugar charcoal and an explanation of these results is put forward.

J. F. S.

Adsorption and Catalysis in Fuller's Earth. Eric Keightley Rideal and William Thomas (T., 1922, **121**, 2119—2123).

Adsorption and Orientation of the Molecules of Dibasic Acids and their Ethereal Salts in Liquid–Vapour Interfaces. H. H. King and R. W. Wampler (*J. Amer. Chem. Soc.*, 1922, **44**, 1894—1902).—Surface tension measurements have been made at 20° by the drop-weight method of aqueous solutions of a series of concentrations of tartaric, malonic, succinic, fumaric, oxalic, malic, and maleic acids and the diethyl esters of the four first-named acids. The adsorption has been found for each solution by means of the Gibbs equation $u=-1/iRT\,.\,\delta\gamma/\delta\log C$. A general explanation of the chemical theory of capillarity is given and this is shown to serve as an explanation of catalysis. Tables are drawn up giving the adsorption, surface tension, drop weight, and density of all the above-named solutions. It is shown that the adsorption of the dibasic acids is less than that of the monobasic acids; the degree of adsorption of the dibasic acids increases with increasing carbon content, but the increase is not regular for each carbon atom added to the chain. The presence of a hydroxyl group in the molecule decreases the amount adsorbed, and raises the surface tension, as shown by malic and *d*-tartaric acids. The esters are adsorbed more than the acids, due to the replacement of the polar carboxyl group by the group $-C(=O)-O-C_2H_5$. The molecules are oriented in the surface with the polar groups in the liquid and the least active portions of the molecule forming the surface. J. F. S.

The Rate of Absorption of Carbon Dioxide by Ammoniacal Solutions. PAUL RIOU (*Compt. rend.*, 1922, **175**, 472—474).—Investigation of the influence of temperature and of concentration on the rate of absorption of carbon dioxide by solutions of ammonium carbonate and hydrogen carbonate shows that at constant temperature it increases to a maximum with increase of concentration. In the presence of ammonium hydrogen carbonate, the absorption velocity is considerably less and a decrease takes place with higher concentration after the maximum has been reached. With increase of temperature, a maximum rate is also obtained; the presence of a larger proportion of hydrogen carbonate in the solution corresponds with a reduction in the temperature at which this maximum is reached. H. J. E.

Cataphoretic Charges of Collodion Particles and Anomalous Osmosis through Collodion Membranes Free from Protein. JACQUES LOEB (*J. Gen. Physiol.*, 1922, **5**, 89—107).—If a collodion membrane separate a solution of a salt at a definite P_H from pure water, it is found that at P_H3 the rate of diffusion of the water into the salt solution is normal, and is determined almost entirely by osmotic forces. If, however, the P_H be increased, "anomalous osmosis" is obtained. Measurements have been made of the potential difference between the salt solutions and pure water, and also of that between collodion particles and such salt solutions. It is found that the anomalous diffusion rates can be largely explained as due to the potential difference between the solutions on the two sides of the membrane, and that between the membrane and the liquid in its pores. The former potential difference appears to be due to the diffusion potential. W. O. K.

Interpretation of the Influence of Acid on the Osmotic Pressure of Protein Solutions. JACQUES LOEB (*J. Amer. Chem. Soc.*, 1922, **44**, 1930—1941).—The effect of adding acid to casein solutions has been investigated with regard to the changes brought about in the osmotic pressure. The results show that the addition of a little acid to isoelectric casein solutions increases the osmotic pressure until a maximum is reached, after which the addition of more acid depresses the osmotic pressure. This is explained on the basis of the dispersion hypothesis by the assumption that the addition of a little acid increases the degree of dispersion and consequently the osmotic pressure of the solution, whilst the addition of more acid diminishes the degree of dispersion and consequently the osmotic pressure. The present observations show that when osmotic equilibrium is established between a solution of casein chloride enclosed in a collodion bag and an outside aqueous solution free from protein, the hydrogen-ion concentration is always greater in the outer solution than in the casein solution. There exists a membrane potential between the casein chloride solution enclosed in a collodion bag and the surrounding aqueous solution free from protein with which the casein solution is in osmotic equilibrium, and this membrane potential can be measured with indifferent calomel electrodes and a Compton electrometer. When this is done at 24°, it is found that the number of millivolts of the observed membrane potential is equal to 59 (P_H inside $-P_H$ outside), the latter values being measured with the hydrogen electrode. This is the result to be expected if the inequality of the hydrogen-ion concentrations inside and outside the casein chloride solution at equilibrium is determined by Donnan's equation for membrane equilibria (A., 1911, ii, 848). The fact that the hydrogen-ion concentration inside and outside the casein chloride solution is not the same as that of the outside free from casein chloride which is in osmotic equilibrium shows that the observed osmotic pressure of the protein chloride solution cannot be entirely due to the protein, but must be partly due to the difference in the concentration of the crystalloid ions, hydrogen and chloride, in the inside and outside solution. It is therefore necessary to correct the observed osmotic pressure of a protein chloride solution for this difference of concentration of the hydrogen and chloride ions on the opposite sides of the membrane on the basis of the Donnan equilibrium. The method of evaluating this correction is demonstrated. When this evaluation is made, it is found that within the limit of accuracy of the observations and calculations the entire effect of the hydrogen-ion concentration on the osmotic pressure of the casein chloride solution is covered by the correction required and that there is little if anything left for the dispersion hypothesis to explain. This is in keeping with the conclusion previously drawn by the author, that the influence of electrolytes on the osmotic pressure of protein solutions is entirely, or almost entirely, the consequence of the difference in the concentration of crystalloid ions inside the protein solutions and the outside aqueous solutions at equilibrium, this difference being caused by the establishment of a membrane equilibrium. J. F. S.

Selective Solvent Action by the Constituents of Aqueous Alcohol. ROBERT WRIGHT (T., 1922, **121**, 2251—2256).

Variations in the Solubility of a Compound in Presence of Other Compounds. I. Water–Phenol–Diphenols. P. LEONE and E. ANGELESCU (*Gazzetta*, 1922, **52**, ii, 61—74).—The critical solubility temperature for the system water–phenol is raised by addition of naphthalene, benzophenone, calcium chloride, benzoic acid, tartaric acid, etc., lowered by addition of succinic acid, sodium oleate, or mercuric cyanide, and first raised and then lowered by increasing proportions of acetone. The addition to this system of resorcinol, quinol, or catechol produces marked increase in the reciprocal solubility and a considerable lowering of the critical temperature. Thus, the compositions of the two layers formed at any temperature in a water–phenol mixture gradually approach one another on addition of a dihydroxybenzene and, for a certain concentration of the latter, become equal. The critical temperature of the system is 66·6°; Rothmund (A., 1898, ii, 503) found a rather higher temperature. The results obtained are given both graphically and in tabular form. T. H. P.

Variations in the Solubility of a Compound in Presence of Other Compounds. II. Water–Epichlorohydrin–Acetic Acid. P. Leone and M. Benelli (*Gazzetta*, 1922, **52**, ii, 75—86; cf. preceding abstract).—The reciprocal solubilities of water and epichlorohydrin increase as the temperature is raised, but the critical solution temperature cannot be ascertained since chemical reaction occurs at temperatures above 80°. The authors have measured the reciprocal solubilities at different temperatures and also the depressions of the temperature of saturation by addition of varying proportions of acetic acid, which is miscible in all proportions with both water and epichlorohydrin. T. H. P.

Electronic Structures of Crystals. I. Maurice L. Huggins (*J. Amer. Chem. Soc.*, 1922, **44**, 1841—1850).—A theoretical paper in which the author shows how the Lewis hypothesis of atomic and molecular structures (A., 1916, ii, 310) may be applied to ascertain the relative position of electrons and electronic groups in crystals for which the atomic arrangements are known from *X*-ray investigation. It is shown that the valency electrons, in the crystals discussed, tend to form complete shells round each atomic kernel, each shell consisting of four or six electron pairs. Except for the elements of the first series of the periodic table, these pairs tend to be opposite to the faces of the kernel polyhedra. The atoms are held together by single bonds, each of which is a valency pair in the shell of two atoms and on or near the centre line between them, or by double bonds in each of which there are two electron pairs common to two atoms; the latter case obtains between the carbon and oxygen, and the nitrogen and oxygen in carbonates and nitrates, respectively. There are isolated pairs, that is pairs not acting as bonds in arsenic, antimony, bismuth, and quartz. From the point of view of the foregoing statements, the following crystals have been discussed with regard to their electronic structure: diamond, silicon, germanium, grey tin, zinc sulphide (cubic and hexagonal), cuprous chloride, bromide and iodide, silver iodide (cubic and hexagonal), zinc oxide, cadmium sulphide, carborundum, chalcopyrite, marcasite, hauerite, iron-nickel sulphide, arsenoferrite, loellingite, smaltite, safflorite, cloanthite, rammelsbergite, cobaltite, willyamite, gersdorffite, wolfachite, ullmanite, kallilite, arsenopyrite, glaucodotite, arsenic, antimony, bismuth, quartz, calcite, aragonite, carbonates of calcium, magnesium, iron (ferrous), manganese, zinc, strontium, barium, and lead, and several mixed carbonates of the above-named metals, and sodium and potassium nitrate. J. F. S.

The Effect of Scratching the Wall of a Vessel with a Glass Rod. L. Dede (*Z. Elektrochem.*, 1922, **28**, 364—365). Robert Fricke (*ibid.*, 365—366).—The first author criticises Fricke's explanation (*ibid.*, 244) of the manner in which crystallisation of a solution or liquid is started when the wall of the containing vessel is rubbed with a glass rod, namely, that detached particles of glass act as nuclei. The view is put forward that the phenomenon is electrostatic in character, and experiments with ammonium magnesium phosphate are described supporting this view. Fricke replies, criticising Dede's experiments and maintaining his opinion. E. H. R.

Crystallisation and Proteins. ÉMILE CAVAZZANI (*Arch. internat. physiol.*, 1921, **18**, 446—450; from *Chem. Zentr.*, 1922, i, 1214).—The crystallisation of ammonium chloride from saturated solutions is prevented by 0·05% of egg-albumin, or by 0·2—0·5% of gum arabic. G. W. R.

An Electron Theory of Solids. (SIR) J. J. THOMSON (*J. Franklin Inst.*, 1922, **194**, 281—289).—A theoretical paper giving a summary of the author's theory of the solid state (cf. this vol., ii, 252, 355). The potential energy of atoms in the crystals of the elements and the bulk moduli have been calculated, on the assumption that the attractive force between the atoms and nuclei varies as the inverse cube of the distance. The values for the uni-, bi-, and ter-valent elements are in absolute agreement with the experimental values of Richards. The excess of energy in the surface, the surface tension, has been deduced, and it is shown that this is proportional to $K^{\frac{4}{3}}$, where K is the bulk modulus, a relation due to Richards. The calculation of the potential energy of the atoms in chemical compounds is complicated by the unequal distributions of the electrons about the atoms, but the numbers obtained for the bulk moduli are a useful guide to the distribution of the electrons in the crystal. W. E. G.

Hardness of Solid Substances and its Relationship to Chemical Constitution. A. REIS and L. ZIMMERMANN (*Z. physikal. Chem.*, 1922, **102**, 298—358).—The method of determining hardness by Marten's sclerometric method has been investigated in connexion with a large number of substances of different types, including very soft substances which exhibit a scratch of 10 μ in width when a load of only 1 gram is applied to the needle and shown to be trustworthy for this type of investigation. Experiments on the scratching of ninety crystals by one another yield results which on the whole are in agreement with those obtained by the foregoing method. The eroding action of a moving liquid on solid surfaces has been investigated and by using a stream of mercury from narrow nozzles it has been found possible to obtain trustworthy results on the resistance to erosion of solid substances. It is shown that the hardness and the resistance to erosion for the larger number of the substances examined (about one hundred and eighty) are parallel, but that the numerical value of the resistance to erosion, measured as time required for the removal of the same amount of material, increases much more than the hardness. The hardness depends on the particular crystal face employed, and on the direction of the scratch, whereas no such dependence could be observed in the erosion experiments. The relationship between the hardness, crystal structure, and chemical constitution has been investigated for a large number of substances of all types. A general connexion is shown to exist on the basis of the classification of crystal lattices according to the strength and spacial partition of the forces of attraction between the atoms. In the case of those salts with lattices which are maintained by the electrostatic attractions of the ions, it is shown that generally the charges and distances between the ions are determinative of the hardness. In the case of compounds which have not the nature of salts, the hardness runs parallel with the strength of the residual affinities which the molecules exert outwardly. In keeping with the general chemical experience and with the tendency to association, it is shown from the hardness measurements that the residual affinity is smallest in the case of the hydrocarbons and increases most strongly under the influence of hydroxyl, carboxyl, and cyanogen groups. In the case of mixed crystals, it is shown that the mixture is harder than the mean of the components and in some cases harder than the harder component. The hardness of compressed pastilles has been compared with that of crystals of the same substances, and the two values are shown to be very nearly equal. A number of methods of producing large crystals have been investigated, and it is shown that the tendency of substances to form large crystals is to a certain extent a function of the chemical constitution and is often parallel with the hardness. J. F. S.

The Increase in the Size of Grain of Metallic Bodies (not previously Worked in the Cold) Formed from Powdered Material by Pressure or Sintering. F. SAUERWALD (*Z. anorg. Chem.*, 1922, **122**, 277—294).—The application of pressure did not increase the size of the grain; nor does this occur at moderate temperatures, but at higher temperatures an increase in granular size was observed in the case of iron, nickel, cobalt, tungsten, and copper. This limiting temperature could be fixed within 100°, and an increase of temperature beyond this limit resulted in a rapid increase in the size of the grains. This limiting temperature is independent of the pressure applied in compressing the powder, and has a characteristic value for each metal. Increase in the size of grains was not observed in the cases of zinc and aluminium. These results are discussed in the light of Tammann's new theory of crystallisation (A., 1921, ii, 172). W. T.

The Influence of Electrolytes on the Cataphoretic Charge of Colloidal Particles and the Stability of their Suspensions. I. Experiments with Collodion Particles. JACQUES LOEB (*J. Gen. Physiol.*, 1922, **5**, 109—126).—The potential difference between collodion particles and the aqueous solution in which they are suspended has been determined by measuring the mobility of the particles under a given potential gradient. It is found that the influence of acid and of alkali and of most salts is to cause the negative charge on the collodion particle to increase to a maximum and then to decrease with increasing concentration of the solution.

A tervalent kation, however (for example, in the case of lanthanum chloride), may cause a steady decrease in the charge and even reverse it. The effects of hydrochloric acid, sodium hydroxide, lithium chloride, sodium chloride, and potassium chloride are very similar. If the P_H of the solution be varied, the variation of the charge with changing concentration of salt in the solution remains similar.

When the potential difference between the particles and the solution is reduced below a certain critical value, about 16 millivolts, the suspension of colloidal particles becomes unstable, and precipitation occurs. W. O. K.

Elasticity of Purified Gelatin Jellies as a Function of the Hydrogen-ion Concentration. S. E. SHEPPARD, S. S. SWEET, and ANBER J. BENEDICT (*J. Amer. Chem. Soc.*, 1922, **44**, 1857—1866).—The rigidity and hydrogen-ion concentration of demineralised gelatin jellies, which are free from products of hydrolysis, has been determined for 4, 5, 7, and 10% jellies. The effect on the rigidity of the addition of 0·001% to 0·10% of alum to the above-named jellies has also been investigated. It is shown that except at very high ($P_H > 2$) and very low ($P_H < 11$) hydrogen-ion concentrations, the rigidity does not vary rapidly with changes of the hydrogen-ion concentration, the maximum being at $P_H =$ 7—9. The addition of quantities of aluminium equivalent to 0·01—0·1% of alumina based on the dry gelatin produced considerable changes in the rigidity–P_H curve, and markedly increased the rigidity. These results are discussed in connexion with the theory of the viscosity and elasticity of gelatin. A misleading statement on Poisson's ratio for gelatin jellies in a previous paper (A., 1921, ii, 311), and also in the literature, has been corrected. J. F. S.

The Ultra-filtration of Soap Solutions: Sodium Oleate and Potassium Laurate. JAMES WILLIAM MCBAIN and WILLIAM JOB JENKINS (T., 1922, **121**, 2325—2344).

The Reversibility of the Reaction between Nitrogen, Carbon, and Sodium Carbonate. CHRISTOPHER KELK INGOLD and DANIEL WILSON (T., 1922, **121**, 2278—2286).

The Ammonium Carbonate–Carbamate Equilibrium. CARL FAURHOLT (*Z. anorg. Chem.*, 1922, **121**, 132—134).—A reply to Wegscheider's theoretical paper (this vol., ii, 376). The author shows that his results for the above equilibrium are in fair agreement with those obtained by Burrows and Lewis and by Fenton. The author also shows that the conclusions of Wegscheider (A., 1916, ii, 617) are incorrect, because the latter found that carbamic acid was very weak and the ammonium salt completely hydrolysed in aqueous solution. The present author carried out colorimetric hydrogen-ion estimations and found that the ammonium salt is not hydrolysed to any appreciable extent. W. T.

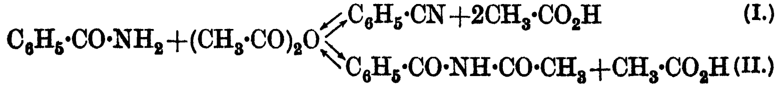
Equilibrium in the System Potassium Chlorate, Potassium Nitrate, and Water at 25°. SHIGERU TODA (*J. Chem. Soc. Japan*, 1922, **43**, 320—328; *Mem. Coll. Sci. Kyoto Imp. Univ.*, 1921, **4**, 377—382).—The equilibrium in the system potassium chlorate, potassium nitrate, and water at 25° has been studied. The solubility of potassium chlorate at 25° is 7·745 grams in 100 grams of solution or 8·395 grams in 100 grams of water, and that of potassium nitrate is 27·24 grams in 100 grams of solution or 37·44 grams in 100 grams of water. At 25°, potassium chlorate forms a solid solution with potassium nitrate taking up the latter to the extent of 14·37 molar %, whilst the nitrate takes up none of the chlorate. K. K.

Equilibrium in the System Copper Sulphate, Ammonium Sulphate, Potassium Sulphate, and Water at 25·0°. RYONOSUKE HAYAMI (*Mem. Coll. Sci. Kyoto*, 1921, **4**, 359—369; *J. Chem. Soc. Japan*, 1921, **42**, 421—441).—The equilibrium diagram for the system copper sulphate, potassium sulphate, ammonium sulphate, and water at 25° has been determined, and also the relation between the composition of the aqueous solutions and that of the solid solutions when the residue is either a mixture of $CuSO_4,5H_2O$ and $CuSO_4,(NH_4,K)_2SO_4,6H_2O$ or a mixture of $(NH_4,K)_2SO_4$ and $CuSO_4,(NH_4,K)_2SO_4,6H_2O$. J. S. G. T.

Dynamics of the Formation of Nitriles from Acid-anhydrides and Amides. II. Kinetic Study of the Reaction between Acetamide and Acetic Anhydride, using Phase Rule Methods. ROBERT KREMANN, ALFRED ZOFF, and VICTOR OSWALD (*Monatsh.*, 1922, **43**, 139—144).—The reaction: acetamide+acetic anhydride $\rightleftharpoons$ acetonitrile+2 acetic acid, is followed kinetically, and shown to reach an equilibrium corresponding with 83% conversion (from left to right in the sense of the above scheme) at 98°, and with 87% conversion at 78°.

The method consisted in taking the freezing points of mixtures of the components which had been heated at the required temperature for different lengths of time. The percentage compositions were then read from an experimentally determined curve of the freezing points of mixtures of the two systems involved in the reversible reaction. C. K. I.

Dynamics of the Formation of Nitriles from Acid-anhydrides and Amides. III. Reaction between Benzamide and Acetic Anhydride. ROBERT KREMANN, WILHELM RÖSLER, and WILHELM PENKNER (*Monatsh.*, 1922, **43**, 145—159).—Two side reactions take place when equimolecular quantities of acetic anhydride and benzamide are heated together:



$$C_6H_5\cdot CO\cdot NH_2+(CH_3\cdot CO)_2O\begin{array}{l}\nearrow C_6H_5\cdot CN+2CH_3\cdot CO_2H \quad (I.)\\ \searrow C_6H_5\cdot CO\cdot NH\cdot CO\cdot CH_3+CH_3\cdot CO_2H \quad (II.)\end{array}$$

and in order to follow the process kinetically by the method previously employed (cf. preceding abstract) it was necessary first to construct a ternary freezing-point diagram for the systems [$C_6H_5\cdot CO\cdot NH_2+(CH_3\cdot CO)_2O$], [$C_6H_5\cdot CN+2CH_3\cdot CO_2H$], and [$C_6H_5\cdot CO\cdot NH\cdot CO\cdot CH_3+CH_3\cdot CO_2H$]. With the aid of this diagram the progress of the reactions is followed by a series of freezing-point determinations. The following values are deduced for the composition of the equilibrium mixture: benzamide 0·48, acetic anhydride 0·48, benzonitrile 0·14, acetylbenzoylimide 0·38, acetic acid 0·66 mol. C. K. I.

Studies in Acidolysis. I. The Equilibrium between Acetic Acid, Trichloroacetic Acid, and their Ethyl Esters. II. The Equilibrium between Acetic Acid, Trichloroacetic Acid, and their Methyl Esters. J. J. SUDBOROUGH and D. D. KARVÉ (*J. Indian Inst. Sci.*, 1922, **5**, 1—21).—As a preliminary to the study of the reaction between ethyl alcohol and a mixture of acetic and trichloroacetic acids, the equilibrium between the two acids and their ethyl esters was examined at 30°. The equilibrium constant of the reaction $CH_3\cdot CO_2Et+CCl_3\cdot CO_2H \rightleftharpoons CH_3\cdot CO_2H+CCl_3\cdot CO_2Et$ was found to be equal to unity, and the same result was obtained with the methyl esters. It follows that the relative affinities of the methoxy- and ethoxy-residues for acetyl and trichloroacetyl are practically identical, in spite of the difference between the dissociation constants of the two acids. In the absence of a catalyst the reaction $CH_3\cdot CO_2Et+CCl_3\cdot CO_2H \longrightarrow CH_3\cdot CO_2H+CCl_3\cdot CO_2Et$ and the reverse reaction proceed very slowly at 30°, the time required for the attainment of equilibrium being 1200—1400 hours. The velocity constants in both directions are equal, the value of k/V being 0·00039, where $k/V=1/2A_1t\log A_1/A_1-2x$. In this expression, V_1=volume of 1000 grams of the mixture, A_1=the number of gram-mols. per 1000 grams, and x the number of molecules which have reacted after t hours. With the methyl esters, the reaction is still slower, and $k/V=0{\cdot}000097$. E. H. R.

The Ignition of Gases. II. Ignition by a Heated Surface. Mixtures of Methane and Air. WALTER MASON and RICHARD VERNON WHEELER (T., 1922, **121**, 2079—2091).

The Explosions of Varieties of Organic Dust. Experimental Investigation of the Simple Case of Sugar Dust. P. BEYERSDORFER (*Ber.*, 1922, **55**, [*B*], 2568—2596).—The experiments consist in a thermal and an electrical investigation of the causes leading to the exploding of mixtures of very finely divided sucrose and air.

The explosion chamber consists of a glass vessel of about 600 c.c. capacity which is suspended symmetrically in a copper pot surrounded by an asbestos mantle and heated from below by a Franke burner. The vessel is provided with inlet and outlet tubes for gases and at its centre a cage of thin aluminium foil is suspended against which the sugar dust is blown through a horizontal side tube. The temperature is measured by a silver-constantan thermo-element. The sugar dust is passed through a sieve having ten thousand meshes to the square centimetre, dried at 105°/100 mm., and preserved over concentrated sulphuric acid. The apparatus is heated to slightly above the desired temperature, and then allowed to cool to the desired extent, when the dust is blown against the foil. In this manner, the latter is the hottest part of the apparatus at the moment of the experiment.

The author defines the following terms. Ignition is a process which leads to visible combustion. Its cause may be of a dynamic, thermal, or an electrical nature. The ignition may lead to inflammation or explosion. Inflammation is a visible process of combustion which takes place throughout the material with small velocity and little change of pressure and has the power of causing further thermal ignition. Explosion is a visible process of combustion which is propagated through the material with high velocity and great change of pressure, and has the ability to ignite other combustible material by thermal action or by shock.

The author draws the following conclusions. The explosion of dusts can be caused by thermal or electrical processes. The temperature of ignition of sugar dust in air is 410±1°, and in oxygen 371°. The presence of small quantities of ozone lowers the temperature of ignition by 3° in air and by 4° in oxygen. The temperature of ignition is dependent on the oxygen content of the gas and on the nature and thermal conductivity of the relatively inert gases which accompany the oxygen, carbon dioxide having a noticeably greater extinguishing action than nitrogen. The dependence of the temperature of ignition of sugar dust on the oxygen content of mixtures of the latter gas with nitrogen is represented graphically. The curve approaches asymptotically to the temperature axis. At a point corresponding with the presence of about 9% of oxygen, the region of ignition becomes divided into an inflammation and an explosion region. Ultimately, the thermal explosion of sugar dust is a gaseous explosion. The process occurs in two phases: (i) the gasification of sugar dust such as takes place in the case of coal, and (ii) the oxidation of the "sugar gas" until ignition sets in. [In experiments on the temperature of ignition of sugar dust in air in which such ignition just does not occur, a rapid initial drop of 10—15° in temperature is invariably observed (due to gasification of the sugar) followed by a rise in temperature which generally exceeds the initial temperature ultimately (due to oxidation of the gas).] The upper limit of explosion is established at 13·5 kilos. of dust per cubic metre; the lower safety limit is calculated to be 17·5 grams per cubic metre.

Sugar dust becomes positively charged when projected through the air. If it is whirled through the air, tensions of multiples of ten thousand volts may be developed. Discharge of the loaded particles in a gas may occur silently, but they have no immediate connexion with the luminosity which accompanies the process and is readily visible in the dark. This luminosity is specific for each gas, and is identical with that observed for it in an alternating field.

Sugar dust may be caused to explode in an alternating field. The phases of the electrical explosion are: (1) the formation of ozone and nitrogen pentoxide, (2) the reaction of these substances with the most minute sugar particles, and (3) explosion as a result of this reaction in the alternating field. Sugar dust forms an aerosol with air; if this suddenly approaches the isoelectric point, a flash occurs which ignites the dust cloud.

The conclusions elucidated for sugar dust are applicable to every explosive dust whether organic or inorganic.

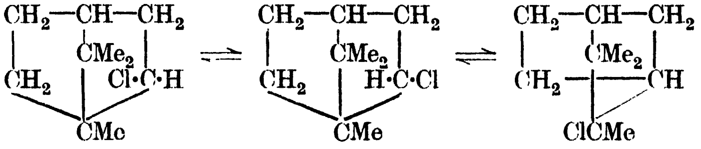
Magnetic phenomena have no influence on the occurrence of dust explosions.

The violence of a dust explosion is attributed to the adsorption of oxygen by the dust.

Triboluminescence cannot be regarded as a cause of sugar dust explosions. H. W.

Michael's Addition and Separation Rule. L. Smith (*Z. physikal. Chem.*, 1922, **102**, 359—363).—A theoretical paper in which on the basis of the author's investigations on the velocity of the reactions $\mathrm{OH{\cdot}CH_2{\cdot}CH(OH){\cdot}CH_2Cl+OH' \rightleftharpoons OH{\cdot}CH_2{\cdot}\underset{\diagdown O \diagup}{CH{\cdot}CH_2}+Cl'+H_2O}$, and $\mathrm{OH{\cdot}CH_2{\cdot}CHCl{\cdot}CH_2{\cdot}OH+OH' \rightleftharpoons OH{\cdot}CH_2{\cdot}\underset{\diagdown O \diagup}{CH{\cdot}CH_2}+Cl'+H_2O}$ (A., 1920, i, 658), an attempt is made to explain Michael's addition and separation rule. This rule may be stated as follows: When two isomeric compounds may be formed from an unsaturated compound, a direct relationship exists between the relative quantities of the additive compounds produced and the velocities with which they may be reconverted into the original substance. J. F. S.

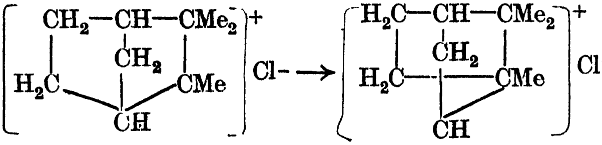
The Equilibrium Isomerism between Bornyl Chloride, *iso*Bornyl Chloride, and Camphene Hydrochloride. Hans Meerwein and Konrad van Emster [with Jacob Joussen] (*Ber.*, 1922, **55**, [*B*], 2500—2528; cf. A., 1920, i, 855).—In the molten condition and in solution, an equilibrium is established between bornyl chloride (1), *iso*bornyl chloride (II), and camphene hydrochloride (III), in accordance with the scheme:



(I.) (II.) (III.)

The equilibrium is dependent on the temperature and to a slight extent on the solvent. At the atmospheric temperature, it is greatly displaced in the direction of bornyl chloride. The transformation from right to left occurs exothermally; bornyl chloride is therefore the most stable, camphene hydrochloride the most labile isomeride. With increasing temperature, the equilibrium becomes more and more displaced in favour of *iso*bornyl chloride and camphene hydrochloride. The interconversion of *iso*bornyl chloride and camphene hydrochloride takes place readily at the atmospheric temperature, whereas the transformation of bornyl chloride into *iso*bornyl chloride occurs with greater difficulty and only at a more elevated temperature.

The velocity of the conversion of camphene hydrochloride into *iso*bornyl chloride at 20° or 40° has been examined in the following solvents: cresol, sulphur dioxide, nitromethane, acetonitrile, nitrobenzene, benzonitrile, anisole, bromobenzene, ethyl bromide, chlorobenzene, benzene, light petroleum, and ether. The rate of change is enormously influenced by the solvent. In cresol, it occurs so rapidly that it is complete almost as soon as the camphene hydrochloride has passed into solution; ether, at the other end of the scale, acts practically as a stabilising agent towards camphene hydrochloride. The transformation is a unimolecular change. In general, the values of *k* exhibit a decreasing tendency during the course of an experiment, which is due to the partial dissociation of camphene hydrochloride in solution into camphene and hydrogen chloride and the catalytic acceleration of the transformation by the latter; with decreasing content of camphene hydrochloride, the concentration of the hydrogen chloride also diminishes and the rate of change becomes smaller. The results indicate that the conversion of camphene hydrochloride into *iso*bornyl chloride is due to an actual, intramolecular atomic displacement and cannot be explained by elimination and re-addition of hydrogen chloride. An intimate connexion is obvious between the dielectric constant of the solvent and its influence on the rate of conversion of camphene hydrochloride into *iso*bornyl chloride, the latter being greatest in strongly ionising solvents (nitromethane and acetonitrile) and smallest in non-ionising solvents (benzene, ether, light petroleum). From this it appears that the velocity of the change depends on the degree of the electrolytic dissociation of camphene hydrochloride and that the conversion only occurs subsequently to ionisation. The change, therefore, consists not in a wandering of the chlorine atom, but in a rearrangement of the cation in accordance with the annexed scheme, whereby the more strongly ionised camphene hydrochloride passes into the less strongly ionised *iso*bornyl chloride. A perfect parallelism between rate of change and dielectric constant of the solvent is not observed, exceptions being encountered in the cases of cresol, sulphur dioxide, and anisole, on the one hand, and of ether on the other. Precisely these solvents have an anomalous action towards triphenylmethyl chloride, and it seems probable that their effect can be explained in a uniform manner, and that phenol, sulphur dioxide, and (to a less extent) anisole form complex compounds with camphene hydrochloride in which the mobility of the chlorine atom is increased or the ionisation of camphene hydrochloride occurs to a greater degree. The influence of complex formation on the ionisation and therefore on the rate of transformation of camphene hydrochloride is further



illustrated by the catalytic acceleration of the change by the halogen acids, antimony pentachloride, stannic chloride, ferric chloride, mercuric chloride, and antimony trichloride (all of which yield additive compounds with triphenylmethyl chloride), whereas phosphorus trichloride and silicon tetrachloride, which show no tendency to complex formation, are inactive. In the presence of catalysts, the change is unimolecular, and the constancy of k is more satisfactory than in their absence, since the effect of the hydrogen chloride (see above) is of relatively less importance.

The influence of the solvent on the degree of ionisation of camphene hydrochloride is also observed in the alcoholysis of this substance. The conversion of camphene hydrochloride into camphene hydrate methyl ether by methyl alcohol has been examined kinetically in the presence of nitromethane, acetonitrile, nitrobenzene, benzonitrile, anisole, bromobenzene, chlorobenzene, benzene, ethyl bromide, pyridine, and ether and it is found that the effect of the solvents is approximately the same as that observed in the conversion of camphene hydrochloride into *iso*bornyl chloride. The analogy between triphenylmethyl chloride and camphene hydrochloride is illustrated further by a study of the alcoholysis of the former by amyl alcohol in the presence of nitrobenzene, benzonitrile, bromobenzene, chlorobenzene, anisole, ethyl bromide, benzene, pyridine, and ether, and the complete parallelism thus established justifies the assumption of the ionisation of camphene hydrochloride which cannot be measured directly on account of the ease with which it is converted into *iso*bornyl chloride in all solvents which are suitable for measurements of conductivity.

Unfortunately, it is not possible to measure the rate of the reverse transformation of *iso*bornyl chloride into camphene hydrochloride, but it is shown to be subject to the same catalytic influences by observation on the rate of decomposition of *iso*bornyl chloride into camphene or camphene hydrate and hydrogen chloride under differing conditions, this decomposition being consequent on the transformation of *iso*bornyl chloride into camphene hydrochloride.

The mutual transformation of *iso*bornyl and bornyl chlorides takes place with much greater difficulty and in non-ionising solvents in the absence of catalysts is extremely slow at 130°. In cresol, sulphur dioxide, or chlorobenzene in the presence of stannic chloride, the change occurs with considerable rapidity at 70°, but the conditions are unsuitable for physico-chemical examination.

The authors have previously described (*loc. cit.*) the isolation of "true" pinene hydrochloride. The compound had been obtained previously in 1914 by Aschan (cf. A., 1921, i, 795), whose work, however, was not generally accessible until recently. It has now been obtained in the crystalline condition (although not quite free from bornyl chloride) by the action of hydrogen chloride on a dilute solution of pinene in light petroleum at −60°. It is instantly decomposed by water and alcohol, and can be titrated in alcoholic solution in the same manner as hydrochloric acid. It resembles camphene hydrochloride in that its solutions can be greatly stabilised by the addition of ether.

The estimation of camphene hydrochloride, *iso*bornyl chloride, and free hydrogen chloride in their solutions is effected in the following manner. Camphene hydrochloride is determined by adding an excess of *N*/5-absolute alcoholic sodium ethoxide to the solution together with methyl alcohol, and titrating the excess of alkoxide after the mixture has been preserved for an hour at 20° with *N*/10-alcoholic hydrogen chloride in the presence of phenolphthalein as indicator. *iso*Bornyl chloride is estimated by boiling the mixture for an hour with *N*/5-alcoholic potassium hydroxide solution, with the addition of a little water. Free hydrogen chloride in the presence of camphene hydrochloride is estimated by taking advantage of the observation that the dissociation of the latter can be delayed to such an extent by the addition of ether that the free acid can be titrated with sodium ethoxide solution in the presence of iodoeosin as indicator.

Camphene hydrochloride is prepared by treating a solution of camphene in ether with hydrogen chloride and filtration of the product with exclusion of atmospheric moisture; the material, when most carefully prepared in this manner, contains about 9—10% of *iso*bornyl chloride. A somewhat purer product (containing 93·3% of camphene hydrochloride) can be secured by using light petroleum as solvent, in which, however, the addition of the halogen acid occurs very slowly. *iso*Bornyl chloride is obtained by saturating a solution of camphene in ethyl bromide with hydrogen chloride at 10—20°, heating the mixture uninterruptedly under a reflux condenser during six days at 55°, removing the solvent, and crystallising the residue from amyl alcohol. It has m. p. 161·5°, and contains 99·6% of pure *iso*bornyl chloride; the presence of camphene hydrochloride cannot be detected. H. W.

The Velocity of Reaction in Mixed Solvents. III. The Influence of Temperature on the Velocity of Saponification of Esters. HAMILTON MCCOMBIE, HAROLD ARCHIBALD SCARBOROUGH, and RICHARD HARDCASTLE SETTLE (T., 1922, **121**, 2308—2318).

Rate of Hydrolysis of Wheat Gliadin. HUBERT BRADFORD VICKERY (*J. Biol. Chem.*, 1922, **53**, 495—511).—Results are given of a large number of experiments in which measurements were made of the rate of hydrolysis of gliadin by acids of various concentrations and also by alkalis. Hydrolysis both of the amide nitrogen and of the peptide linkings proceeds more rapidly the greater the concentration of the acid. In the early stages, alkalis are more effective than acids. Owing to secondary decompositions, however, considerably larger quantities of ammonia are liberated by alkalis than by acids. Hydrolysis is more rapid with barium hydroxide than with sodium hydroxide of equivalent concentration. E. S.

Influence of the Catalyst on the Thermodynamic Quantities Regulating the Velocity of a Reaction. E. VAN THIEL (*Proc. K. Akad. Wetensch. Amsterdam*, 1922, **25**, 199—209).—After a theoretical discussion of the velocity of chemical reactions in which the hypotheses of Trautz, Lewis, Scheffer, and Marcelin are considered, it is shown that the hypotheses of Trautz and Lewis demand that a reaction which is strongly catalysed shall have a smaller temperature coefficient than the same reaction uncatalysed or weakly catalysed, whilst Scheffer's hypothesis shows that a catalysed reaction can have a temperature coefficient and an energy increment which are greater than those of the uncatalysed reaction. An attempt has been made to decide between these two hypotheses by means of measurements of the rate of acetylation of diphenylamine at 0°, 20°, 30°, 40°, and 50° both without a catalyst and in the presence of *p*-bromobenzenesulphonic acid or *p*-toluenesulphonic acid as catalyst. The results of these experiments show that Scheffer's hypothesis is in keeping with the facts. J. F. S.

Dislocation Theory of Catalysis. J. Böeseken (*Proc. K. Akad. Wetensch. Amsterdam*, 1922, **25**, 210—215).—A theoretical paper in which the author discusses the mechanism of catalysis. He starts from the idea that ideal catalysts are those which are not temporarily fixed in intermediate compounds and so withdrawn from the reaction mass. Real catalysis is the interaction between the catalyst and the molecules which has nothing to do with the formation of a compound. This interaction is termed a *dislocation*, and may be regarded as consisting of a change in the paths of the electrons. The hypothesis is considered in the case of the photo-oxidation of alcohols in the presence of *p*-benzophenone and oxygen. In this case, the author has shown (A., 1921, ii, 500) that above a certain concentration of the ketone the velocity is independent of this concentration, and, further, it is proportional to the square of the intensity of the light and to the concentration of the alcohol, which is explained as follows: The ketone absorbs part of the light and is activated by it, the quantity of activated ketone is $I(1-e^{-kcd})$, where k is the absorption coefficient, c the concentration of the ketone, and d the thickness of the layer. When k, c, and d are large, the quantity of activated ketone becomes proportional to I and independent of c. The whole process then is as follows: Under the influence of light a quantity of photo-ketone $kI(1-e^{-kcd})$ is formed instantaneously, this amount approaches the value kI, so that the first stage of the process is represented by the equation (1) ketone+light=photo-ketone, and is followed by the reaction which regulates the process. (2) photo-ketone+alcohol=(photo-ketone), alcohol; the meeting of the two molecules activates two hydrogen atoms of the alcohol and is represented by (3) (photo-ketone), alcohol $\longrightarrow$ [(photo-ketone), active alcohol]. This process which probably takes place with the velocity of light, is the real catalysis, the dislocation. The alcohol molecules are thereby brought into the condition to react according to (4) 2[(photo-ketone) active alcohol]+O_2=2 ketone+2 aldehyde+ $2H_2O$, which also occurs with a great velocity. The photo-ketone may be replaced by palladium, and the same type of reaction will occur and is similarly explained. This explanation demands intimate contact between the catalyst and the reacting molecules. It is shown that Scheffer's relation of the reaction constant, $\log_e k = (E_t - E)/RT + B$ represents the thermodynamic aspect of the above hypothesis (cf. Thiel, preceding abstract). J. F. S.

The Influencing of the Catalysis of Hydrogen Peroxide with Platinum by Röntgen Rays. ANTON KAILAN (*Ber.*, 1922, 55, [*B*], 2492—2494).—Recalculation of the experimental results of Schwarz and Friedrich (this vol., ii, 436) show that the catalytic decomposition of concentrated hydrogen peroxide is a bimolecular action and not unimolecular as stated by these authors.

In an addendum to the communication, the correctness of the criticism is recognised by Schwarz and Friedrich. H. W.

Catalysis. XIV. The Action of Nitric Acid on Metals and an Example of a Periodic Reaction. B. C. BANERJI and N. R. DHAR (*Z. anorg. Chem.*, 1922, **122**, 73—80).—The rate of standard solution of copper, silver, lead, nickel, brass, mint silver, and of copper–nickel alloy, in nitric acid, was studied in the presence of different salts. Ferrous salts acted as catalysts; this catalytic effect is ascribed to the nitrous acid which is formed by the action of ferrous salts on nitric acid. Ferric salts were also found to act as positive catalysts; this is due to the formation of ferrous salts by the action of the metals copper, silver, etc., on the ferric salts. Oxidising agents, for example, potassium permanganate, potassium chlorate, are negative catalysts because they prevent the formation of nitrous acid. The dissolution of a 50% copper–nickel alloy in nitric acid takes place in well-defined periods of reaction, each period being followed by a period of no reaction. W. T.

Catalytic Action at Solid Surfaces. VIII. Action of Sodium Carbonate in Promoting the Hydrogenation of Phenol. E. F. ARMSTRONG and T. P. HILDITCH (*Proc. Roy. Soc.*, 1922, [*A*], **102**, 21—27; cf. this vol., ii, 41).—The results of a number of experiments on the hydrogenation of phenol in the presence of nickel powder and sodium carbonate at 180° and under a pressure of hydrogen of 80 lb. per sq. inch are described. The object of the experiments was to ascertain the part played by a promoter in a catalytic change. The products of the reaction are *cyclo*hexanol 95%, some *cyclo*hexanone, with practically no unchanged phenol. The presence of sodium carbonate has an accelerating action which is dependent on the amount of carbonate present; if an excess is present the hydrogenation is retarded. The optimum amount of sodium carbonate bears no relationship to the amount of phenol present, but is closely connected with the amount of nickel catalyst employed, and in the present experiments is found to be at the point where the amount of sodium carbonate is about 25% of the weight of the nickel. The exact mechanism by which the sodium carbonate assists the hydrogenation has not been discovered, but it appears that the stimulation is not a true acceleration but the restoration of the nickel to its normal function by the suppression of a retardation, which is probably of the nature of a poisoning of the catalyst by the phenol. It is found that the curvilinear nature of the time–absorption relationship in the absence of sodium carbonate becomes linear in the presence of this substance. This fact furnishes further evidence that the rôle of the promoter in this case is a protective one with respect to the catalyst, rendering the latter free to exert its normal functions.

J. F. S.

Catalytic Action at Solid Surfaces. IX. Action of Copper in Promoting the Activity of Nickel Catalyst. E. F. ARMSTRONG and T. P. HILDITCH (*Proc. Roy. Soc.*, 1922, [*A*], **102**, 27—32; cf. preceding abstract).—It is shown that a copper–nickel catalyst may be produced in hydrogen when suitably supported compounds are heated at 180°, whereas supported nickel compounds alone are not reduced by hydrogen below 300° and not rapidly below 350—400°. It is shown that for the reduction of the nickel at this low temperature an intimate mixture of the two compounds must be used, which must be more intimate than can be obtained by mechanical mixture. Co-precipitation is not always sufficient to obtain the desired degree of intimacy, for a comparison of the activity of the catalysts with the nature of the nickel cupricarbonates from which they are produced shows that both the nickel and copper must be in the same complex molecule to obtain any degree of catalytic activity. On the basis of the foregoing, the relatively low temperature of the reduction of the nickel is explained as follows: the reduction of copper carbonate or cupric oxide is strongly exothermic, and even although the exterior temperature is only 180°, it is evident that the temperature inside the molecule must momentarily, at least, be far above the outside temperature.

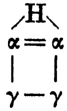
J. F. S.

Influence of *s*.-Trinitrobenzene on Reactions in which Arylamines are involved. J. J. SUDBOROUGH and R. C. SHAH (*J. Indian Inst. Sci.*, 1922, **5**, 29—35).—To determine whether, on account of the readiness with which polynitro-aromatic compounds form additive compounds with most of the simple arylamines, such nitro-compounds would have a catalytic influence on reactions involving aromatic amines, a number of such reactions which are readily catalysed by iodine were carried out in presence of *s*.-trinitrobenzene. The reactions studied were the methylation of aniline, formation of phenyl-α-naphthylamine from aniline and α-naphthylamine, condensation of aniline with benzophenone, the formation of thiodiphenylamine from diphenylamine and sulphur, and the acetylation of aniline. In no case had the *s*.-trinitrobenzene any catalytic influence, whilst iodine was a powerful catalyst for all except the last of these reactions.

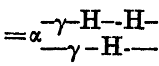
E. H. R.

Atoms and Electrons. ROBERT N. PEASE (*Nature*, 1922, **110**, 379—380).—In view of the facts (1) that the distances between the atomic centres in crystals of cerium and thorium are practically the same, the number of electrons being 58 and 90, respectively, and (2) that in the atom of uranium (atomic volume 12·8) there are concentrated 32 more electrons than in the atom of neodymium (atomic volume 20·7), it is significant that elements of higher atomic number than uranium are not known to exist, and that most of those of immediately lower atomic number are unstable. In the case of elements of high atomic number, the electron-density must therefore be greater than in other cases, and be accompanied by a greater attractive force on the nucleus. It is suggested that periodical exertion by numbers of electrons of attractive forces on the positive nucleus in the same direction may result in the extraction of a positively charged constituent of the latter and its expulsion as an α-particle. The rate of decay would depend primarily on the stability of the nucleus, and the suggested mechanism would constitute the trigger action. A. A. E.

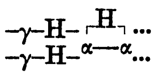
Periodic Structure of Atoms and Elements. H. Newman Allen (*Nature*, 1922, **110**, 415).—In one of the models postulated by Crehore (A., 1921, ii, 632; this vol., ii, 438, 494), one of the particles marked 4 is also marked with a dot, evidently indicating that it has a charge $+e$ only. By calling these particles γ, it has been found possible to construct hypothetical models for a considerable number of atoms of the form indicated by the following examples representing nitrogen (I), fluorine (II or III), and uranium (IV), respectively:



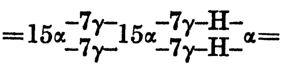
(I.)



(II.)



(III.)



(IV.)

The strokes represent electrons; in II, the α's join to form a ring, in III, two γ's join to the α to form a ring, and in IV, a ring structure is also obtained. A. A. E.

The Rare Earths in the Periodic System. Carl Renz (*Z. anorg. Chem.*, 1922, **122**, 135—145).—The author reviews the literature on the subject and discusses the difficulties. He suggests as a solution a modification of Soddy's helical representation of the periodic law. W. T.

Determination of the Molecular Weight of Substances in Alcoholic Solution from the Elevation of the Flash Point. Robert Wright (T., 1922, **121**, 2247—2250).

Polar and Non-polar Valency in Organic Compounds. W. E. Garner (*Nature*, 1922, **110**, 543—544).—Two explanations may be given of the positive and negative relationships of groups in organic compounds: (*a*) there may be a partial transference of an electron between the group and the residue of the molecule, or (*b*) there may be a varying concentration of polar molecules in the typically non-polar substance. In the consideration of the second possibility, an equilibrium may be imagined to exist between the polar and non-polar substances which will be affected by the temperature, nature of the solvent, etc. Thus, in those substances where the stability of the non-polar arrangement is very great, the occurrence of both forms, $\overset{-}{A}\overset{+}{X}$ and $\overset{+}{A}\overset{-}{X}$, will be possible, and in the presence of a suitable solvent these may give rise to the respective ions. A. A. E.

Melting Point Tubes as Reaction Vessels. August Fuchs (*Monatsh.*, 1922, **43**, 129—137).—Details are given for carrying out the commoner manipulations, using very small quantities of material (2—5 mg.). That satisfactory preparations and purifications can be effected by the methods indicated is proved by a record of examples actually worked out. C. K. I.

Perforation Apparatus for the Extraction of Liquids by Liquids. Non-miscible Liquids. Fayolle and Ch. Lormand (*Chim. et Ind.*, 1922, **8**, 273—274).—Two types of apparatus are described for the extraction of a liquid by another liquid with which it does not mix. One type is for use where the solvent is heavier than the liquid to be extracted, and the other where the solvent is the lighter of the two liquids. In either case the extraction is continuous. W. G.

A Shaking Machine for Large Quantities of Fluid. Hartwig Franzen (*Z. physiol. Chem.*, 1922, **122**, 86—87).—An apparatus is described suitable for stirring large amounts of lead precipitates in aqueous suspension, while treating them with carbon dioxide or hydrogen sulphide. W. O. K.

Inorganic Chemistry.

Vapour Pressure of Hydrogen. Determinations in the Region of Liquid Hydrogen. H. Kamerlingh Onnes and J. Palacios Martinez (*Anal. Fís. Quím.*, 1922, **20**, 233—242).—The vapour pressures of liquid hydrogen at temperatures near its normal boiling point were measured using a helium thermometer. By interpolation, the boiling point of hydrogen at a pressure of 759·549 mm. of mercury is given as 20·35° *K* (Kelvin international scale). G. W. R.

Spontaneous Incandescence of Substances in Atomic Hydrogen Gas. R. W. Wood (*Proc. Roy. Soc.*, 1922, [*A*], **102**, 1—9).—A number of experiments with very long hydrogen discharge tubes are described from which it is shown that some metals, oxides, and other substances are raised to incandescence when introduced into a stream of atomic hydrogen, the surface of the substance acting as a catalyst in bringing about the recombination of the atoms. Atomic hydrogen, practically free from molecular hydrogen, may be drawn by a pump from the central portion of a long discharge tube excited by a current of high potential. Fire polished glass surfaces, such as the walls of a glass tube, have a comparatively feeble catalysing power whilst fractured surfaces cause the recombination of the atoms, and are strongly heated. The action of water vapour or oxygen in enhancing the Balmer spectrum, and suppressing the secondary spectrum of hydrogen, is probably due to its action on the walls of the tube, which, when dry, catalyse the atomic hydrogen as fast as it is formed by the current. The peculiar spectroscopic phenomena observed with long hydrogen tubes, described in an earlier paper (A., 1920, ii, 569) are explained. Methods are suggested for determining the physical and optical properties of atomic hydrogen gas. J. F. S.

Evidence of the Existence of Isotopes of Chlorine. MATAKICHI ISHINO (*Mem. Coll. Sci. Kyōtō*, 1921, **4**, 311—315).—Employing the method of positive-ray analysis, using the crossed-deflexion method devised by Thomson, the author has obtained evidence of the existence of chlorine isotopes of respective atomic weights 34 and 36, and of positively charged chlorine atoms.

J. S. G. T.

The Decomposition of Chlorine into Atoms. MAX TRAUTZ and WALTER STÄCKEL (*Z. anorg. Chem.*, 1922, **122**, 81—131).—The apparatus employed and methods of working are described in detail. The amount of chlorine decomposed was 1·50% at 1200°, 2·10% at 1240°, and 3·05% at 1280°. The limit of the absorption band for chlorine was found to be 390—420 $\mu\mu$. This corresponds with 67,500—73,000 cal. as the heat of decomposition according to Trautz's "approximate" equation $q_0=Ah\nu$ (A., 1918, ii, 151). The heat of decomposition of chlorine calculated from the temperature coefficient was found to be 71,000±3,000 cal. The same result was obtained by the use of the quantum theoretical constants and also by the use of Victor Meyer's vapour density measurements. With the exception of hydrogen, the heat of decomposition of the diatomic elements found experimentally agrees with the value obtained from the equation $d_0=(5{\cdot}78\times10^5/\sqrt{M})$ cal., where M is the molecular weight. W. T.

Vapour Pressure of Solid Chlorine and Bromine. F. A. HENGLEIN, G. VON ROSENBERG, and A. MUCHLINSKI (*Z. Physik*, 1922, **11**, 1—11).—The vapour pressure of solid and liquid chlorine and solid bromine has been determined over a wide range of temperature. The following values are recorded for chlorine, 119·2° 0·0013; 126·0°, 0·0063; 133·0°, 0·028; 146·6°, 0·30; 161·1°, 2·75; 177·6°, 17·40; 194·5°, 64·40, and for bromine 177·6°, 0·0020; 210·0°, 0·26; 228·8°, 1·12; 227·0°, 1·71; and 241·1°, 6·44; the temperatures are expressed in absolute degrees and the pressures in millimetres of mercury. Vapour pressure formulæ have been deduced for both cases and have the form: $\log p=-1160/T+7773$ for liquid chlorine; $\log p=-1530/T+9950$ for solid chlorine; these formula are representative over the temperature ranges −95° to −78° and −154° to −112°, respectively, $\log p=-12150/T^{1{\cdot}368}+75030$ for solid bromine over the range −32° to

−96°. From the above data a number of constants have been calculated which include the following: Chlorine, m. p. 170·0° Abs.: vapour pressure at the melting point 8·9 mm., molecular heat of vaporisation at the melting point 5300 cal., heat of sublimation of solid chlorine at the melting point 6960 cal., molecular heat of fusion 1660 cal.; bromine: vapour pressure at the melting point 44·12 mm., molecular heat of sublimation at the melting point 9740 cal., specific heat of sublimation 60·91 cal., specific heat of vaporisation at the melting point 48·4 cal., molecular heat of fusion 12·5 cal. From the dissociation equilibrium of the chlorine molecule and the chemical constant as determined by Stern and Tetrode the vapour pressure of diatomic chlorine has been calculated and the chemical constant for diatomic chlorine in its normal condition has also been obtained. J. F. S.

Physical Constants of Ozone. E. H. RIESENFELD and G. M. SCHWAB (*Z. Physik*, 1922, **11**, 12—21; cf. this vol., ii, 637).—An account of the determination of a number of physical constants of pure ozone which was prepared as previously described by the authors (*loc. cit.*). The following values are put on record: m. p. −249·7°, b. p. −112·4°; critical temperature, −5°; specific gravity at −183°, 1·71±0·1; change of density with temperature, $1/d=a+bT+cT^2$, where $a=0{\cdot}51193$, $b=0{\cdot}0004559$, $c=0{\cdot}000003929$; density at the boiling point, 1·46; coefficient of expansion, 0·0025; critical density, 0·537; critical pressure, 64·8 atmospheres. The authors show that neither in the gaseous nor in the liquid state is there any other molecular species present than that represented by the formula O_3. J. F. S.

Solubility of Sulphur Dioxide in Suspensions of Calcium and Magnesium Hydroxides. WM. THOMPSON SMITH and REGINALD B. PARKHURST (*J. Amer. Chem. Soc.*, 1922, **44**, 1918—1927).—The solubility of sulphur dioxide has been determined in water, milk of lime, and milk of magnesia, at partial pressures of sulphur dioxide up to 760 mm., and temperatures from 5° to 60°. All proportions of calcium and magnesium hydroxides were used in suspensions of a total alkalinity of one equivalent per litre. It is shown that the concentration of sulphur dioxide as sulphurous acid is proportional to its partial pressure. With solutions of the same alkali concentration, the percentage salting-out effect increases with, but more than in proportion to, the temperature. With solutions of constant temperature, the percentage salting-out effect increases with the alkali concentration, but is less than proportional to it. Varying proportions of calcium and magnesium hydroxide have no effect on the equilibrium concentration of sulphur dioxide as sulphurous acid. J. F. S.

The Physico-chemical Study of the Lead Chamber Process. MAX FORRER (*Bull. Soc. chim. Belg.*, 1922, **31**, 254—293).—A detailed description of a form of apparatus in which sulphur dioxide, nitrogen peroxide, water, oxygen, and nitrogen may be brought into contact with each other under definite conditions of pressure, temperature, and, in the case of liquids, surface of reaction. The proportions of these substances could be varied at will. It is shown that, in such a system, the formation of sulphuric acid only occurs in presence of a liquid phase, so that the system must be heterogeneous; the formation of the acid takes place in a shorter time and the yield is increased if a liquid, either sulphuric acid or water, is present at the outset. Further, the rate at which water vapour is supplied during the course of the reaction exerts a considerable effect both on the velocity of reaction and on the concentration of the product. Under certain conditions, the acid formed may disappear, which appears to indicate that the reactions assumed to take place in the chambers are at least partly reversible. For low concentrations of the gases, there is an optimum rate of intake for water vapour: this gives the best yield and, at the same time, the most concentrated acid. As the gas concentration increases, the optimum point shifts in the direction of diminution of water supply; a curve is given showing the speed of reaction plotted against concentration of gas. The relation between these two factors is much less complex when the composition of the liquid phase is constant. The author infers from his experimental results the existence of an intermediate substance of which water is a constituent; it is, however, decomposed in presence of an excess of water. He points out that, of the series of reactions which occur, the slowest is the "limiting reaction" in that it conditions the rate of formation of the product and shows that, in practice, the reaction velocity is strongly influenced by the rate of supply of nitrogen peroxide and water, but is practically unaffected by the supply of sulphur dioxide.

An attempt is made to calculate the order of the reaction, and, for this purpose, the heterogeneity of the system and the non-equivalence of the reactants are neglected. The values obtained vary from 1·26 to 3·67. However, when the concentration of the liquid phase does not vary, the values are in the neighbourhood of 2. In the case of temperature variations which have a similar effect to that of variations in water supply, it was not found possible to obtain a coefficient in agreement with the experimental data.

H. J. E.

Density of Atmospheric Nitrogen. A Small Anomaly in the Air of Madrid. M. Payá and E. Moles (*Anal. Fis. Quim.*, 1922, **20**, 247—254).—The normal density of nitrogen obtained from the air of Madrid is given as 1·25681. The density of air in Madrid corresponds with a slightly higher proportion of oxygen than the normal for other places. The anomaly is attributed to the presence of higher proportion than normal of ozone and gases of the argon group.

G. W. R.

The Reactions between Gaseous Oxides of Nitrogen and Alkaline Solutions. A. Sanfourche (*Compt. rend.*, 1922, **175**, 469—472).—The action of oxides of nitrogen on solutions of alkali hydroxide in which the calculated proportions of nitrate and nitrite are formed only occurs if the alkali is in excess at all points in the solution. Otherwise, reaction with the water takes place with formation of nitric acid and nitric oxide, the latter being further oxidised if oxygen is present. Moreover, if all the oxides of nitrogen are not absorbed in their first passage through the solution, this reaction with water continues in the gaseous phase with water vapour. This is shown by the formation of a nitric acid mist and by its subsequent deposition as acid dew on the upper portion of the walls of the vessel in spite of the presence of excess of alkaline solution. It is pointed out that estimation of nitrous vapours by the method of absorption in alkali hydroxide is liable to lead to considerable error and for this reason it is preferable to use sulphuric acid as the absorbent. H. J. E.

The Solubility of Arsenic Trichloride in Concentrated Hydrochloric Acid at 100°. W. D. TREADWELL [with CH. MUSSLER] (*Helv. Chim. Acta*, 1922, **5**, 818—821).—The solubility of arsenic trichloride in concentrated hydrochloric acid at 100° was determined by an indirect method which consisted in measuring the rate of volatilisation of the trichloride from the solution in a current of hydrogen chloride at 100°. From Henry's law, it follows that $\log(x_0-x)/x_0=-kV/V_0$, where x is the quantity of trichloride volatilised by the volume V of gas in a given time, x_0 is the quantity of trichloride originally present, V_0 the volume of the solution, and k the solubility coefficient. Experiments showed that the value of k remained constant for a considerable period of time, its mean value being 0·0233. From this it can be calculated that to volatilise 99% of the arsenic trichloride present in 100 c.c. of solution at 100° requires 19·8 litres of hydrogen chloride. From the known vapour pressure of arsenic trichloride, a litre of the vapour contains 2·34 grams. Hence the solubility in concentrated hydrochloric acid at 100° is $2{\cdot}34/k=100{\cdot}3$ grams per litre. E. H. R.

Boric Acid Phosphors. RUDOLF TOMASCHEK (*Ann. Physik*, 1922, [iv], **67**, 612—648; cf. Tiede and Wulff, this vol., ii, 245). —A number of boric acid phosphors have been prepared by the addition of phthalic anhydride, terephthalic acid, the sodium salt of fluorescein (uranin), naphthalic anhydride, and phenanthrene. The phosphorescence of these organic phosphors is in many ways simpler than that of the metal phosphors. In general, the bands of the former are all excited by the same wave-lengths of light, and owe their origin to the same phosphorescence centre. Thus the three mercury lines, 365·4, 313, and 253·6 $\mu\mu$, all appear to excite the four components of the band of the phenanthrene-phosphor. On the other hand, the different bands of the metal phosphors are excited independently. The relative intensities of the components of the bands of the boric acid substances may change with temperature; the uranin-phosphor emits a yellow light at −70°, but, when heated on metal foil, this radiation rapidly changes into a bluish-green phosphorescence. In opposition to the heavy metal phosphors, the duration and intensity of the emitted light are influenced only slightly by changes in temperature, being, in many cases, the same at the temperature of liquid air as at the ordinary temperature. Neither can the phosphorescence be extinguished by exposure to red light. Phenanthrene-phosphor is especially sensitive to light, and it is shown that the decolorisation which occurs is not in any way the cause of the phosphorescence, as suggested by Perrin. The wave-lengths of the absorption bands of the transparent phosphor frequently coincide with those of the exciting radiation, and in the case of phenanthrene, correspondence is found to occur between the fluorescence bands and the absorption bands in the ultra-violet. The duration of the phosphorescence for organic boric acid phosphors is about one minute, and this comparatively short period points to the presence of very small centres; this is supported by the difficulty of fully exciting these centres. When the terephthalic acid phosphor is fully excited by an intense beam of light, the larger portion of the total phosphorescence takes place within the first second, so that the centres are mainly of very short duration. The centres do not all possess the same duration. The $1/L$ curves indicate that a bimolecular chemical reaction is not the cause of the phosphorescence, which can be explained satisfactorily on the assumption of a photoelectric process. Three kinds of emission take place, phosphorescence, fluorescence, and an emission in the ultra-violet. The conclusion is drawn that the fields of force are almost exclusively in the interior of the organic molecules. W. E. G.

Borates. The System $(NH_4)_2O$–B_2O_3–H_2O. Temperature–Concentration Diagram. U. SBORGI and L. FERRI (*Mem. Accad. Lincei*, 1922, [v], **13**, 570—591).—The results previously obtained (A., 1913, ii, 213, 318; 1915, ii, 686; this vol., ii, 568) are collected. T. H. P.

The Modifications of Silicon. II. Silicon from Copper Silicide. WILHELM MANCHOT and HERBERT FUNK (*Z. anorg. Chem.*, 1922, **122**, 22—26).—Specimens of silicon obtained from a copper silicide regulus have been studied; the results were similar to those obtained by the authors when employing aluminium and silver reguli (this vol., ii, 286). Conditions which favour the formation of crystals produce silicon which reacted but slowly with hydrofluoric acid. Crystalline silicon very soluble in this acid could not be obtained. W. T.

Alkali Iodides. L. W. WINKLER (*Pharm. Zentr.-h.*, 1922, **63**, 386—387).—Analyses of samples of commercial potassium iodide and sodium iodide showed that these substances have a high degree of purity. The respective quantities of iodide found corresponded with 98·6 to 99·6% of potassium iodide and with 97·0 to 99·9% of sodium iodide. W. P. S.

Composition of the Liquid Phases in a Univariant System, Liquid–Liquid–Vapour, for Mixtures of Sodium and Ammonia. CHARLES A. KRAUS and WALTER W. LUCASSE (*J. Amer. Chem. Soc.*, 1922, **44**, 1949—1953).—In an earlier paper (A., 1907, ii, 935), it has been shown that at low temperatures concentrated solutions of sodium in liquid ammonia separate into two liquid phases which have an upper critical end-point at about —45°. The concentrations of these liquid phases have now been determined by electrical conductivity measurements and it has been found that the upper critical end-point lies at —41·6° and at a composition of 4·15 atom % of sodium. The phase relations in the system sodium–ammonia are briefly discussed. J. F. S.

Nature of the Complexes formed between Sodium and Tellurium in Liquid Ammonia. CHARLES A. KRAUS and C. Y. CHIU (*J. Amer. Chem. Soc.*, 1922, **44**, 1999—2008).—The reaction between sodium and tellurium in liquid ammonia has been investigated and the composition of the resulting solutions has been determined under various conditions. The initial compound formed is normal sodium telluride of the formula Na_2Te. In equilibrium with the normal telluride, the complex in solution has a composition corresponding with the formula Na_2Te_2. In equilibrium with free tellurium the solution has a composition which varies as a function of the concentration. The maximum amount of tellurium present corresponds approximately with the formula Na_2Te_4. J. F. S.

Crystal Structure of Silver Molybdate. RALPH W. G. WYCKOFF (*J. Amer. Chem. Soc.*, 1922, **44**, 1994—1998).—Making use of the data obtained from the reflection spectra and Laue photographs of silver molybdate, the crystal structure of this substance has been shown to be the same as that of the spinels and magnetite. The length of the side of the unit cube, which contains eight molecules, is 9·26 Å.U., and the parameter defining the position of the oxygen atoms is very close to 3/8. The distance between molybdenum and adjacent oxygen atoms is 2·00 Å., between silver and the nearest oxygen atom 2·31 Å., and between the nearest molybdenum atom and silver 4·02 Å. J. F. S.

The Dissociation of the Chlorides of Bivalent Metals in Aqueous Solution. A. GÜNTHER-SCHULZE (*Z. Elektrochem.*, 1922, **28**, 387—389).—In a previous paper it was shown from a study of the basic exchange between copper salts in solution and permutite that the copper salt solution, even at high dilutions, contains complex kations (this vol., ii, 504). The investigation has now been extended to salts of barium, strontium, calcium, cadmium, manganese, cobalt, and nickel, using the chlorides of the metals and ammonium permutite. If a represents the number of equivalents of metal passing into the permutite in exchange for ammonia, and c the number of equivalents of chlorine likewise disappearing from the solution, then if the metallic chloride is present in solution only in the form of $M^{\cdot\cdot}$ and Cl' ions, $c=0$ and $a/c=\infty$. If, however, the ions are $MCl^{\cdot}$ and Cl', the $MCl^{\cdot}$ ion passing into the permutite, $a/c=2$. If still more complex ions are formed, such as $M_2Cl_3^{\cdot}$, $a/c<2$. Applying this reasoning to the experimental results, it is found that at the highest concentrations of all the above salts, some $MCl^{\cdot}$ ions are present and, in the cases of magnesium, nickel, and copper, still more complex ions. The first stage of dissociation into MeCl˙ and Cl′ preponderates in the case of those metals having the smallest ionic radius. At a dilution of 1·0*N*, a considerable proportion of MeCl˙ ions is found only in the case of those metals having the smallest ion radius, namely, nickel and copper. E. H. R.

Transference of the Acid Radicle in the Solid Phase. I. Carbonates of the Alkaline Earths and Magnesium. J. Arvid Hedvall and J. Heuberger (*Z. anorg. Chem.*, 1922, **122**, 181—187).—It was found that if the oxides of the elements considered are arranged in order of increasing basicity MgO, CaO, SrO, BaO, then the oxide of the more basic will on heating with the carbonate of the less basic element be changed into the carbonate without the evolution of gas and at a temperature well below the temperature of dissociation of the carbonate taken. The temperature of the reaction decreases and the heat effect increases with increasing difference of basicity, for example, $MgCO_3+BaO=BaCO_3+MgO+19$ cal. ($t=230°$); $SrCO_3+BaO=BaCO_3+SrO+6·14$ cal. ($t=280°$). W. T.

The Crystal Structure of Glucinum and Glucinum Oxide. L. W. McKeehan (*Proc. Nat. Acad. Sci.*, 1922, **8**, 270—274).—The glucinum was obtained by electrolysis of sodium glucinum fluoride, $2GlF_2,NaF$, and contained a few per cent. of glucinum oxide. The diffracting centres in the metal and its oxide lie at the points of two symmetrically interpenetrating hexagonal space lattices. For glucinum oxide, the axial ratio, $c/a=1·63$, and $a=2·696\times10^{-8}$ cm.; for glucinum, $c/a=1·58$ and $a=2·283\times10^{-8}$ cm. These values give computed densities within 1% of the best previous values. Glucinum more closely resembles magnesium, zinc, and cadmium, rather than calcium, strontium, and barium; the oxide is an analogue of zinc oxide, and the structure suggested by W. L. Bragg (A., 1920, ii, 433) for the latter substance is also possible for glucinum oxide. W. E. G.

Physical Chemistry of the Oxides of Lead. VI. The Anodic Behaviour of Lead and Lead Dioxide. Samuel Glasstone (T., 1922, **121**, 2091—2098).

The Isomerism of Metallic Oxides. I. Lead Monoxide. Malcolm Percival Applebey and Robert Douglas Reid (T., 1922, **121**, 2129—2136).

The Hindrance of Precipitations with Hydrogen Sulphide by Neutral Chlorides. L. Dede and P. Bonin (*Ber.*, 1922, **55**, [*B*], 2327—2331).—The action of hydrogen sulphide on a 1/1000-molar solution of lead chloride in water at 20° in the presence of hydrochloric acid and of neutral chlorides has been investigated. Precipitation of lead sulphide is completely inhibited by hydrochloric acid alone if present in a concentration of 1·4*N*. In the presence of increasing quantities of calcium, ammonium, or potassium chlorides, decreasing concentrations of hydrochloric acid are sufficient to prevent precipitation entirely. In the presence of considerably smaller concentrations of hydrochloric acid, the precipitation of lead sulphide is incomplete. At higher temperatures, the effect of hydrochloric acid in the presence of neutral chlorides is still more marked. Similar results are obtained with cadmium salts, and apparently also with tin salts. The precipitation of lead sulphide is also hampered, although to a less degree, by the presence of perchloric acid. In this case, however, the addition of sodium perchlorate favours precipitation presumably by depressing the dissociation of the acid.

The precipitation of lead chromate in acetic acid solution is not quantitative in the presence of much chloride; in ammoniacal solution this is not the case. H. W.

The Constitution of Basic Lead Salts. R. WEINLAND and RUDOLF STROH (*Ber.*, 1922, **55**, [*B*], 2706—2718).—It has been assumed by Werner (A., 1908, ii, 42) that certain basic salts are to be regarded as aquo-salts in which the water molecules are replaced by metallic hydroxide, that is, as compounds containing a polynuclear kation; thus, atacamite, $CuCl_2,3Cu(OH)_2$, has been formulated $\left[\mathrm{Cu}\left(<\substack{\mathrm{OH}\\ \mathrm{OH}}>\mathrm{Cu}\right)_3\right]\mathrm{Cl}_2$. The presence of such ions in several forms has been established by preparative substitution in the case of lead salts. Thus, in the basic perchlorates, $[Pb_2(OH)_2](ClO_4)_2,1\cdot5H_2O$ (I) and $[Pb_3(OH)_4](ClO_4)_2$ (II), the perchlorate residues could be replaced by other acid radicles. The stability of the metal-ol kations is not to be compared with that of the typical metal ammines in aqueous solution, since the above basic perchlorates are to some extent decomposed into new basic salts when their solutions are diluted, so that, at any rate, a partial change has occurred in the complex. This instability is also shown by the fact that potassium ferricyanide and potassium cobalticyanide give salts with differently constituted lead kations from those obtained with alkali chlorides. The presence of such lead-ol complexes in basic lead acetates has also been established by the substitution method in the case of the basic lead acetate; one such ion is identical with that contained in the perchlorate (I).

Polynuclear lead kations are also present in the neutral lead acetate–perchlorates and lead acetate–nitrates (Weinland and Stroh, this vol., i, 981). They are distinguished from those contained in the basic salts only by containing acetato- instead of ol-bridges, thus: $[Pb_2(OH)_2](ClO_4)_2,1\cdot5H_2O$ and $[Pb_2(CH_3CO_2)_2](ClO_4)_2,H_2O$. Application of these considerations to lead acetate itself causes the authors to regard it as the acetate of a polynuclear lead acetato-kation. In aqueous solution, undoubtedly more than one such kation is present, since the action of perchloric acid on lead acetate in neutral and acetic acid solution yields the perchlorates of four different lead acetato-kations. It has not yet been found possible to decide which kation is present in solid lead acetate, $Pb(OAc)_2,3H_2O$.

Basic lead perchlorate (I) is readily prepared from a solution of lead monoxide in the calculated quantity of perchloric acid; its electrical conductivity indicates that three ions are present in its solutions. It is converted by double decomposition into basic lead chloride, $[Pb_2(OH)_2]Cl_2$, a colourless powder which does not appear under the microscope to be crystalline; basic lead nitrate, $[Pb_2(OH)_2](NO_3)_2$, *basic lead dithionate*, $[Pb_2(OH)_2]S_2O_6$, lustrous leaflets and needles, and *basic lead nitroprusside*,

$$[Pb_2(OH)_2]\left[Fe^{NO}_{(CN)_5}\right],H_2O,$$

pale brownish-red cubes. With potassium ferricyanide and potassium cobalticyanide, it gives the analogously constituted *compounds*, $Pb_4(OH)_2[Fe(CN)_6](ClO_4)_3$, a brown powder, and

$$Pb_4(OH)_2[Co(CN)_6](ClO_4)_3,$$

a colourless, heavy powder.

Basic lead perchlorate (II), tetrahedra and octahedra, is prepared by cooling a hot solution of perchloric acid which has been saturated with lead monoxide. It is converted by double decomposition into basic lead chloride, $[Pb_3(OH)_4]Cl_2$, a yellowish-white powder; basic lead iodide, a yellow powder; basic lead nitrate, $[Pb_3(OH)_4](NO_3)_2$, a heavy, white powder, and *basic lead dithionate*, $[Pb_3(OH)_4]S_2O_6$, a colourless, crystalline precipitate. The following salts, also prepared by double decomposition, do not contain the original kation: *basic lead chromate*, $[Pb_2(OH)_2],CrO_4$, a fine, red powder; *basic lead ferricyanide-perchlorate*, $Pb_3(OH)_5[Fe(CN)_6](ClO_4)_2$, a pale brown powder which explodes violently when heated; *basic lead ferricyanide*, $Pb_5(OH)_7[Fe(CN)_6],3{\cdot}5H_2O$, a yellow powder; *basic lead cobalticyanide-perchlorate*, $Pb_5(OH)_5[Co(CN)_6](ClO_4)_2,1{\cdot}5H_2O$, a heavy, white powder; *basic lead nitroprusside-perchlorate*,

$$Pb_4(OH)_5[Fe(CN)_5NO]ClO_4,H_2O,$$

pale, brownish-red, crystalline aggregates.

Basic lead acetate is shown to contain the same kation as the perchlorate (I) by the fact that it gives by double decomposition the same basic chloride and dithionate. Concentrated solutions of the salt and potassium ferricyanide give the *salt*, $Pb_6(OH)_7[Fe(CN)_6](CH_3{\cdot}CO_2)_2,H_2O$, brownish-red crystals, whereas dilute solutions yield a dark yellow, amorphous precipitate which fairly rapidly passes into the *compound*, $Pb_4(OH)_5[Fe(CN)_6]$, garnet-red prisms (the corresponding cobalt *compound*,

$$Pb_4(OH)_5[Co(CN)_6],$$

is prepared similarly). Treatment of the ferricyanide last mentioned with dilute acetic acid leads to the formation of the salt $Pb_3(OAc)_5[Fe(CN)_6],2H_2O$, brownish-red needles. Solutions of lead acetate and sodium perchlorate give, under different conditions, the *salts*, $Pb(OAc)_2,NaClO_4$, rectangular prisms capped by pyramids at either end; $Pb_2(OAc)_4,NaClO_4,3H_2O$, colourless needles, and $Pb_4(OH)_4(ClO_4)_4,NaClO_4,3H_2O$, large, many-sided plates. H. W.

The Complex Cuprammoniates $Cu(CN)_2,CuCN,2NH_3$; $Cu(CN)_2,4CuCN,4NH_3$; $Cu(CNS)_2,Cu(CN)_2,5CuCu,6NH_3$, and the Analytical Methods for their Identification. F. HALLE and K. HIRSCHKO (*Z. anorg. Chem.*, 1922, **122**, 188—194).—The above three new complex cuprammoniates have been prepared, and details are given of their analysis. W. T.

Critical Constants of Mercury. SOPHUS WEBER (*K. Danske Vid. Medd.*, 1920, 3, No. 4, 1—12; from *Chem. Zentr.*, 1922, iii, 27).—From theoretical considerations, the author derives the following critical constants for mercury: t_c 1450°; d_c 5·0; p_c 1042 atmospheres. The same value for p_c is given by extrapolation at 1450° with Knudsen's vapour pressure formula. The correlation of the Trouton constants with the critical data established by Cederberg is valid for the above values. The reduced vapour pressure curve for mercury approximately coincides with the curve for hydrogen. G. W. R.

Oxychlorides of Mercury. Equilibrium in the System Mercuric Chloride, Yellow Mercuric Oxide, and Water at 35°. SHIGERU TODA (*J. Chem. Soc. Japan*, 1922, **43**, 312—320; *Mem. Coll. Sci. Kyōtō Imp. Univ.*, 1921, **4**, 305—310).—The equilibrium in the system mercuric chloride, yellow mercuric oxide, and water at 35° has been studied. The solubility of mercuric chloride, 9·39 grams in 100 grams of water, and that of yellow mercuric oxide is 0·0014 gram in 100 grams of water. In the system investigated, two oxychlorides of mercury were found to exist: $HgCl_2,2HgO$, purplish-scarlet needles, and $HgCl_2,4HgO$, a brownish-yellow, amorphous substance. It is probable that the latter forms a solid solution with mercuric oxide. K. K.

The Rare-earth Magnesium Sulphide Phosphors. ERICH TIEDE and ARTHUR SCHLEEDE (*Ann. Physik*, 1922, [iv], **67**, 573—580).—Phosphors containing cerium, lanthanum, didymium, praseodymium, neodymium, samarium, yttrium, gadolinium, erbium, ytterbium, scandium, thorium, and zirconium were prepared by the methods previously described (Tiede and Richter, this vol., ii, 215). They were all yellow in colour and, like the phosphors of the heavy metals, this colour was destroyed by pressure. The temperature relationships, and the spectrum of the phosphorescent light of the magnesium samarium phosphor were very similar to those of the calcium samarium phosphor of Hauer and Kowalski (A., 1914, ii, 320). Cerium, didymium, praseodymium, samarium, gadolinium, and scandium gave the best phosphors in the ordinary sense of the word, although the other metals gave strong phosphorescence in the cathode ray tube. The colour of the phosphorescence ranged from orange-yellow to pale green, and the duration of the emitted light was approximately twenty minutes. The spectra differed considerably from those of the phosphors of the heavy metals, being composed of intense sharp lines and bands. The exciting light, in all cases, lay in the ultra-violet. W. E. G.

The Separation of the Rare Earths by Basic Precipitation. IV. WILHELM PRANDTL and JOHANNA RAUCHENBERGER (*Z. anorg. Chem.*, 1922, **122**, 311—314).—The influence of cadmium nitrate on the equilibrium between the nitrates of the rare earths and ammonia in ammonium nitrate solutions of various concentrations has been investigated. The conditions were the same as in previous experiments (cf. this vol., ii, 298). The presence of cadmium nitrate increased considerably the amount of rare earth kept in solution, especially lanthanum, this increase being much more marked than in the case of zinc nitrate. W. T.

Rare Earths. III. Atomic Weight of Lanthanum. B. S. HOPKINS and F. H. DRIGGS (*J. Amer. Chem. Soc.*, 1922, **44**, 1927—1929).—The atomic weight of lanthanum has been determined by a comparison of lanthanum chloride with silver. The material used was the less soluble portion of the magnesium rare-earth nitrates from which the whole of the cerium had been removed by James and Pratt's method (A., 1911, ii, 935). The sparingly soluble fractions containing lanthanum and praseodymium were fractionated further as double ammonium nitrates until the first twenty fractions failed to show the faintest trace of the praseodymium absorption spectrum. Fractions 7 and 8 of this series were precipitated with hot dilute oxalic acid solution, the precipitate filtered, washed, and ignited to oxide which was dissolved in nitric acid, and the solution treated with ammonia gas to precipitate the hydroxide. The alternate precipitation as oxalate and hydroxide was repeated four times, the last two taking place in conductivity water. The final oxide was suspended in conductivity water and treated with hydrogen chloride in a quartz flask. This material showed no spectroscopic lines of any of the related elements. The solution of lanthanum chloride was dried in a quartz flask in a current of air and hydrogen chloride until crystallisation commenced, the air current was shut off, and hydrogen chloride alone passed in until, at 85°, the first five molecules of water of crystallisation had come off, then the temperature was raised to 125°, when the final molecule of water commences to come off. As soon as this evolution was complete, the temperature was raised to 325°, and kept there for an hour, after which the salt was rapidly melted over a bunsen flame and then allowed to cool. The hydrogen chloride was displaced by dry air and the material weighed. The chloride was treated with silver solution and exact equivalence between the two substances determined nephelometrically. Using the data: density, $LaCl_3=3{\cdot}947$, $Ag=10{\cdot}5$; atomic weights, $Ag=107{\cdot}88$, $Cl=35{\cdot}457$, it was found that 1·02450 grams $LaCl_3$ is equivalent to 1·35189 grams of silver, whence the mean atomic weight of lanthanum (10 expts.)=138·89; the extreme values being 138·84 and 138·97. This value is very close to 138·91, the value found by Baxter, Tani, and Chapin (A., 1921, ii, 454), and seems to indicate that the value 139·0 adopted by the International Atomic Weight committee is slightly too high. J. F. S.

The Separation of the Rare Earths by Basic Precipitation. III. The Quantitative Separation of Cerium from the Other Earths. WILHELM PRANDTL and JOSEPH LÖSCH (*Z. anorg. Chem.*, 1922, **122**, 159—166).—The separation is based on the fact that ceric hydroxide is a weak base and its salts are highly hydrolysed. Cerous nitrate mixed with the nitrates of the other rare earths was oxidised by trinitratocobalttriammine in acid solution with quantitative precipitation of the ceric hydroxide, $Ce(NO_3)_3 + [Co(NH_3)_3(NO_3)_3] + 4H_2O = Ce(OH)_4 + Co(NO_3)_2 + 3NH_4NO_3 + HNO_3$. The formation of free acid prevents the precipitation of the other rare earths. W. T.

Intermetallic Actions. The System Aluminium–Arsenic. Qasim Ali Mansuri (T., 1922, **121**, 2272—2277).

The Constitution of Aluminates. Jaroslav Heyrovsky (*Chem. News*, 1922, **125**, 198—199).—In order to investigate further the monobasicity of "aluminic acid" (cf. T., 1920, **117**, 1013), cryoscopic and conductivity determinations were made on solutions of the alkaline-earth hydroxides when gradually saturated with aluminium hydroxide in the nascent condition, generated by the action of the solution on amalgamated aluminium. The regular fall in conductivity observed and the slight changes in the lowering of the freezing point show that only univalent aluminate ions exist. In contact with crystalline aluminium hydroxide, all the solutions are about 50% hydrolysed; with nascent aluminium hydroxide, the hydrolysis is only 1—1·5%. The process by which aluminium hydroxide dissolves in alkali is undoubtedly by complex-ion formation, $Al(OH)_3 + OH' \longrightarrow Al(OH)_4'$, and not, as is often stated, by sending into solution one, two, or three of its hydrogen atoms as hydrions. The hydrolysis of aluminates is therefore, on this view, not due to scarcity of hydrions, but to the incompleteness of the complex formation. G. F. M.

The Properties of Potassium Permanganate. G. Fester and G. Brude (*Z. angew. Chem.*, 1922, **35**, 527).—Crystals of pure potassium permanganate prepared in the dark and in air free from carbon dioxide and organic matter, are brown and have a bronze, metallic lustre. The finely powdered crystals, however, show a dark violet colour. When exposed to subdued daylight and ordinary air, the surfaces of the crystals develop a violet colour in a few hours and a steel blue lustre after two days. This change is confined to the surface layer, which acts as a protective layer to the remainder of the crystal. The change is particularly rapid in an atmosphere containing mineral acid. The crystals of potassium permanganate should be described as bipyramidal rhombs rather than as prisms. Potassium permanganate oxidises paper and most other organic substances, so that the statement that it is without action on litmus paper is untrue. H. C. R.

Mechanism of the Reduction of Permanganate and its Physico-chemical Basis. IV. Reduction of Permanganate by Formate in Alkaline Solutions. Josef Holluta (*Z. physikal. Chem.*, 1922, **102**, 276—297; cf. this vol., ii, 448, 628, 700).—A continuation of previous work. It is shown that the reduction of permanganate by formates in alkaline solution takes place in two stages which are sharply separated from one another. In the first stage, the reduction of permanganate to manganate takes place, and this is reduced to an alkali manganite in the second stage. The first stage takes place according to the equation $2MnO_4'+HCO_2'+3OH'=2MnO_4''+CO_3''+2H_2O$, and it is shown that a disturbance occurs in the reaction at a point immediately before the completion of the reduction to manganate due to the commencement of the reduction of the manganate. The first stage is shown to be a second order reaction, inasmuch as one molecule of permanganate apparently oxidises one molecule of formate. To explain the behaviour of the manganate and the low order of the reaction it is assumed that it is not the permanganate itself which oxidises the formate, but atomic oxygen which is split off from the permanganate under the influence of the hydroxyl ions. It is further assumed that the hydroxyl ions, through the formation of an additive compound with the permanganate, act as oxygen carriers. It is shown that the above assumptions can be justified on the basis of the experiments and calculations of Sackur and Taegener (A., 1912, ii, 916). The temperature coefficient of this reaction is found to be 2·06. From the potential measurements of Sackur and Taegener (*loc. cit.*), the equilibrium constant of the reaction $2MnO_4''+2H_2O \rightleftharpoons 2MnO_2+4OH'+O_2$ is calculated to be 53·1 for 18—20°. It is shown that the presence of hydroxyl ions accelerates the reaction, the cause of which being in all probability that the hydroxyl ions affect the equilibrium pressure at which oxygen is separated from the permanganate hydroxyl ion complex.

J. F. S.

The Diffusion of Carbon in Metals and in Mixed Crystals of Iron. G. TAMMANN and K. SCHÖNERT (*Z. anorg. Chem.*, 1922, **122**, 27—43).—Carbon was found to diffuse into iron at 750°, whereas no diffusion into the other metals took place at 980°. In mixed crystals of iron with tungsten, molybdenum, nickel, cobalt, and manganese containing a large amount of iron, the diffusion was found to increase with the addition of the second element until a maximum was reached; the diffusion then diminished. In the cases of tungsten and molybdenum, the maxima corresponded with 0·0306 molar concentration, and the diffusion increased by 0·166; with nickel, cobalt, and manganese as added metals, the maxima required a molar concentration of 0·114, and the increase in diffusion was 0·057. The diffusion coefficients found for different pieces of iron were found to vary; this was due to the foreign matter between the crystallites.

W. T.

Photochemical Examination of the Reaction between Ferric Salts and Iodides. NOBUJI SASAKI (*Mem. Coll. Sci. Kyōtō Imp. Univ.*, 1922, **5**, 315—327).—The reaction between ferric salts and iodides is retarded by exposure to sunlight or bright artificial light, whilst that between ferrous salts and free iodine is accelerated. These photochemical reactions are discussed, and are shown to follow a simple law.

W. P. S.

System Fe_2O_3–SO_3–H_2O. E. POSNJAK and H. E. MERWIN (*J. Amer. Chem. Soc.*, 1922, **44**, 1965—1994).—The system ferric oxide–sulphur trioxide–water has been investigated over the temperature range 50—200°, by heating various mixtures of the components at various temperatures and analysing the phases produced. The following crystalline phases have been obtained: Fe_2O_3; Fe_2O_3,H_2O; $3Fe_2O_3,4SO_3,9H_2O$; $Fe_2O_3,2SO_3,H_2O$; $Fe_2O_3,2SO_3,5H_2O$; $2Fe_2O_3,5SO_3,17H_2O$; Fe_2O_3,SO_3 (2 forms); $Fe_2O_3,3SO_3,6H_2O$; $Fe_2O_3,3SO_3,7H_2O$; $Fe_2O_3,4SO_3,3H_2O$, and $Fe_2O_3,4SO_3,9H_2O$. The conditions under which these substances are formed, the ranges of their stability, and some of their crystallographic and optical properties have been determined. J. F. S.

Some Poly-acids of the Elements of the Sulphur Group. JULIUS MEYER and VALENTIN STATECZNY (*Z. anorg. Chem.*, 1922, **122**, 1—21).—The poly-acids formed by elements of the sulphur group are formulated according to the co-ordination system with a co-ordination number equal to four. The authors have succeeded in preparing the following heteropoly-acids and some of their salts: chromosulphuric acid, $H_2[CrO_3(SO_4)]$, and its potassium, sodium, ammonium, barium, strontium, and calcium salts; chromoselenic acid, $H_2[CrO_3(SeO_4)]$, together with its potassium and barium salts. Methods of preparation are given in detail. The solubilities of chromic anhydride in sulphuric and selenic acids of various concentrations were determined and a method was given for the preparation of the pure anhydride. The existence of the sulphoselenic acids, $H_2[SeO_3(SO_4)]$ and $H_2[SeO_2(SO_4)_2]$, was indicated by thermal analysis. Sulphomolybdic acid, $H_2[MoO(SO_4)_2(MoO_4)]$, was also prepared, but the corresponding selenic acid could not be isolated. Indications were obtained of the existence of chromyl-sulphuryl chloride, $CuSO_3Cl_2$. W. T.

Experimental Attempts to Decompose Tungsten at High Temperatures. GERALD L. WENDT and CLARENCE E. IRION (*J. Amer. Chem. Soc.*, 1922, **44**, 1887—1894).—Attempts have been made to decompose tungsten by rapidly discharging a condenser holding 30,000—45,000 volts through a tungsten wire 4 cm. long and 0·035 mm. diam., either in a vacuum or in carbon dioxide at 1 atm. pressure. In this way, momentary temperatures above 20,000° were produced in the wires which were entirely dissipated, no smoke, dust or solid residue being found after the explosion. Abundant quantities of gas were present after the explosions in a vacuum, and a spectroscopic examination of this showed the strong yellow helium line, and two red, one bright blue, and one pale violet line were also observed but have not been identified. The gas from the explosions in carbon dioxide was collected and measured, and it was found that about the same weight (mean 0·713 mg.) of tungsten yields in different experiments from 3·62 to 0·30 c.c. of gas unabsorbable by potassium hydroxide. It is pointed out that if the whole of the tungsten had been decomposed into helium the volume of gas would have been 4·0 c.c. J. F. S.

The Hydrates of Tungsten Trioxide. GUSTAV F. HÜTTIG and BRUNO KURRE (*Z. anorg. Chem.*, 1922, **122**, 44—50).—The existence of hydrates of tungsten trioxide was investigated by the Hüttig tensi-eudiometer (A., 1921, ii, 195). Solutions of the pure white and yellow acids were employed, and the process of dehydration was followed. No compound was indicated in the case of the white acid, the temperature–composition curve indicating adsorption as the water content changes gradually. The dehydration of the yellow acid showed the existence of a monohydrate WO_3,H_2O. The authors found that at temperatures above 188° and below 76° the white acid is the more stable, whereas between 76° and 188° the yellow variety is the stable form. W. T.

Sodium Tungstates. I. EDGAR F. SMITH (*J. Amer. Chem. Soc.*, 1922, **44**, 2027—2036).—Tungstates in which the basic and acidic oxides are present in the ratio 4 : 10 constitute a very definite series of salts. The sodium compound, $4Na_2O,10WO_3,23H_2O$, can be prepared by the method of Forcher and Gibbs, by passing carbon dioxide during several days through an aqueous solution of normal sodium tungstate or by the gradual addition of formic acid, until the action is distinctly acid, to a solution of normal sodium tungstate (100 grams) in water (100 c.c.). A mixture of the salts $4Na_2O,10WO_3,23H_2O$ and $5Na_2O,12WO_3,28H_2O$ is produced by the action of glacial acetic acid on a solution of sodium tungstate; the product, $9Na_2O,22WO_3,51H_2O$, appears to be a mixture of the two salts described above. The salt $4Na_2O,10WO_3,23H_2O$ forms monoclinic crystals which effloresce rapidly in dry air. It is soluble in water to the extent of 19 parts in 100 parts at atmospheric temperature; and has *d* 4·3. The following melting points are recorded for the various sodium tungstates: Na_2O,WO_3, 665°; $5Na_2O,12WO_3$, 705·8°; $4Na_2O,10WO_3$, 680·8°; $9Na_2O,22WO_3$, 683·3°; $Na_2O,4WO_3$, 706°. Addition of an excess of the respective metallic chlorides to a boiling aqueous solution of the salt $4Na_2O,10WO_3,23H_2O$ leads to the formation of the following compounds: *calcium* salt, $4CaO,10WO_3,25H_2O$, a white, granular powder which does not melt when heated to intense redness; the *barium* salt, $4BaO,10WO_3,22H_2O$, and the *strontium* salt, $4SrO,10WO_3,26H_2O$, white, insoluble, granular powders; the *nickel* salt, $4NiO,10WO_3,34H_2O$, a greenish-white powder; the *cobalt* salt, $4CoO,10WO_3,35H_2O$, pink granules; the *manganese* salt, $4MnO,10WO_3,30H_2O$, a colourless, granular powder. The action of a solution of the sodium salt, $4Na_2O,10WO_3,23H_2O$, towards solutions of salts of many inorganic and organic bases has been examined qualitatively. The sodium salt loses the whole of its water of crystallisation when it is strongly ignited, but when dried at 100° until constant in weight it retains six molecular proportions. It therefore appears that it may be formulated definitely as an acid salt, $4(Na_2O,WO_3),6(H_2O,WO_3),17H_2O$, and similar considerations are extended to the tungstates of other series. Confirmation of its acidic character is found in the ready neutralisation of its solutions with *N*-sodium carbonate solution and also in conductivity experiments during its neutralisation with barium hydroxide solution. H. W.

The Binary Systems Na_2SiO_3–Na_2WO_4, K_2SiO_3–K_2WO_4, and Na_2WO_4–K_2WO_4. J. A. M. VAN LIEMPT (*Z. anorg. Chem.*, 1922, **122**, 175—180).—Klooster (A., 1911, ii, 111) examined the system Na_2WO_4–Na_2SiO_3 and found no indications of a compound; the liquid salts were found to be immiscible. The present author has examined the viscosity and conductivity of aqueous solutions of the mixture. Curves representing the results showed no maxima or minima. The system K_2WO_4–K_2SiO_3 gave similar results. The equilibrium curve for the system K_2WO_4–Na_2WO_4 was obtained by the cooling method; a minimum freezing point was found for a mixture containing 80% of the sodium and 20% of the potassium salt. W. T.

Preparation and Reactions of Stannous Oxide and Stannous Hydroxides. FRANK WARD BURY and JAMES RIDDICK PARTINGTON (T., 1922, **121**, 1998—2004).

Reduction of Thorium Oxide by Metallic Tungsten. THE RESEARCH STAFF OF THE GENERAL ELECTRIC CO., LTD., LONDON (work conducted by COLIN JAMES SMITHELLS) (T., 1922, **121**, 2236—2238).

Germanium Hydride. JOHN H. MÜLLER and NICOL H. SMITH (*J. Amer. Chem. Soc.*, 1922, **44**, 1909—1918).—Germanium may be detected by a modification of Marsh's test in quantities as small as 0·00006 gram of the metal. The delicacy of the hydride relation is greatly increased by use of an alkaline generator as source of nascent hydrogen. Aluminium and dilute potassium hydroxide solution serve best for the formation of large quantities of germanium hydride, whilst sodium amalgam is best for small quantities. A modification of the usual form of Marsh apparatus is described which permits of the formation of a richer mixture of the hydride than has hitherto been prepared and still further increases the delicacy of the test. The apparatus is arranged as follows:—an electrolytic hydrogen generator, using 15% sodium hydroxide as electrolyte and having nickel electrodes, a washing tower containing a solution of a silver salt, a sulphuric acid drying tower, and a trap for exit of excess of hydrogen from the generator. The gas prepared and purified in the above train passes into the germanium hydride generator, which consists of a small wash-bottle the inner tube of which is cut off at a height 5 cm. above the bottom of the bottle; the generator is fitted with a funnel and stopcock through which the sodium amalgam and germanium solution may be added after the whole system has been filled with electrolytic hydrogen. To the generator is attached a small drying tube and to the end of this a constricted tube in which the germanium mirror may be formed. A rich mixture of germanium hydride and hydrogen is obtained by placing dry sodium amalgam in the generator and expelling the air by means of electrolytic hydrogen. The hydrogen stream is then interrupted and an aqueous solution of the germanium salt added and washed in with water. The germanium hydride is then allowed to form in the closed apparatus, and when the action is over swept through the heated constricted tube by means of electrolytic hydrogen, when a mirror of germanium is immediately formed. The decomposition temperature of germanium hydride lies between 340° and 360°, and the deposition of the mirror is best obtained below a red heat. The reverse action, involving the loss of germanium in hydrogen, has been quantitatively investigated and shows that at 750—800° 1·41855 grams of germanium loses 0·00647 gram when in a stream of hydrogen for thirty-eight hours. The dissimilarity of films of arsenic and germanium as obtained by the Marsh test is shown by a spectroscopic examination of the light transmitted by the films, and the thickness of the films has been determined. A study of the composition of the substance described by Voegelen (A., 1902, ii, 401) shows this substance to be a mixture which may contain little or much silver germanide Ag_4Ge along with metallic silver, depending on the method used in the preparation of the hydride. The precipitate contains much more germanide if the hydride is generated by the action of potassium hydroxide on aluminium and passed slowly through a solution of a silver salt, whilst if the formation of the hydride is brought about by means of sodium amalgam or the gas passed rapidly through the silver salt, the precipitate contains little germanide and the solution contains germanic acid. Evidence is put forward which indicates the presence of at least one hydride other than the tetrahydride, but the presence of this hydride has not been finally established. The richest mixture of hydrogen and germanium hydride examined contained 0·176% of the hydride. J. F. S.

Germanium Hydride. FRITZ PANETH and EDGAR SCHMIDT-HEBBEL (*Ber.*, 1922, **55**, [*B*], 2615—2622).—Germanium hydride has been described previously by Voegelen, but its composition has not been settled definitely. The substance has now been re-examined, and since the authors had only a very limited amount of material at their disposal they have found it most convenient to prepare the gas by the action of zinc or, preferably, magnesium on a solution of germanium in the presence of 3—4*N*-sulphuric acid; the yield varies between 0·2 and 1·5%. The gas evolved from the solution is dried by passage over granulated calcium chloride and phosphoric oxide and subsequently led through a Landsiedl apparatus filled with potassium hydroxide solution (50%), a U-tube immersed in pentane cooled to −110° and finally through three U-tubes cooled in liquid air. The almost invisible white condensate in the last three tubes is analysed by the method used previously for antimony and tin hydrides (this vol., ii, 383). It is thus shown that the atomic ratio of hydrogen to germanium is exactly 4 : 1. The accuracy of the analyses excludes the possibility of the presence of more than the merest traces of possible hydrides, such as Ge_2H_6, and the existence of these is the more improbable, since, under the conditions of the condensation, they must have become concentrated in the condensate; the pentane tube does not retain any germanium compounds, and about 15%

of germanium hydride passes uncondensed through the apparatus. It is shown that the molecular formula of germanium hydride is GeH_4.

Germanium hydride is unusually stable, being unaffected by potassium hydroxide solution (50%) or phosphoric oxide, and requiring a relatively very high temperature to cause its certain decomposition. The colours of the germanium mirrors are extraordinarily varied and in this respect the metal is differentiated from all others which yield hydrides decomposable by heat. In doubtful cases, confirmation may be obtained by oxidising the mirror to colourless germanium dioxide by heating it in a current of oxygen and subsequently reducing it in hydrogen to copper-coloured germanium, which can then be dissolved in sodium hypochlorite. Arsenic exhibits greater solubility in the reagent, but its oxide would be volatilised completely under the experimental conditions.
H. W.

The System Bi_2O_3–PbO. L. BELLADEN (*Gazzetta*, 1922, **52**, ii, 160—164).—The occurrence in nature of a series of minerals constituted of double sulphides of bismuth and lead which may mostly be regarded as derivatives of hypothetical ortho-, meta-, and pyro-sulphobismuthous acids renders possible the existence of similar compounds containing oxygen in place of the sulphur atoms. The author has investigated the fusion diagram of the system Bi_2O_3 : PbO, the results obtained indicating the formation of the compounds: (1) $4Bi_2O_3$,PbO, m. p. 695° (decomp.); (2) $3Bi_2O_3$,2PbO, m. p. 686°, stable when fused; (3) Bi_2O_3,2PbO, m. p. 625°, stable on fusion. These indications are fully confirmed by micrographic examination.

Litharge has m. p. 870° and bismuth trioxide, m. p. 817°.
T. H. P.

Polonium Hydride. II. FRITZ PANETH and ADOLF JOHANNSEN (*Ber.*, 1922, **55**, [*B*], 2622—2637).—Polonium hydride closely resembles bismuth hydride in the order of magnitude of its yields by all methods of preparation, its great instability during the condensation of minimal amounts, and its ready decomposability by chemical reagents.

The preparation of polonium hydride has been affected previously by the action of dilute acids on an electrolytic deposit of polonium on magnesium (A., 1919, ii, 76). Since it is difficult by this method to secure highly activated magnesium foil in uniformly good yield, a process has been evolved which depends on the deposition of polonium on magnesium powder by distillation. For this purpose, the polonium is first deposited electrolytically from a lead nitrate solution containing radium-*D* on the central portion of a thin piece of platinum foil. The latter is now suspended in a glass dish, the bottom and sides of which are covered with magnesium powder; the apparatus is brought into an evacuated desiccator and the foil is raised electrically to a bright yellow heat. The volatilised polonium is deposited mainly on the powder, which, after being carefully mixed, gives a preparation of uniform activity.

(A method for the recovery of polonium from its residual solutions and again precipitating it on magnesium is described in detail.) The yield of polonium hydride obtained by the solution of the activated powder in dilute acid is practically the same as from the activated foil, and lies intermediate between those of lead and bismuth hydrides. The formation of the hydride cannot be ascribed to the decomposition of a compound of magnesium and polonium, since the gas is also obtained by adding magnesium powder to a solution containing polonium. The method of " spark electrolysis " is also applicable to the production of polonium hydride, but the evolution of the gas by this method is too irregular for use for the present purposes.

Polonium hydride which has been condensed at the temperature of liquid air is very extensively decomposed during re-evaporation. The action appears to depend to some extent on the accompanying gases; thus, for example, it has not been found possible to re-volatilise polonium hydride which has been prepared by " spark electrolysis." The condensation and partial re-volatilisation of polonium hydride affords the most conclusive evidence of the gaseous nature of the compound.

Phosphoric oxide causes very extensive decomposition of the hydrides of polonium and thorium-*C*, whereas calcium chloride has a less strongly marked action; the latter, however, can only be used for the desiccation of polonium hydride when a very high initial activity can be used. Under the experimental conditions adopted, unboiled distilled water only allows 3% of polonium hydride to pass unchanged, whereas 50% of the gas passes through air-free, distilled water. *N*/10-Sodium hydroxide and *N*/10-silver nitrate solution cause very extensive decomposition of polonium hydride.

The rates of spontaneous decomposition of polonium and bismuth hydrides have been examined; the former is decomposed to the extent of 50% after four minutes, the latter after about twenty-five minutes. A more exact calculation is not warranted by the accuracy of the experiments, which suffer under the disadvantages that the gases cannot be dried. It is, however, established that moist polonium hydride is considerably more easily decomposed than bismuth hydride. H. W.

The Recrystallisation of Pure Mechanically Unworked Gold, obtained by Solidification from the Fused Mass. W. FRAENKEL (*Z. anorg. Chem.*, 1922, **122**, 295—298).—Pure mechanically unworked gold showed no change in size or form of crystals on heating at 1000—1040°. The purity could not be guaranteed to be such that the crystallites might not be surrounded by films of impurity (cf. Tammann, A., 1921, ii, 172). W. T.

Mineralogical Chemistry.

Colour of Fluorites. TOKUTARO SAKAO and MITSUIE HIROSE (*Mem. Coll. Sci. Kyōtō*, 1921, **4**, 349—350).—The colour of fluorite crystals has been attributed by Blount and Sequeira (T., 1919, **15**, 705) to the presence of a small amount of organic matter. Employing the ultra-microscope, the authors were unable to detect the presence of such matter in a state of colloidal suspension in five varieties of coloured fluorite crystals. J. S. G. T.

Analytical Chemistry.

Qualitative Chemical Analysis. V. MACRI (*Boll. Chim. Farm.*, 1922, **61**, 417—418).—By means of the following scheme, the use of sulphur compounds is avoided. The hydrochloric acid solution is placed, together with a rod of zinc, in a flask fitted with a gas delivery tube, the latter being heated so as to make a Marsh apparatus; the flask is eventually heated. The liquid is filtered, the precipitate containing silver, mercury, lead, bismuth, copper, cadmium, platinum, gold, tin, antimony, and arsenic. The filtrate is heated to boiling with zinc acetate, aluminium, iron, and chromium being precipitated. The filtrate from this is heated with hydrogen peroxide, which precipitates manganese. The filtrate from the latter is heated and treated with zinc oxide in presence of chlorine, nickel and cobalt being thus precipitated. Reference is made to various circumstances which prevent the subdivision into groups from being rigorously exact. [Cf. *J. Soc. Chem. Ind.*, 1922, 839A.] T. H. P.

Quantitative Microanalysis. MAURICE NICLOUX and GEORGES WELTER (*Chim. et Ind.*, 1922, **8**, 269—272).—A summary of Pregl's methods of microanalysis for use with which a Longue's aperiodic microbalance is recommended. A micro-method for the estimation of urea in blood is outlined (cf. this vol., ii, 170). W. G.

Use of Resorcinol in Qualitative Inorganic Analysis. LAVOYE (*J. Pharm. Belg.*, 1921, **3**, 889—890; from *Chem. Zentr.*, 1922, ii, 1154).—One c.c. of a 10% solution of resorcinol mixed with 2 c.c. of 10% ammonia solution gives characteristic colorations when added to 2 c.c. of different metallic salt solutions. The following colorations are obtained. Zinc salts, a yellowish-green colour, changing to deep blue; cadmium salts, a less intense blue colour; manganese salts, in the presence of ammonium salts, a bluish-green colour; nickel salts, bluish-green; copper salts, reddish-violet, changing to bluish-violet. With salts of the latter two metals the solutions should be so dilute that ammonia alone gives no coloration. Platinum salts give a garnet-red colour; mercury salts give no colour, but the solution on evaporation gives crystalline needles. All the colorations mentioned change to red on the addition of acid. The reactions are sensitive with very small amounts of the metals in question. G. W. R.

Analysis of Minerals by the Röntgen Spectrograph. ASSAR HADDING (*Z. anorg. Chem.*, 1922, **122**, 195—200).—The suitability of this method is shown by the fact that monazite, which contains twelve oxides, only gives twelve lines. Quantities of substances are indicated roughly by the strength of the lines. Very small amounts of substances are shown by weak lines and the author suspects the presence of the unknown element of atomic number 61 in "fluocerite." W. T.

Use of Mixed Indicators. A. COHEN (*J. Amer. Chem. Soc.*, 1922, **44**, 1851—1857).—It is shown that differences of subjective colour are enhanced when two indicators are partially transformed at the same hydrogen-ion concentration. The colorimetric determination of hydrogen-ion concentration can, therefore, be rendered more precise by the use of suitable mixed indicators and in certain titrations sharper end-points can be obtained, particularly in coloured liquids. Thus with the indicator bromothymol-blue the value P_H 6·8 is indicated by a pure green colour, but in a yellow medium the colour is yellowish-green and difficult to observe; if, however, an indicator is added which is violet at this concentration, then the total effect of the mixed indicators will be a green end-point. This may be achieved by adding equal quantities of bromothymol-blue and bromocresol-purple. Several cases of the use of mixed indicators are described. J. F. S.

Modification of the Chlorometric Method of Hayem and Winter. J. MALGOYRE (*Bull. Soc. pharm. Bordeaux*, 1922, **60**, 59—64).—Gastric juice is treated with a reagent prepared by dissolving 2 grams of chromic acid in 100 c.c. of 95% ethyl alcohol to remove proteins, and then titrated directly. The free and total hydrochloric acid are estimated by the Topfer-Linossier method, and the combined acid found by difference. The total chlorine is estimated by neutralising 10 c.c. of gastric juice with a saturated solution of sodium carbonate, adding 10 c.c. of the chromic acid reagent, filtering, and titrating with 0·1*N*-silver nitrate. The fixed chlorine is equal to the difference between the total chlorine and total acidity. CHEMICAL ABSTRACTS.

Reductions with Cadmium and Lead in Volumetric Analysis. III. W. D. TREADWELL (*Helv. Chim. Acta*, 1922, **5**, 806—818).—[With P. HRISTIE, L. EGGER, and P. STURZENEGGER.] A warm solution of a chlorate in presence of sulphuric acid can be reduced quantitatively to chloride by passing it through a cadmium reduction tube (A., 1921, ii, 523), and the chloride can then be titrated by the Volhard process. Since perchlorates are not reduced under these conditions, chlorate can be determined in presence of perchlorate by this method. Perchlorate can be reduced to chloride by boiling in sulphuric acid solution (about 10 c.c. of concentrated acid to 50 c.c. of $0 \cdot 1N$-chlorate solution) in presence of titanium sulphate for one-half to one hour with finely divided cadmium. The cadmium is only attacked to a slight extent by the acid, and a small amount of cadmium sulphide is formed which, however, does not interfere with the estimation of perchlorate. After cooling, the solution is diluted, the titanous sulphate present is carefully oxidised with permanganate and the chloride is titrated either by the Volhard process or electrometrically.

[With A. FREULER and A. WEBER.]—A reduction method for the estimation of columbium was described by Metzger and Taylor (A., 1909, ii, 702), depending on the stabilising effect of succinic acid on a solution of columbic acid in sulphuric acid. The solution was reduced with amalgamated zinc to the constant stage $Cb_2O_{3 \cdot 107}$. It has now been found that the succinic acid solution of columbic acid prepared in this manner is far from stable. In course of a few days it becomes opalescent and its reducibility gradually becomes less. The reducibility also becomes less when a solution of columbic acid in sulphuric acid is diluted, confirming the view that the reducibility depends on the dispersity of the colloidal acid. Consistent results were obtained when the reduction was carried out in a cadmium reduction tube in presence of ammonium molybdate or vanadate or of titanium sulphate, the subsequent titration being carried out with permanganate. The most stable solutions of columbic acid were obtained by dissolving the fluoride in concentrated hydrochloric acid, and consistent results were obtained when such solutions were reduced in a cadmium tube and titrated electrometrically with ferric chloride.

[With R. F. EDELMANN.]—A concentrated hydrochloric acid solution of a molybdate can be reduced quantitatively to the Mo''' stage by finely divided lead. Lead in a suitable form for a reduction tube was obtained by immersing a zinc rod in an acidified solution of lead acetate. The crystals of lead must be carefully washed with alcohol and ether, not pressed together. Stannic chloride was also reduced quantitatively to stannous chloride by means of lead. The oxidation titrations were carried out with permanganate. E. H. R.

Chlorination of Mixed Silver Haloids in Gooch Crucibles. M. G. MELLON and J. C. SIEGESMUND (*Proc. Indiana Acad. Sci.*, 1921, 197—199).—The crucible containing the silver haloids is placed inside a larger crucible which is covered with a watch glass with a hole in the centre. Chlorine is passed into the crucible through a tube extending to within 1 cm. of the bottom, the outer crucible being gently heated meanwhile.

CHEMICAL ABSTRACTS.

Electrometric Titrations with Lead Nitrate. I. M. KOLTHOFF (*Z. anal. Chem.*, 1922, **61**, 369—377).—Electrometric titration of iodide solutions, of not too low concentration, with lead nitrate solution yields trustworthy results, even in the presence of chlorides and bromides; the method is applicable to the estimation of ferrocyanides and also of sulphates provided that mineral acids, ferric salts, and aluminium salts are not present. The titration of pyrophosphates with lead nitrate solution gives unsatisfactory results, but the method may be used in the case of a few organic salts such as oxalates, tartrates, and succinates.

W. P. S.

A New Iodometric Method Based on the Formation and the Estimation of Cyanogen Iodide. Rudolf Lang (*Z. anorg. Chem.*, 1922, **122**, 332—348).—A volumetric method for the estimation of iodide is given, based on the fact that an iodide in hydrochloric or sulphuric acid solution is oxidised by an iodate or permanganate in the presence of hydrocyanic acid to cyanogen iodide, the end-point being indicated by starch solution. This can be controlled by estimating the cyanogen iodide with thiosulphate $ICN+2S_2O_3''+H^{\cdot}=I'+HCN+S_4O_6''$. The method is found to be applicable in the presence of bromides and nitrates. Different stages of oxidation of iodine can also be estimated in mixtures.

W. T.

The Estimation of Sulphur in Vulcanised Rubber. J. W. W. Dyer and Amy R. Watson (*J. Soc. Chem. Ind.*, 1922, **41**, 332T).—With reference to the method described for the estimation of combined sulphur in vulcanised rubber (this vol., ii, 656), the authors acknowledge priority of publication to A. R. Pearson (*Analyst*, 1920, **45**, 405). They prefer to use the method for combined sulphur only, however, and not for total sulphur, unless the amount of free sulphur is small.

G. F. M.

Estimation of Sulphides by Oxidation with Ferric Salts. P. P. Budnikoff and K. E. Krause (*Z. anorg. Chem.*, 1922, **122**, 171—174).—The estimation is based on the reaction $3Na_2S+3Fe_2(SO_4)_3=3Na_2SO_4+6FeSO_4+3S$. The amount of ferrous salt is found by permanganate. The acidity of ferrous sulphate is neutralised by the addition of alkali carbonate. The method is only applicable to sulphides which are soluble in water and acids.

W. T.

The Estimation of Sulphuric Acid as Barium Sulphate in the Presence of Aluminium. L. Moser and P. Kohn (*Z. anorg. Chem.*, 1922, **122**, 299—310).—The results of the estimation of sulphuric acid in the presence of aluminium are too low, these low results being due to the presence of aluminium sulphate in the precipitate. The amount of this impurity increases up to a maximum with an increase in the concentration of the aluminium salt. Precipitated barium sulphate takes up aluminium sulphate from solution—a solid solution is thus indicated. The best results are obtained by working in hydrochloric acid solution when the maximum error is −0·15%. The errors observed in the presence of the aluminium-ion are only one-tenth those obtained in the presence of the ferric-ion.

W. T.

A New Accelerator for the Destruction of Organic Matter in the Kjeldahl Method for the Estimation of Nitrogen. M. SBOROWSKY and I. SBOROWSKY (*Ann. Chim. Analyt.*, 1922, **4**, 266—267).—Mercurous iodide accelerates the destruction of organic matter in the digestion with sulphuric acid much more effectively than metallic mercury or other mercury salts. In two experiments carried out with 10 c.c. of sulphuric acid, with mercurous iodide 0·7 gram of sugar was destroyed in the time required for the destruction of only 0·1 gram with metallic mercury. A digestion was completed in fifty to sixty minutes which with metallic mercury required four to eight hours. H. C. R.

Estimation of Total Nitrogen in Fertilisers containing Nitrites and of Nitrite Nitrogen in the Presence of Nitrates. F. MACH and F. SINDLINGER (*Z. angew. Chem.*, 1922, **35**, 473—474).—To estimate the total nitrite and nitrate nitrogen, 25 c.c. of an aqueous solution of the sample (this quantity of solution should contain not more than 0·05 gram of nitrogen) are added gradually to a boiling mixture of 30 c.c. of saturated potassium permanganate solution and 5 c.c. of dilute sulphuric acid (1 : 2); a further quantity of 10 c.c. of the acid is then added, the mixture is cooled, treated with 10 grams of ferrum redactum, and again boiled for about ten minutes. The resulting ammonia is estimated by distillation in the usual way. The nitrate nitrogen is then estimated in another portion of 25 c.c. of the solution by boiling this quantity for ten minutes with 30 c.c. of *N*/3-sulphuric acid and 10 c.c. of methyl alcohol (the whole of the nitrous acid is thus expelled in the form of its methyl ester), neutralising the cooled mixture, and reducing the remaining nitrate with ferrum redactum in sulphuric acid solution. The nitrite nitrogen is found by subtracting the nitrate nitrogen from the total nitrogen. If ammonium salts are present, the ammonia nitrogen must be estimated separately and an allowance made for its quantity. W. P. S.

Comparison of the Methods for the Estimation of Nitric Oxide. ALFONS KLEMENC and CORNELIE BUNZL (*Z. anorg. Chem.*, 1922, **122**, 315—331).—Nitric oxide was prepared according to the method of Emich (A., 1892, ii, 939); this, however, contained 1% of impurity and was purified by fractionation, using liquid air. The estimation of the gas by passing it over heated copper was found to give accurate results. Estimations (1) with hydrogen in the Drehschmidt platinum capillary (Knorre and Arndt, A., 1899, ii, 806), (2) by the method of Baudisch and Klinger (*Ber.*, 1918, **45**, 3231), and (3) by absorption with ferrous sulphate were found to give untrustworthy results. Good results were obtained by absorbing the gas by acidified bromate or *N*/5-potassium permanganate and estimating the excess. The latter method can also be used in the presence of carbon dioxide and other gases. W. T.

Detection of the Nitrous Anion. P. FALCIOLA (*Gazzetta*, 1922, **52**, ii, 87—89).—Small proportions of nitrite may be detected : (1) By the transitory yellow coloration obtained by acidification

with sulphuric acid and gradual addition of sodium thiosulphate solution. (2) By the orange colour developed on addition, to a litre of the solution, of about 2 c.c. of sulphuric acid, excess of thiocyanate, and about 0·1 gram of ferrous sulphate (cf. Horst, A., 1921, ii, 461). (3) By the yellow coloration formed on addition of excess of aniline phosphate. [Cf. *J. Soc. Chem. Ind.*, 1922, 856A.]
T. H. P.

Separation of Phosphoric Acid in Qualitative Analysis. N. Tarugi (*Boll. Chim. Farm.*, 1922, **61**, 545—552).—The author's investigation of Gattermann and Schindhelm's proposal to eliminate phosphoric acid by means of stannic chloride (A., 1917, ii, 41) shows that, even under the best conditions, 15·4% of the total phosphoric acid passes into the filtrate from the stannic precipitate, and that the latter contains part of the iron, chromium, calcium, barium, etc., present. Further, when the proportion of phosphoric acid in the solution to be examined is unknown, it is impossible to add the exact quantity of ammonium phosphate to give a definite ratio between phosphate and stannic chloride. T. H. P.

Effect of Iron on the Iodine Titration of Arsenite. F. L. Melvill (*J. S. African Chem. Inst.*, 1922, **5**, 3—5).—The interference of ferric salts in the titration of arsenite solution by iodine solution may be prevented by the following procedure. The slightly acid arsenite solution, containing not more than 0·1% of iron (expressed as Fe_2O_3), is treated with about one-half the quantity of iodine solution required to oxidise all the arsenite, 10 c.c. of saturated sodium hydrogen carbonate solution are then added, and the titration is completed. In this way the whole of the iron is precipitated as ferric arsenate and no longer interferes with the titration. W. P. S.

Estimation of Boric Acid. Wilhelm Strecker and Ernst Kannappel (*Z. anal. Chem.*, 1922, **61**, 378—397).—The substance containing boric acid or its salts is mixed with 40% phosphoric acid and methyl alcohol and the mixture is distilled in a current of air saturated with methyl alcohol (the air is passed previously through a flask containing methyl alcohol) until all the methyl borate has been collected in a receiver containing sodium hydroxide solution. The distillate is then heated to expel methyl alcohol, treated with a slight excess of hydrochloric acid, using methyl-orange as indicator, boiled to expel carbon dioxide, and neutralised with sodium hydroxide solution. After the addition of mannitol in the proportion of 1 gram for each 10 c.c. of solution, the mixture is titrated with *N*/10-barium hydroxide solution, using α-naphtholphthalein solution as indicator. W. P. S.

Sulphonated Derivatives of the Naturally Occurring Sulphidic Hydrocarbons. C. Pépin and G. Reaubourg (*J. Pharm. Chim.*, 1922, [vii], **26**, 258—261).—As the therapeutic value of ichthyol is largely dependent on the amount of "sulphidic" sulphur it contains as distinguished from total sulphur which comprises in addition sulphonic and sometimes sulphatic sulphur, it is desirable that more precise standards should be laid down to which commercial ichthyol preparations should conform. Ammonium or other sulphates should be almost completely absent, as indicated by the formation of nothing more than an opalescence on the addition of barium chloride to the filtrate after precipitation of an ichthyol solution by albumin and hydrochloric acid. Sulphidic sulphur can only be estimated by difference by Thal's method, which consists in an estimation of total sulphur, by Carius's method, for example, and subtracting from this the sulphur present as sulphate, if any, determined by weighing the above barium sulphate precipitate, and the sulphonic sulphur determined by an ammonia estimation, and calculating on the basis of one sulphonic group for each molecule of ammonia after making allowance for the ammonia combined as sulphate. As thus estimated, "sulphidic" sulphur should represent at least 15% of the weight of the dried ichthyol. The conservation of ethylenic linkings in the preparation of the ichthyol should be confirmed by the decolorisation of bromine water. G. F. M.

Radioactive Indicators. FRITZ PANETH (*Z. angew. Chem.*, 1922, **35**, 549—552).—Use has been made of radioactive isotopes of metals such as lead and bismuth for indicating the presence of minute and unweighable quantities of these elements or their compounds. Quantities of the radioactive isotopes of the order of a millionth of a milligram are easily detected by the electroscope. Once mixed with the inactive isotope, they cannot be separated by chemical means, so that the presence of the radioactive isotope indicates the presence of the inactive one also. Practical applications have been made in analytical chemistry in determining the solubility of very sparingly soluble substances and in the study of adsorption phenomena. In electrochemistry it has been established by this means that an interchange of the metallic portion of the molecule actually occurs on mixing solutions of two salts of the same metal and subsequently recovering them from solution, but that no such interchange occurs when one or both the substances are non-ionised. The actual deposition of an unweighable quantity of metal on the electrode before the minimum potential of electrolysis is reached has also been established. In colloid chemistry, the active surface of powders has been measured for the first time by the use of a radioactive indicator, and the distinction between crystalloid and colloid in the diffusion of the former through parchment membranes has been studied down to a dilution of 10^{-11} mol. per litre. In inorganic chemistry, the conditions for the preparation of bismuth and lead hydrides were studied by this means and the method was successfully applied to the measurement of the gas-tightness of rubber fabrics for gasmasks. The kinetic theory has received further experimental confirmation by the actual proof of the movement of the molecules in molten lead and measurements of the movement of lead ions in lead chloride even below its melting point. H. C. R.

Estimation of Small Quantities of Calcium. PATRICK PLAYFAIR LAIDLAW and WILFRED WALTER PAYNE (*Biochem. J.*, 1922, **16**, 494—498).—The method described is suitable for estimating calcium in amounts of the order of 0·1 mg., and gives results accurate to about 0·002 mg. The calcium is first precipitated as oxalate (in the case of blood serum, this may be done directly from the serum without previous ashing). After separation, the precipitate is dissolved in hydrochloric acid and the calcium reprecipitated in the form of calcium alizarinate by the addition of excess of alizarin in alcoholic solution, and, after warming, of a few drops of strong ammonia. When crystalline, the precipitate is collected in a Gooch crucible, washed with dilute ammonia, and decomposed with a solution of oxalic acid in 50% alcohol. The liberated alizarin is dissolved in 95% alcohol, made just alkaline with ammonia, and estimated colorimetrically by comparison with a standard solution of ammonium alizarinate. E. S.

The Separation of Zinc from Other Metals, especially Nickel. ALOIS LUDWIG (*Z. anorg. Chem.*, 1922, **122**, 239—261).—Zinc can be separated from nickel by precipitation with hydrogen sulphide in the presence of ammonium tartrate. The latter salt forms stable complex compounds with nickel, which may perhaps explain its action; the latter might, however, be due to the replacement of the freed mineral acid by the weaker tartaric acid. Results are also given of attempts to effect the separation by precipitation of zinc from zinc ammonium phosphate in neutral solution in the presence of neutral tartrates and thiocyanates. These investigations are being continued. W. T.

The Influence of the Alkalis on the Titration of some Metals with Ferrocyanide. W. D. TREADWELL and D. CHERVET (*Helv. Chim. Acta*, 1922, **5**, 633—639).—The electrometric titration of zinc with potassium ferrocyanide was described by Treadwell and Weiss (A., 1920, ii, 120). The sharpness of the end-point depends on the insolubility of the ferrocyanide of the heavy metal, but it is also dependent on the alkali metal used, since the precipitate is generally a double salt. When cadmium sulphate is titrated with potassium ferrocyanide in neutral or weakly acid solution, the end-point is indicated by a moderately sudden drop in potential, but only in a highly dilute solution has the precipitate the exact composition $CdK_2Fe(CN)_6$. In the presence of a rubidium salt or a cæsium salt, however, the end-point is much sharper, probably because the alkali metals with higher atomic volumes form less soluble double salts with cadmium ferrocyanide. When sodium ferrocyanide is used for the titration, the precipitate is the simple salt, $Cd_2Fe(CN)_6$. When a zinc salt is titrated with potassium ferrocyanide the precipitate is $Zn_3K_2[Fe(CN)_6]_2$, but with sodium ferrocyanide, $Zn_2Fe(CN)_6$, is obtained. In presence of a potassium salt, however, sodium ferrocyanide gives the above zinc–potassium salt, whilst in presence of a cæsium salt, potassium ferrocyanide gives $ZnCs_2Fe(CN)_6$ with a very sharp end-point. Lead nitrate can be titrated with ferrocyanide in neutral solution, but lead ferrocyanide is very sensitive to acid; consequently zinc can be titrated with ferrocyanide in hot acid solution in presence of lead. The precipitate obtained from lead nitrate and potassium ferrocyanide is $Pb_2Fe(CN)_6$, but in presence of a cæsium salt the precipitate has the composition $Pb_3X_2[Fe(CN)_6]_2$, where X is probably entirely cæsium. The ferrocyanides of the bivalent heavy metals appear to be less soluble the smaller the atomic volume of the heavy metal. E. H. R.

Estimation of Lead in Lead Amalgam. M. G. MELLON and H. F. REINHARD (*Proc. Indiana Acad. Sci.*, 1921, 189—195).—Existing methods are considered to be unsatisfactory for the estimation of small quantities of lead in the presence of large quantities of mercury. A weighed quantity of the amalgam is covered with 25 c.c. of a 10% solution of cupric nitrate and allowed to remain for fifteen to twenty-four hours; lead enters into solution, but mercury does not. After decantation through a filter, the amalgam is washed, and the filtrate treated with a few drops of acetic acid and sufficient potassium dichromate solution to precipitate the lead as lead chromate, which is washed in a Gooch crucible, dried at 120°, and weighed. CHEMICAL ABSTRACTS.

The Kastle-Meyer Reagent as a very Sensitive Reagent for Copper. OTTORINO CARLETTI (*Boll. Chim. farm.*, 1922, **61**, 449).—A claim for priority (A., 1914, ii, 74) over Thomas and Carpentier (this vol., ii, 86). T. H. P.

New Method for the Estimation of Manganese. ST. MINOVICI and CONST. KOLLO (*Chim. et Ind.*, 1922, **8**, 499—500).—Manganese may be estimated with accuracy, even when present in only small quantities, by precipitation as iodate by means of iodic acid according to the equation $MnSO_4+2HIO_3=Mn(IO_3)_2+H_2SO_4$. A solution of about twice the theoretical quantity of iodic acid is added to the manganese solution, and after warming for ten minutes on a water-bath twice the volume of alcohol is added. After keeping for a short time, the precipitate is collected on a filter or Gooch crucible and washed with 70% alcohol saturated with manganous iodate. The mother-liquor contains no traces of manganese, the iodate being insoluble in 70% alcohol in presence of iodic acid. In water at the ordinary temperature, its solubility is 0·195%, and in 70% alcohol 0·005%. The precipitate of manganous iodate is finally dried at 100°, and weighed. The absolute percentage error in the examples given varies from 0·16 to 0·63% when quantities of the order of 0·1—0·3 gram of the hydrated sulphate are taken for estimation. G. F. M.

A New Microchemical Method for the Identification of Tungsten. J. A. M. VAN LIEMPT (*Z. anorg. Chem.*, 1922, **122**, 236—238).—A small quantity of sodium nitrite is melted on a platinum spoon and a little tungsten is thrown in; sodium tungstate is formed. This is dissolved in a little water and tungstic acid precipitated by the addition of hydrochloric acid (1 : 1). This is collected and then mixed with a few drops of concentrated ammonia and placed on a slide. Ammonium paratungstate soon crystallises in four-cornered plates on the edges of the drop and as long needles in the centre. W. T.

Glacial Acetic Acid Method for Estimating Uranium in Carnotite. Wilfred W. Scott (*J. Ind. Eng. Chem.*, 1922, **14**, 531—532).—Half a gram of the ore is heated with 40 c.c. of dilute (1 : 1) nitric acid, the mixture is evaporated to dryness, the residue ignited, and then boiled for five minutes with a mixture of glacial acetic acid and nitric acid (100 : 5); the insoluble portion is separated by filtration and the filtrate is evaporated to dryness. This residue is ignited until it turns black and the extraction with the acetic acid–nitric acid mixture repeated; the filtrate obtained is evaporated, the residue dissolved in 10 c.c. of nitric acid and 40 c.c. of water, the solution neutralised partly with ammonia and ammonium carbonate is added in quantity sufficient to dissolve the precipitate of uranium carbonate which first forms. After the addition of an excess of 3 grams of ammonium carbonate and 5 c.c. of ammonia, the mixture is filtered, the filtrate is acidified with nitric acid, and heated to expel carbon dioxide. An excess of ammonia is then added and the boiling is continued until all the uranium has been precipitated, which is denoted by the yellow solution becoming colourless. The precipitate is collected, washed with 2% ammonium nitrate solution, ignited, and weighed as U_3O_8. W. P. S.

Reductions with Cadmium in Volumetric Analysis. II. W. D. Treadwell (*Helv. Chim. Acta*, 1922, **5**, 732—743).—[With M. Blumenthal.]—Uranyl salts can be titrated by first reducing to the uranous stage and titrating back with potassium permanganate (cf. A., 1921, ii, 523). When zinc is used for the reduction, the reaction tends to go beyond the uranous stage to the U''' stage and the same occurs, although to a less extent, when cadmium is used. Owing to the ease with which tervalent uranium is oxidised by air to the uranous stage, any over-reduction can be corrected by allowing the reduced solution to run from the reduction tube drop by drop into a vessel open to the air. Oxidation from the uranous to the uranyl stage by means of air depends on the degree of acidity of the solution. To prevent such oxidation, the reduction is carried out in a $3{\cdot}0N$-sulphuric acid solution. When the electrometric method of titration is used over-reduction can be ignored, as the titre is given by the distance between the two breaks in the potential curve. Titanium and uranium may be estimated together by reducing in very dilute solution and titrating electrometrically with permanganate in an atmosphere of carbon dioxide, the two breaks in the curve representing the completion of oxidation of titanous and uranous ions respectively.

[With M. Stärkle.]—The accuracy of the electrometric method for titrating titanium after reduction with cadmium (*loc. cit.*) was confirmed by comparison with a gravimetric method. It is shown that small quantities of titanium can be estimated accurately by this method in presence of large quantities of iron, using potassium dichromate for the titration.

[With M. Hooft.]—Careful experiments in which every precaution was taken to exclude air during the reduction and titration with permanganate show that vanadic acid is reduced quantitatively to the V″ stage by cadmium.

[With M. Dreifuss and A. Bossi.]—Indigotinsulphonic acid is reduced by finely divided cadmium in 0·2 to 0·5*N*-sulphuric acid solution to the leuco-stage, and can then be accurately titrated by means of ferric chloride by the electrometric method in an atmosphere of carbon dioxide. The course of the potential curve indicates that the oxidation proceeds in two stages, probably through a quinhydrone stage. Thioindigotin and methylene-blue can be estimated in the same way. [Cf. *J. Soc. Chem. Ind.*, 1922, Nov.] E. H. R.

A Micro-method for the Estimation of Ethyl Alcohol in Blood. Erik M. P. Widmark (*Biochem. Z.*, 1922, **131**, 473—484).—A method is described suitable for estimating the alcohol in a drop of blood or in larger quantities. It depends on the absorptive power for alcohol of concentrated sulphuric acid containing a known amount of dichromate. The operations are conducted in a specially designed flask to avoid mixing and contamination of the standard dichromate by organic matter, and at a temperature of 50—60°. Absorption of the alcohol is complete within two hours. The excess of dichromate is estimated, after dilution with water, by potassium iodide and thiosulphate. Blank estimations are essential features. H. K.

The Estimation of the Methyl Group in Methylated Thiolbenzenes. J. Pollak and Anna Spitzer (*Monatsh.*, 1922, **43**, 113—120).—The estimation of the methylthiol group by a method analogous to Zeisel's process for estimating the methoxyl group is complicated by the fact that hydrogen sulphide and methylthiol are evolved along with methyl iodide during the decomposition by hydriodic acid. The process now described consists in decomposing the substance with hydriodic acid (*d* 1·7), and passing the volatile products through a paste of red phosphorus and weakly acidified cadmium sulphate solution, to remove hydrogen sulphide, and thence into alcoholic silver nitrate. The precipitate is ignited, and the mixture of silver and silver iodide completely converted into the iodide for weighing. C. K. I.

Identification of Small Quantities of Terpineol Hydrate in Complex Mixtures. G. Denigès (*Bull. soc. pharm. Bordeaux*, 1922, **60**, 49—54).—The sample is moistened with a drop of ethyl alcohol on a glass slide, terpineol being deposited on the edge in tufts of prismatic needles; previous sublimation between two slides may be desirable. On addition of a drop of sulphuric acid, a yellow colour is produced, passing to orange on heating. Finally, on addition of a drop of a solution containing 0·5 gram of lævulose in 25 c.c. of ethyl alcohol and 75 c.c. of water, a carmine-red coloration is developed. Chemical Abstracts.

Estimation of the so-called Total Geraniol Content of Citronella Oil. A. W. K. DE JONG and A. RECLAIRE (*Perf. Essent. Oil Rec.*, 1922, **13**, 319—321).—Numerous samples of citronella oil were analysed by slightly varying methods in order to ascertain the reason for the different results often obtained by different operators. The maximum difference observed was 2·8%, the average difference 0·7%. The influence of acetic anhydride of higher percentage strength than usual (80%) was negligible, and sodium acetate dried over sulphuric acid did not give better results than the usual fused article. The method recommended is to heat 10 grams of the dry oil with 10 c.c. of 80% acetic anhydride and 2 grams of freshly fused sodium acetate for two hours. After cooling, 50 c.c. of water are added and the excess of anhydride is decomposed by warming and shaking. The acetylated oil is separated, washed with brine until neutral, and dried. About 1·5 grams are then saponified with $N/2$-alcoholic potassium hydroxide after neutralising any residual acidity. After two hours' boiling under reflux the excess of alkali is titrated back with $N/2$-sulphuric acid. G. F. M.

Causse and Bonnan's Method for the Estimation of Dextrose. R. KRULL (*Pharm. Weekblad*, 1922, **59**, 1035—1039).—The unsatisfactory end-point referred to by Lemkes and Lansberg (this vol., ii, 724) is due to the fact that towards the end of the titration, when most of the cuprous oxide has been removed from the solution, dextrose is being added to a strongly alkaline solution, to which, as is well known, it is very sensitive. The abnormal course of Fehling's reaction with urine may be considered in the light of Benedict's reaction. The iodometric estimation is accurate to 0·1%. S. I. L.

Apparatus for Facilitating the Estimation of Dextrose by Titration with Permanganate by the Mohr-Bertrand Method. J. VAN DER HAAR (*Arch. Suikerind*, 1922, **30**, 213—216).—Precipitation is carried out in a 500 c.c. round flask, and the supernatant liquid siphoned slowly through a Soxhlet tube into an 800 c.c. bottle, the neck of which is of the same size as that of the round flask. The precipitate is washed with hot water and the washings are siphoned off. The Soxhlet tube is removed from the bottle and placed on the flask. A little ferrous ammonium sulphate solution is next run through the siphon into the Soxhlet tube and the remainder poured directly into the tube itself; the tube is rinsed, and the contents of the flask are titrated with permanganate after acidification with sulphuric acid. CHEMICAL ABSTRACTS.

Estimation of Sucrose in Presence of Other Sugars by means of Alkaline-earth Hydroxides. A. BEHRE and A. DÜRING (*Z. Unters. Nahr. Genussm.*, 1922, **44**, 65—70).—Material containing about 20 grams of sucrose is heated with 1·2 grams of freshly burnt lime in about 50 c.c. of water for one hour at 60—80°.

Other sugars are destroyed, and the sucrose can be determined polarimetrically. A. G. P.

Flax and Kindred Fibres. I. Behaviour and Structure of Textile Fibres, and a Convenient Method of Distinguishing Flax from Hemp. C. R. NODDER (*Trans. Text. Inst.*, 1922, **13**, 161—171).—Flax and ramie fibres always twist in a clockwise direction when drying, whereas hemp and jute fibres twist in the reverse way, and cotton usually exhibits different twists in different parts of the same hair. An examination of about 100 fibres in a warm, dry room is sufficiently accurate for determining the proportion of flax and hemp in a mixture. The direction of twist is connected with the spiral, fibrillar structure of these "bast" fibres. This structure is best revealed by mounting the fibre in concentrated calcium chloride solution, tinged with iodine, and carefully compressing it by gentle pressure on the cover-slip. The fibre is easily made ten times its normal width and the spirals show as bright reddish-purple lines (the compressed parts) among brownish-yellow ones. The striations in the outer layer of flax and ramie cells form left-handed spirals, and those of hemp and jute right-handed spirals. It follows, therefore, that wetting of these fibres is accompanied by an untwisting of the fibrils which make up the outer layer of the cell-wall. The phenomena are discussed in the light of the physico-chemical properties of cellulose. J. C. W.

Rapid Estimation of Acetic and Butyric Acids in Mixtures. L. NOTENBAART (*Natuurwetenschapp. Tijdschr.*, 1921, **3**, 131—134).—After previous experimental determination of the distribution of acetic acid and butyric acid between water and toluene, the total quantity of acid present is estimated by titration with 0·04*N*-sodium hydroxide. After extraction of most of the butyric acid and a little of the acetic acid by shaking with an equal volume of toluene, the aqueous solution is again titrated.

CHEMICAL ABSTRACTS.

Adaptation of the Pentabromoacetone Method to the Estimation of Citric Acid in Urine. WILLIAM B. MCCLURE (*J. Biol. Chem.*, 1922, **53**, 357—363).—The pentabromoacetone method for the estimation of citric acid (cf. Kunz, A., 1915, ii, 595) cannot be applied directly to urine owing to the formation of other precipitates. Satisfactory results may, however, be obtained if the urine is first made alkaline with sodium hydroxide and then treated, in the cold, with animal charcoal, and if the pentabromoacetone is finally separated from small quantities of impurities by volatilisation. E. S.

Estimation of Meconic Acid in Opium. H. E. ANNETT and M. N. BOSE (*Analyst*, 1922, **47**, 387—391).—Five grams of opium are triturated with 50 c.c. of water and after keeping over-night 40—45 c.c. of the filtered liquid are treated with 6 c.c. of 50% calcium chloride solution and kept a further twenty-four hours.

The precipitate, which is almost white, consists of calcium meconate and sulphate. It is collected, washed until the washings are colourless, and dissolved in 15 c.c. of 1·25*N*-hydrochloric acid. After keeping for twenty-four hours, pure meconic acid will have separated in white, crystalline scales. It is collected, washed twice with 0·5 c.c. of water, dried over sulphuric acid, and weighed as $C_7H_4O_7,3H_2O$. To the weight found 0·0213 gram is added, to correct for the solubility of meconic acid in 15 c.c. of 1·25*N*-hydrochloric acid. The figure obtained is multiplied by the factor depending on the amount of the aliquot portion of the solution taken for analysis, and then by the factor 10/9, to correct for the amount of meconic acid unprecipitated by calcium chloride, in order to arrive at the weight of acid in 5 grams of opium. G. F. M.

Pregl's Solution. M. BACHSTEZ (*Ber. Deut. pharm. Ges.*, 1922, **32**, 216—221).—Discrepancies between the analyses of Pregl's solution made by different observers indicate that its composition is variable in spite of assurances to the contrary given by the makers. A solution prepared by dissolving 0·0165 gram of sodium iodate and 0·65 gram of potassium iodide in 100 c.c. of water with the addition of 10 drops of *N*/10-hydrochloric acid gave very similar results to Pregl's solution when tested quantitatively for total, active, and free iodine. Its physiological and bacteriological properties were also similar to those of Pregl's solution. E. H. R.

The Sulphuric Acid Reaction for Liver Oil. H. D. RICHMOND and E. H. ENGLAND (*Analyst*, 1922, **47**, 431).—Constant results were obtained in testing cod-liver oil by the dilution method (Drummond and Watson, this vol., ii, 665) by adding 1 c.c. of the cod-liver oil to 10 c.c. of liquid paraffin (B.P.), mixing, and transferring 10 drops of the mixture to a white porcelain basin, adding 1 drop of sulphuric acid (B.P.) and stirring with a glass rod. If a transient purple colour developed, liquid paraffin was added in successive quantities of 5 c.c. until no purple coloration was given, and the dilution at which a faint transient purple was seen was recorded. If no purple was seen, successive additions of 1 c.c., 1 c.c., 2 c.c., and 5 c.c. of cod-liver oil were made. H. C. R.

Properties and Preparation of Dutch East Indies Sandal Wood Oil. A. ROJDESTWENSKY (*Perf. Essent. Oil Rec.*, 1922, **13**, 331—332).—The amount of oil obtainable from Dutch Indian sandal wood varies from 3·8—5·8%, and has the following characters: d^{15° 0·9745—0·9842, α_D^{28} −16·4 to −18·4, santalol content 93·7—98%; n_D^{28} 1·5000—1·5013, soluble in 3—4 vols. of 70% alcohol. The quantity of oil obtainable from a sample may be ascertained by distilling not more than 0·5 kilo. of shavings with water after soaking for forty-eight hours. After ten to fifteen hours, the colour of the oil begins to darken, and in twenty hours the distillation is finished. The first and last runnings do not differ greatly in properties. G. F. M.

Importance of Dimethylhydroresorcinol for Detection of Volatile Aldehydes in Body Fluids. The Identification of Formaldehyde in Urine after Administration of Hexamethylenetetramine. WILHELM STEPP (*Biochem. Z.*, 1922, **130**, 578—581).—After administration of hexamethylenetetramine to a patient with kidney disease, formaldehyde was recognised in quantity in the urine by combination with dimethylhydroresorcinol. H. K.

A Modified Schiff's Solution. E. WERTHEIM (*J. Amer. Chem. Soc.*, 1922, **44**, 1834—1835).—Rosaniline hydrochloride (0·005 gram) is dissolved in hot water (50—100 c.c.); the solution is filtered if necessary, diluted to 300 c.c. and cooled with running water. Sodium hyposulphite (6 grams) is added to the cooled solution. The salt dissolves completely in a few minutes, after which the solution is ready for use. If it is boiled for one minute (not longer) it first becomes red and subsequently practically colourless. It may now be heated in testing for aldehydes in order to hasten the test. Used in this manner, the solution gives the aldehyde test in about half the time required for the ordinary Schiff's test, although without heating it is usually a little slower than the ordinary Schiff's solution. Special precautions in preserving the solution are unnecessary. H. W.

Comparative Estimations of Acetone in Urine. KURT KÄDING (*Biochem. Z.*, 1922, **130**, 448—458).—A comparison has been made of various methods, suitable for clinical purposes for the estimation of acetone in urine. Scharf's method (*Med. klin.*, 1921, **36**), like Schall's method, is a modification of Legal's test and is the most suitable. H. K.

The Characterisation of the Colouring Matter of Saffron: Its Use in Investigations Relating to Laudanum Poisoning. MARCEL GUERBET (*J. Pharm. Chim.*, 1922, **26**, 218—220).—The coloration produced by the action of concentrated sulphuric acid on crocetin may be used for the detection of the colouring matter of saffron which yields crocetin on hydrolysis. This test may be used in the case of poisoning by drugs which are coloured with saffron. H. J. E.

A Qualitative Test for Tannin. ETHEL ATKINSON and EDITH OLIVE HAZLETON (*Biochem. J.*, 1922, **16**, 516—517).—A piece of gold-beater's skin is pinned on a surface of paraffin wax, soaked in water, and then covered with an aqueous extract of the material to be tested. After about fifteen minutes it is washed, treated with a 1% solution of ferric chloride, and again washed. If the skin is stained, the presence of tannin is indicated. E. S.

Estimation of Indican in Blood-serum. J. SNAPPER and W. J. VAN BOMMEL VAN VLOTEN (*Klin. Woch.*, 1922, **1**, 718—721; from *Chem. Zentr.*, 1922, ii, 1122).—In the estimation of indican in serum, a stronger reaction is given after precipitation with trichloroacetic acid than after precipitation with alcohol. The following procedure is recommended. The serum is precipitated with an equal volume of 20% trichloroacetic acid. 2·5 C.c. of the filtrate are diluted to 10 c.c. with water and after addition of 1 c.c. of thymol in alcohol (5%) and 10 c.c. of Obermayer's reagent, left for twenty minutes. The liquid is then extracted with 2 c.c. of chloroform and the reading taken after thirty minutes. With a weak positive reaction a slightly increased indicanæmia is indicated, implying hypofunction of the kidneys (niereninsuffizienz). In acute nephritis, hyperindicanæmia implies a more marked intoxication than does retention of urea alone. The principal precautions to be observed in the estimation are given.

G. W. R.

Detection of Urea in Tissue by Means of Xanthydrol. M. Bonnet and J. Haushalter (*Compt. rend. Soc. Biol.*, 1922, **86**, 395—397; from *Chem. Zentr.*, 1922, ii, 922).—For the microchemical detection of urea, the fixation of the tissue in a 10% solution of xanthydrol in ethyl alcohol and pure acetic acid in the ratio 1 : 7 is recommended. G. W. R.

A Reaction of Urea with *p*-Dimethylaminobenzaldehyde. H. K. Barrenscheen and O. Weltmann (*Biochem. Z.*, 1922, **131**, 591—595).—The yellowish-green coloration obtained in dilute urine on addition of Ehrlich's aldehyde reagent is due to urea. The reaction can be used for the recognition of residual nitrogen in serum freed from proteins by trichloroacetic acid when it exceeds 36—40 mg. %. H. K.

Accurate Ureometer. Antonio Sciortino (*Arch. Farm. sperim. Sci. aff.*, 1922, **33**, 186—189).—The modified apparatus for the estimation of carbamide described allows of the use of varying quantities of the urine, blood, etc., and of arbitrary amounts of the sodium hypobromite. Equilibrium may be established between the external and internal pressures prior to the reaction and completion of the latter assured by shaking the reaction bottle under diminished pressure. The volume of the nitrogen formed is read in a burette graduated to 0·05 c.c. T. H. P.

The Estimation of Urea in Urine by the Hypobromite Method with Complete Yield. (Mlle) M. Janet (*J. Pharm. Chim.*, 1922, **26**, 161—170).—Sodium hypobromite, under the usual experimental conditions, gives results which indicate only 90—92% of the actual urea present. The method described is said to be accurate within 1% when compared with results obtained by standard gravimetric methods. The solution containing urea is diluted, if necessary, so that the concentration is not much above 1% and a considerable excess of sodium hydroxide is added followed by the hypobromite. The presence of creatinine introduces a slight error; this is stated to be negligible. If ammoniacal compounds are present, the whole of their combined nitrogen is liberated by the action of sodium hypobromite and sodium hydroxide so that the nitrogen due to urea is found by difference after estimating the ammonia. H. J. E.

Electrometric Titration of Ferrocyanides. Erich Müller and Hans Lauterbach (*Z. anal. Chem.*, 1922, **61**, 398—403).—The end-point of the titration of ferrocyanides in sulphuric acid solution with permanganate solution may be determined accurately electrometrically in cases where the titration has to be made under artificial light; the results obtained agree with those found where the end-point is denoted by the pink coloration of the slight excess of added permanganate. W. P. S.

A Test for Pyridine. Friedrich Lehner (*Chem. Z.*, 1922, **46**, 877).—If a few drops of aniline are added to a solution of pyridine containing water and a trace of cyanogen bromide, a red colour is immediately obtained and crystals of 2-anilinodihydropyridine phenyl bromide separate. One part of pyridine in 350,000 parts can be detected in this way. H. C. R.

Detection of Small Quantities of Pyridine. A. Goris and A. Larsonneau (*Bull. Sci. Pharmacol.*, 1921, **28**, 497—498; from *Chem. Zentr.*, 1922, ii, 731).—By addition of aniline to a solution of pyridine in the presence of cyanogen bromide, 1-*anilinodihydropyridinium phenyl bromide*, a red substance, is formed. The coloration is noticeable even with one drop of pyridine in 10,000 c.c. of water. This reaction takes place even in the presence of pyrrole derivatives. G. W. R.

A Reaction of Veronal and of the Hypnotics Derived from Barbituric Acid. René Fabre (*J. Pharm. Chim.*, 1922, [vii], **26**, 241—249).—Veronal and other hypnotics of the barbituric acid series are readily condensed with xanthydrol to form crystalline dixanthyl derivatives by heating at 100° for about one minute an approximately 10% solution of the hypnotic in acetic acid with twice its weight of xanthydrol. After keeping for a few hours, the product is separated and washed with a little boiling alcohol, and is then sufficiently pure for melting-point determination. The m. p. of the principal dixanthylbarbituric acids are as follows: dixanthylveronal 245—246°, dixanthylphenylethylbarbituric acid 218—219°, and dixanthyldiallylbarbituric acid 242—243°. Similar derivatives are not formed by other hypnotics, and the reaction is therefore valuable for the characterisation and identification of the barbituric acids for both pharmaceutical and toxicological purposes, as it can easily be carried out with as little as 0·01 gram of the substance, or with the crude product obtained by the usual methods in toxicological investigations from the viscera, etc. G. F. M.

The Estimation of Uric Acid. Henry Jackson, jun., and Walter W. Palmer (*J. Biol. Chem.*, 1922, **53**, 373).—A simplified method for the preparation of the modified phosphotungstic acid reagent (this vol., ii, 328) is described. E. S.

Estimation of Uric Acid in Blood. L. BAUMAN and L. M. KEELER (*J. Lab. Clin. Med.*, 1922, 7, 551—552).—A modification of Folin and Wu's method in which calibrated Lovibond tintometer glasses replace standard uric acid solution. A red glass (0·4) is placed over the unknown solution and a blue glass (2·9) over the opposite prism in a Duboscq colorimeter; the blue compound is developed without the use of sodium sulphite. The glasses may also be used with the Bock-Benedict colorimeter if the red glass is placed over the immersion cylinder and the blue in front of and parallel to the standard cell. The method is of general application; the use of glasses shortens the time of procedure and removes uncertainty arising from the possible decomposition of the standard uric acid solution. Precipitation may be avoided by addition of three drops of a solution of gum acacia preserved with thymol.
CHEMICAL ABSTRACTS.

Estimation of Uric Acid and Urates in Blood. CH. O. GUILLAUMIN (*Compt. rend. Soc. biol.*, 1922, **86**, 194—196; from *Chem. Zentr.*, 1922, iv, 111; cf. this vol., ii, 170—171).—Blood is freed from albuminous substances and a volume of the filtrate corresponding with 2 c.c. of plasma, clot, or total blood is treated with 1—2 c.c. of 0·9—1·0% sodium chloride solution and sufficient 40% sodium carbonate solution to give an alkaline reaction to litmus. Five c.c. of Folin's silver reagent are added, and, after mixing, the liquid is centrifuged. The clear liquid is removed and the precipitate treated with 2 c.c. of a solution of sodium chloride containing hydrochloric acid and 7—8 c.c. of water, and again centrifuged. The clear liquid obtained is treated with 0·5 c.c. of a solution of 2·5 grams of sodium cyanide and 5 grams of sodium sulphite in 100 c.c. of water, 1·5 c.c. of sodium carbonate solution, made up to 12·5 c.c., and, after addition of Folin and Denis's phosphotungstic acid reagent, compared with a standard uric acid solution. G. W. R.

Estimation and Constitution of a Fraction of the Uric Acid in Blood. CH. O. GUILLAUMIN (*Compt. rend. Soc. biol.*, 1922, **86**, 258—260; from *Chem. Zentr.*, 1922, iv, 111; cf. preceding abstract).—Direct estimation of uric acid in serum freed from albuminous substances gives higher results than those obtained by the Folin and Denis phosphotungstate method. The difference corresponds with a portion of the uric acid of the blood which is associated with fractions of the original nuclein complex. For its estimation (by difference) the preliminary removal of albuminous substances is preferably effected by using metaphosphoric acid.
G. W. R.

The Volatilisation and Hydrolysis of Atropine in Toxicology. PAUL HARDY (*J. Pharm. Chim.*, 1922, **26**, 220—226).—The author has investigated the error in estimations of atropine due to losses by reason of volatility and hydrolysis, and finds that no loss occurs in extraction of the alkaloid, as it is not volatile in alcohol, ether, or chloroform vapour. In the case of water, atropine was detected in the distillate on boiling. Hydrolysis occurs readily in aqueous solution, increasing considerably with temperature; it is more rapid in alkaline than in neutral solution, but ammonia is not such an active hydrolytic agent as sodium hydroxide. H. J. E.

The Estimation of Creatinine. K. PFIZENMAIER and S. GALANOS (*Z. Unters. Nahr. Genussm.*, 1922, **44**, 29—41).—The method given in the *Schweizerisches Lebensmittelbuch* (3rd ed., p. 72) for the estimation of creatinine is rapid and simple, but can be successfully used only when light-coloured solutions are available for colorimetric comparison and a colorimeter of the Duboscq type is used. If the solutions are dark in colour or contain sugar, the method fails, as animal charcoal cannot be used because it adsorbs creatinine. The colorimetric comparison in cylinders as specified in the book was found to be unsatisfactory. The method of Sudendorf and Lahrmann (*Z. Unters. Nahr. Genussm.*, 1915, **29**, 1) can always be used and is the only one available for use with dark-coloured solutions. If the authors' instructions are exactly followed and too great an excess of potassium permanganate —especially with very dark-coloured solutions—is avoided, accurate results are always obtained. The methods referred to are given in detail. H. C. R.

An Apparatus for the Extraction of Theobromine and Caffeine by means of boiling Chloroform. O. P. A. H. SCHAAP (*Pharm. Weekblad*, 1922, **59**, 920—923).—The Soxhlet extractor is modified to allow of heating by means of a water-bath. Exact dimensions and procedure are laid down (cf. *J. Soc. Chem. Ind.*, 1922, 781A). S. I. L.

Estimation of Yohimbine in Yohimba Bark. ARNOLD SCHOMER (*Pharm. Zentr.-h.*, 1922, **63**, 385—386).—In applying a method described previously (A., 1921, ii, 360) to barks containing but little yohimbine, the results obtained are more trustworthy when the crystallisation of the yohimbine hydrochloride is made in the cold. The impure hydrochloride, after treatment with 5 c.c. of ether and evaporation of this solvent, is dissolved in 3 c.c. of absolute alcohol and the solution is kept at 0° for eighteen hours. The crystals which form are collected, washed with a small quantity of chloroform, then with ether, dried at 100°, and weighed. W. P. S.

Identification of Traces of True Albumin in Urine. Separation of *pseudo*Albumins. M. RENOUX (*J. pharm. Belg.*, 1922, **4**, 381—382).—As a result of tests with a solution of egg-albumin, the author concludes that either neutral crystals of sodium sulphate or magnesium sulphate may be used for the defecation of urine (after being made alkaline), preparatory to testing for traces of true albumin. CHEMICAL ABSTRACTS.

The Estimation of Total Albumin in the Spinal Fluid. J. B. AYER and H. E. FOSTER (*Repert. pharm.*, 1922, **34**, 114—115).—The albumin is precipitated with thiosalicylic acid and compared with the precipitate obtained from blood serum of known albumin content. The method is very exact. The normal quantity of albumin in 100 c.c. of fluid varies between 16 and 40 mg. (average 25 mg.). It is usually increased in pathological conditions. The authors give the albumin content found in a number of cerebrospinal diseases. CHEMICAL ABSTRACTS.

The Estimation of Albumose–Silver. J. HERZOG (*Pharm. Z.*, 1922, 67, 802—803).—One gram of the silver–protein is dissolved in 10 c.c. of water and 10 c.c. of concentrated sulphuric acid added in a thin stream. Two grams of finely powdered potassium permanganate are added in small portions with vigorous shaking. After fifteen minutes, the solution is diluted with 50 c.c. of water and ferrous sulphate added in small portions to decolorise the solution. The silver is then titrated with *N*/10-ammonium thiocyanate solution, the oxidised iron acting as indicator. H. K.

The Estimation of Fibrinogen. Protein Estimations in Salt Plasma. Question of the Utility of Serum for the Quantitative Investigation of Blood. G. LEENDERTZ and B. GROMELSKI (*Arch. expt. Path. Pharm.*, 1922, **94**, 114—123).—Indirect methods for the estimation of fibrinogen in blood are based on the fact that the fibrinogen content is equal to the difference between plasma- and serum-proteins. Since, however, serum formed by the spontaneous coagulation of blood contains water and chlorides emanating from the corpuscles, this relation only holds when the serum is obtained from separated plasma. Applications of the refractometric method to the indirect estimation of fibrinogen have not hitherto been successful when oxalate plasma has been used. Such failures have been due to two causes—the formation of a precipitate and the production of hypertonic plasma by the addition of sodium oxalate to blood. By using a 3·55% solution of sodium citrate, which is isotonic with blood and does not produce a precipitate, as anti-coagulant, the refractometric method may be readily applied. Two such methods, based on the above considerations, are described. E. S.

Estimation of Hæmoglobin. E. MEULENGRACHT (*Fol. hæmatol. I. Archiv*, 1921, **27**, 1—9; from *Chem. Zentr.*, 1922, ii, 849).—Observations on the working details of hæmoglobin estimations by Sahli's and by Autenrieth's methods. It is held that the former is superior to the latter for clinical work. G. W. R.

The Colorimetric Estimation of Hæmoglobin with Especial Reference to the Production of Stable Standards. EDWIN H. TERRILL (*J. Biol. Chem.*, 1922, **53**, 179—191).—Stock solutions of acid hæmatin such as those of Cohen and Smith (A., 1919, ii, 532) and Robscheit (A., 1920, ii, 339) suffer from the disadvantages that the colour both changes and fades on keeping, whilst a turbidity is produced on dilution. Two modified methods for the preparation of acid hæmatin standards are therefore described. The first results in the formation of a concentrated stock solution which may be diluted, especially when the diluting fluid contains glycerol, without the production of a turbidity; although it fades slowly, it does not change qualitatively in colour. The second gives an acid hæmatin protein powder which is quite stable in the dry state and forms clear solutions in water and in 0·1*N*-hydrochloric acid. After standardisation, weighed quantities may be used for the preparation of standard solutions. A method is also described for the preparation from the powder of gelatin films of acid hæmatin which may be used with advantage in place of the glass plates of Newcomer (A., 1919, ii, 179).

In estimating hæmoglobin, the laking of the blood with water prior to acidification is recommended. Direct acidification produces a turbidity which leads to high results when a clear standard is used. Heat should not be employed to develop maximum colour as this again produces a turbidity. E. S.

Estimation of Bilirubin in Blood. PAUL HOLZER and HEINZ MEHNER (*Klin. Woch.*, 1922, **1**, 66).—Meulengracht's (*J. Amer. Med. Assoc.*, 1920, **74**, 68) method is worthless for the estimation of small amounts of bilirubin, and untrustworthy for the estimation of large amounts. To obtain accurate results it is necessary to enhance the bilirubin colour by diazotisation; Bergh's (" Der Gallenfarbstoff im Blute," 1918) method is the most trustworthy, whilst that of Haselhorst (A., 1921, ii, 472) gives inaccurate results for small concentrations of bilirubin.

CHEMICAL ABSTRACTS.

[Detection of Bile Pigments in] Gastric Juice. FRANZ UTZ (*Süddeutsch. Apoth.-Ztg.*, 1922, **62**, 77—78; from *Chem. Zentr.*, 1922, ii, 921—922).—In examination of the contents of the stomach for bile pigments, the filtrate should not be used, as the pigments are retained by the filter. Directions are given for the use of the Gmelin and Plesch tests for bile pigments and for the detection of rennin. G. W. R.

Modification of the Iodine Test for Bile Pigments in Urine. ERNST SILBERSTERN (*Zentr. inn. Med.*, 1922, **43**, 185—187; from *Chem. Zentr.*, 1922, ii, 850).—The ordinary reaction is modified, whereby the urine under examination is shaken with a solution of 0·5 gram of iodine in 36 grams of ether or 76·5 grams of chloroform (1 c.c. of this solution to 2—4 c.c. of the liquid to be tested). The excess of iodine remains in its original solvent whilst the biliverdin colours the aqueous phase. In neutral solution, the reaction is more sensitive than the Gmelin test, although less sensitive in alkaline solution. The chloroform solution is preferable to the ethereal solution. G. W. R.

Tests for Liver Function. LEPEHNE (*Münch. Med. Woch.*, 1922, **69**, 342—344; from *Chem. Zentr.*, 1922, ii, 921).—Hay's flowers of sulphur test for bile acids in duodenal juice and urine is described in application to certain pathological conditions. G. W. R.

Estimation of the Activity of Invertase. T. SWANN HARDING (*Sugar*, 1922, **24**, 89—90; from *Chem. Zentr.*, 1922, ii, 1032).—A solution of sucrose, approximately 10%, is prepared so that on addition of 5 c.c. of water to 50 c.c. of the solution a reading of +33·5° *V* ± 1° is given in Schmidt and Haensch's polarimeter. The reading being accurately determined after acidifying with acetic acid, 5 c.c. of invertase solution are added and, after keeping at 30° for ten minutes, the solution is rendered alkaline by addition of sodium carbonate solution. The change in polarimeter reading is taken as a measure of the activity of the invertase solution. Ordinary invertase solutions change the polarimeter reading from +33·5° *V* to +23—10° *V*, the most active invertases giving 10° *V*. Invertases which diminish the reading to +18—20° *V* invert a 10% sucrose solution within half an hour. G. W. R.

Analysis of Blood. F. UTZ (*Pharm. Zentr.-h.*, 1922, **63**, 425—430).—A procedure is given for a complete examination of blood, and the methods used are described in detail. The following estimations should be made, the figures in brackets being the values obtained for normal blood: *Blood*, sp. gr. (1·050 to 1·060) and total solids (21 to 22%). *Blood-serum*, sp. gr. (1·027 to 1·032), refractive index (n_D 1·343 to 1·350), freezing point (—56°), total solids (6 to 10%), total nitrogen (1·04 to 1·2%). *Blood-serum after removal of proteins by uranium acetate*, nitrogen (0·02 to 0·035%), urea (0·02 to 0·04%), uric acid (0·0025 to 0·0035%), creatinine (0·001%), reducing sugars (0·06 to 0·12%), sodium chloride (0·56 to 0·60%), and indican (0·045 mg. per 100 c.c.). W. P. S.

General and Physical Chemistry.

The Refractive Indices of Phosphorescent Sulphides. MAURICE CURIE (*Compt. rend.*, 1922, **175**, 617—619).—Direct determination of the refractive indices of phosphorescent sulphides gives, for yellow light, values between 2·10 and 2·15. An appreciable fraction of each substance gives figures ranging to a lower limit of 1·6, whilst for no portion did the refractive index exceed 2·20. According to the work of Lenard (A., 1910, ii, 369) and Schmidt (*Ann. Physik*, 1922) the values should lie between 2·70 and 3·16, so that Lenard's interpretation of the constancy of the ratio $\lambda/\sqrt{K}$ does not appear to be well founded. H. J. E.

Quantum Theory of Line Spectra. N. BOHR (*Danske Vid. Selsk. Skrifter, nat. mat. Afd.*, 1918, **4**, [8], 1—100; from *Chem. Zentr.*, 1922, iii, 221—223).—Theoretical. The author develops his quantum theory of line spectra with special reference to the hydrogen spectrum, and to the Stark and Zeeman effects. G. W. R.

The Intensities of the Lines in the Balmer Series of Hydrogen. MASAMICHI KIMURA and MITSUHARA FUKUDA (*Mem. Coll. Sci. Kyoto*, 1922, **5**, 165—168).—The intensity distribution of the hydrogen lines in the Balmer series is greatly affected by the pressure of hydrogen. The addition of the vapours of hydriodic acid, iodine, sulphur, mercury, or sodium exerts an effect similar to that obtained on increased pressure. These gases suppress the higher members of the Balmer series and appear to exert a specific effect on the hydrogen atoms. The results on the action of iodine vapour are in disagreement with those of Holtzmark (A., 1918, ii, 283). W. E. G.

The Broadening of the Balmer Lines of Hydrogen with Pressure. E. O. HULBERT (*Astrophys. J.*, 1922, **55**, 399—405).—Experimental evidence is adduced for abandoning, as a cause which interferes with the absolute homogeneity of spectrum lines, the consideration of disturbance depending on collision with other particles, and suggesting that the principal cause of the widening of the lines is the influence of an electric field on the radiating particle (cf. Merton, *Proc. Roy. Soc.*, 1915, **92**, 322). A. A. E.

Influence of Gases and Vapours on the Intensities of the Lines of the Secondary Spectrum of Hydrogen. MASAMICHI KIMURA and MITSUHARA FUKUDA (*Mem. Coll. Sci. Kyoto*, 1922, **5**, 153—163).—The intensities of the lines in the hydrogen secondary spectrum are modified by pressure, and the addition of gases and vapours. Increase in pressure weakens those lines in the secondary spectrum on the long wave-length side of λ 6240, and in the region between λ 5690 and H_β. Between these two regions, the lines undergo selective changes in intensity. The Fulcher group I lines are relatively intense at low pressures, whilst those belonging to group II are weak. The addition of helium, mercury, or bromine to the spectrum tube produces similar changes in the intensities of the lines to those obtained on increase of pressure, although helium exerts a specific effect on some of the hydrogen lines. The suggestion is made that the hydrogen molecule can be reformed either by the combination of a positively charged molecule and an electron, or by the association of two neutral atoms, and that the two groups of lines owe their existence to the occurrence of these two distinct processes. W. E. G.

The Continuous Spectrum of Hydrogen in the Schumann Region. E. P. LEWIS (*Physical Rev.*, 1920, **16**, 367—368; cf. *Science*, 1915, **41**, 947).—By the use of a fluorite vacuum spectrograph it has been found that the continuous spectrum of hydrogen extends with undiminished intensity well into the Schumann region. At λ 1800 it begins rather suddenly to diminish in intensity, and disappears at about λ 1750. Slightly below λ 1700, the line spectrum of hydrogen reappears, with no trace of a continuous background. Attention is directed to the fact that the continuous spectrum completely fills the region between the Balmer series and the Schumann line spectrum, with no lines whatever superimposed on it. The perfect uniformity and continuity of this spectrum make it the best background for the examination of absorption spectra (for example, of benzene) in the ultra-violet. Helium and neon give similar, although less intense, continuous spectra extending far into the ultra-violet. A. A. E.

Identification of Air Lines in Spark Spectra from λ 5927 to λ 8683. PAUL W. MERRILL, F. L. HOPPER, and CLYDE R. KEITH (*Astrophys. J.*, 1921, **54**, 76—77).—Data have been secured (cf. *ibid.*, 1920, **51**, 211) for the chemical identification of the air lines from λ 5927 to λ 8683 in spark spectra. The spark was operated alternately in oxygen and air, and the lines due to oxygen identified. The remaining air lines, except a few argon lines, are ascribed to nitrogen. A. A. E.

The Intensity Distribution in the β-Ray Spectra of Radium-*B* and -*C*. J. CHADWICK and C. D. ELLIS (*Proc. Camb. Phil. Soc.*, 1922, **21**, 274—280).—Two radically different views of β-ray disintegration have been put forward. That of Meitner (this vol., ii, 416) in which the entire β-ray emission of a radioactive substance consists of a series of homogeneous groups of electrons, and that of Ellis (this vol., ii, 466) according to which the disintegration electrons form a continuous spectrum. In the present paper, measurements are made of the intensity distribution in the β-ray emission of radium-*B* and -*C*, and it is shown that the continuous spectrum has a real existence, and is independent of the experimental arrangement. The five strong lines in the radium-*B* β-ray spectrum formed only one-fifth of the total emission, the main feature of which was the continuous spectrum. The number of electrons received per second in the ionisation chamber, calculated from the observed ionisation currents, was in agreement with the number of atoms disintegrating per second at the source.

W. E. G.

The Spectrum of Radium Emanation. R. E. NYSWANDER, S. C. LIND, and R. B. MOORE (*Astrophys. J.*, 1921, **54**, 285—292).—Photographic and visual measurements were made of the spectrum of radium emanation, λλ 3982 to 7450. The relative intensities of the lines differed markedly, as a rule, from the previous observations of Watson and Royds and Rutherford; many strong lines of the one hundred and twenty previously measured were not found; of the forty-four lines obtained, nine were new. Changes of intensity with duration of the discharge were observed, some lines decreasing and some increasing in strength, whilst the colour of the discharge changed from a bright glow to violet. A modification is described of Duane's apparatus for the purification of radium emanation. A. A. E.

The Spectrum of Neutral Helium. C. V. RAMAN (*Nature*, 1922, **110**, 700—701).—A criticism of Silberstein's attempt (this vol., ii, 674) to explain the spectrum of neutral helium on the assumption of the independence of the electrons. The view is expressed that the approximate agreements between the calculated and actual frequencies are merely fortuitous arithmetical coincidences, and a number of statements are made, based on a survey of the figures and a series of computations, in its support. The same considerations apply with even greater force in the case of lithium, when a choice of six numbers, compared with four in the case of helium, is permitted. Further, it is held that the Rydberg constant 109723 is appropriate only to the case of the ionised helium atom in which only one electron is coupled to the nucleus.

A. A. E.

The Structure of the Red Lithium Line. T. R. MERTON (*Nature*, 1922, **110**, 632).—A criticism of the views of McLennan and Ainslie (this vol., ii, 541; cf. Zeeman, A., 1913, ii, 812; *Proc. K. Akad. Wetensch. Amsterdam*, 1913, **15**, 1130; Kent, *Astrophys. J.*, 1914, **40**, 337; King, *ibid.*, 1916, **44**, 169; Takamine and Yamada, *Proc. Tokio Math. Phys. Soc.*, 1914, **7**, 339; Merton, *Proc. Roy. Soc.*, 1921, [*A*], **99**, 101) on the structure of the lithium line λ=6708. Under the appropriate conditions, the line appears to be a simple pair; if the four components were really two pairs due to the two isotopes, they should always appear together with an invariable intensity ratio of 1 : 16. This is not in accordance with the experimental results. Theoretical objections are also raised. A. A. E.

The Exploded-wire Spectrum of Calcium. R. A. SAWYER and A. L. BECKER (*Physical Rev.*, 1921, **18**, 164).—By expending constant power on wires of varying mass of calcium and other elements, or varying power on wires of constant mass, spectra have been obtained in which the relative intensities of the three calcium lines, *H*, *K*, and λ 4227, vary as in the spectra of stars of different classes. The calcium lines, particularly *H* and *K*, appear to be tremendously enhanced by the very high temperature of the explosion, since they appear more prominently in the spectra of exploded wires of other metals (in which the amount of calcium present must be very minute) than the spectra of the metals themselves. A. A. E.

Excitation of Atoms to Light Emission by Electron Collisions. R. Seeliger (*Z. Physik*, 1922, **11**, 197—200).—According to the Bohr theory, the passage of an electron from an initial to a final orbit is determined by the two probabilities, *W* and *w*, where *W* is the probability that the electron shall be raised from the normal to the initial orbit, and *w* is the probability of the transition from the initial to the final state. The former (*W*) is affected by the conditions of excitation, and according to Franck, the latter (*w*) should be also dependent on the external conditions. To test this point, the effect of the velocity of the exciting electrons on the intensity of certain related mercury lines has been examined. Two pairs of lines, 4916 ($3{\cdot}5S—2P$) and 2857 ($3{\cdot}5S—2p_2$), and 2652 ($4d'—2p_2$) and 4339 ($4d'—2P$) were chosen, and the intensities of these measured in different parts of the glow-discharge. The form of the intensity curves were widely different for the individuals of both pairs, and the maxima occurred at different distances from the mercury electrode. Thus, in these cases, the probability of transition from one orbit to another is dependent on the external electric field. W. E. G.

Mass-absorption Coefficients as a Function of Wave-length Above and Below the *K X*-Ray Limit of the Absorber. F. K. Richtmyer (*Physical Rev.*, 1921, **17**, 264—265).—An extension to silver and lead, and to longer wave-lengths, of the relation between *X*-ray wave-lengths and the mass-absorption coefficient μ/ρ (for aluminium, copper, and molybdenum, cf. this vol., ii, 105).
A. A. E.

The Evidence Regarding the so-called "*J*" Radiation in the Characteristic *X*-Ray Spectra of the Elements. F. K. Richtmyer (*Physical Rev.*, 1921, **17**, 433—434).—From an examination of the absorption of water, aluminium, copper, boron, silver, and molybdenum, the author concludes that, within 1%, there are no discontinuities in absorption suggestive of *J*-radiations.
A. A. E.

Absorption of *X*-Rays by Chromium, Manganese, and Iron. William Duane and Hugo Fricke (*Physical Rev.*, 1921, **17**, 529—531).—The *K* critical absorption wave-lengths ($\lambda \times 10^8$ cm.) of chromium, manganese, and iron are 2·0623, 1·8893, and 1·7377, respectively. The energy changes corresponding with the critical absorption appear to be the same for iron atoms in the bi- and ter-valent conditions. A. A. E.

The Tungsten *X*-Ray Spectrum with a Mica Spectrometer. USABURO YOSHIDA and SHINSUKE TANAKA (*Mem. Coll. Sci. Kyoto*, 1922, **5**, 173—178).—The arrangement is essentially that used previously (*ibid.*, 1921, **4**, 343) and the grating constant was calculated from the wave-lengths of the prominent lines of the *L*-series of tungsten. With the mica spectrometer the *X*-ray spectrum of tungsten may be obtained up to the seventh and even to the tenth order. Eleven lines of unknown origin were detected on the photographs, but these might be due to reflection from the mica in an unknown manner. The wave-lengths of the known lines are in agreement with those given by Siegbahn within the limit of the experimental error. The existence of the line found by Overn at 1070 Å. has been confirmed. W. E. G.

Critical Potentials of the *L*-Series of Platinum. DAVID L. WEBSTER (*Physical Rev.*, 1920, **15**, 238).—The *L*-series must be regarded as consisting of three sub-series, L_1 (containing the lines l, α_2, α_1, β_2, β_5, and β_6), L_2 (containing the lines η, β_4, β_1, γ_1, γ_2, and possibly β_3), and L_3 (containing the lines γ_4, γ_3, and possibly β_3). A. A. E.

Temperature Shift in Near Ultra-red Bands. H. M. RANDALL, W. F. COLBY, and R. F. PATON (*Physical Rev.*, 1920, **15**, 541—543; cf. Randall and Imes, A., 1920, ii, 570; Colby, A., 1920, ii, 655).—Curves are given showing the absorption of hydrogen chloride in the neighbourhood of 3·4 μ at 20°, 105°, and 250°. It appears that in spite of the outward shift of intensity to higher velocity values, no shift takes place in the fine structure. Further investigations at higher temperatures are in progress. A. A. E.

The Labile Nature of the Halogen Atom in Organic Compounds. VII. Absorption Spectra of the Halogen Derivatives of some Cyclic Compounds, and their Bearing on the Question of an Oxygen–Halogen Linking. HUGH GRAHAM and ALEXANDER KILLEN MACBETH (T., 1922, **121**, 2601—2608).

Carbon Dioxide Absorption in the near Ultra-red. E. F. BARKER (*Astrophys. J.*, 1922, **55**, 391—398).—New absorption curves have been obtained. The 2·7 μ region, previously considered to be a doublet, proves to be a pair of doublets, with centres at 2·694 μ and 2·767 μ (approx.). The 4·3 μ band appears as a single doublet with centre at 4·253 μ. The frequency difference between maxima is nearly the same for each of the three doublets, and equal to $4{\cdot}5\times10^{11}$. Complete resolution of the band series was not effected, but there is evidently a complicated structure, with a "head" in each case on the side of shorter wave-lengths. If a linear configuration of the three atoms in the molecule of carbon dioxide is assumed, the moment of inertia of the molecule, computed from the doublet frequency difference, is 50×10^{-40}. This gives the distance of the central carbon atom from each oxygen atom as $0{\cdot}97\times10^{-8}$ cm. Since the linear molecule could have only three modes of vibration, it is suggested that the two doublets at 2·7 μ may correspond with two successive changes in stationary state for the same vibration. A. A. E.

Absorption of Light by Inorganic Salts. E. F. GEORGE (*Diss., Ohio,* 1920).—The change in absorption produced by mixing sulphates in solution with other sulphates is small in comparison with corresponding changes in nitrates, and still smaller than in the case of chlorides. The influence of temperature on the absorption of solutions of mixed salts is greatest with chlorides. It therefore appears that Ostwald's view that the coloured ion alone is effective in the absorption of light is not well founded. When the ratio of the absorption of the mixture to the sum of the absorptions of the component parts is plotted as a function of the wave-length, the resulting curve generally shows a minimum near the middle of the spectrum. Many of the curves are shown to be exponential in form. CHEMICAL ABSTRACTS.

The Absorption Spectra of *o*-Cresolsulphonphthalein. W. R. ORNDORFF, R. C. GIBBS, M. SCOTT, and S. D. JACKSON (*Physical Rev.,* 1921, **17**, 437).—*o*-Cresolsulphonphthalein and other related compounds have in neutral aqueous solutions two absorption bands which are modified or replaced by new bands on the addition of acid or alkali. In the case of a dilute alkaline solution, the new type of absorption is not stable, but reverts to the two band absorption found in the corresponding neutral solution. It is considered that in neutral aqueous solutions the carbinol and hydrate forms of the phthalein are present and that on the addition of either acid or alkali a salt having a quinoid structure is formed. A. A. E.

Flame Excitation of Luminescence. E. L. NICHOLS and D. T. WILBER (*Physical Rev.,* 1921, **17**, 453—468).—The fluorescence developed by certain substances, notably lime, zirconia, magnesia, silica, alumina, zinc oxide, some phosphorescent sulphides, and a number of other compounds, by contact with a hydrogen flame, differs from photoluminescence and from mere temperature radiation. A definite temperature-range exists for each substance, and the effect does not appear to depend on the presence of traces of activating elements. Many substances which are strongly luminescent under the action of light do not respond to flame excitation. Excitation does not occur by heating in air or hydrogen or in a vacuum, or by contact with a jet of hydrogen while hot unless the hydrogen is ignited and conditions are favourable for free oxidation. The effect probably cannot be ascribed to the presence of H or H_3 molecules. The spectra obtained by flame excitation have been examined. A. A. E.

Chemoluminescence. I. A. A. GRINBERG (*J. Russ. Phys. Chem. Soc.,* 1920, **52**, 151—185).—A summary is given of previous work on this subject, particularly on bioluminescence (cf. Radziszewski, A., 1877, ii, 345; Lenard and Wolf, A., 1888, 1000; Trautz, A., 1905, ii, 662; Trautz and Schorigin, A., 1905, ii, 494; Dubois, A., 1913, i, 1021; Harvey, A., 1917, i, 365; ii, 436; Goss, A., 1917, ii, 436). The light effect obtained with the system, pyrogallol–hydrogen peroxide–potassium permanganate under various conditions has been investigated, the intensity of the light being measured photographically. At 16—17° the greatest intensity was obtained with a mixture of 4 c.c. of 0·005*M*-potassium permanganate, 2 c.c. of 0·01*M*-pyrogallol, and 2 c.c. of 3—12% hydrogen peroxide solutions. Sulphuric acid in the concentration 0·018—0·04% weakens the effect considerably, whilst 0·0046—0·026% of potassium hydroxide enhances it to a slight extent. T. H. P.

Mutarotation. I. C. N. Riiber (*Ber.*, 1922, **55**, [*B*], 3132—3143).—The data with regard to the relationship of mutarotation to other physical changes in solution are very scanty and exhibit considerable discrepancies among themselves. The changes in refractive index and volume of a solution containing a substance undergoing mutarotation have now been studied.

The index of refraction of an aqueous solution of dextrose does not appear to vary when the ordinary Pulfrich refractometer is used, but the instrument is scarcely suitable for the purpose owing to the impossibility of maintaining the requisite degree of constancy in temperature. By means of a Hallwachs's prism, it can, however, be shown that the refractive index increases slightly with age in the case of dextrose solutions and that the change occurs with immeasurably greater rapidity when a little ammonia is added to the solution. The method, however, does not lend itself to the periodical observation of the action and attention has therefore been directed to the measurements of alteration of volume in the solution. The dilatometer employed resembles essentially a Sprengel pyknometer. One tube is firmly closed by a small rubber plate and the change in volume of the solution is indicated by the movement of the meniscus in the other limb and measured by means of a microscope. A movement of 0·005 mm. can be detected with certainty; this corresponds with an alteration in volume of less than 0·0000001. The capacity of the instrument is 66·7 c.c. The temperature is maintained constant to within 0·001°. It is thus shown that solutions of dextrose in water increase in volume during the process of mutarotation at a rate corresponding with that required for a unimolecular, irreversible reaction but subsequent observations prove that in reality a state of equilibrium is finally attained and indicate that water possibly takes some part in the change. The quantitative parallelism between mutarotation and change of volume makes it certain that the two phenomena have a common cause.

A solution of lactose the optical activity of which diminishes progressively shows a gradual expansion, whereas a contraction is observed with a solution of maltose with increase of specific rotation. Galactose solution suffers a primary expansion and a subsequent contraction. Solutions of sucrose and mannitol which do not exhibit mutarotation are constant in volume. Solutions of the optically inactive dulcitol do not undergo change in volume. Acetaldehyde, in 30 per cent. aqueous solution, exhibits a considerable expansion, whereas acetone under similar conditions gives a marked and rapid contraction. Ethyl alcohol gives a slight expansion.

The applicability of the dilatometer just described is not restricted to reactions involving mutarotation. but since changes in volume are probably involved in all chemical reactions, it can be used for the investigation of processes taking place at the ordinary temperature. The accuracy of the procedure is at least as great as that of the polarimetric or refractometric method and it has the great advantage that it does not necessitate the use of transparent and colourless solution. It has been found very useful in the study of the inversion of sugar by invertin and the saccharification of starch by ptyalin; in each case a marked contraction takes place as is to be expected. H. W.

Photochemistry of Chlorine Detonating Gas. FRITZ WEIGERT and KARL KELLERMANN (*Sitzungsber. Preuss. Akad. Wiss. Berlin*, 1922, **24**, 315—320).—The early stages of the combination of hydrogen and chlorine have been investigated. It is shown that a characteristic streaky appearance is visible in the gas mixture during the time 1/100—1/20 second from the moment of excitation. A vanishingly small quantity of hydrogen chloride only is formed directly by the radiation, but this is followed by a large subsequent formation. From this result, the authors show that the primary reaction, contrary to many previous assertions, in all probability is in keeping with Einstein's photochemical equivalent law. J. F. S.

Photochemical Oxidation of Hydriodic Acid. CHR. WINTHER (*K. Danske Vid. Medd. Math.-fys. Medd.*, 1920, **2**, No. 2, 1—28; from *Chem. Zentr.*, 1922, iii, 592).—In the oxidation of hydriodic acid solutions in thin films, the velocity of reaction was measured at the beginning and also in the course of the reaction. The effect of shaking, oxygen concentration, and wave-length of light was also investigated. With vigorous shaking, the reaction shows an increase in velocity during an induction period and then remains constant. The sensitiveness of the oxidative process to light is proportional to the absorption of tri-iodide-ion which acts as an optical catalyst. This is an example of "optical autosensibilisation" where the catalyst is actually formed by the reaction which it catalyses. The oxidation of leuco-compounds to dyes, the oxidation of pyrogallol in alkaline solution, and the oxidation of sodium sulphide in aqueous solution are similarly catalysed. G. W. R.

Photochemical Efficiency of Absorbed Radiation. CHR. WINTHER (*K. Danske Vid. Medd. Math.-fys. Medd.*, 1920, **2**, No. 3, 1—35; from *Chem. Zentr.*, 1922, iii, 592—593).—The amount of energy absorbed in the photochemical oxidation of a certain amount of hydrogen iodide was found to be identical with the amount calculated as necessary for its activation. The absorbed energy is thus used exclusively for the activation of the hydrogen iodide molecule. The equivalence of absorbed energy and energy required for activation is enunciated as a general principle in photochemical reactions. Certain consequences of this principle are discussed. Discrepancies are attributed to experimental errors or to the conversion of the absorbed radiation into radiation of shorter wave-length. G. W. R.

The Decomposition of Hydrogen Molecules by Excited Mercury Atoms. G. CARIO and J. FRANCK (*Z. Physik*, 1922, **21**, 161—166).—On the collision of excited atoms with other atoms, the quantum energy may be given up without light emission (cf. Franck, this vol., ii, 464), and chemical change may take place. On exposing a mixture of hydrogen and mercury to the mercury line 2536·7 Å., the radiation was strongly absorbed, and the hydrogen dissociated. Powdered copper oxide was reduced, and the pressure of the hydrogen continuously decreased at a temperature of 45°. In the absence of hydrogen and mercury, no reduction occurred. The mercury is acting as a sensitiser. In the absence of copper oxide, the atomic hydrogen is adsorbed by the walls. At low pressures, the velocity of dissociation was very slow, and this behaviour indicates a short period of activity of the mercury atoms. The velocity of reaction increases up to 15 mm. pressure and then remains constant. Tungsten trioxide is also reduced, and the reduction is not in any way due to illumination by the light. Since tungsten oxide is not reduced by hydrogen below a red heat, it is unlikely that the phenomenon is caused by rapidly moving hydrogen molecules.

The hydrogen is dissociated by mercury atoms which are in the $2p_2$ condition. Calculations show that the upper limit for the heat of dissociation of hydrogen is 112 Cal. W. E. G.

Photoelectric Effect of Alkali [Metal] Vapours and a New Determination of *h*. E. H. WILLIAMS and JAKOB KUNZ (*Physical Rev.*, 1920, **15**, 550).—The resonance potential of cæsium vapour is 1·48 volts, whilst the ionisation potential is 3·9 volts. If the same amount of work is required for the breaking up of a neutral cæsium atom by light as by moving electrons, then the long wave-length limit of the photoelectric effect of cæsium vapour should be $l=318{\cdot}4$ $\mu\mu$, according to the equation $hn=eV$. If this is found to be the case, then (1) the long wave-length limit is quite different for cæsium metal and for cæsium vapour, and (2) a new photoelectric method for the determination of *h* is available. Experimentally, there is no photoelectric effect in cæsium vapour down to 313 $\mu\mu$, but the effect at 253 $\mu\mu$ is very marked. A. A. E.

The Photoelectric Long Wave-length Limit of Platinum and Silver. OTTO STUHLMAN, jun. (*Physical Rev.*, 1920, **15**, 549—550; cf. *ibid.*, 1919, **13**, 109).—The photoelectric long wave-length limits of platinum and silver are $\lambda_0=284$ $\mu\mu$ and $\lambda_0=325$ $\mu\mu$, respectively. A. A. E.

Soft X-Rays of Characteristic Type. E. H. KURTH (*Physical Rev.*, 1921, **17**, 528—529; **18**, 99—100).—The radiation curve of aluminium shows breaks at 38 and 120 volts, corresponding with 326 Å.U. (possibly the *M*-series) and 103 Å.U. (possibly the *L*-series), respectively. For iron, 62·8 Å.U. and 48·4 Å.U. appear to represent the extremes of the *M*-series, whilst 16·3 Å.U. probably corresponds with the *L*-series. There was also some indication of a break in the curve at 50 volts, corresponding with 247 Å.U. Carbon yields a pronounced break at 43·6 Å.U., agreeing with the extrapolated value for the *K* series. The following approximate figures (Å.U.) are also recorded: *K*-series: carbon, 42·6; oxygen, 23·8. *L*-series: carbon, 375; oxygen, 248; iron, 16·3; copper, 12·3. *M*-series: iron, 54·3; copper, 41·6. *N*-series: iron, 247; copper, 119. A. A. E.

Absorption of X-Rays in Crystals. TYCHO E:SON AURÉN (*Medd. K. Vetenskapsakad. Nobel-Inst.*, 1922, **4**, No. 10, 1—6).—It has been shown in a previous paper (A., 1921, ii, 367) that, in the case of amorphous substances, the molecular absorption coefficient can be calculated as a sum of the atomic absorption coefficients for *X*-rays of the constituent elements. It is now shown that the same holds true for a number of crystalline substances, including alum, calcite, and gypsum. The observed absorption coefficients agreed with considerable accuracy with those calculated from the atomic absorption coefficients derived from a study of amorphous substances, and the absorption showed no variation in different directions in the crystals. In the cases of rock salt and sylvine an abnormally low absorption was observed when the incident rays were parallel to the principal planes of the crystal. This effect, which is probably due to scattering, becomes less marked as the angle between the direction of the incident rays and the principal structural planes is increased. E. H. R.

The Durability of Radium Solutions. AUG. BECKER (*Z. anorg. Chem.*, 1922, **124**, 143—152).—The permanency of the radium solution is defined as its constancy in emitting emanation. The author found that solutions containing from 0·02 to 0·0000005 mg. radium per gram solvent did not show any decay in eight years. The possible experimental error was 1%. W. T.

Electric Furnace Experiments involving Ionisation Phenomena. ARTHUR S. KING (*Astrophys. J.*, 1922, **55**, 380—390; cf. Saha, A., 1920, ii, 457, 659; 1921, ii, 4, 162; *Proc. Roy. Soc.*, 1921, [*A*], **99**, 135).—Results are obtained which verify certain predictions due to Saha. It is shown that the intensity of the enhanced lines of alkaline-earth metals is decreased by the presence of the more easily ionised potassium and cæsium. The results with mixed gases are such as would be expected if it is assumed, with Saha, that flame and enhanced lines are associated with neutral and ionised atoms, respectively. A. A. E.

Thermal Ionisation of Gaseous Elements at High Temperatures. Confirmation of Saha's Theory. ARTHUR A. NOYES and H. A. WILSON (*Proc. Nat. Acad. Sci.*, 1922, **8**, 303—307).—On the basis of Saha's hypothesis (A., 1920, ii, 659; 1921, ii, 162), the authors show that the constant, K, of the reaction $M = M^+ + E^-$ can be calculated by means of the formula $\log k = -5048V/T + 2{\cdot}5 \log T - 6{\cdot}56$, where V is the ionisation potential and T the absolute temperature. From some earlier experiments of Wilson on the conductivity of salts in flames, it is possible to calculate approximately the value of K (A., 1916, ii, 72). These values have been calculated for the case of salts of the alkali metals and the value of $K \times 10^{12}$ obtained both by means of the above formula and Wilson's experiments. The values in brackets are obtained by the formula, cæsium 3500 (8200), rubidium 780 (1600), potassium 430 (620), sodium 5·6 (6·2), and lithium 0·8 (1·4). The two sets of values are comparable and of the same order, and this is taken as a confirmation of Saha's hypothesis. From these ionisation constants, it is possible to calculate the degree of ionisation of an element into an electron and an ion. J. F. S.

Resonance and Ionisation Potentials of Helium. J. Franck (*Z. Physik.*, 1922, **11**, 155—160).—A theoretical paper. The lines in the parhelium spectrum discovered by Lyman (this vol., ii, 674) throw light on the relationship between the resonance and ionisation potentials, and the structure of the helium atom. The potentials calculated from the lines in this spectrum are in agreement with the experimental results of Franck and Knipping (A., 1920, ii, 72) and Horton and Davies (A., 1921, ii, 672), if 0·8 volt be subtracted from these values. It is not possible that this divergence is due to error of observation. Reasons are advanced to show that the first break in the curve corresponds with the change $0{\cdot}5S - 1{\cdot}5s$, and the second with two successive changes, $0{\cdot}5S - 1{\cdot}5S + 0{\cdot}5S - 1{\cdot}5s$. The difference is $0{\cdot}5S - 1{\cdot}5S$, and not $0{\cdot}5S - 1{\cdot}5s$ as has been assumed. This accounts for the difference of 0·8 volt.

The resonance and ionisation potentials of other gases, which are based on those of helium, must be reduced by this amount, and the following ionisation potentials are obtained after making this correction: H_2, 16·4±0·25, 29·7±0·4; N_2, 17·05±0·3, 24·7, 30·0; HI, 12·7; HBr, 13·3; HCl, 13·7; HCN, 14·8. W. E. G.

Spectroscopic Investigation of the Ionisation of Argon by Electron Collisions. F. Horton and Ann Catherine Davies (*Proc. Roy. Soc.*, 1922, [*A*], **102**, 131—150).—The authors' previous determinations of the resonance radiation, 11·5 volts, and ionisation, 15·1 volts, of argon (cf. A., 1920, ii, 215) have been confirmed by both spectroscopic investigation and current–voltage curves. The apparatus used resembles that developed in their experiments with neon (cf. A., 1921, ii, 422). The brighter red lines of the argon spectrum appeared simultaneously, at a point a few volts higher than the ionisation voltage. The first visibility of the lines is accompanied by a sharp increase in the current which is due to the neutralisation of the space charge of the emitted electrons near the filament. On reducing the voltage the lines persist to an extent which depends on the electron current. At moderate gas pressures, the difference between the voltages of appearance and disappearance of the lines sometimes amounted to 11 volts. On decreasing the voltage from about 25 volts, the lines in the "red spectrum," λ 4510·9, λ 4345·3, λ 4272·3, undergo a marked enhancement in the region of 19 to 16 volts. The intensity of the bright lines λ 7067·5 and λ 6965·8 decreases continuously in brightness as the voltage is lowered. The "blue spectrum" requires for its stimulation higher potential differences across the tube. At 19 volts, the lines λ 4430·4 and λ 4426·2 become visible, and with increasing voltage the intensity increases up to 24 volts and remains stationary until 34 volts, when the intensity again rapidly increases. The break at 19 volts corresponds with the removal of a second electron from an already ionised atom, and that at 34 volts with the double ionising voltage of the argon atom. The difference between the two values gives the normal ionising voltage. From a consideration of the minimum voltages at which the "blue spectrum" lines could be detected, it is shown that the Stark classification of the helium lines into "bivalent" and "tervalent" is inaccurate. The ionisation voltage is related to one of the *M* *X*-ray absorption limits of the elements in a manner analogous to that in which the helium ionisation voltage is related to the *K* absorption limits, and the neon ionisation voltage to the *L* absorption limits. W. E. G.

Luminous Discharge in Hydrogen and Mercury and a New Method of Measuring Ionisation Potentials. GEORGE E. GIBSON and W. ALBERT NOYES, jun. (*J. Amer. Chem. Soc.*, 1922, **44**, 2091—2106).—The authors have examined the conditions of stability of the luminous discharge in hydrogen and mercury, and the variation of the potential, E_d, at which the luminous discharge vanishes, with changes of pressure. To explain the phenomena observed, they put forward the hypothesis that the potential gradient in the portion of the tube between the cathode and the place where ionisation first occurs diminishes as the pressure is decreased until at the minimum of E_d the potential drop in this region has fallen to a very low value, not more than a few tenths of a volt in the shorter tubes or more than about a volt in the longest tubes measured. At the higher pressures, ionisation occurs at regions intermediate in position between the anode and cathode, and as the pressure is diminished these regions recede from the cathode until at the minimum of E_d ionisation occurs only in the immediate neighbourhood of the anode. It is shown that the voltage at which the luminous discharge in hydrogen disappears in tubes furnished with heated tungsten cathodes is a function of the pressure for a given tube passing through a minimum value which is usually a simple multiple of the ionisation potential, 30·9±0·4 volts. In mercury vapour the disappearance voltage of the luminous discharge is a simple integral multiple of the ionisation potential, 10·7±0·4 volts. J. F. S.

Electrical Conductivity of Hydrochloric Acid and Potassium Chloride in Presence of Sucrose. ARTHUR JOSEPH KIERAN (*Trans. Faraday Soc.*, 1922, **18**, 119—125).—Experimental determinations have been made of the electrical conductivities at 25° of solutions of hydrochloric acid of concentrations ranging from 0·05N to 0·0005N in the presence of 5%, 10%, and 20% of sucrose. Similar determinations were made with potassium chloride solutions ranging from 0·01N to 0·0005N in the presence of 10% of sucrose. In the latter case, the equivalent conductivity increased normally with increasing dilution, to an asymptotic limit. In the case of hydrochloric acid solutions, however, the behaviour was abnormal, the equivalent conductivity passing through a maximum in the region $N/300$—$N/500$, dependent on the concentration of the sucrose, and thereafter steadily decreasing with increasing dilution. This abnormality was traced to the presence of minute traces of an electrolytic impurity (probably an organic salt of calcium) in all samples of sucrose. Values of m in the relation $\Lambda=\Lambda'\eta^m$, in which Λ and Λ' are respectively the equivalent conductivities in media of unit viscosity and of viscosity η, have been determined as follows: hydrochloric acid and sucrose, 0·57; hydrochloric acid and dextrose, 0·68; potassium chloride and sucrose, dextrose, and glycerol, respectively, 0·73, 0·77, and 0·92. The results confirm the conclusion of Kraus (A., 1914, ii, 90) that m approaches the value unity as the molecules of the medium become smaller in size and the larger the size of the ions of the electrolyte.

J. S. G. T.

Conductivity of Sodium Iodide in Amyl Alcohol at very Low Concentrations. Charles A. Kraus and J. Egbert Bishop (*J. Amer. Chem. Soc.*, 1922, **44**, 2206—2212).—Exceedingly pure amyl alcohol may be prepared, as follows: ordinary amyl alcohol was submitted to an initial fractionation and the portion boiling above 130° dehydrated over quicklime, after which it was redistilled. The product was treated with a small amount of sodium and the resulting solution repeated fractionated. In this way, amyl alcohol with a specific conductivity of 2×10^{-8} was obtained and by effecting the fractionation under reduced pressure the specific conductivity became 1×10^{-8}. Solutions made up in this product were not stable, but if the alcohol was subjected to fractional condensation under reduced pressure and the distillate collected in the conductivity cell a product with specific conductivity $1·4\times10^{-9}$ was obtained and solutions made up in this were very stable; solutions of sodium iodide in this specially prepared amyl alcohol did not vary more than 0·1% in fourteen hours. The electrical conductivity of solutions of sodium iodide in amyl alcohol was measured at 18° for concentrations ranging between $1·0\times10^{-5}N$ to $17\times10^{-5}N$. The mean variation of the results does not exceed 0·1%. In the more dilute solutions, the points conform to the requirements of the law of mass action within the limits of the experimental error. At the higher concentrations there is a small although constant deviation from the mass action relation. From an extrapolation of the curve to zero concentration the value 11·059 is obtained for Λ_0 and the value $2·933\times10^{-4}$ for K.

J. F. S.

Variation of the Electrical Conductivity among the Ammoniacal Derivatives of Platinous Nitrite. L. A. TSCHUGAEV and N. A. VLADIMIROV (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 135—138).—The values of Λ_{1000} for tetra-amminoplatinous nitrite, $[Pt4NH_3](NO_2)_2$; nitrotriamminoplatinous nitrite,

$$[NO_2Pt3NH_3]NO_2;$$

cis- and *trans*-dinitrodiamminoplatinum, $[(NO_2)_2Pt(NH_3)_2]$; and potassium platinonitrite are found to be, respectively, 276·5, 96·5, 0·95, 2·42, and 302·4. The observed value of Λ_{2000} for nitrotriamminoplatinous platinonitrite, $[NO_2Pt3NH_3]_2Pt(NO_2)_4$, is 217, the value calculated by summation of the mobilities of the corresponding ions being 197·2 (cf. Tschugaev and Kiltinovitsch, T., 1916, **109**, 1286). T. H. P.

Passivity and Over-potential. ULICK R. EVANS (*Trans. Faraday Soc.*, 1922, **18**, 1—13).—It is suggested that the relative values of the interfacial tensions between the metal, corrosion product, and solution is the factor on which the protection against corrosion of the metal by the solution depends. The activation of passive metals by chlorides is related to the peptising action of metallic hydroxides by chlorides; the rendering passive by chromates is correlated with the flocculating action of these salts. The protective layer probably consists of a layer of oxygen atoms connecting the metal on the one side with solution on the other. Similarly, at a cathodically polarised electrode a layer of hydrogen nuclei connect the metal with the liquid, the hydrogen being probably in a state intermediate between the elementary and ionic forms. The theory is, in some respects, opposed to that of Friend (T., 1922, **119**, 932). J. S. G. T.

Chemical Passivity of Metals. J. GILLIS (*Natuurwetenschapp. Tijdschr.*, 1921, **3**, 66—68).—The phenomena of passivity may not be explained by the formation of an oxide membrane protecting the metal. The most accurate optical methods—which permit estimation of a layer of 0·8 $\mu\mu$—fail to detect any sign of an oxide membrane. On the other hand, the metals which become passive by anodic polarisation are also those the ions of which do not readily discharge and precipitate on the cathode. There is, therefore, a co-existence of the anodic retardation (passivity) and of the cathodic retardation (slow metallic precipitation); the transformation $M^+ \rightleftarrows M+\oplus$ is slow in both directions.

CHEMICAL ABSTRACTS.

Thermo-electric Force, the Entropy of Electrons and the Specific Heat of Metals at High Temperatures. WENDELL M. LATIMER (*J. Amer. Chem. Soc.*, 1922, **44**, 2136—2147).—A theoretical paper in which the thermo-electric force of a circuit of two metals has been expressed in terms of the entropy of the electrons in the two metals. This expression has the form

$$dE/dT=\int_0^T\sigma_2\,.\,dT/T-\int_0^T\sigma_1\,.\,dT/T$$

where σ_1 and σ_2 are the specific heats of the electrons of the two metals. It has been postulated that the specific heat of a gram-molecule of electrons in a metal is given by the increase in the specific heat at constant volume of a gram-molecule of the metal above the equipartition value of $6/2R$. On this assumption, the absolute value of the thermo-electric force of the potassium sodium couple has been calculated at 25° from values of the specific heats of these metals. The changes in thermo-electric force of platinum, iron, cobalt, nickel, gold, copper, tungsten, molybdenum, calcium, aluminium, magnesium, and lead against silver have been calculated from specific heat data for temperature differences of 100° to 700°. Satisfactory agreement is obtained between the calculated and observed values. To make these calculations, the existing data on the thermo-electric force have been collected; new data for the thermo-electric force of lead, zinc, magnesium, aluminium, molybdenum, and tungsten against silver have been obtained, and these are summarised in a thermo-electric diagram. The entropy of the metal electrons at low temperatures has been discussed and the possibility of using thermo-electric data as a means of determining C_v for metals at higher temperatures pointed out. The C_v curves for cobalt, iron, calcium, nickel, palladium, aluminium, platinum, lead, magnesium, iridium, gold, copper, silver, molybdenum, and tungsten have been drawn in agreement with existing thermo-electric data. J. F. S.

Thermochemistry and Electromotive Force in Electric Elements. JARL A. WASASTJERNA (*Monograph, Helsingfors*, 1918).—A systematic, mathematical study of representative types of electrolytic cells, the *E.M.F.* being derived from the reaction energy and the affinity. The following results are recorded for the various cells, for the reaction energy, U, the affinity, A, and the electromotive force, E, respectively, the subscript figures representing absolute temperatures: (1) Cu|saturated solution CuI|I crystals; U_0 16296; A_{293} 15908; E_{293} 0·69. (2) Cd|saturated solution CdI,—Hg_2I_2 paste|Hg; U_0 20856; A_{234} 20485; E 0·45. (3) Cu amalgam 10%|saturated solution $CuSO_4,5H_2O$,—Hg_2SO_4 paste|Hg; U_{293} 25745; A_{293} 16560; E_{293} 0·353. (4) H_2|0·1*N*-HCl|Cl_2; E_{298} 1·38. (5) Pb|saturated solution $PbCl_2$|Cl_2; E_{291} 1·58. (6) H_2|equivalent weights of $FeCl_3$ and $FeCl_2$ in 0·1*N*-HCl|Pt; A 3480 and 5220; E_{293} 0·42 and 0·46. (7) Daniell element with saturated solutions of $CuSO_4,5H_2O$ and $ZnSO_4,7H_2O$; U_{291} 52045; A_{291} 49488 (subtract 220 cal. for osmotic work); E_{291} 1·69. (8) Daniell element with water as $100H_2O$; U_0 50350; A_{290} 50600; E 1·098. Cells delivering electrical energy, but without thermal changes, are considered, but no data are given. Values obtained for the Clark element are: U_0 67310; A_{288} 66218 (subtract 295 cal. for osmotic work); E_{288} 1·43.

CHEMICAL ABSTRACTS.

Complex Ion Formation in Hydrochloric Acid. RALPH M. HIXON (*Medd. K. Vetenskapsakad. Nobel-Inst.*, 1922, 4, No. 12, 1—8).—If complex acids of the type H_2CaCl_4 exist in solutions of metallic chlorides in hydrochloric acid solution, a study of the migration of the metallic ion when such solutions are electrolysed should reveal their presence. Solutions of magnesium, calcium, barium, and zinc chlorides at different concentrations in concentrated hydrochloric acid were electrolysed for six to eight hours at 12 volts, and samples of anolyte and catholyte were analysed. The solutions of magnesium and calcium chlorides both showed migration of the metal towards the anode at medium concentrations, but towards the cathode at higher and lower concentrations. The migration towards the anode is strong evidence for the existence of complex ions of the type $(CaCl_2)_yCl_x^-$. The observed migration will depend on the relative concentrations of these complex ions and of the simple ions Ca^{++}, as well as on their migration velocities. At low concentrations, Ca^{++} will predominate. At concentrations of $[CaCl_2]$ approaching saturation, Ca^{++} may again predominate owing either to the decrease in the [HCl] concentration or to the formation of a more complex acid $(HCl)_x(CaCl_2)_y$ which would be less dissociated than the simpler acid formed at medium concentrations. E. H. R.

The Hydration of the Lithium-ion. J. Baborovsky and J. Velisek (*Chem. Listy*, 1922, **16**, 250—256).—A new apparatus suitable for determining the transport numbers and hydration of ions, consists of two membranes of parchment paper separating the central portion of the solution from the anodic and cathodic portions and also of an arrangement whereby the anodic and cathodic vessels can be disconnected and weighed with their contents. The hydration of the lithium-ion was calculated from the change in weights and in concentrations of the solutions around the electrodes. The determination of the hydration of ions by this method is complicated by electro-osmosis. This the authors claim to have measured by replacing the two parchment paper membranes by a single membrane and estimating the differences in the concentration and specific gravity of the central portion after each experiment. The lithium-ion has one more molecule of water of hydration than the chlorine-ion. The transport number of lithium in a decinormal solution of its chloride is 0·3128±0·0048. The authors propose that the hydration of ions should be expressed in terms relative to that of the hydrogen-ion (the most mobile of all) which would be put equal to zero. W. T.

Electrolysis with Drops of Mercury as the Electrode. J. Heyrovsky (*Chem. Listy*, 1922, **16**, 256—264).—To study the electrolysis of aqueous solutions of the alkali and alkaline-earth metals, the author employed drops of mercury as the electrode; the apparatus is figured. This enabled him to determine the exact course of the electrolysis. Electrolysis is produced when a certain *E.M.F.* is applied the value of which is characteristic of each salt and depends on the logarithm of the concentration. The rapid increase of the current is explained by a diffusion towards the interior of the drop of mercury of very dilute amalgams. This diffusion commences because the metal has not sufficient mercury for combination. The author calculated the potential at which the kations deposit from their normal solutions on a mercury cathode: lithium, −2·023; sodium, −1·860; potassium, −1·883; rubidium, −1·796; cæsium, −1·837. The affinity of the metals for mercury is given by the difference between the characteristic potentials of polarised drops and the normal electrolytic potentials of the pure alkali metals. They were found to be lithium, 1·281; sodium, 1·138; potassium 1·325; rubidium, 1·409; cæsium, (1·50). W. T.

Simultaneous Electrodeposition of Lead and Lead Dioxide. M. G. Mellon and H. F. Reinhard (*Proc. Indiana Acad. Sci.*, 1921, 181—188).—The amounts of lead and lead dioxide deposited simultaneously on the cathode and anode respectively when a solution of lead nitrate is electrolysed under varying conditions are variable when free nitric acid is present, but for neutral solutions a fair constancy exists in the ratios for the amounts of each of the two deposits to that of the quantity of silver deposited in a coulometer in the circuit. The ratios of the anode and cathode deposits respectively to the lead equivalent of the silver were 1·0053 (alternatively, 0·990) and 0·9864. The cause of the inaccuracy has not been traced. Chemical Abstracts.

Electrolytic Migration of Sodium through Glass. M. Pirani and E. Lax (*Z. tech. Physik*, 1922, 3, 232—235).—The film of water which persists inside an exhausted glass tube was removed by the migration of sodium ions through the glass. A tube shaped like a lamp bulb and containing a small tungsten wire was exhausted and immersed in molten sodium nitrate at 450°. The wire was heated to a high temperature and a potential of 200 volts was applied between the wire and the molten bath. Sodium ions migrated through the glass and a yellow luminescence was produced in the tube. The water film was displaced by this process and was attacked by the hot tungsten as evidenced by the formation of a film of blue tungsten trioxide on the tube. Chemical Abstracts.

Method of Maintaining Small Objects at any Temperature between −180° and +20°. P. P. Cioffi and L. S. Taylor (*J. Opt. Soc. Amer.*, 1922, 6, 906—909).—The object is placed within a double-walled vacuum tube through which a stream of cold air, produced by the evaporation of liquid air contained in a Dewar vessel, is maintained. The rate of evaporation is controlled by means of an electric heater immersed in the liquid air, and determines the temperature to which the object is subjected. If desired, the object may be placed beyond the splayed-out end of the vacuum tube and an unbroken stream of cold air caused to flow across it by suction across the gap between the end of this tube and the wide mouth of a second tube connected to a vacuum pump. The latter tube should have a diameter about double that of the former and its length should be about twice that of the gap. The Dewar flask is preferably unsilvered, and is charged with liquid air through a funnel extending almost to the bottom and provided with a plug of glass wool for filtering out ice and solid carbon dioxide. Temperature regulation may be maintained constant to within about 4° for many hours. J. S. G. T.

Heat of Evaporation. W. Herz (*Z. anorg. Chem.*, 1922, **124**, 56—58).—Employing the values obtained by Young, the author finds that the quotients of heats of evaporation at equal fractions of the critical temperatures (on absolute scale) are fairly constant for the twenty-six organic compounds investigated. The quotient of latent heat of evaporation and absolute temperature is given for pentane at different temperatures, and remains fairly constant, 0·11—0·15, except in the neighbourhood of the critical temperature. The same was found to hold in the case of twenty-eight other organic compounds. Acetic acid is exceptional, this being probably due to association. W. T.

The Form of the Vapour Pressure Curve at High Temperature. I. The Curve for Lead. Christopher Kelk Ingold (T., 1922, **121**, 2419—2432).

High Temperature Investigations. XV. The Vapour Pressure of the Alkali Fluorides. Otto Ruff, Gerhard Schmidt, and Susanne Mugdan (*Z. anorg. Chem.*, 1922, **123**, 83—88).—The apparatus used was like that described by Ruff and Mugdan (A., 1921, ii, 485) except that iridium crucibles were employed. The results are given for the fluorides of sodium, lithium, potassium, rubidium, and cæsium. The latent heat of evaporation calculated by means of Liempt's equation (A., 1920, ii, 588) was found to be, LiF, 52·2 Cal.; NaF, 51·1 Cal.; KF, 44·7 Cal.; RbF, 40·4 Cal.; CsF, 33·6 Cal. The critical temperatures calculated by the relationship $T_c=1{\cdot}55T_{760}$ are LiF, 3010°; NaF, 3070°; KF, 2750°; RbF, 2600°; CsF, 2370°. W. T.

Heats of Combustion and Energy of Dissociation. Walter Hückel (*Ber.*, 1922, **55**, [*B*], 2839—2843).—A detailed criticism of the publications of von Weinberg on this subject (A., 1920, ii, 668, 669).

In the final tables given by von Weinberg, only the previously known data for HCl, HBr, and HI are independent of hypothesis. The values for the C—C, C—H, C=C, C≡C, C—Cl, C—Br, and C—I linkings depend on the equality of Q_{CC} and Q_{CH} which has not been established. All the other data depend also on other unproved assumptions. The value of Weinberg's work lies in the fact that he has established for the first time a series of interesting relationships between the energy content of different organic compounds as illustrated by the scheme: (1) $Q_{(CO)}=Q_{C=O}+Q_{C-C}$, $Q_{(CO)}=Q_{C-O-C}+Q_{C-C}$, $Q_{C=O}=Q_{C-O-C}$ (2) $6Q_{NH}-Q_{N\equiv N}=6Q_{CH}-3Q_{CC}$ (3) $Q_{CC}-Q_{CH}=Q_{CCl}-Q_{HCl}$. H. W.

The Energy of the Atomic Linkings in Diamond and in Aliphatic Hydrocarbons. K. Fajans (*Ber.*, 1922, **55**, [*B*], 2826—2838; cf. A., 1920, ii, 354).—A reply to various criticisms in many of which allowance has not been made for the admitted uncertainty of the author's data (cf. Hückel, A., 1920, i, 603; Polanyi, A., 1921, ii, 179; Swientoslawski, A., 1921, ii, 535; von Weinberg, A., 1920, ii, 668, 669; Thiel, A., 1920, ii, 667).

1. *Heat of sublimation of carbon and the absolute values of the linking energies.*—In the previous paper, the heat of sublimation of carbon was assumed for purposes of numerical illustration to be 287 Cal. Subsequently it has been shown by Kohn (A., 1921, ii, 302) that the heat of sublimation of carbon is 163·5 Cal. as a general mean of all measurements and that of diamond 168 Cal. The values for the most important linking energies have therefore been recalculated on a basis of 150 Cal. as the most probable value, on the supposition that carbon vapour is monatomic at 4200°, and that an equilibrium is established in Lummer's experiments.

2. *The energy of the double and triple linking.*—It is shown by a somewhat modified method that the heat of formation of a double or treble bond is greater than that of a single bond. Arguments are advanced in disproof of the criticism by Thiel (*loc. cit.*) that this conception is contrary to the known instability of substances with unsaturated linkings.

3. *Chemical forces in crystals.*—It has been asserted by Thiel (*loc. cit.*) that the chemical forces which are operative in the formation of a crystal are essentially those of subsidiary valency. This does not appear to be universally true, since the forces which hold the sodium chloride lattice together are identical with those which are operative in the vaporised salt molecule. The lattice is therefore held together by main valencies and the heat of sublimation is of the same order as that of the dissociation of the molecules into the free ions. On the other hand, the lattices of many organic compounds, for example solid hexane, are without doubt held together entirely by subsidiary valencies; this is shown by the fact that the molecular heat of sublimation of solid hexane is only 8 Cal., whereas the energy necessary for the disruption of the vaporised molecule into atoms is calculated to be 1511 Cal. The conception that the valency forces which unite the carbon atoms in the diamond lattice are identical with those uniting the carbon atoms of aliphatic compounds is not new; the advance made by Fajans consists in the exact quantitative demonstration of the correctness of the hypothesis by thermochemical methods.

4. The remainder of the communication is devoted to a question of priority (cf. von Weinberg, *loc. cit.*). H. W.

The Thermochemistry of Carbon Compounds. A. THIEL (*Ber.*, 1922, **55**, [*B*], 2844—2845).—A reply to Fajans (preceding abstract). H. W.

Thermochemistry of Solutions. M. LEVALT-EZERSKY (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 108—113).—Simple reasoning from fundamental principles leads to a number of equations which may be combined in the form: $q^l_m = q_m - Bq^k_l = BQ_l - Q_m = \phi_l - \phi_m = BR_l - R_m$, where q^l_m represents the heat of dilution of a solution containing $100m/(100-m)$ grams of solute per 100 grams of water to the concentration $l\%$, and q_m^k and q_l^k have analogous significations; Q_l and Q_m are the heats of solution of $100l/(100-l)$ and $100m/(100-m)$ grams, respectively, of the solute in 100 grams of water; $\phi_m=Q_m$ and $\phi_l=m(100-l)Q_l/l(100-m)$, that is, $\phi_l-\phi_m$, corresponds with the difference between the heats of solution of one and the same quantity of the solute in such different amounts of water that solutions of $l\%$ and $m\%$ concentration, respectively, are obtained; R_l and R_m represent, respectively, the heats of reaction of $100l/(100-l)$ and $100m/(100-m)$ grams of the solute, liquefied at the temperature of the experiment, with 100 grams of water.

The above equation furnishes a convenient means of passing from the heats of solution of different amounts of a substance in one and the same amount of solvent to the heats of solution of one and the same quantity of solute in different quantities of solvent and from these to the heats of dilution. T. H. P.

Effect of Variation in Weight of the Riders and Plummets of the Westphal Balance on the Accuracy of Specific Gravity Determinations. EDWARD A. TSCHUDY (*J. Amer. Chem. Soc.*, 1922, **44**, 2130—2135).—Accurate specific gravity determinations with the Westphal balance are possible only when the weight of water displaced by the plummet at 15° and the weights of the riders possess an exact multiple relationship amongst themselves. Variations in weight of the riders which disturb this relationship produce errors, often of considerable magnitude, in specific gravity determinations. Inaccurate plummet thermometers are also a source of error. The magnitude of ordinary variation in weight of riders and plummets has been ascertained, and equations have been derived for calculating the correction which must be applied to any indicated balance reading to obtain the true specific gravity of liquids lighter or heavier than water. Application of the corrections for any specific system of riders to indicated balance readings is facilitated by the construction and use of correction graphs. J. F. S.

The Degree of Molecular Polymerisation of Substances under Critical Conditions. J. A. MULLER (*Compt. rend.*, 1922, **175**, 760—761).—A table of the calculated values of the degree of polymerisation of a number of elements and compounds under critical conditions is given. All the substances included, with the exception of helium, undergo polymerisation to a certain extent; those which, under normal conditions of pressure and temperature, approximate in their behaviour to perfect gases are least affected, the values of the mean degree of polymerisation ranging from 1·227 in the case of hydrogen to 1·285 in that of nitrogen. Liquid hydrocarbons and monohalogen derivatives of benzene give values from 1·39 to 1·45, whilst those for esters of saturated monobasic fatty acids vary from 1·45 to 1·48. Nitriles, water, and acetic acid yield results in the neighbourhood of 2.

H. J. E.

Corresponding States. W. HERZ (*Z. anorg. Chem.*, 1922, **123**, 132—136).—A theoretical paper in which the author investigates whether there is a constant relationship between the viscosity of liquids at the same fraction of the critical temperature. The viscosity at one-half the absolute critical temperature is divided by the viscosity at seven-twelfths the absolute critical temperature. In the case of 29 non-associating liquids, the ratio is 1·51—1·91. In the case of liquids which associate, the viscosity decreases more rapidly with increasing temperature and the ratio in the case of six liquids varies from 1·95 to 4·33. The author in the same way finds the ratio of the refractive indices at corresponding temperatures. The refractive index is calculated by equation $n=\sqrt{M+2dR_L/M-dR_L}$. In the case of 29 liquids the approximate constancy of the ratio showed the validity of the law of corresponding states. W. T.

The Viscosity of Amphoteric Electrolytes in Solution. GUNNAR HEDESTRAND (*Z. anorg. Chem.*, 1922, **124**, 153—184).—Solutions of amino-acids are found to have a minimum viscosity at the isoelectric point. In the case of glycine and alanine, the viscosities of the anions is greater than that of the kations. Mixtures of glycine and alanine solutions have a viscosity which is the arithmetical mean of the corresponding unmixed solutions. The addition of neutral salts increases the viscosity of glycine and alanine solutions; it also displaces the minimum. The minimum viscosity of a gelatin solution is at the isoelectric point; the addition of salts increases the minimum value and at the same time shifts it to a lower hydrogen-ion concentration. On both sides of the minimum, the viscosity is decreased considerably by the salts. The author treated powdered gelatin with hydrochloric acid, and found that, on washing, a large amount of the gelatin went into solution; the same result was obtained by treating the powder with a mixture of hydrochloric acid and a salt. W. T.

Effect of Surface Tension. P. B. GANGULY and B. C. BANERJI (*Z. anorg. Chem.*, 1922, **124**, 140—142).—A stick of sodium hydroxide was held vertically in distilled water so that only one-half was immersed. In the absence of stirring, the part of the stick in contact with the surface dissolved the more rapidly. The same was observed in the case of sticks of potassium hydroxide, sodium nitrite, copper sulphate, and zinc chloride, and also of a zinc rod in dilute sulphuric acid. In the case of an iron rod in hydrochloric acid the reverse was observed and the part further from the surface dissolved the more rapidly. These effects are reduced by lowering the surface tension by a covering of oil, and are therefore assumed to be due to surface tension effects. W. T.

Negative Adsorption. II. Calculation of the Amount of Adsorbed Solvent. M. A. RAKUSIN and TATJANA GÖNKE (*Biochem. Z.*, 1922, **132**, 82—83).—The amount of adsorbed solvent can be calculated by Gurvitsch's equation for positive adsorption (A., 1914, ii, 435). H. K.

The Sorption of Saturated Vapours by Charcoal. JOHN DRIVER and JAMES BRIERLEY FIRTH (T., 1922, **121**, 2409—2414).

Salt Adsorption on Metal Surfaces. H. VON EULER and G. ZIMMERLUND (*Arkiv Kem. Min. Geol.*, 1922, **8**, No. 14, 1—23).—Measurements have been made of the silver nitrate and potassium chloride adsorbed from aqueous solution by finely divided gold particles and by gold leaf. It has been found that the amount adsorbed increases with the amount of salt in solution, at first linearly and then tending to a maximum. At the maximum there is more adsorbed than would correspond with a unimolecular layer on the gold. Experiments are also described with mercury dropping through a calomel solution in which the amount of mercury in solution was determined by finding its effect as an enzyme poison. W. O. K.

Mordanting of Wool with Potash Alum. W. W. PADDON (*J. Physical Chem.*, 1922, **26**, 790—793).—Experiments are described from which it is concluded that, contrary to the opinion of Knecht, the mordanting of wool with potash alum does not lead to the formation of definite chemical compounds on the fibre, but is strictly an absorption phenomenon in which both alumina and sulphuric acid are involved. J. S. G. T.

Mordants. III. Chrome. WILDER D. BANCROFT (*J. Physical Chem.*, 1922, **26**, 736—772).—The author reviews critically a part of the literature, more especially the work of Liechti and Hummel (*J. Soc. Chem. Ind.*, 1893, **12**, 244) concerned with the use of chromic oxide as a mordant in dyeing wool, cotton, and silk. The following are among the conclusions drawn: from dichromate solutions wool first adsorbs chromic acid and this is reduced to chromic oxide, which is the true mordant; within limits, increasing the acid concentration increases the chromic acid taken up; chromic acid oxidises organic compounds more readily in presence than in absence of wool; when wool is mordanted with chrome alum, a basic sulphate changing later to chromic oxide is first formed; silk adsorbs chromic oxide less strongly than wool does; cotton takes up scarcely any chromic oxide from chrome alum, but adsorbs it from an alkali solution; there is no evidence of the formation of any definite compound when wool is mordanted with chromic oxide. J. S. G. T.

Tungsten Furnace for Experiments on Dissociation and Ionisation. K. T. COMPTON (*J. Opt. Soc. Amer.*, 1922, **6**, 910—912).—Tungsten sheet is bent into the form of a cylindrical tube and clamped by end pieces each consisting of a steel ring fitting in a split rectangular steel block. The blocks are mounted on water-cooled brass tubes serving as leads for the heating current. Short glass tubes surround the leads for purposes of insulation. Loops of fine tungsten wire, drawn tightly round the cylindrical tube, prevent bulging of the furnace. The central electrode consists of a straight length of "20 mil." tungsten wire welded to heavier molybdenum leads. A furnace 60 mm. overall length and about 5 mm. diameter was raised to a white heat by 100 amperes at 6 volts, and reached its melting point when a current of about 200 amperes was employed. J. S. G. T.

The Thermal Decomposition of Chlorine. FR. A. HENGLEIN (*Z. anorg. Chem.*, 1922, **123**, 137—165).—A description of the apparatus suitable for a reactive gas at low pressure and high temperature is given in detail (cf. this vol., ii, 441). The apparatus was tested by measuring the dissociation of bromine. The dissociation of chlorine was investigated at a pressure of 1×10^{-5} atmospheres and between the temperatures of 700° and 900°. The following relationship was found to hold $\log K_{(\text{atmos.})}=-(5400/4{\cdot}571T)+1{\cdot}75\log T-4{\cdot}09\times10^{-4}T+4{\cdot}726\times10^{-8}T^2+0{\cdot}93$ (cf. Bodenstein, A., 1916, ii, 554). The chemical constant of monatomic chlorine was calculated in three different ways: (1) by Stern's method (A., 1914, ii, 543), (2) by the reaction $Ag+\frac{1}{2}Cl_2=AgCl$, the heat effect and electromotive force of which are accurately known, (3) by the reaction $Hg+\frac{1}{2}Cl_2=HgCl$. The values found were respectively 0·68, 0·93, and 1·50. A linear relationship was found to exist between the heats of dissociation of chlorine, bromine, and iodine and their atomic radii and other spatial and thermal constants. The electroaffinity of chlorine was calculated to be 73 cal. W. T.

Theory of Solvates. JA. K. SYRKIN (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 267—280).—Solvates in general and hydrates in particular vary in composition and are stable only within narrow limiting conditions, so that they must be regarded as transitory systems of physico-chemical character. The structure of a hydrate may be represented as a molecule of solute surrounded by an envelope of water molecules. Such of the latter as are near to the nucleus are held by a force approximating to chemical force, whereas the more remote, semi-combined water molecules exist under the configurational influences of chemical and kinetic forces, the system being in a condition of stationary thermal equilibrium. Hence it is possible for hydrates of different composition to exist in one and the same solution. This equilibrium of hydrates possesses a macroscopic character. The gradual variation of the thermal effect with the temperature confirms these views and distinguishes the decomposition of a hydrate from the stoicheiometric decomposition of an ordinary system. The existence of hydration is shown also by the change in the internal pressure, and the work of the internal forces may be expressed as the mechanical equivalent of chemical affinity (cf. Tammann, "Uber die Beziehungen zwischen den inneren Kräften und Eigenschaften der Lösungen," 1907, **34**). T. H. P.

Solubility of Carbon Dioxide and Nitrous Oxide in certain Solvents. WILLIAM KUNERTH (*Physical Rev.*, 1922, **19**, 512—524).—In view of its bearing on the Lewis-Langmuir theory, a comparison was made between the solubilities of carbon dioxide and of nitrous oxide between 18° and 36° in water, acetone, acetic acid, methyl alcohol, pyridine, ethyl alcohol, benzaldehyde, aniline, amyl acetate, ethylene bromide, *iso*amyl alcohol, and chloroform. In this series, the ratio of the solubility of carbon dioxide to that of nitrous oxide decreases regularly from 1·34 to 0·66. The ratio is nearly constant for each solvent, and the temperature coefficient, ds/sdT, which is always negative, is in most cases nearly the same for the two gases. It is found that Raoult's law does not hold for the solubility of gases in liquids, and that there is little, if any, relation between solubility and the difference between internal or cohesion pressures of solvent and solute. Since, however, the ratio of the solubilities of carbon dioxide and nitrous oxide (the former of which is the more active chemically, and therefore has the stronger polarity) varies regularly with the dielectric constant of the solvent, and since this constant may be taken as an index of the polarity of the solvent, it is suggested that polarity may be an important factor in determining the relative solubility of gases in liquids. The following figures, for carbon dioxide and nitrous oxide, respectively, at 20°, are abstracted from a table giving the solubilities expressed in c.c. of the gas under existing barometric pressure per c.c. of solvent: water, 0·900, 0·675; acetone, 6·98, 6·03; acetic acid, 5·23, 4·85; pyridine, 3·85, 3·58; methyl alcohol, 3·57, 3·32; ethyl alcohol, 2·87, 2·99; benzaldehyde, 2·98, 3·15; aniline, 1·38, 1·48; amyl acetate, 4·65, 5·14; ethylene bromide, 2·27, 2·81; *iso*amyl alcohol, 1·91, 2·47; chloroform, 3·71, 5·60.

A. A. E.

Partition of a Substance between two Solvents and the Solution Field of Force. N. A. SCHILOV and L. K. LEPIN [with M. P. JANTSCHAK] (*Nachr. Phys.-Chem. Lomonossow-Ges.*, 1920, **1**, 1—103; from *Chem. Zentr.*, 1922, iii, 541—542).—The partition of a dissolved substance between two liquid phases changes with varying concentrations and only remains constant in particular cases owing to the operation of compensating factors. The partition does not in general depend on the solubilities in the individual solvents; this relationship, in fact, only holds at the triple point of the three phases. The isotherms for the changes in concentration are different for each phase and are not linear. The relation $k=c_1{}^2/c_2$ is only a particular case of the relation $k=c_1{}^m/c_2=q\,.\,c^1/c_2{}^n$, where n is an integer or fraction and given by $n=\log\beta_1/\log\beta_2$, β_1 and β_2 being factors expressing the changes in the solution field of force (lösungskraftfeld) depending on concentration. The partition coefficient thus obtained is constant for many systems, excepting those where the two solvents have a considerable reciprocal solubility, and where chemical factors may play a part.

G. W. R.

Solubility of Liquids in Liquids. The Partition of the Lower Acids, particularly Formic, between Water and various Organic Solvents. NEIL E. GORDON and E. EMMET REID (*J. Physical Chem.*, 1922, **26**, 773—789).—The partition ratios at 25° of formic acid between water and the following respective solvents: cotton-seed oil, petroleum, benzene, toluene, xylene, carbon tetrachloride, carbon disulphide, and bromoform have been determined. In like manner, the respective partition ratios at 25° of acetic acid between water and either cotton-seed oil or petroleum, of propionic and butyric acids between water and cotton-seed oil have been determined. The results have been employed to determine the so-called solubilities of the acids in the solvents and vice versa. J. S. G. T.

The Behaviour of Two Metals towards One Another when Dissolved in Mercury. G. TAMMANN and W. JANDER (*Z. anorg. Chem.*, 1922, **124**, 105—122).—The authors investigated the affinity of one metal for another when dissolved in mercury: (1) by measuring the freezing-point depression of the compound crystals and comparing this with that of the components, (2) by measuring the influence of the one metal on the *E.M.F.* concentration-curve of the other dissolved in a third more noble liquid metal. Thus the addition of small amounts of a more noble to a less noble metal has but a very small effect on the *E.M.F.* if the compound of the two metals is very highly dissociated, whereas, if a stable compound is formed, then a sudden change in the *E.M.F.* is caused when the concentrations of the metals correspond with the composition of this compound. The following intermetallic compounds were found to be very stable: AuZn, Mg_2Sn, $CeSn_2$, and Ce_4Bi_3, having very high affinity constants. AuZn $K=3\cdot4\times10^7$. Mg_2Sn $K=1\times10^{10}$. $CeSn_2$ $K=1\times10^{40}$. Ce_4Bi_3 $K=3\times10^{120}$. Cf. water $K=4\cdot6\times10^{78}$. Others were very highly dissociated in solution in mercury; for example, compounds of gold with cadmium and lead, of silver with zinc and cadmium, of copper with zinc and cadmium. W. T.

Systems in which Metals Crystallise. JOHN L. HAUGHTON and G. WINIFRED FORD (*Trans. Faraday Soc.*, 1922, **18**, 112—118).—Of the twenty-nine elements the crystalline structures of which have been determined by *X*-ray analysis, five only are exceptions to the rule that all elements of the same periodic series crystallise in the same system. In nearly every case, alloys which form a homogeneous series of solid solutions right across the equilibrium diagram, crystallise in the same system. There appears to be no relationship between the changes which occur in the physical properties of metals at the melting point and the crystalline habit of the metals. A possible exception occurs in the case of the electrical resistivity of the metals in the odd series of group 5. J. S. G. T.

Solutions, Suspensions, Colloids. N. P. PESKOV (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 73—99).—The theoretical considerations developed by the author lead to the following conclusions. The modern doctrine of colloids deals with a conception of heterogeneity which is totally different from that assumed by the doctrine of phases, but is identical with the molecular-kinetic view of the universe; the latter is termed the generalised conception of heterogeneity. The notion of dispersion current in the chemistry of colloids must be regarded as composed of two different conceptions, distinguished as qualitative and quantitative dispersion. The former of these is synonymous with the generalised conception of heterogeneity referred to above, and has no special bearing on systems represented by suspensions, colloids, and solutions. The latter, possessing a dimensional character, differs from the idea of a phase only in that the latter is characterised by the spacial magnitudes of its separate elements. Thus all systems to which the term quantitative is applied must be considered to be polyphasic.

Physical theories of colloids in general postulate that: (1) suspensions, colloids, and true solutions are systems, the qualitative differences between which may be regarded as functions of their degrees of dispersion, (2) colloids represent typical polyphase systems, and (3) all the characteristic properties of colloids are merely the results of the magnitudes of the molecules. The logical objection to such theories is that they accept as results of the doctrine of dispersion the hypothetical assumptions on which this doctrine is based.

The author considers that only careful investigation, from all points of view, of the process of coagulation and of the adsorption phenomena accompanying them will decide the question of the heterogeneity of colloids in their normal condition. T. H. P.

Electrical Colloid Synthesis. SVEN BODFORSS and PER FRÖLICH (*Koll. Chem. Beihefte*, 1922, **16**, 301—340).—Svedberg's method of synthesis of colloids has been investigated for the case where the induction coil current is replaced by a high tension symmetrical alternating current and the dependence of the amount of dispersion on the dimensions of the oscillation circuit determined. The dispersion of copper, tin, lead, zinc, antimony, aluminium, silver, magnesium, bismuth, and thallium by Svedberg's method and the present method has been compared, and it is shown that for the more easily dispersed metals the present method is inferior to the original Svedberg method, the yield being about one-half to two-thirds that obtained by the older method. In the case of the harder metals, the dispersion is about the same by both methods. Alloys belonging to the systems lead–tin and antimony–zinc have been dispersed by the present method and the sols produced examined. J. F. S.

Winkelblech's Phenomenon or Pseudo-extraction and its Importance in Colloidal Chemistry. New Methods of Extracting Solids. K. CHARITSCHKOV (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 96—107).—Winkelblech (A., 1907, ii, 17) found that when certain pseudo-solutions are treated with various non-aqueous solvents insoluble in water, the solid disperse phase passes partly or completely into the liquid, non-aqueous phase, throughout which it becomes distributed in the form of a gel. This phenomenon is usually regarded as a special case of adsorption, but the results obtained on examining different combinations of disperse phases and non-aqueous solvents are completely incompatible with this view. The effect seems to be due rather to mechanical seizure of the molecules of the solid phase by disintegrated liquid drops of lower specific gravity or to attraction of these molecules to the bottom by molecules of a heavier liquid.

From a pseudo-solution of gelatin part of the sol may be drawn to either the surface or the bottom of the liquid by treatment with light petroleum, chloroform, carbon disulphide, etc., and owing to the resemblance of the phenomenon to extraction the author terms it "pseudo-extraction."

For the velocity of transport of the molecules, Lewis's formula, $V=2r^2S(S-S_1)/9\eta$, should be valid, S and S_1 being the specific gravities of the solid and liquid phases, r the radius of the molecules, and η the coefficient of viscosity, but greater exactitude would be attained by addition of the term, $2r^2S(S-d)/9\eta$, d denoting the specific gravity of air.

The fact that sols of silicic acid, Prussian blue, and almost all metals remain unchanged when treated with light petroleum, benzene, and similar liquids is explained on the assumption that, for certain values of S and S_1 the magnitude of V will be negative, the specifically lighter molecules of air and light petroleum being then not in a condition to draw upwards the heavier molecules of the sols of metals and various oxides.

The results of experiments on the pseudo-extraction of gelatin, agar-agar, and sodium oleate show that the quantity of the colloidal substance thus extracted is not proportional to the concentration; when the latter is very high, no pseudo-extraction takes place. For every disperse phase, the phenomenon appears to exhibit an optimum concentration and an optimum temperature. In no case, however, is it possible to remove by pseudo-extraction the whole amount of a sol occurring in the disperse phase. The excess above the normal proportion of potassium hydrogen tartrate or sodium sulphate present in supersaturated solution is withdrawn instantaneously from the latter by shaking with light petroleum. The same occurs when an aqueous alcoholic solution of sucrose is similarly treated, but in this instance the sucrose withdrawn partly redissolves in the aqueous alcoholic layer on prolonged keeping of the system after being shaken with the light petroleum. T. H. P.

General Method for Obtaining Gels of Inorganic Salts, and its Relation to Theories of the Colloidal State. K. CHARITSCHKOV (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 91—96).—Treatment of a solution of sodium (potassium, etc.) naphthenate in a hydrocarbon containing excess of naphthenic acid with hydrogen chloride or carbon dioxide yields colloidal sodium chloride or carbonate. With heavy metal salts of naphthenic acid, which dissolve readily in benzene, toluene, or light petroleum, excess of naphthenic acid is not required; colloidal cupric and mercuric chlorides, etc., are obtainable in this way. The naphthenic acid may be replaced by oleic acid. The products formed show Brownian movement and the corresponding ultramicroscopic appearance. The sol first formed rapidly undergoes coagulation but not throughout its entire mass, part remaining in a condition of pseudo-solution detectable ultramicroscopically.

Treatment of ferrous sulphate in the above way results in the formation of a white precipitate which, as oxidation proceeds, is gradually converted first into a black sol of triferric tetroxide and ultimately into a brown sol of ferric oxide. The action of hydrogen chloride on ferric naphthenate yields, not ferric, but ferrous chloride, the hydrogen chloride acting as a reducing agent under these conditions.

These and allied phenomena do not appear to be explicable by any of the existing theories of the colloidal state, or by von Weimarn's crystallisation theory, which is generally accepted. Neither this author's formula for expressing the course of separation of precipitates, nor that given by Nernst to indicate the velocity with which a precipitate forms round centres of crystallisation, takes into account the attraction or affinity between solvent and solute, which constitutes an important factor; in many cases, the whole process of crystallisation is the resultant of the force uniting the molecules and the affinity of the latter for the solvent.

The author regards gels and sols as the extreme and final stages of the interactions between solid and liquid phases, intermediate stages being represented by crystals of various degrees of symmetry.

T. H. P.

Sensitisation of Coagulation Processes: Colloids as Indicators of Photo-electric Effects. N. P. PESKOV (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 101—104).—Anthracene is found to exert a sensitising action on the coagulation of sols of arsenic trisulphide, platinum, and carbon, but it is not known if this action is exercised towards all sols or if it is limited to those carrying a definite charge. The action does not depend on chemical transformation of the anthracene or on its fluorescence, but lies in the electronic transpositions taking place in the system under the influence of insolation. Hence colloids constitute a new type of indicator for photo-electric effects. Reference is made to the various possible interpretations of the mechanism of the coagulation of colloids under the sensitising action of anthracene.

T. H. P.

Flocculation by Mixtures of Electrolytes. H. FREUNDLICH and P. SCHOLZ (*Koll. Chem. Beihefte*, 1922, **16**, 267—284).—The authors have confirmed the results of Odén, to the effect that the coagulating properties of a salt are diminished or destroyed by the presence of a second salt, but in contradiction to Odén they have also found that the reduction is not due to a diminution of the kation action by the anion but rather to an antagonism between the kations. The antagonistic action is measured by mixing Odén's sulphur sol with a quantity of an electrolyte insufficient to cause flocculation and then determining the quantity of a second electrolyte necessary to effect this change. In the case of ion pairs with strong antagonism such as magnesium–lithium, or magnesium–hydrogen, the coagulation value of the magnesium is a whole number multiple of the value obtained when the coagulation is effected by magnesium alone. The anions have also an influence in the diminution of the coagulation value in the order citrate''>sulphate''>chloride'. Definitely hydrophobic sols, such as Weimarn's sulphur sol and Donau's gold sol, do not exhibit the above-named phenomena. In these cases the coagulation values of sols containing electrolytes are always less than those of the pure sols; that is, the action of the two electrolytes is additive, as is to be anticipated from the coagulation hypothesis of hydrophobic sols. In these cases also, the coagulum cannot be peptised by electrolytes. The behaviour of Odén's sulphur sol is probably to be connected with its distinct hydrophilic character; that is, with the hydration of the micellæ. In the case of arsenic sulphide sol, a certain antagonism is observed for salts such as lithium chloride and magnesium chloride. J. F. S.

Coagulation of Manganese Dioxide Sol by Different Electrolytes. PHANI BHUSAN GANGULY and N. R. DHAR (*J. Physical Chem.*, 1922, **26**, 701—714).—The coagulative powers of different electrolytes on manganese dioxide sol do not follow the Schulze-Hardy law, namely, the higher the valency of an ion the greater its precipitating action on a colloid. Changes of concentration of the sol alter the relative order of the electrolytes when arranged according to their coagulative powers. Coagulative power is not purely a function of valency, but is more a specific property of the ions, and is influenced, among other factors, by the time allowed for coagulation and the presence of anions.

J. S. G. T.

Rôle of the Hydrogen-ion Concentration in the Precipitation of Colloids. HERMANN V. TARTAR and ZALIA JENCKS GAILEY (*J. Amer. Chem. Soc.*, 1922, **44**, 2212—2218).—The effect of the hydrogen-ion concentration on the precipitation of mastic and gamboge sols by solutions of acids and salts has been investigated. It is shown that acids cause precipitation at the same hydrogen-ion concentration irrespective of the concentration of the colloid. The negative ion of the acid is without effect. Various potassium and ammonium salts precipitate the sols at the same concentration provided that the hydrogen-ion concentration is kept approximately constant. The precipitating values of the salts vary directly as the concentration of the colloid at the same hydrogen-ion concentration. The stabilising or peptising effect of the ion bearing a charge similar to that of the colloidal particle is shown to be very limited if it exists at all. J. F. S.

Soaps and Proteins. II. Colloid Chemistry of Soap Manufacture, Analogies in the Colloid Chemistry of Soaps, Albumins, and Tissues. III. Colloid Chemical Behaviour of Fatty Acids and their Derivatives and the Analogous Behaviour of Neutral Proteins and their Derivatives. MARTIN H. FISCHER [with GEORGE D. MCLAUGHLIN and MARIAN O. HOOKER] (*Koll. Chem. Beihefte*, 1922, **16**, 99—179; cf. this vol., ii, 430).—A continuation of previous work. The principles of the hot and cold processes in the soap industry are described. The significance of some of the constants of oils and fats, such as the density, saponification number, the iodine number, and the Reichert-Meissl number, is pointed out. The physical properties of soaps are discussed. An account of experiments on the systems, globulin–water, globulin–sodium hydroxide, globulin–acid, globulin–metallic chloride, gelatin–water, gelatin–alkali hydroxide, gelatin–acid, and gelatin–salt is given and peptisation and coagulation are discussed. The theory of poisoning by ammonium and heavy metal salts is discussed and it is shown that these substances combine with the protoplasm with the formation of compounds which are much less hydrated than the normal protoplasm compounds, and that this constitutes the poisoning. Reproductions of a large number of photographs, illustrating the experiments, are contained in an appendix to the paper. J. F. S.

Action of Anions, particularly the Hydroxyl-ion, on the Colloidal Condition of Night-blue. S. Akamatsu (*Kolloid Z.*, 1922, **31**, 209—215).—The effect of various anions on the surface tension of solutions of night-blue has been investigated to ascertain whether or no the position of the hydroxyl-ion in the activity series found by Traube (A., 1912, ii, 740) is correct. This series places the hydroxyl ion after the halogen ions instead of in the most active position as was expected. The surface tension of 0·2% solutions of night-blue containing concentrations varying from *N*/10 to *N*/1000000 of potassium iodide, bromide, chloride, nitrate, thiocyanate, chlorate, sulphate, hydroxide, and dihydrogen phosphate has been measured. It is shown that the addition of the various electrolytes causes the surface tension to rise to a maximum and then to fall to a value approaching the water value with decreasing concentration of the added electrolyte. The measurements showed that the hydroxyl ion is the most active of all anions and that the reason for the position given to it by Traube lies in the fact that he took as his concentration of hydroxyl ions the concentration of the hydroxide added. In the present work the concentration of the hydroxyl ion has been measured electrometrically. J. F. S.

The Equilibrium between some Organic Substances. H. Hammersten (*Arkiv Kem. Min. Geol.*, 1922, **8**, No. 16, 1—14).—The equilibrium constant, *K*, for the reaction between phenylhydrazine and acetone or acetaldehyde has been investigated by the solubility method of Euler and Svanberg (A., 1921, i, 68), and also by the measurement of the refractive indices of the solutions. The various results are not very consistent, but in the case of acetone–phenylhydrazine the value of *K* appears to be about $7—9\times10^{-4}$, and in the case of acetaldehyde–phenylhydrazine about 10^{-3}. W. O. K.

The Solubility of Calcium Carbonate in Water in Equilibrium with a Gaseous Phase containing Carbon Dioxide. Yukichi Osaka (*Mem. Coll. Sci. Kyoto*, 1922, **5**, 131—141).—The solubility of calcium carbonate in water has been calculated from the data given by McCoy and Smith (A., 1911, ii, 379). It is assumed that carbon dioxide dissolved in water is a much stronger acid than acetic acid (cf. Strohecker, A., 1916, ii, 522, and Pusch, A., 1916, ii, 477, 557) and that the gas is only slightly combined with water. The apparent first dissociation constant and the second dissociation constant of water are taken as $3{\cdot}50\times10^{-7}$, and $4{\cdot}91\times10^{-11}$, respectively; and the solubility product of calcium carbonate (calcite) at 25° was calculated to be $7{\cdot}24\times10^{-9}$. The solubility of calcium carbonate in water, in the presence of carbon dioxide, is given by $C=[Ca^{\cdot\cdot}]+1-\gamma/2\gamma[HCO_3']$, where γ is the degree of dissociation of calcium hydrogen carbonate, assuming that the solution is ionised to the same extent as that of calcium acetate of the same concentration. Formulæ are given for the relationship between $[Ca^{\cdot\cdot}]$, and $[HCO_3']$, and the partial pressure of carbon dioxide. W. E. G.

The Propagation of Explosion Waves in Gases contained in Tubes of Varying Cross-section. Colin Campbell (T., 1922, **121**, 2483—2498).

Limits for the Propagation of Flame in Vapour–Air Mixtures. II. Mixtures of More than One Vapour and Air at the Ordinary Temperature and Pressure. Albert Greville White (T., 1922, **121**, 2561—2577).

The Velocity of the Action of Oxygen, Hydrogen Sulphide, and the Halogens on Metals. G. Tammann and W. Köster (*Z. anorg. Chem.*, 1922, **123**, 196—224).—When iodine, chlorine, or air acts on a metal, a variety of surface colours is formed, and these colours give the rate of thickening of the film of compound formed (cf. A., 1920, ii, 248). The rate of chemical action is high but diffusion of the gas through the film of compound is slow. In the case of iodine, the rate is inversely proportional to the thickness of the film and is independent of the temperature. There is in the case of the action of iodine on silver a change in the velocity at 145° which is the transition temperature of silver iodide. In the case of the action of moist air containing chlorine and bromine on copper, silver, and lead there is a parabolic relationship between the time of action and the thickness of film. The same holds in the case of the oxidation of metals. At high temperatures oxidisable metals are almost immediately covered with a thin film of oxide which protects the metals.

Hydrogen sulphide reacts rapidly with copper and manganese, more slowly with silver, and still more slowly with lead. Iron, cobalt, nickel, chromium, antimony, bismuth, tin, aluminium, zinc, and cadmium show no change after several days' contact with the gas. The action of air on copper–zinc alloys was also investigated. W. T.

The Formation of Oxides of Multivalent Metals from their Hydroxides. Hans von Euler and Ulf von Euler (*Z. anorg. Chem.*, 1922, **124**, 70—80).—The temperature-coefficient of the coagulation of albumin is very high, the rate being doubled for an increase of temperature of 2°. The rate of dehydration of copper hydroxide was measured at different temperatures. The temperature-coefficient was very high, as in the coagulation of albumin, but was found to decrease with increasing temperature 40—45°=3·0 for 5°, 55—60°=1·8. The results were not in agreement with Arrhenius's formula (A., 1889, 1103), which led the authors to the conclusion that the dehydration consists of several reactions. The rate of dehydration was measured colorimetrically. The isoelectric points for copper hydroxide is 3×10^{-13} as obtained from the equation $I=\sqrt{K_s.K_w/K_b}$. W. T.

Velocity of Hydrolysis of Ethyl Acetate. HERBERT S. HARNED and ROBERT PFANSTIEL (*J. Amer. Chem. Soc.*, 1922, **44**, 2193—2220).—The unimolecular velocity constants of the hydrolysis of ethyl acetate in the presence of hydrochloric acid of many concentrations have been accurately determined at 25°. A solution of the general equation for the velocity of hydrolysis has been obtained and the velocity constants have been calculated by the general equation. In four series of measurements, it has been found that the curve of the velocity constants divided by the molecular concentration of hydrochloric acid against $\log c_1$, where c_1 is the molecular concentration of hydrochloric acid, shows a minimum at 0·07—0·08*N*-acid. This is similar to the curve of the individual hydrogen-ion activity coefficient against $\log c_1$, which has a minimum at 0·15—0·18*N*-acid. It has been shown that the velocity constant divided by the product of the activities of the hydrogen ion and the water molecule is not a constant at different acid concentrations but has a maximum at 0·3*N*-hydrochloric acid. Some factors which may cause this deviation from constancy have been suggested. The kinetics of the hydrolysis of ethyl acetate are very complex, but the authors are of the opinion that the evidence obtained in the present work shows that the method employed is in general the correct method of attacking this problem. J. F. S.

Velocity of Inversion of Sucrose as a Function of the Thermodynamic Concentration of the Hydrogen-ion. HAROLD A. FALES and JACQUE C. MORRELL (*J. Amer. Chem. Soc.*, 1922, **44**, 2071—2091).—The velocity of hydrolysis of sucrose by solutions of sodium hydroxide, acetic acid, and hydrochloric acid of various concentrations has been determined at 35° and the thermodynamic hydrogen-ion concentration has been calculated from *E.M.F.* determinations of the reaction mixtures at the same temperature. It is shown that the addition of sucrose to solutions of hydrochloric acid causes a definite increase in the thermodynamic concentration of hydrogen-ion over the whole range of concentration of the acid. In the case of acetic acid, a maximum increase in hydrogen-ion concentration is observed which diminishes as the concentration of hydrogen-ion decreases, on the addition of sucrose. The addition of sucrose to sodium hydroxide appears to cause an increase in the thermodynamic concentration of hydrogen-ion. The thermodynamic concentration of hydrogen-ion in the system remains appreciably constant during the course of the inversion process. The velocity of inversion of sucrose by hydrochloric acid is proportional to the thermodynamic concentration of hydrogen-ion only for the limited range of concentration of acid which lies between 0·01*N* and 0·001*N*. The bimolecular velocity constants, reduced to unit thermodynamic hydrogen-ion concentration, are constant with changing concentrations of sucrose only for each molecular concentration of hydrochloric acid between 0·01*N* and 0·3*N*. These constants vary considerably for different concentrations of acid. Evidence is adduced which shows that for acetic acid, the undissociated molecule is not a positive catalyst in the inversion process; or that there are other factors entering here which have never been considered. With strong acids, the inversion process does not appear to be strictly unimolecular, especially in the early periods of the reaction. Within the limits of the concentrations of the reactants used, no appreciable change in volume was noticed when the solutions of hydrochloric acid and sucrose were mixed. J. F. S.

Generator Gas Equilibrium at High Pressures. KARL JELLINEK and ALOIS DIETHELM (*Z. anorg. Chem.*, 1922, **124**, 203—229).—The electric furnace employed was a modification of that used by Nernst (*Z. Elektrochem.*, 1907, **13**, 52); it allowed measurements to be carried out at 1300° and at 150 atmospheres. The reaction $C+CO_2 \rightleftharpoons 2CO$ was investigated between 800° and 1000° at pressures up to 50 atmospheres. Various forms of charcoal were employed, and the equilibrium, which was well defined, was practically the same in each case, and again the same in the case of graphite. The law of mass action was obeyed at all pressures. The integration constant of the reaction isochore of generator gas equilibrium was found to be 3·876; this agrees well with the value calculated by means of Nernst's heat theorem (3·80). The authors show that the maximum work of this reaction is equal to the heat effect if the reaction is carried out isothermally and reversibly and if the excess of oxygen has the same pressure as the carbon dioxide formed. W. T.

Catalytic Activity of Copper. O. W. BROWN and C. O. HENKE (*J. Physical Chem.*, 1922, **26**, 715—727).—In continuation of previous work (this vol., i, 445), the authors have investigated the catalytic reduction of nitrobenzene to aniline by hydrogen in the presence of copper catalysts prepared by the reduction of the precipitated oxide. Sabatier's conclusion that a catalyst so prepared is more efficient than one prepared from an ignited nitrate was confirmed. By the use of the former catalyst, much lower rates of supply of hydrogen may be used without reduction in yield, and the reaction may be carried out at a much greater rate. The best temperature for carrying out the reduction was found to be about 260°. A small amount of iron in a copper catalyst prepared from an ignited oxide prevents the rapid decrease in activity of the catalyst. Copper deposited on asbestos was found to be capable of effecting the reduction at a much greater rate per gram of copper than copper alone, but with high rates of supply of nitrobenzene, it quickly lost its activity. Copper on asbestos is a better catalyst than an equal volume of copper on pumice. J. S. G. T.

Selective Activation of Alumina for Decarboxylation or for Dehydration. HOMER ADKINS (*J. Amer. Chem. Soc.*, 1922, **44**, 2175—2186).—Alumina has been preferentially activated for decarboxylation or for dehydration by modifying the method of preparation. This has been accomplished by obtaining aluminium hydroxide and hydrated alumina by precipitation from its salts or esters in water or xylene solution, and by preparing it by the action of water vapour on aluminium alkyl oxides, both in the pure state and when the latter are impregnated in pumice. The extent to which selective activation has been accomplished is indicated by the following figures, which give the relative "ethylene efficiency" of the variously prepared catalysts with ethyl acetate vapour at 465°: 34, 38, 41, 50, 107, and 150. The catalysts indicated were prepared as follows: by melting aluminium *iso*propoxide on pumice and exposing to moist air for eighteen hours (34); as last, but aluminium *iso*butoxide was used (38); by the action of moist air on aluminium methoxide; this was used as compressed tablets and contained traces of mercury (41); alumina from aluminium butoxide supported on pumice as above (50); tablets made from the precipitate produced by the action of hydrochloric acid on solutions of sodium aluminate (107); and tablets made from alumina obtained by the action of water on aluminium amalgam (150). An hypothesis has been advanced in which it is considered that the catalytic activity of alumina is conditioned by its molecular porosity, or the distances between the aluminium atoms and this, in part, is determined by the size, shape, and position of the radicles attached to the aluminium when the aluminium compound passes into the solid state. All the experimental evidence obtained with alumina catalysts is in complete harmony with this hypothesis. In terms of this hypothesis, it is held that decarboxylation is favoured by large pores in the alumina and that ethylene formation is favoured by small pores, large and small referring to units of molecular dimensions. The work of Milligan and Mead (this vol., ii, 447) on the dehydration and *X*-ray pattern of aluminium hydroxide is discussed in its relation to catalytically active alumina. The results obtained by Palmer (A., 1921, ii, 542), in the use of electrolytic copper and copper by reduction for the hydrogenation of alcohol, are explained on the basis of the hypothesis noted above. Cf. Langmuir (this vol., ii, 629). J. F. S.

The Influencing of Catalysts and Specifically Active Catalysts. KARL W. ROSENMUND and F. ZETZSCHE (*Ber.*, 1922, **55**, [*B*], 2774).—A reply to Abel (cf. Rosenmund and Zetzsche, A., 1921, ii, 320, 392, 393; this vol., ii, 41; Abel, A., 1921, ii, 542; this vol., ii, 26). H. W.

Kinetics of Inductive Processes: Schönbein's Reaction. A. V. PAMFILOV and N. N. PETIN (*Bull. Inst. Polyt. Ivanovo-Voznesensk*, 1922, **6**, 221—231).—The authors discuss previous work published on the influence of ferrous oxide on the liberation of iodine from an iodide by the action of hydrogen peroxide, and give the results of their own experiments on this reaction. It is found that not only the velocity of the initial stage of the reaction, but also the nature of its dependence on the concentration of the iron salt and on the corresponding acidity are completely different according as the iron is in the ferric or the ferrous condition. The liberation of iodine by ferric oxide or hydrogen peroxide separately is considerably accelerated when the two reactions occur together, and the velocities of the separate, and that of the combined, reactions increase with increase of the concentrations of all the components; the acidity of the medium is of comparatively little influence, but in general accelerates the reaction.

On the other hand, in neutral and faintly acid media the reaction is accelerated more by ferrous oxide than by ferric oxide in low concentration, but for definite conditions of concentration the reaction is retarded by increasing the concentration of the ferrous oxide either absolutely or in relation to the potassium iodide; this retardation is observed also in an acid medium. Increase in the acidity also retards the reaction considerably. This phenomenon disappears when the concentration of the potassium iodide increases and the solution is rendered strongly acid, especially as liberation of iodine by the acid becomes pronounced under these conditions.

Hence the diminution in the sensitiveness of Schönbein's reaction in a neutral medium caused by increase in the concentration of the catalyst (cf. Meissner, "Untersuchungen über den Sauerstoff," 1868, 78—80; Struve, *Z. anal. Chem.*, 1869, **8**, 319) is not fortuitous but holds generally, both in acid and in neutral solutions. The results of replacement of the acid by the corresponding concentration of a sulphate show, as was found by Brode (A., 1901, ii, 443) for ferric-ions, that the influence of increased acidity is not to be referred to diminished concentration of the ferrous ions and that the hydrogen-ions must here play a part.

The mechanism of the action of ferrous oxide, typical of inductors in general, is probably based on its spontaneous oxidation, and the retarding influence exerted on the reaction by acidity is related to the great stability of ferrous-ions in an acid solution. T. H. P.

Union of Hydrogen with Acetylene Derivatives. XV. Velocities of Catalytic Reactions. J. S. ZALKIND (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 199—211).—The author discusses the results obtained by various investigators on the course followed by reactions occurring under the influence of enzymes and other catalysts. The general conclusion drawn is that, even when catalysts so chemically simple as palladium and platinum are used, the course of the reaction is often quite complex, and that no essential difference exists between the actions of these simple catalysts and those of enzymes. In both cases, it is necessary to assume the formation of intermediate compounds between the catalyst and the reacting compounds, although with regard to the means by which such intermediate compounds are formed—whether by chemical reaction or by simple adsorption—opinions differ. Adsorption phenomena may, indeed, exhibit complex character and a sharp distinction between adsorptive and chemical phenomena is scarcely possible. T. H. P.

Speculations concerning the Positive Electron. [SIR] OLIVER LODGE (*Nature*, 1922, **110**, 696—697).—According to Larmor's theory, the positive and negative electrons can only differ in one being the mirror-image of the other. No positive electron in this sense has yet been discovered. Both positive and negative electrons are supposed to be extremely mobile, and the forces between them immense, so that they instantly bind themselves together into a compact and stable structure consisting of several thousands of each kind, the simplest and lightest of these composite structures being the hydrogen nucleus or proton. The proton for the first time allows a negative electron to revolve round it without being absorbed into its composition. On the mirror-image hypothesis, however, it becomes difficult to explain why only negative electrons should occur in the satellite systems; that is, why some atoms should not have nuclei with a surplus of negative charge, and be attended by positive electrons. The case of a number of primary electrons, both positive and negative, is considered. If, in the many possible ways of structural packing, something less than half the atomic nuclei formed were of the kind with positive satellites, whilst the other approximate half were of the negative satellite variety, the two classes would speedily combine with great violence and thereby form the tight-packed and stable nuclei of heavier atoms, until the complexity was too great to ensure stability. The combination of nuclei would cease only when they were protected by a screen of similar electrons, of which the sign might be positive or negative, but could not be both; that is, the resulting atoms could not be of opposite varieties. Thus the outlying satellites are all of one sign, either in every case or in so vast a preponderance of cases that no exceptions are as yet manifest. The free lifetime of the less plentiful variety would be too brief for ordinary detection, but it is suggested that by means of the shattering of nuclei and rapid methods of detection, the composite nature of the proton may possibly be demonstrated by the emission of something fractional of extreme instability. In this connexion, attention is directed to the fact that the atomic bombardment of aluminium yields particles of specially long range. A. A. E.

Motions of Electrons in Argon and Hydrogen. J. S. TOWNSEND and V. A. BAILEY (*Phil. Mag.*, 1922, [vi], **44**, 1033—1052; cf. this vol., ii, 277, 494).—Further measurements have been made of the movement of electrons in argon and hydrogen, and in mixtures of the two gases, in a uniform electric field. The velocity of the electrons (W) in the direction of the electric force, their mean velocities of agitation in the gas (u), their mean free path (l), the loss of energy on collision with a gas molecule (λ), and the factor (k) by which the energy of agitation of an electron exceeds the energy of a molecule of gas at 15°, are given for varying values of Z/p, where Z is the fall in potential in volts, and p is the gas pressure in millimetres. The loss in energy of an electron on collision with a molecule of argon is extremely small. When moving with a velocity of agitation of $12{\cdot}6\times10^7$ cm. per sec., the fraction of energy lost by an electron on collision with a molecule is $1{\cdot}6\times10^{-5}$ in argon, 5×10^{-2} in nitrogen, and 4×10^{-2} in hydrogen, and the corresponding mean free paths are 0·147 cm. in argon, 0·029 cm. in nitrogen, and 0·035 cm. in hydrogen, the gases being at 1 mm. pressure.

In the case of argon, whereas W increases steadily with increase in Z/p, u increases to the constant value, $20{\cdot}7\times10^7$ cm. per sec. Between the values of Z/p, 1·25—15, the velocity of agitation remains practically constant, whilst the loss of energy on collision steadily increases. This is due to a large loss in energy in collisions with velocities greater than the mean. The free path of an electron in argon at 1 mm. pressure has a maximum value of 1·6 cm. for the velocity $3{\cdot}75\times10^7$ cm. per second, whereas the mean free paths of nitrogen and hydrogen show minima in the neighbourhood of 8×10^7 cm. sec. The large increases in the mean free paths of the electrons as the velocity diminishes are very striking.

The addition of argon to hydrogen, whilst reducing W, the velocity in the direction of the electric force, scarcely affects u, the mean velocity of agitation of the electrons. This is in agreement with the small loss in energy on collision with a molecule of argon. The mean free paths in argon, for velocities of agitation less than $11{\cdot}5\times10^7$ cm. per second, were found by measurement of the mean free paths in mixtures of hydrogen and argon. W. E. G.

The Motion of Electrons in Carbon Dioxide. M. F. SKINKER (*Phil. Mag.*, 1922, [vi], **44**, 994—999).—The apparatus used was similar to that of Townsend and Bailey (cf. this vol., ii, 277, 494). Curves are given comparing the speed of electrons in carbon dioxide, nitrogen, and hydrogen. Values for the mean free path of the electron, its speed in the direction of the electric force, its velocity of agitation, and the proportion of energy lost on collision with a molecule of gas, are tabulated against different values of Z/p (cf. Townsend and Bailey, preceding abstract). A sudden increase in the loss of energy which occurs on collision between an electron and a molecule of carbon dioxide is observed between the velocities of agitation 13×10^7 and 15×10^7 cm. per second. W. E. G.

The Constitution of the Chemical Elements. FRIEDRICH WÄCHTER (*Z. anorg. Chem.*, 1922, **123**, 1—13).—A theoretical paper. The author assumes that the light ether is a ponderable gas, an atom of which has a mass 1/1800 the mass of an atom of hydrogen. He regards the elements as different condensation forms of the light ether, the number of ether atoms in an atom of any element being 1800 times the atomic weight of the element. This is applied to the atomic heat of elements and to the spectral lines. W. T.

The Disintegration of Chemical Elements. Friedrich Wächter (*Z. anorg. Chem.*, 1922, **123**, 14—30).—A theoretical paper. The author assumes that hydrogen and helium atoms are made up of light ether atoms, and that other elements are built up of hydrogen and helium atoms. He then endeavours to explain the disintegration of the radio elements. W. T.

Electronic Structures of Atoms. Maurice L. Huggins (*J. Physical Chem.*, 1922, **26**, 601—625).—A theoretical paper in which the Lewis hypothesis of valency and atomic structure is assumed to be correct for the lighter atoms. The evidence in favour of a tetrahedron of electron pairs, rather than a cube of single electrons, being the most stable arrangement for the valency shell of these atoms, is put forward. It is shown how the stability of such an arrangement may be the result of the deviation of the force law between two electrons from Coulomb's law at small distances. The chief requirement for this purpose is that as two electrons approach each other, the repulsion between them reaches a maximum at a distance of the order of magnitude of 1 Å., the force then decreasing, for a considerable proportion of the remaining distance at least. As a result of a law of this type, whenever two electrons, forming part of an atomic shell, are forced close enough together, they come still closer to each other, that is, the pair off, and similarly from three pairs aided by the attraction of an atomic nucleus and the repulsion of other electrons, triplets are formed. Based on this assumption and on the idea that the electrons in an atomic shell tend to place themselves opposite the centres of the faces of the imaginary polyhedron formed by the electron groups in the next underlying kernel shell, an arrangement of electrons is obtained for each element in each valency stage, with a few exceptions which have not yet been deduced. These arrangements conform with the known properties of the elements, and account for the periodic relationships in a simple and logical manner. J. F. S.

Bohr's Model of the Hydrogen Molecules and their Magnetic Susceptibility. Kôtarô Honda (*Nature*, 1922, **110**, 664—665).—Since, according to Langevin, hydrogen molecules should have a paramagnetic susceptibility, it has hitherto been assumed that Bohr's model does not explain the diamagnetic property of the gas. The actual diamagnetic susceptibility, as determined by Soné, is shown to lie between the two values calculated when the validity of Bohr's model is assumed in the case of $n+n'=1$ and $n+n'=2$, where n and n' are the azimuth and radial quantum numbers. A. A. E.

The Normal Helium Atom and the Quantum Theory. J. H. Van Vleck (*Phil. Mag.*, 1922, [vi], **44**, 842—869).—A study is made of the Kemble model of the helium atom. In this model the two electrons are arranged with axial symmetry. The energy of this atom has been computed, and the calculation has given a value of 20·7 volts for the ionisation potential, instead of 25·4 demanded by experiment, the discrepancy being slightly greater than for the Bohr model. It does not seem possible to devise a satisfactory symmetrical model of helium based on the conventional quantum theory of atomic structure. W. E. G.

The Neuburger Nuclear Model. Maximillian Camillo Neuburger (*Physikal Z.*, 1922, **23**, 389).—A reply to Meitner (cf. this vol., ii, 702). The author's model of the structure of the atomic nucleus is not dependent on the existence of *iso*helium in the free state. The nuclear formula requires, however, that groups, composed of three hydrogen nuclei and an electron, shall be capable of existence in the nucleus itself. W. E. G.

Negative Valency and Co-ordination Number. E. A. Schilov (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 281—290).—The most pronounced negative affinity is accompanied by non-metallic properties, so that, if it is assumed that negative affinity is the result of a tendency of the rings of valency electrons to attain saturation, it becomes necessary to make the supplementary assumption that only non-metallic rings of a special type exhibit such tendency. It is suggested that the origin of complex compounds may be represented on an analogous principle, co-ordinative affinity arising as a result of the tendency towards saturation of non-dissociating, non-metallic atomic skeletons.
T. H. P.

Quanta of the Ideal Monatomic Gas. K. Schaposchnikov (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 105—124).—A mathematical paper, in which the quantum theory is applied to gases at high and at low temperatures. T. H. P.

Chemical Constants of some Diatomic Gases. J. R. Partington (*Phil. Mag.*, 1922, [vi], **44**, 988—993).—The investigations of Sackur (cf. A., 1913, ii, 128), and Tetrode (*Ann. Physik*, 1912, [iv], **38**, 434; **39**, 225) on the chemical constants of monatomic gases have been extended to the case of a hypothetical diatomic molecule. In the first case considered, the gas molecule is assumed to consist of two identical atoms rigidly attached to each other at a fixed distance apart. The method of calculation is based on generalised statistical mechanics, and it is shown that the following equation holds over a certain range of temperatures, $C=2{\cdot}5\log M+2\log K+12{\cdot}730$, where K=radius of gyration and M the molecular weight. This gives values for the chemical constants $C_{O_2}=1{\cdot}001$, $C_{N_2}=0{\cdot}904$, and $C_{H_2}=-2{\cdot}255$. On account of the very small mass and diameter of the hydrogen molecule, hydrogen should behave in a manner intermediate between that of a monatomic and a diatomic gas. In the second case, that of two different atoms rigidly bound together, it is necessary to add $\log 2$ to the above equation, and $C_{CO}=1{\cdot}205$, and $C_{NO}=1{\cdot}263$. These results are in all cases of the right order. W. E. G.

A New Apparatus for Washing Gases. A. Ernst (*Chem. Listy*, 1922, **16**, 274—276).—The tube leading the gas to be purified

into the washing bottle is surrounded by a long spiral, along which the gas has to make its way and is thus well washed. The tube leading in the gas and the spiral are easily removed from the vessel.
W. T.

Protection of Brass Weights. J. J. Manley (*Phil. Mag.*, 1922, [vi], **44**, 948—950).—The method introduced by Faraday for protecting iron from rust has been employed for protecting brass weights. A satisfactory method of procedure is to cover the weight with a thin film of linseed oil, and heat it, appropriately supported in a covered "vitreosil" crucible or closed muffle, until the weight assumes a golden tint. The protecting film which is formed is tough and may be polished. The weight of 1 sq. cm. of normal film is 0·00005 gram.
W. E. G.

Lecture Experiments with Hydronitric [Hydrazoic] Acid and the Trinitrides [Azides]. A. W. Browne and A. B. Hoel (*J. Amer. Chem. Soc.*, 1922, **44**, 2116—2119).—A series of lecture experiments with azoimide is described which includes the following. *Nitridation of hydriodic acid:* 5 c.c. of hydriodic acid (*d* 1·5) are placed in a 15 cm. test-tube and 1 c.c. of 1% hydrazoic acid is added when both iodine and nitrogen are liberated according to the equation $N_3H+2HI=NH_3+N_2+2I$. This experiment illustrates the similarity between hydrazoic acid and hydrogen peroxide. *Nitridation of hydrochloric acid:* 5 c.c. of hydrochloric acid are treated with 1 c.c. of 1% hydrazoic acid and raised to the boiling point for one minute; the contents of the tube are then poured into 2½ litres of water containing starch and potassium iodide, when the free chlorine liberates iodine. The reaction is represented by the equation $N_3H+2HCl=NH_3+Cl_2+N_2$. *Formation of potassium manganate by the action of potassium azide on manganese dioxide:* 0·5 gram of finely powdered potassium azide and 0·5 gram of manganese dioxide are mixed and gently heated in a 100 c.c. porcelain crucible covered by a 200 c.c. crucible. The reaction is violent and proceeds with a hissing noise and the emission of numerous sparks. When the reaction has moderated, the larger crucible is removed and the heating continued for a short time. After cooling the mass, it is thrown into 2½ litres of water, when the green solution produced speedily changes to that of a permanganate solution. In this experiment it is advisable that the operator should not come too close to the crucible at the commencement of the experiment. *Detonation of silver azide by means of a fuse consisting of paper impregnated with potassium azide:* Silver azide, prepared by adding a dilute solution of silver nitrate cautiously to 25 c.c. of a 1% solution of hydrazoic acid, filtering and washing with water, is made into a thin disk 18 mm. diameter and 1 mm. thick, while still moist. This is then stuck on a piece of filter-paper prepared as follows: a strip 0·5—1·0 cm. wide and 0·25—0·50 metre long is painted on a filter-paper by means of a small brush dipped in a 5% aqueous solution of potassium azide and dried. The disk of silver azide is attached to one end of the strip and the whole thoroughly dried. The dried paper is then suspended and a glowing splint brought in contact with the end of the strip removed from the silver azide; the combustion gradually progresses toward the silver azide, which finally detonates with a sharp report. J. F. S.

Inorganic Chemistry.

Diffusion of Hydrogen and Helium through Silica Glass and other Glasses. G. A. Williams and J. B. Ferguson (*J. Amer. Chem. Soc.*, 1922, **44**, 2160—2167).—The rate at which hydrogen and helium, respectively, leak into evacuated tubes of silica glass, pyrex glass, and Jena glass has been determined at a series of temperatures and pressures. It is shown that silica glass is permeable to hydrogen at high temperatures. The permeability is proportional to the gas pressure and is an exponential function of the temperature. It becomes appreciable at 300°. Silica glass is similarly permeable to helium, and this is easily measurable at 182°. At 500°, the permeability for helium is about twenty-two times that for hydrogen. Neither pyrex glass nor Jena combustion glass was found to be permeable to hydrogen, but apparently hydrogen reacts with pyrex glass causing it to blacken. At 610°, pyrex glass is permeable to helium. The permeabilities of a number of samples of glass have been determined and the results compared with those of Wüstner (*Ann. Phys.*, 1915, [iv], **46**, 1095) and others. J. F. S.

The Solubility of Oxygen in Various Organic Solvents. Franz Fischer and Georg Pfleiderer (*Z. anorg. Chem.*, 1922, **124**, 61—69).—The solubility was determined by pumping the gas from the saturated solution by means of a mercury–air pump and measuring the amount obtained. The results embodying the solubility of oxygen in sixteen organic solvents are tabulated; the specific gravities and vapour pressures are also given. W. T.

A New Form of Ozoniser. H. Němeček (*Chem. Listy*, 1922, **16**, 276).—Two stout copper wires serve as electrodes in a horizontal glass cylinder, the arrangement being such that the distance between the electrodes can be varied. The energy can be obtained by means of a Rhumkorff's coil or an electric machine. W. T.

Hydrophobic and Hydrophilic Sols of Sulphur. H. Freundlich and P. Scholz (*Koll. Chem. Beihefte*, 1922, **16**, 234—266).—The behaviour of the hydrophobic and several hydrophilic sols of sulphur has been compared. As a markedly hydrophile sol, that investigated by Odén, and prepared by the interaction of hydrogen sulphide and sulphur dioxide, and by the decomposition of thionic acids, has been considered, and as a hydrophobe sol, that prepared by Weimarn by pouring an alcoholic solution of sulphur into water, is considered. The Weimarn sulphur sol has been shown to be completely hydrophobic; it is negatively charged and is coagulated by electrolytes according to the general laws concerning the coagulation of hydrophobic sols, namely, the strong influence of the absorbability and valency of the kations, the strong effect of the hydrogen-ion, and the slight effect of the hydroxyl-ion. The sols may only be prepared in relatively small concentrations, the coagulum is not peptised by washing with water, and the sols may be preserved for a day or two only. In keeping with Odén's results, the coagulation of Odén's sol is markedly different from that of Weimarn's sol, as is demanded by its greater hydrophilic behaviour. The difference is mainly shown in the following points: (i) alkali salts have a ten to twenty times weaker coagulating action than with Weimarn's sol; (ii) the lyotropic series of the kations is well defined; lithium-ions have a very weak coagulating action, whilst sodium-, potassium-, rubidium-, and cæsium-ions are markedly and increasingly stronger; (iii) acids have a still weaker coagulating action than the alkali salts; (iv) alkalis convert the Odén sol into one which has similar properties to the hydrophobic Weimarn sol. The assumption that the micellæ of Weimarn's sol consist of λ-sulphur and those of Odén's sol of μ-sulphur is insufficient to explain these differences; for neither the behaviour towards acids nor that towards bases is in the least explained by the above assumption, whilst a very possible explanation is that Odén's sol contains pentathionic acid, whereas Weimarn's sol does not. The presence of pentathionic acid in Odén's sol is proved by the following data: (i) the acid can be detected in the filtrate from coagulated sulphur by the fact that on the addition of alkali more sulphur is deposited; (ii) prolonged action of alkali on coagulated sulphur or sulphur micellæ brings about the formation of thiosulphate; this action is brought about by ammonia without the sulphur itself being markedly attacked. It is probable that the pentathionic acid is adsorbed in the sulphur particles, since this substance is very difficult to remove by washing. The quantity of pentathionic acid bound to the sulphur is found to be 0·1—0·7 millimol. per gram of sulphur. The influence of pentathionic acid on the stability of Odén's sol is explained as follows. This acid has a constitution which is closely related to that of water and sulphur and therefore it facilitates the formation of micellæ, which, in addition to sulphur and pentathionic acid, contain large quantities of water. The greater water content of Odén's sol is manifested by its greater transparency when compared with Weimarn's sol of equal sulphur content. The micellæ are to be represented in Odén's sol by the formula $\boxed{\begin{matrix} S\mu \\ S_5O_6H_2 \\ H_2O \end{matrix}} S_5O_6''$, and in Weimarn's sols by $\boxed{\begin{matrix} S\lambda \\ H_2O \end{matrix}}'$. The structure of the micellæ of Odén's sol explains the behaviour on coagulation as regards the following points: (i) alkalis decompose the pentathionic acid, whereby the loose combination between the sulphur and water is also disturbed and converted into one which is similar to that of the Weimarn sol; (ii) acids have such a feeble coagulating power because they increase the stability of the pentathionic acid and produce more pentathionic acid from the pentathionates which may be present. The structure also is in keeping with the fact that hydrogen sulphide has an action on the sol similar to that of the alkalis; that is, it converts it into an hydrophobic sol which is much less stable because the pentathionic acid is decomposed by hydrogen sulphide with separation of sulphur. Further, sols of the same nature as Odén's sol are obtained by reactions which produce both sulphur and pentathionic acid; for example, the decomposition of sulphur monochloride by water: $5S_2Cl_2+6H_2O=5S+H_2S_5O_6+10HCl$. The stability of Odén's sol, which is due to pentathionic acid, does not depend on the charge of the micellæ. Whether or no Odén's sol contains $S\mu$ cannot be definitely answered, although the yellow colour of the sol makes it extremely likely that this variety of sulphur is present. J. F. S.

The Existence of Sulphur Tetroxide. FRIEDRICH MEYER, GUSTAV BAILLEUL, and GERHARD HENKEL (*Ber.*, 1922, **55**, [*B*], 2923—2929).—The experiments described owed their origin to a desire to examine Berthelot's sulphur heptoxide more fully, and as a considerable quantity of the product was desired, the original method was modified by submitting a current of sulphur dioxide and oxygen to the silent electric discharge instead of working with a fixed volume of the gases. Contrary to Berthelot's statements, the product which is formed does not appear to have an appreciable vapour tension even at 20°. The crystalline substance described by Berthelot is only formed when analysis shows that sulphur trioxide is present in excess. On the other hand, an amorphous product is obtained the analyses of which sometimes agree with the formula, S_2O_7, but sometimes show more oxygen than is required by this expression. The latter substance has been prepared in a specially designed discharge tube (which is figured in the original), which is so constructed that it is sufficiently small and light to be weighed on an analytical balance, that it can be evacuated and kept vacuous, and has little dead space. The material, thus prepared in the tube from sulphur dioxide and oxygen, is weighed and analysed in situ. For the latter purpose, it is treated with an aqueous solution of potassium iodide with which, at a sufficiently low temperature, it reacts with unexpected slowness and with the liberation of a very small proportion of oxygen. The latter is measured together with the liberated iodine and sulphuric acid. The highest stage of oxidation yet reached corresponds with the formula, $SO_3,2SO_4$. The authors, however, do not consider that this product represents the most highly oxidised form of sulphur which is possible, since in their work up to the present the imparted energy has not been sufficiently great in proportion to the volume of gas employed.

It appears possible that Berthelot's sulphur heptoxide is a mixture of sulphur trioxide and sulphur tetroxide in equimolecular ratio. H. W.

The Isotopes of Selenium and some other Elements. F. W. Aston (*Nature*, 1922, **110**, 664).—Very satisfactory mass-spectra have been obtained in the case of selenium by vaporising the element in the discharge tubes. Selenium is shown to consist of six isotopes, giving lines at 80, 78, 76, 82, 77, and 74, respectively, in decreasing order of intensity. The results agree with the atomic weight as determined by chemical methods, and measurement of the lines shows no detectable deviation from the whole-number rule. The mass spectra of cadmium and tellurium could not be obtained by this method, but the experiments have incidentally shown that chlorine has no isotope of mass 39, and that aluminium is a simple element of mass 27. Two new isotopes of xenon, 124 and 126, making nine in all, are found to exist in minute amounts. The first of these is isobaric with tin, and the selenium lines 78, 80, and 82 are isobares of krypton; it is noted that all isobares so far discovered have even atomic weights. A. A. E.

Action of Compounds of Nitric Oxide and Hydroxylamine on Trisodium Arsenite. A. Gutmann (*Ber.*, 1922, **55**, [*B*], 3007—3012).—The oxidation of sodium arsenite to arsenate by sodium benzenediazoxide (which is not effected by the *iso*-diazoxide) has been attributed previously to the presence of a reactive, labile quadrivalent oxygen atom (A., 1912, i, 397; 1915, i, 127); an extension of the observations to a series of derivatives of nitric oxide and hydroxylamine indicates that sodium arsenite is a specific reagent for active oxygen.

Nitric oxide oxidises sodium arsenite in accordance with the equation: $2NO+Na_3AsO_3=N_2O+Na_3AsO_4$; a similar change occurs when an excess of sodium arsenite is added to a solution of nitric oxide in freshly prepared, strongly alkaline potassium sulphite solution. Nitrosobenzene does not react with sodium arsenite at the atmospheric temperature but at the temperature of the boiling water-bath gives azoxybenzene and sodium arsenate. The constitutions $\begin{array}{l}N\cdot O\\ \| \;\;\, \| \! \|\\ N\cdot O\end{array}$ and $\begin{array}{l}Ph\cdot N\cdot O\\ \quad\;\; | \;\; \| \\ Ph\cdot N\cdot O\end{array}$, are suggested for nitric oxide and nitrosobenzene, respectively. Sodium nitroprusside does not appear to react with sodium arsenite. With hydroxylamine, the reactions $NH_2\cdot OH+Na_3AsO_3=Na_3AsO_4+NH_3$ and $3NH_2\cdot OH=NH_3+N_2+3H_2O$ occur concurrently. β-Phenylhydroxylamine gives sodium arsenate, aniline, and azoxybenzene, $4NHPh\cdot OH+Na_3AsO_3=Na_3AsO_4+2NH_2Ph+O{<}\begin{array}{l}NPh\\ | \\ NPh\end{array}+2H_2O$, whereas the isomeric *p*-aminophenol is inactive. β-Ethylhydroxylamine, on the other hand, appears to give only arsenite and ethylamine. Dimethylaniline-*N*-oxide and sodium arsenite readily yield dimethylaniline and sodium arsenate. Quinine-*N*-oxide similarly gives quinine and sodium arsenate; the two oxides are therefore peroxidic in character. H. W.

Properties and Structure of Pernitric Acid. IV. TRIFONOV (*Z. anorg. Chem.*, 1922, **124**, 123—135).—Pernitric acid is formed by the action of hydrogen peroxide on an acidified nitrite solution; low temperature and low concentration are not essential for its formation. Above 70°, it decomposes rapidly. The per-acid can be estimated by the addition of potassium bromide in dilute solution, and the liberated bromine estimated by means of a potassium iodide solution. The author finds that the reaction of formation is represented by the equation $2HNO_2+3H_2O_2+(n-1)H_2O=N_2O_6,nH_2O+3H_2O$, and not as given by Raschig (*Ber.*, 1907, **40**, 4585) or Schmidlin and Massini (A., 1910, ii, 498). It thus receives the formula $NO_2\cdot O\cdot O\cdot NO_2,nH_2O$. The reactions of pernitric acid with some organic compounds are given. W. T.

Phosphorus. W. MARCKWALD and K. HELMHOLTZ (*Z. anorg. Chem.*, 1922, **124**, 81—104).—The authors find the melting point of scarlet phosphorus to be 592·5±0·5°, and the critical temperature of the yellow modification to be 720·6°. Rapid cooling of phosphorus vapour deposits a mixture of the yellow and scarlet forms; slow cooling deposits the pure yellow modification. To explain this the authors assume that phosphorus vapour at 900° and 120 mm. pressure consists of P_4 molecules and 10% P_2 molecules. On cooling, the P_2 and P_4 molecules combine to form the complex molecules of scarlet phosphorus and this is to a certain extent deposited. Slow cooling, however, allows the scarlet phosphorus vapour to change into the vapour of the yellow form. The phenomenon observed on cooling liquid scarlet phosphorus is explained as follows. The liquid contains molecules of yellow (P_4) and scarlet (P_x) phosphorus in equilibrium: $nP_4 \rightleftharpoons mP_x$. Above 592·5°, most of the molecules are P_4 and on rapid cooling these solidify, giving the yellow variety. Slow cooling allows of a change of equilibrium to the right and therefore a deposit of the scarlet form on solidification. It is shown that the crystals isolated from a melt of the scarlet variety are identical with Hittorf's phosphorus. Black phosphorus changes into the scarlet form on being heated at 575°. W. T.

The Toxic Properties of Commercial Ferrosilicon. N. KURNAKOV and G. URASOV (*Z. anorg. Chem.*, 1922, **123**, 89—131).—Commercial ferrosilicon has been found to evolve poisonous and explosive gases. The alloys containing about 50% silicon, which is attacked by water, are very dangerous. The authors found that a solid phase of variable composition, *lebeauite*, makes its appearance in iron–silicon alloys with 33·4 to 100% by weight of silicon; lebeauite solidified at 1245°. Lebeauite can form ternary and quaternary solid solutions with phosphorus and aluminium. The ternary solid solutions (Fe,Si,P, and Fe,Si,Al) of lebeauite are stable towards water. The quaternary solution (Fe,Si,Al,P) is, however, attacked by water, phosphine being evolved. Ferrosilicon with less than 33·4% silicon in γ-iron can dissolve phosphorus and aluminium to the extent of 1·7% and 3%, respectively.

These ternary and quaternary solid solutions resist the action of water. Calcium phosphide will not dissolve in solid or liquid ferrosilicon. W. T.

The Mechanism of the Formation of Silane from Magnesium Silicide. I. ROBERT SCHWARZ and ERICH KONRAD (*Ber.*, 1922, **55**, [*B*], 3242—3252).—The decomposition of magnesium silicide by aqueous hydrochloric acid leads ultimately to the production of a solid, white substance, $H_2Si_2O_3$, which shows all the properties of dioxodisiloxan. The substance, however, cannot be a primary product of the decomposition of the silicide, but is to be regarded as the final result of a series of intermediate reactions which cannot be followed in purely aqueous solution. Attempts are therefore made to arrest the reaction at intermediate stages by replacing the water to a greater or less extent by alcohol. Under these conditions, monosilane is not evolved during the first period of the action, and the solid product contains magnesium, which cannot be removed by washing, but is free from chlorine. It is a colourless substance (the usual brown tint is due to admixed elementary silicon) which explodes on contact with air, yielding silicon and silicon dioxide, is decomposed by water, decolorises potassium permanganate and alcoholic bromine, and reduces silver nitrate. Analysis of it gives the ratio $Si : Mg : H = 1 : 2 : 2$. The primary hydrolysis of magnesium silicide may therefore be expressed by the equation: $Mg{:}Si{:}Mg+2H\cdot OH=H_2Si(Mg\cdot OH)_2$. In these circumstances, not more than 15% of the silicon actually present is found in the solid product, whilst also none escapes as monosilane. The remainder is found as a stable alcohol sol of silicic acid. A second reaction must therefore have occurred, possibly in accordance with the scheme: $Mg_2Si+4HCl+2H_2O=4H_2+2MgCl_2+SiO_2$, whereby account is rendered of the evolution of hydrogen. Approximately 10% of the magnesium silicide is decomposed in accordance with the first and about 90% in accordance with the second equation.

Many attempts have been made by varying the concentration of the alcohol and shortening the period of the action of the acid on the silicide to isolate other compounds intermediate between the primary product and the ultimate silicoformic anhydride. With increasing dilution of the alcohol, the production of silanes increases, but very little definite information is afforded by analysis of the solids. They can only be regarded as mixtures formed by further hydrolysis of the primary product, which they resemble in their ready inflammability on exposure to air. It appears probable that the initial product suffers further hydrolysis in two directions such as are suggested by the schemes: $SiH_2(Mg\cdot OH)_2+2H\cdot OH=2Mg(OH)_2+SiH_4$ and $SiH_2(Mg\cdot OH)_2+H_2O+4HCl=2MgCl_2+2H_2O+SiH_2O+2H_2$.

Magnesium silicide is prepared by igniting an intimate mixture of finely-divided, ignited quartz and magnesium powder in an atmosphere of hydrogen and mechanical separation of the crystals of the silicide from the mixture. The crude product is freed from admixed magnesium by the action of ethyl bromide and anhydrous ether. The purified material is a uniform, steel-blue, crystalline powder which contains traces of amorphous silicon and iron silicide. The apparatus used in studying the decomposition of the silicide is fully figured and described in the original. H. W.

Pressure of Saturated Carbonyl Chloride Vapour. N. I. Nikitin (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 235—249).—The vapour pressure of carefully purified carbonyl chloride has been measured at a number of temperatures ranging from 12·6° to −99°. The pressure has the value 889·2 mm. at 12·6°, and diminishes rapidly with fall of temperature to 540·4 mm. at −0·41°, and then continually more slowly; at −19·43°, the value is 232·2 mm. and at −94·2° a few tenths of a millimetre. T. H. P.

Interaction of Carbon Tetrachloride and Fuming Sulphuric Acid. A. I. Lepin (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 1—17).—The author has investigated the mechanism of the formation of carbonyl chloride and chlorosulphonic acid from carbon tetrachloride and fuming sulphuric acid (cf. Schützenberger, *Annalen*, 1870, **154**, 375; Armstrong, *J. pr. Chem.*, 1870, [ii], **1**, 246; Erdmann, A., 1893, i, 681). If the fuming acid contains 45% of dissolved sulphur trioxide, corresponding with the formula $H_2S_2O_7$, the reaction is expressed by the equation, $CCl_4+H_2SO_4,SO_3=COCl_2+2SO_3HCl$. If less than 45% of dissolved trioxide is present, so that the acid may be regarded as a solution of fuming in monohydrated acid, the fuming acid acts as above, the excess of monohydrate remaining together with the secondary product, chlorosulphonic acid. Finally, if the dissolved sulphur trioxide exceeds 45%, the acid may be considered as a mixture of pyrosulphuric acid with sulphur trioxide. In this case, part of the carbon tetrachloride reacts according to the equation $CCl_4+H_2SO_4,SO_3=COCl_2+2SO_3HCl$, and part according to $CCl_4+2SO_3=COCl_2+S_2O_5Cl_2$; both these reactions proceed quantitatively. T. H. P.

Reaction between Potassium Azide and Iodine in the Presence of Carbon Disulphide. A. W. Browne and A. B. Hoel (*J. Amer. Chem. Soc.*, 1922, **44**, 2106—2116).—Potassium azide reacts with iodine in the presence of carbon disulphide, with the formation of potassium iodide and the liberation of nitrogen. The first stage in this reaction consists in the formation of potassium azidodithiocarbonate, $KS{\cdot}CS{\cdot}N_3$, by interaction of potassium azide and carbon disulphide, as expressed by the equation $KN_3+CS_2=KS{\cdot}CS{\cdot}N_3$. This reaction is irreversible, consequently there is no regeneration of carbon disulphide after it has once reacted. The second stage consists in the reaction between potassium azidodithiocarbonate with iodine, which results in the precipitation of azidocarbon disulphide $S_2(CS{\cdot}N_3)_2$ according to the equation $2KS{\cdot}CS{\cdot}N_3+2I=S_2(CS{\cdot}N_3)_2+2KI$. The halogenoid substance azidocarbon disulphide liberates triatomic nitrogen from potassium azide, with resultant evolution of ordinary nitrogen, as shown by the equations $2KN_3+S_2(CS{\cdot}N_3)_2=2KS{\cdot}CS{\cdot}N_3+2N_3$; $2N_3=3N_2$.

Combination of these equations with the preceding one leads to the simple expression of the final result obtained when carbon disulphide, potassium azidodithiocarbonate, or azidocarbon disulphide, in relatively small amount, is brought into contact with a solution containing potassium azide and iodine. These results have been confirmed by iodometric and nitrometric determinations: $2KN_3+2I=2KI+3N_2$. J. F. S.

Potassium Azidodithiocarbonate. A. W. Browne and A. B. Hoel (*J. Amer. Chem. Soc.*, 1922, **44**, 2315—2320; cf. preceding abstract; Sommer, A., 1916, ii, 29).—Potassium azidodithiocarbonate may be prepared by the action of carbon disulphide on an aqueous solution of potassium azide at 40°. It is obtained in colourless, deliquescent crystals, which decompose quantitatively when gently heated, yielding potassium thiocyanate, sulphur, and nitrogen. When rapidly heated, the substance explodes, with the formation of potassium sulphide, carbon dioxide, and sulphur dioxide and trioxide in addition to the above. Solutions of the salt when treated with various oxidising agents or when electrolysed yielded azidocarbon disulphide $(SCSN_3)_2$. The authors confirm the structure, K·S·CS·N:N:N, as assigned to it by Sommer (*loc. cit.*). W. G.

Melting and Freezing Point of Sodium Chloride. John Bright Ferguson (*J. Physical Chem.*, 1922, **26**, 626—630).—The melting point and freezing point of sodium chloride have been determined by means of a platinum–platinum-rhodium thermo-element. As the mean of a number of experiments, the value 803·1° is found for the freezing point and 803·4° for the melting point. The author recommends the value 803°±1° as the best value for the freezing point. J. F. S.

The Properties of Ammonium Nitrate. IV. The Reciprocal Salt-pair, Ammonium Nitrate and Sodium Chloride. Edgar Philip Perman (T., 1922, **121**, 2473—2483).

Colloidal Calcium Hydroxide. M. von Glasenapp (*Kolloid Z.*, 1922, **31**, 195—196).—Two varieties of colloidal calcium hydroxide have been obtained from a marly dolomite of the composition CaO 22·75%, MgO 15·50%, Al_2O_3 7·68%, Fe_2O_3 1·87%, SiO_2 15·27%, CO_2 34·83%, H_2O 1·81%. The dolomite was burnt at 720—780° until the magnesium carbonate was entirely decomposed and the calcium carbonate half decomposed. After the burnt product had been kept for twelve hours in water, the two colloidal varieties of calcium hydroxide were microscopically visible. The primary product separates first from solution as small droplets which grow speedily, and pass into the secondary product which forms agglomerates of drops having the appearance of a cell network. Both colloids are optically isotropic but strongly refracting. In reflected light, the primary colloid is light blue and the secondary bright orange in colour. The secondary colloid does not maintain the colloidal state very long, but passes into crystalline calcium hydroxide. J. F. S.

Valency. XVI. The Ammonia Compounds of Calcium Haloids. Gustav F. Hüttig (*Z. anorg. Chem.*, 1922, **123**, 31—42).—The methods of investigation were as previously communicated by the author (A., 1920, ii, 293 and 318). The following ammonia compounds were found to exist in the stable state :—$CaCl_2,8NH_3$; $CaCl_2,4NH_3$; $CaCl_2,2NH_3$; $CaCl_2,NH_3$; $CaBr_2,8NH_3$; $CaBr_2,6NH_3$; $CaBr_2,2NH_3$; $CaBr_2,NH_3$; $CaI_2,8NH_3$; $CaI_2,6NH_3$; $CaI_2,2NH_3$, and CaI_2,NH_3.

These determinations were carried out at various temperatures ranging from −80° to 230°. The isothermal curves pressure-composition are given. W. T.

The Solubilities of Calcite and Aragonite. Hans L. J. Bäckström (*Medd. K. Vetenskapsakad. Nobel-Inst.*, 1922, **4**, No. 11, 1—11).—An account of work published more fully elsewhere (A., 1921, ii, 317). E. H. R.

Setting and Velocity of Solution of Burnt Gypsum. P. P. Budnikov and Ja. K. Syrkin (*Bull. Inst. Polyt. Ivanovo-Voznesensk.*, 1922, **6**, 235—247).—The authors have investigated the velocities of dissolution of gypsum after the latter had been heated at various temperatures, the concentrations being determined at different stages of the dissolution by means of conductivity measurements. For the samples which have been heated at 115° and 125°, the conductivity and hence the solubility increases rapidly to a point corresponding with a solution considerably supersaturated with respect to $CaSO_4,H_2O$, and afterwards diminishes, at first rapidly and then slowly, but still indicates a certain degree of supersaturation after twenty-four hours. Supersaturated solutions are obtained also with gypsum heated at 400°, but not when a temperature of 500° is reached. In so far as the setting of gypsum is conditioned by crystallisation from supersaturated solutions, the temperature at which "dead-burnt" gypsum is formed may therefore be assumed to be about 450°.

Burnt gypsum may be regarded as consisting of two components, one soluble, which dissolves readily, and the other relatively insoluble. The solubility of samples which have been burnt at temperatures between 500° and 800° is rapid at first, this being explained by the presence of appreciable proportions of the soluble modification in dead-burnt gypsum.

The time occupied by dissolution does not furnish an exhaustive explanation of the disappearance of the ability of gypsum to set, and the authors suggest that the presence of the insoluble component in the interstices of the crystals prevents the latter from growing. T. H. P.

The Silicates of Strontium and Barium. Pentti Eskola (*Amer. J. Sci.*, 1922, [v], **4**, 331—375).—The author has determined the equilibrium diagrams of the binary systems $SrO-SiO_2$ and $BaO-SiO_2$, respectively, and also certain characteristics (crystalline system and habit, refractive indices and dispersion, cleavage and density) of the compounds and eutectics formed in these systems. The corresponding diagram and characteristics in the case of the system $CaO-SiO_2$ are given for purposes of comparison. In the system $SrO-SiO_2$, compounds $2SrO,SiO_2$ and SrO,SiO_2 were found, and these, together with SrO, occurred in one form only, although the temperature of formation of the silicates was varied from the melting point down to about 900°. SrO,SiO_2 was found to be closely isomorphous and optically very similar to $\alpha CaO,SiO_2$. Its crystals are apparently hemimorphic and belong either to the dihexagonal pyramidal or monoclinic domatic class, probably the latter. In the system $BaO-SiO_2$, compounds $2BaO,SiO_2$, BaO,SiO_2, $2BaO,3SiO_2$, and $BaO,2SiO_2$ were found. Of these, $2BaO,3SiO_2$ and $BaO,2SiO_2$ were found to be isomorphous, of orthorhombic symmetry, forming a complete series of solid solutions. The melting-point diagram of this series is of Roozeboom's type I, without maximum or minimum, and the index of refraction varies continuously, but not linearly with the composition. Barium metasilicate, BaO,SiO_2, is not isomorphous with the calcium and strontium meta-silicates. It is optically biaxial, probably of orthorhombic symmetry, and forms no solid solutions with $\alpha CaO,SiO_2$, but a double compound, $2CaO,BaO,3SiO_2$ is formed, which decomposes on heating into $\alpha CaO,SiO_2$ and liquid. Crystals of the double compound are uniaxial and negative, are probably hexagonal, and show good cleavages in their prismatic zone. Neither strontium nor barium metasilicate forms with magnesium metasilicate a double compound analogous to diopside. Felspars analogous to anorthite are formed by both strontium and barium. Strontium felspar and anorthite resemble one another very closely in optical properties, and the two appear to be completely miscible. Barium felspar is monoclinic and readily forms Carlsbad twins of the contact type. J. S. G. T.

The System Ammonium Sulphate–Glucinum Sulphate–Water at 25°. HUBERT THOMAS STANLEY BRITTON (T., 1922, **121**, 2612—2616).

Preparation and Properties of Magnesium Perchlorate and its Use as a Drying Agent. H. H. WILLARD and G. FREDERICK SMITH (*J. Amer. Chem. Soc.*, 1922, **44**, 2255—2259).—The hexahydrate of magnesium perchlorate may be prepared by dissolving magnesia in perchloric acid, evaporating the solution until fumes of perchloric acid are evolved and crystallisation commences at the surface. The mass is then cooled to the ordinary temperature with the addition of sufficient water to keep the mass semi-fluid. The crystals are separated by centrifuging, redissolved in water, and crystallised. The hexahydrate, m. p. 145—147°, d_4^{25} 1·970, is now deliquescent. The trihydrate is prepared by keeping the hexahydrate over phosphoric oxide at 20—25° for a month. The product has m. p. 145—147°, d_4^{25} 2·044. The anhydrous compound is obtained by heating either hydrate at 170° in a current of dry air for some time and then at 250° for a short time. Magnesium perchlorate decomposes at 400° without melting, forming a mixture of the oxide and chloride. When moist gas is passed over anhydrous magnesium perchlorate at a rate not greater than 5 litres per hour, it is found to be as efficient a desiccating agent as phosphoric oxide. The trihydrate is as efficient as the anhydrous salt at 0°, but much less so at higher temperatures. J. F. S.

Crystal Structure of Cadmium Iodide. RICHARD M. BOZORTH (*J. Amer. Chem. Soc.*, 1922, **44**, 2232—2236).—The crystal structure of cadmium iodide has been investigated by means of *X*-ray spectra and Laue photographs. It is shown that cadmium iodide is not hexagonal, as has generally been supposed, but trigonal. The unit parallelepiped contains one molecule, and the shortest distance between the centres of the cadmium and iodine atoms is 3·00 Å.U., which is exactly the sum of the radii of these atoms as found by Bragg (A., 1920, ii, 537). Because of the nature of the structure, the iodine atoms are also "in contact" on the Bragg hypothesis. The shortest distance between their centres is 4·21 Å.U., whilst Bragg's value of the diameter of this atom is 2·80 Å.U. This separation indicates that the atoms which are presumably similarly charged may be expected to be farther apart than Bragg's hypothesis requires. The structure may be divided into electrically neutral layers by passing planes parallel to the base midway between the cadmium atoms, and this may well account for the excellent basal cleavage of the crystal. J. F. S.

The Ammoniates of Lead Haloids. Mixed Compounds and the Parent Salts. WILHELM BILTZ and WILHELM FISCHER (*Z. anorg. Chem.*, 1922, **124**, 230—247).—The following ammoniates of the haloids of lead are described in literature: $PbCl_2,1{\cdot}5NH_3$; $PbCl_2,2NH_3$; $PbBr_2,2NH_3$; PbI_2,NH_3; $PbI_2,2NH_3$; and $PbI_2,4NH_3$. The authors were able to show also the existence of the following: $PbCl_2,NH_3$; $PbCl_2,3{\cdot}25NH_3$; $PbBr_2,NH_3$; $PbBr_2,3NH_3$; $PbBr_2,5{\cdot}5NH_3$; $PbI_2,0{\cdot}5NH_3$; and $PbI_2,5NH_3$. The method of investigation was the same as that employed in previous work (cf. Hüttig, A., 1920, ii, 293, 318; this vol., ii, 849. The authors regard the compound $PbCl_2,3{\cdot}25NH_3$ or $4PbCl_2,13NH_3$ as a mixed compound of the salts $PbCl_2,8NH_3$, $PbCl_2,2NH_3$, and $2PbCl_2,3NH_3$. Similarly, $2PbBr_2,11NH_3$ is a compound of $PbBr_2,8NH_3$ and $PbBr_2,3NH_3$, and $2PbI_2,10NH_3$ a compound of $PbI_2,8NH_3$ and $PbI_2,2NH_3$. These mixed compounds are not characterised by great stability or by instability; methods of detecting their formation are desirable. W. T.

Action of Ammonium Nitrate and of Aqueous Ammonia on Copper. Properties of Cupric Tetrammine Nitrite and Nitrate. HENRY BASSETT and REGINALD GRAHAM DURRANT (T., 1922, **121**, 2630—2640).

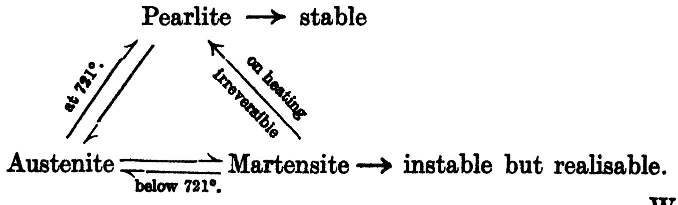
The Solubility of Copper Hydroxide in Sodium Hydroxide Solutions. G. SVENSEN MELBYE (*Medd. K. Vetenskapsakad. Nobel-Inst.*, 1922, **4**, No. 8, 1—11).—The solubility of copper hydroxide in sodium hydroxide solutions between 2·65 and 6·6*N* increases at a linear rate with the concentration of sodium hydroxide according to the equation $[Cu(OH)_2]=0{\cdot}045[NaOH]-0{\cdot}095$.

The solutions were prepared by running a solution of copper sulphate very gently into the sodium hydroxide solution until turbidity appeared, they were then filtered and analysed. Assuming that a true solution of a cuprate is formed of the composition $Na_2Cu_2O_3$ and that its degree of dissociation is equal to that of sodium silicate, the ion product of the labile cupric acid, $H_2Cu_2O_3$, is found to be $K_1=0{\cdot}9\times10^{-17}$. For the hydrate H_2CuO_2 the ion product is $K_2=1{\cdot}3\times10^{-18}$. The solutions of sodium cuprate gradually deposit cupric oxide on keeping. E. H. R.

The Composition of Scheele's Green. G. BORNEMANN (*Z. anorg. Chem.*, 1922, **124**, 36—38).—The author finds that Scheele's green is not acid copper ortho-arsenite, $CuHAsO_3$, but a normal arsenite, $3CuO,As_2O_3,xH_2O$. The composition was found to vary with the method of preparation; the greater the excess of alkali employed the richer is the product in copper oxide. W. T.

The Rate of Formation of some Nitrides. G. TAMMANN (*Z. anorg. Chem.*, 1922, **124**, 25—35).—The rate of increase in thickness of the nitride was measured by the change in colour of the films. In the case of cerium, lanthanum, and a mixture of the two, the rate of increase of the film plotted against the logarithm of the time gave two straight lines cutting in each case at a definite temperature. The same applies to the metals in oxygen. The presence of moisture in the gases greatly accelerates their action. The film of nitride on iron protects the metal. Cobalt, nickel, molybdenum, tungsten, tantalum, and silicon do not change in an atmosphere of nitrogen at 700°; magnesium and calcium are converted into their grey nitrides. W. T.

Honda's Conception of the A^1 Transformation and the Quenching of Steels. MASUMI CHIKASHIGE (*Z. anorg. Chem.*, 1922, **124**, 59—60).—A theoretical paper, in which the author criticises the views of Honda (*Sci. Rep. Tohoku Imp. Univ.*, 1919, **8**, 181), and claims that a better interpretation is given by the following scheme:



W. T.

The Ternary System Iron–Boron–Carbon. R. VOGEL and G. TAMMANN (*Z. anorg. Chem.*, 1922, **123**, 225—275).—The authors discuss the results of Hannesen (A., 1915, ii, 464) and Tschischevsky and Herdt (A., 1917, ii, 372), who investigated the system iron–boron. The disagreement of their results is found to be due to differences in the rate of cooling. Rapid cooling (as carried out by the former) results in the separation of supersaturated mixed crystals. The present authors carried out a systematic study of the ternary system iron–boron–carbon and their results are given in detail. Equilibrium sets in so slowly that the structure and properties of the iron–boron–carbon alloys depend to a large extent on the preliminary heating. The limit of the influence of boron on the structure was found to be 0·02%. W. T.

The Constitution of Erdmann's Salt and its Derivatives. E. H. Riesenfeld and R. Klement (*Z. anorg. Chem.*, 1922, **124**, 1—21).—The authors claim that Erdmann's salt, $[(NO_2)_4Co(NH_3)_2]R$, has the two ammonia molecules in the *cis*-position. They base their conclusions on the fact that (1) by the action of ethylenediamine the trinitro-ethylenediamine-monammine derivative is obtained, $[(NO_2)_3Co\,en\,NH_3]R$; (2) the dioxalato-diammine derivative, $[(C_2O_4)_2Co(NH_3)_2]R$, prepared from Erdmann's salt, could not be resolved into optical antipodes; (3) the non-resolvability again of the monoxalato-derivative, $[C_2O_4(NO_2)_2Co(NH_3)_2]$; (4) the ease with which the dichloro-derivative was prepared, $[(NO_2)_2Cl_2Co(NH_3)_2]$.

The oxalate group could not be replaced by the malonate radicle on account of the solubility and reducibility of the malonate. Methods of preparing the above derivatives are given. W. T.

Preparation of Colloidal Solutions of Nickel and Cobalt Hydroxides and some other Compounds of these Metals. O. F. Tower and Martha C. Cooke (*J. Physical Chem.*, 1922, **26**, 728—735).—Two methods are described for preparing colloidal suspensions of nickel hydroxide, one by dialysing a solution of nickel tartrate in the presence of an alkaline solution of potassium tartrate, and the other by treating a $N/10$-solution of nickel chloride with a little more than the equivalent quantity of a solution of potassium hydroxide, allowing the precipitated nickel hydroxide to settle, siphoning off the supernatant liquid, adding water, and repeating the process several times. Only very weak suspensions of cobaltous hydroxide could be obtained by these methods. Any solids obtained from the solutions referred to in a previous work on this subject (A., 1900, i, 587) are composed of nickel tartrate with potassium tartrate adsorbed in it. Glycerol does not prevent the precipitation of nickel hydroxide from aqueous solutions of nickel salts. In alcoholic solution, interesting transformations occur in the gel on keeping, and finally a solution is obtained from which nickel hydroxide cannot be precipitated by dilution with water. Colloidal solutions of nickel sulphide, which are readily formed in the presence of an alkaline solution of a tartrate, immediately decompose with precipitation of the sulphide on dialysing out the tartrate. J. S. G. T.

Hydrated Oxides. IV. Harry B. Weiser (*J. Physical Chem.*, 1922, **26**, 654—686; cf. this vol., ii, 575).—A continuation of previous work in connexion with the oxides of tin. It is shown that the so-called stannic and metastannic acids are not acids, but are hydrated stannic oxides the composition and properties of which are determined by the conditions of formation. Stannic oxide, freshly prepared by precipitation from a solution of a stannic salt at the ordinary temperature, is a loose, highly hydrated mass which is readily peptised by dilute acids and alkalis, forming a colloidal solution, and is dissolved by concentrated acids and alkalis, forming salts. The oxide is more compact, less hydrated, less soluble, and less easily peptised the higher the temperature of formation. Freshly-prepared stannic oxide undergoes these changes on keeping at the ordinary temperature. Experiments on the peptisation by nitric acid of oxides prepared under different conditions show that the different products are not mixtures of varying amounts of a definite α-oxide peptisable by nitric acid with a definite β-isomeride which is not peptisable by nitric acid. Hydrated stannic oxides prepared at different temperatures or aged for varying lengths of time are chemical individuals which differ from each other in the size of the particles and the structure of the mass, and hence in their adsorbability and mordanting action, their ease of peptisation, and their solubility. There are no definite hydrates of stannic oxide. Salts of the general formulæ SnR_4 and M_2SnO_3 are formed by the action of concentrated acids and alkalis on newly-formed hydrated stannic oxide. Numerous oxy-salts and complex stannates and metastannates have been prepared by the action of acids and alkalis on different hydrated stannic oxides. These are not definite compounds, but are adsorption products, the composition of which is determined by the age of the hydrated oxide and the concentration of acid or base with which they were treated. Colloidal solutions of hydrated stannic oxide can be prepared by peptisation of the freshly-formed oxide with dilute acids or alkalis. The colloid ages slowly on keeping and rapidly on heating. Any number of colloidal solutions are possible, each differing from the others in the size of the hydrated particles and hence in their reactivity, adsorbability, and stability under given conditions. Hydrated stannic oxide adsorbs colloidal gold, silver, and platinum, forming purple masses, the most common of which is the gold compound, purple of Cassius. All these purple substances are colloidal in character, the composition varying with the conditions of formation. When freshly prepared, they are readily peptised by dilute acids and alkalis, but when aged by drying they are peptised but slightly even by concentrated reagents. A mixture of the hydrated oxides of iron and tin in certain proportions is soluble in dilute ammonia. The reason for this is that hydrated stannic oxide is peptised by the hydroxyl-ion, whilst ferric oxide is not, but colloidal stannic oxide adsorbs ferric oxide and carries it into colloidal solution as long as tin is present in excess. At the same time, hydrated ferric oxide adsorbs stannic oxide and tends to take it out of colloidal solution, so that when the former is present in large excess none of the latter remains peptised. Stannic oxide does not precipitate in the usual way from a solution of tin in nitric acid containing a suitable amount of iron. The reason for this is that hydrated stannic oxide peptised by nitric acid coagulates spontaneously, since the aged oxide is neither peptised nor dissolved by this acid. Ferric nitrate peptises the oxide both when newly formed and when aged. Hence if freshly-prepared stannic oxide is peptised either by ferric nitrate or by a suitable mixture of ferric nitrate and nitric acid, coagulation does not take place on keeping or boiling on account of the stabilising action of the strongly adsorbed ferric ion; but if the concentration of ferric ion in the nitric acid solution is too low, complete or partial coagulation takes place on keeping or boiling. Stannic oxide jellies are prepared by coagulation of colloidal solutions of the oxide with suitable concentrations of electrolytes. The results of the present investigation support the author's general hypothesis of the formation of jellies.

J. F. S.

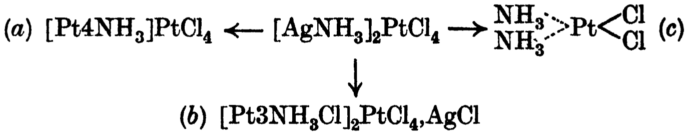
The Occurrence of Germanium in Cassiterite. ASSAR HADDING (*Z. anorg. Chem.*, 1922 **123**, 171—172).—The author examined cassiterite from Finbo by means of the *X*-ray spectrograph and found it to contain the following elements: tin, tantalum, iron, manganese, germanium, and zinc. The intensity of the lines shows that the amount of germanium was less than that of manganese and more than that of zinc. A similar analysis of cassiterite from Mamacka gave like results. No germanium was indicated in cassiterite from Finland and Bohemia. W. T.

Germanium Hydride. RUDOLF SCHENCK [with ALBERT IMKER] (*Rec. trav. chim.*, 1922, **41**, 569—575).—The preparation of an alloy of germanium and magnesium could not be effected by the action of magnesium on germanium oxide, as the reaction is too violent. The germanium was obtained as oxide from argyrodite; this was purified by conversion into germanium silicofluoride, thence into sulphide, and finally into oxide. Reduction to the metal was then effected by heating in a stream of hydrogen, and an alloy was prepared by heating one part of the powdered germanium so obtained with two parts of magnesium powder in an atmosphere of hydrogen. The hydride, prepared by the action of hydrochloric acid on the alloy in a stream of hydrogen, was obtained pure by cooling to the temperature of liquid air. Small quantities of germanium chloroform were produced simultaneously with the hydride and condensed in a freezing mixture in the preliminary stages of cooling. The uncondensed gases were passed through silver nitrate solution and again through a tube cooled in liquid air, but were not completely freed from the hydride, which could still be detected by its nauseating odour and by the deposition of metallic germanium on porcelain when the gas was burnt. The hydride condensed to a white solid which was purified by sublimation, m. p. —165°, b. p. —126°/757 mm. Values for the vapour pressure from —164° to —125° are given. Three determinations of molecular weight by Regnault's method gave a mean value of 76·93, the theoretical value being 76·50. The gas readily decomposes into its elements on heating (cf. Paneth and Schmidt-Hebbel, this vol., ii, 776), and an analysis was carried out by passing it through a heated tube, the hydrogen formed being estimated in a eudiometer and the germanium weighed as such. Three determinations gave 94·70% Ge and 5·29% H as mean values, the calculated percentages for GeH_4 being 94·73 and 5·27. The volume ratio of germanium hydride to the hydrogen obtained by its decomposition was found to be 1 : 2·05. The general reactions of the gas show that it is endothermic and analogous in properties to the hydrides of arsenic, antimony, tin, and bismuth (cf. Voegelen, A., 1902, ii, 401). H. J. E.

Sulphide Sols. III. Sol Preparation by Hydrolysis. F. V. von Hahn (*Kolloid Z.*, 1922, **31**, 200—203; cf. A., 1921, ii, 577).—Fairly stable antimony pentasulphide sols may be prepared by the hydrolysis of the alkali salts of stibiothiosulphuric acid. The hydrolysis takes place extremely readily according to the equation $2Na_3Sb(S_2O_3)_3=Sb_2S_5+3Na_2SO_4+3SO_2+S$ (Szilágyi, A., 1920, ii, 207). The preparation is carried out as follows: a 0·5% solution of sodium antimony thiosulphate is kept until it commences to turn yellow and to show a definite Tyndall cone; it is then placed in a dialyser and washed with warm distilled water. After several hours' dialysis, the solution has taken on a deep red colour. The main point to be observed in the preparation is the rapid removal of the alkali sulphate. In the presence of sodium chloride the sol cannot be prepared, nor can a sol having a greater molecular concentration than 0·4 be obtained. Sols of one-tenth this concentration are stable for a few hours only. The sols prepared from the sodium salt are more stable than those prepared from either lithium or potassium antimony thiosulphate. Attempts to prepare arsenic pentasulphide sols by the hydrolysis of alkali arsenic thiosulphates failed entirely owing to the greater instability of these compounds. J. F. S.

Complex Platinum Compounds. III. Molecular Rearrangements observed with Complex Platinum Compounds. L. A. Tschugaev and N. K. Pschenicyn (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 47—62).—The depolymerisation of bicomplex salts of the type $[Pt4A]PtX_4$ (where A=a molecule of ammonia, amine, organic sulphide, etc.), resulting in the formation of the monomeric type $[Pt2A,X_2]$ and in the accompanying transference of one-half of the total A molecules from one platinum atom to another is frequently encountered among complex platinum compounds, but has not previously been observed with the simplest purely inorganic, in particular with the ammino-, complexes of platinum. This gap has now been filled by the authors, who show that tetraamminoplatinous platinochloride (Magnus's green salt) is capable of undergoing depolymerisation in accordance with the scheme $[Pt4NH_3]PtCl_4=[Pt2NH_3,Cl_2]$, the chloride of Reiset's Base II being thus formed. The reaction is effected by cautious heating over a naked flame to 270°, and never proceeds to completion, part of the green salt decomposing with separation of metallic platinum.

Experiments have been made also with certain heterometallic bicomplex compounds in which the platinum occurs only in the anion, $[PtX]_4$, whilst the kation is formed of another metal in combination with a known number of *A* molecules giving the so-called neutral part of the complex: for example, $[M,nA]PtX_4$. If as the component *M* is taken an element such as silver, zinc, copper, mercury, etc., which, according to all the available data, holds molecules of ammonia, etc., less stably than does platinum, the transference of these molecules from the metal *M* to the platinum should take place with great readiness. With the amminosilver platinichlorides, the transference of ammonia from the silver to the platinum atom occurs at comparatively low temperatures: At 60—70°, monoamminosilver platinichloride yields, together with silver chloride, also (*a*) tetra-amminoplatinous platinichloride (Magnus's green salt), (*b*) chlorotriamminoplatinous platinichloride (Cleve's salt), and (*c*) *cis*dichlorodiamminoplatinum (Peyrone's chloride)



$$\begin{array}{c} (a)\ [\mathrm{Pt4NH_3}]\mathrm{PtCl_4} \longleftarrow [\mathrm{AgNH_3}]_2\mathrm{PtCl_4} \longrightarrow {}^{\mathrm{NH_3}}_{\mathrm{NH_3}}\!>\!\mathrm{Pt}\!<^{\mathrm{Cl}}_{\mathrm{Cl}}\ (c) \\ \downarrow \\ (b)\ [\mathrm{Pt3NH_3Cl}]_2\mathrm{PtCl_4,AgCl} \end{array}$$

whilst at a higher temperature (100°) the last two compounds disappear and are replaced by *trans*-dichlorodiamminoplatinum (chloride of Reiset's Base II); in either case, the loss of ammonia is negligible. At all temperatures between 100° and 200°, diamminosilver platinichloride yields a new product, namely, tetra-amminoplatinous chloride (chloride of Reiset's Base I), the loss of free ammonia being considerable. At 100°, the only compound, besides silver chloride, accompanying the chloride of Reiset's Base I is Magnus's salt; at 150°, the chloride of Reiset's Base II also appears, whilst at 200° Magnus's salt disappears and the chlorides of Reiset's Bases I and II form the sole products. The Base II chloride, which appears in all cases at the highest temperatures, is evidently a secondary product formed from Magnus's salt.

When heated at 50—60°, diethylamminosilver platinichloride readily undergoes transformation into the analogues of the chloride of Reiset's Base I and Magnus's green salt, part of the ethylamine being liberated: $[Ag2NH_2Et]_2PtCl_4=2AgCl+[Pt4NH_2Et]Cl_2$ and $2[Ag2NH_2Et]_2PtCl_4=4AgCl+[Pt4NH_2Et]PtCl_4+4NH_2Et$. Under the same conditions, monoethylamminosilver platinichloride gives the analogues of Magnus's green salt and Peyrone's chloride, part of the original compound also decomposing with complete loss of the amine and formation of silver platinichloride.

Tetramminozinc platinichloride, $[Zn4NH_3]PtCl_4$, gives, at 111°, Peyrone's chloride, Magnus's green salt, and the chloride of Reiset's Base I. T. H. P.

The Alkali-Ruthenium Double Sulphites. HEINRICH REMY (*Z. anorg. Chem.*, 1922, **124**, 248—274).—The following definite double sulphites of ruthenium and the alkali metals were prepared, $K_2SO_3,Ru(OH)SO_3,3H_2O$; $K_2SO_3,3RuSO_3,6H_2O$(?); $7Na_2SO_3,2RuSO_3,7H_2O$; $7Na_2SO_3,2RuSO_3,9H_2O$; $3K_2SO_3,4RuSO_3,6H_2O$.

There were also obtained substances which on analysis did not correspond with any simple formula, probably being mixtures of the above. The properties of the above double sulphites are given. The author discusses the difficulties of analysis. W. T.

Mineralogical Chemistry.

The Examination of Naturally Occurring Gases. II. F. Henrich [with G. Prell] (*Ber.*, 1922, **55**, [*B*], 3021—3025).—The method for the collection and examination of naturally occurring gases has been simplified and extended (cf. A., 1920, ii, 767). The gases from a number of springs have been analysed, since such data appear to the author to form the most trustworthy basis for a judgment as to the atmospheric or terrestrial origin of the water. Re-examination of the gas from a cold spring near Leupoldsdorf, Bavaria, confirms the previous analysis (Henrich, *loc. cit.*), showing it to contain oxygen 13%; nitrogen and the rare gases being the only other constituents. The gas from a second spring situated about a hundred metres above the foregoing was also composed of the constituents of air, but with only 18·8% of oxygen. The gas from a third spring was found to contain oxygen (18·2%), nitrogen (81·8%), argon, and neon (1·1%). Since the ratio of nitrogen to rare gas in these gases is approximately the same as in air, it appears that the latter in some unexplained manner has got below the water in the spring. The low oxygen content of the gases in comparison with that of air is explained by the greater solubility of oxygen than of nitrogen in water, so that a gas richer in nitrogen is evolved. The extent to which the air is depleted of its oxygen appears to depend on the pressure of the water in the spring. H. W.

The Examination of Naturally Occurring Gases. III. F. Henrich [with G. Prell] (*Ber.*, 1922, **55**, [*B*], 3026—3030).—Analyses are given of the gases from a number of pools on the Luisenburg near Wunsiedel and Alexandersbad (Fichtelgebirge) of which one may be quoted

H_2S (traces), CO_2 3·1%, O_2 1·7%, CH_4, 53·9%, N_2+rare gases 41·3%.

Methane, carbon dioxide, and the small amounts of hydrogen sulphide appear to owe their origin to a bacterium which is not completely identical with *Bacillus methanigenes*. Nitrogen and the rare gases must be derived originally from the air. H. W.

Dopplerite. Studies in the Composition of Coal. Frederick Vincent Tideswell and Richard Vernon Wheeler (T., 1922, **121**, 2345—2362).

Massive Troilite from Del Norte Co., California. Arthur S. Eakle (*Amer. Min.*, 1922, **7**, 77—80).—The bronze-tarnished mineral (light greyish-brown when untarnished) resembles pyrrhotite, but differs from this in being non-magnetic and in being readily soluble in dilute sulphuric acid. Analysis of the soluble portion gave Fe 62·70, S 35·40% agreeing with the formula FeS; *d* 4·67. The mineral is thus identical with the meteoric troilite. It occurs with chalcopyrite and magnetite in serpentine, and has probably resulted by the action of hydrogen sulphide solutions on the magnetite. Troilite and pyrrhotite are regarded as distinct species, and the suggestion that pyrrhotite is FeS+S in solid solution (A., 1912, ii, 354) is not accepted. The magnetic character of pyrrhotite suggests the formula Fe_3S_4 for the end-member of the series Fe_nS_{n+1}. L. J. S.

Keeleyite, a new Lead Sulphantimonite from Bolivia. SAMUEL G. GORDON (*Proc. Acad. Nat. Sci. Philadelphia*, 1922, **74**, 101—103).—This occurs as radiating aggregates of acicular (perhaps orthorhombic) crystals with pyrites and quartz in the San José mine at Oruro. It is dark grey with bright metallic lustre and gives a greyish-black streak; *d* 5·21, *H* 2. Analysis by J. E. WHITFIELD gave:

Pb.	Sb.	Cu.	Fe.	S.	Quartz.	Total.
25·80	43·46	2·25	2·77	24·54	(1·18)	100·00

Deducting 8·15% of admixed sulphides, this gives the formula $2PbS,3Sb_2S_3$, corresponding with rezbanyite ($2PbS,3Bi_2S_3$). The compositions of the known lead sulphantimonites are represented on a triangular diagram. L. J. S.

An Andorite-bearing Silver Ore from Nevada. EARL V. SHANNON (*Proc. U.S. Nat. Museum*, 1922, **60**, art. 16, 1—5).—An ore specimen from Keyser mine, Nye Co., Nevada, shows rough prisms of andorite with pyrite and sphalerite in a gangue of rhodochrosite and quartz. Analysis I of the andorite gives, after deducting zinc and iron as sphalerite, the formula $PbAgSb_3S_6$. The crystals are usually altered and filled in a central cavity with a matted mass of fine fibres. Analysis II of this alteration product suggests the formula $Pb_3AgSb_3S_8$, and shows that there has been a removal of silver and antimony sulphides.

	Pb.	Ag.	Fe.	Zn.	Sb.	S.	Total.
I	23·35	12·09	1·55	3·56	37·64	22·63	100·82
II	45·14	7·78	2·72	1·56	23·22	[19·58]	100·00

The pale pinkish-buff rhodochrosite gave:

MnO.	FeO.	CaO.	MgO.	CO_2.	Total.	$MnCO_3$.
49·49	7·68	3·13	0·93	[38·87]	100·10	80·15

L. J. S.

Sodium Carbonate Minerals from Lake Magadi, Kenya Colony. P. WALTHER (*Amer. Min.*, 1922, **7**, 86—88).—The extensive trona deposit of Lake Magadi consists of an aggregate of pale-yellow, bladed crystals up to 9 cm. in length. Analysis of an average sample with *d* 2·14 gave:

Na_2CO_3.	$NaHCO_3$.	H_2O.	NaCl.	Fe_2O_3, Al_2O_3.	SiO_2.	CaO,MgO,SO_3.*	Total.
43·55	40·41	15·55	0·36	0·04	0·07	traces	99·98

agreeing with the formula $Na_2CO_3,NaHCO_3,2H_2O$. The mineral has evidently been formed by the action of carbon dioxide and water on sodium silicates, since the rocks in the neighbourhood show extensive bands of flinty silica and carbon dioxide issues from numerous cracks at the surface. The salt crusts of Little Magadi, a dry salt pan 25 miles to the south, consist of harder, bladed (monoclinic ?) crystals which on analysis proved to be pure sodium hydrogen carbonate. This, owing to ready loss of carbon dioxide and conversion into trona, has not hitherto been recognised as a mineral. It here owes its existence to the presence of a large excess of carbon dioxide, which issues from cracks in the soil and rocks with a hissing sound. Optical examination by E. T. Wherry detected only trona, but the material had evidently been altered in the meantime. A new mineral name for sodium hydrogen carbonate is therefore avoided for the present. L. J. S.

Constitution of Thaumasite. EDW. F. HOLDEN (*Amer. Min.*, 1922, 7, 12—14).—Calculations by the Lorentz-Lorenz formula of the molecular refractivity of thaumasite, directly and from its components, point to the presence of 2OH (rather than 4OH) in the formula $CaCO_3,CaSO_4,CaSiO_3,15H_2O$. L. J. S.

Minerals from Ljubija, Bosnia. RUDOLF KOECHLIN (*Tsch. Min. Mitt.*, 1921, **35**, 1—12).—The iron-ore at Ljubija, near Prijedor, consists of crystalline-granular chalybite with impregnations of galena, pyrites, and chalcopyrite. Near the surface, the chalybite is altered to limonite, with which are various other secondary minerals. These, including the rarer species leadhillite, pyrochroite, and beudantite, are described. L. J. S.

A New Mineral which Contains the Rare Earths as its Main Component. F. HENRICH [with G. HILLER] (*Ber.*, 1922, **55**, [*B*], 3013—3021).—*Weinschenkite* occurs in very small quantity in the Bavarian Oberpfalz in white, matted, globular deposits and in radiating needles on brown hæmatite from which it is readily detached. It appears to be mainly a hydrated phosphate of yttrium and erbium, $PO_4(Er,Y),2H_2O$; but indications of the presence of other rare earths have been obtained. The small amount available was insufficient for a complete analysis.

Pseudowavellite, also occurring in minute amount in the same locality, resembles wavellite in that it contains aluminium as its main component, with calcium oxide (13%), barium oxide, and strontium oxide (about 1%) and rare earths (2—3%). Erbium and yttrium appear to be present in addition, possibly, to the cerium earths. H. W.

Supplementary Note on Ishikawaite, a New Mineral from Ishikawa, Iwaki Province. YÛJI SHIBATA and KENJIRO KIMURA (*J. Chem. Soc. Japan*, 1922, **43**, 648—649).—The unnamed mineral from Ishikawa, of which an analysis was given (this vol., ii, 517), is now termed *ishikawaite;* the crystals are rhombic [$a:b:c=0{\cdot}9451:1:1{\cdot}147$]. K. K.

Glauconite from Lewes, Sussex: Constitution of Glauconite. A. F. HALLIMOND [with analysis by E. G. RADLEY] (*Min. Mag.*, 1922, **19**, 330—333).—A boring through the Gault at Iford Manor, near Lewes, struck the Greensand at a depth of 325 feet. The upper bed of this consists almost entirely of small grains of dark-green glauconite. The grains consist of a felted mass of minute, birefringent flakes with mean *n* 1·62; *d* 2·70. Analysis gave:

SiO_2.	Al_2O_3.	Fe_2O_3.	FeO.	CaO.	MgO.
48·12	9·16	19·10	3·47	0·76	2·36

K_2O.	Na_2O.	H_2O at 105°.	H_2O >105°.	Total.
7·08	0·22	4·78	5·28	100·33

From this and a selection of earlier analyses, the formula is deduced as $R_2O,4(R_2O_3,RO),10SiO_2,nH_2O$, in which $Al_2O_3+Fe_2O_3$ and $FeO+MgO$ are regarded as mutually replaceable. In some cases, there is a considerable replacement of potassium by sodium, and the variety soda-glauconite is suggested. L. J. S.

Structure and Composition of the Strathmore (Perthshire) Meteorite. W. F. P. MCLINTOCK and F. R. ENNOS (*Min. Mag.*, 1922, **19**, 323—329).—Four stones were observed to fall along a track six miles in length on December 3, 1917; the largest weighed 9932 grams and the total weight was 13,255 grams. The structure is that of the intermediate chondrite group; *d* 3·53. The bulk-analysis, deduced from analyses of the attracted and unattracted portions, is:

Fe.	Ni.	Co.	Fe.	S.	SiO_2.	TiO_2.	Al_2O_3.	Cr_2O_3.	Fe_2O_3.
7·31	1·26	0·05	4·00	2·29	40·32	0·14	2·57	0·44	0·35
FeO.	MnO.	CaO.	MgO.	K_2O.	Na_2O.	H_2O.	P_2O_5.	Cl.	Total.
12·99	0·29	1·84	24·96	0·11	0·90	0·17	0·23	0·03	100·25

From this is calculated the following mineral composition: felspar 10·93, ilmenite 0·27, chromite 0·65, magnetite 0·51, chlorapatite 0·56, olivine 41·13, bronzite 30·91, troilite 6·29, nickel-iron 8·62, water 0·17%. L. J. S.

Analytical Chemistry.

A Microcolorimeter and Nephelometer. A. BAUDOUIN and H. BÉNARD (*Compt. rend. Soc. biol.*, 1920, **83**, 602—603).—A description of a miniature Duboscq colorimeter, of which the cups have a capacity of 2 c.c., and the tube an adjustment of 20 mm. The apparatus can also be used as a nephelometer or ultraphotometer, and, by replacing the ocular with a small, direct-vision spectroscope, can be converted into a spectroscope comparator.
CHEMICAL ABSTRACTS.

Colorimeter. ED. MOREAU and A. BONIS (*Ann. Falsif.*, 1922, **15**, 357—360).—The apparatus consists essentially of two graduated cylinders placed side by side in a suitable frame; one of these contains the test solution and the other the standard or comparison solution. The latter is admitted through a side tube at the bottom of the cylinder, this tube being connected with a tapped funnel or reservoir containing the solution. W. P. S.

The Application of Coloured Glasses instead of Liquids in Colorimetric Researches. KLAS SONDÉN (*Arkiv Kem. Min. Geol.*, 1922, **8** No. 7, 1—10).—Combinations of coloured glasses are used as standards in colorimetry. Coloured glasses suitable for this purpose may be prepared by dyeing the gelatin films on photographic plates from which the silver has been removed by treatment with thiosulphate. W. O. K.

A New Apparatus for Exact Gas Analysis. K. A. SCHALLER and W. BERNDT (*Chem. Ztg.*, 1922, **46**, 972—973).—The apparatus consists of a manometer, a measuring tube immersed in a water-jacket with air agitation, and a detachable absorption vessel with an adjustable mercury reservoir. The passage of the mercury from the manometer into the measuring tube is prevented by placing between them a U-tube containing at its lowest point either a constriction or a throttle cock. All the operations of gas analysis can be carried out in this apparatus except explosions, for which the absorption vessel is replaced by a eudiometer. The procedure for estimating carbon dioxide, heavy hydrocarbons, oxygen, carbon monoxide, and the combustion of hydrogen, methane, and ethane is described. H. C. R.

A Modified Methyl-orange Indicator. KENNETH CLAUDE DEVEREUX HICKMAN and REGINALD PATRICK LINSTEAD (T., 1922, **121**, 2502—2506).

Apparatus for Electrometric Titration. W. E. GARNER and C. A. WATERS (*J. Soc. Chem. Ind.*, 1922, **41**, 337—338T).—The electrode vessel, which carries a small bulb, is attached to a rotating stirrer; two side tubes on the vessel are turned downwards and constricted at the ends. The bulb is convenient in the preparation of a calomel electrode. The side tubes are packed with asbestos, the vessel is filled completely with electrolyte, and it is supported from the glass tube of the stirrer by means of a waxed cork. The metal used as an electrode is fused or waxed into a thin glass tube and attached by means of a small binding screw to the rotating spindle, electrical connexion being made through a small steel mercury cup to another binding screw. The outer electrode is of any convenient form; the turned-down side tubes on the electrode vessel make it possible to commence a titration with 5 c.c. of solution in the beaker. W. P. S.

Quantitative Analysis by Measurement of the Degree of Supersaturation. ERNST FRITZ HÖPPLER (*Chem. Ztg.*, 1922, **46**, 957—958).—The time elapsing between the addition of a reagent and the formation of a precipitate or coloration can be utilised as an approximate quantitative measure of traces of substances in solution. The method is particularly applicable to water analysis. Sulphuric acid and calcium can be estimated in this way between the dilutions of 2·3 and 100 mg. per litre. Nitrous acid can also be estimated by this means when not in greater concentration than 0·5 mg. per litre. H. C. R.

The Rapid Estimation of Chlorine in Organic Compounds. E. VOTOČEK (*Chem. Listy*, 1922, **16**, 248—249).—The author combines the method of Marcusson and Dröscher (A., 1910, ii, 543) with his titration of chlorides against a mercuric salt in the presence of sodium nitroprusside as an indicator. The present author carries out the combustion in a funnel-shaped vessel of several litres capacity fitted with a stopcock. Since sufficient hydrogen is present in the molecule to convert all the chlorine into hydrogen chloride, the products of combustion are absorbed by water and titrated directly against mercuric nitrate. The estimation takes about an hour and a half. W. T.

Potassium Dichromate as a Standard in Iodimetry and the Estimation of Chromates by the Iodide Method. WARREN C. VOSBURGH (*J. Amer. Chem. Soc.*, 1922, **44**, 2120—2130).—It is shown that titration of iodine with thiosulphate in dilute acid solutions gives results which are 0·1—0·3% higher, and more concordant than the results of titration in a neutral solution. The presence of air affects the titration of iodine with thiosulphate when the acidity of the solution is equivalent to 0·3*N*-hydrochloric acid or greater, causing too much thiosulphate to be required. An apparent excess of oxidising action of dichromate is caused by the titration of the iodine in a solution of too high an acid concentration. This can be corrected by the exclusion of air, but more easily by dilution to such an hydrogen-ion concentration that the presence of air will not interfere. Chromates may be estimated to within 0·1% by the iodide method under the proper conditions. Potassium dichromate as a standard for thiosulphate solutions agrees with pure iodine to within 0·1%, but gives a slightly lower value. Errors in the iodine standardisation leading to such a difference appear to be about as probable as errors in the dichromate standardisation.

A standard solution of potassium permanganate is not trustworthy as a standard for thiosulphate solutions. J. F. S.

The Estimation of Sulphuric Acid as Barium Sulphate. Evidence of the Existence of a Complex Barium Sulphuric Acid. D. Balareff (*Z. anorg. Chem.*, 1922, **123**, 69—82).—The sources of error in the estimation of sulphuric acid as barium sulphate are: (1) occlusion of salts by the precipitate, for example, barium chloride; (2) occlusion of the mother-liquor; (3) the formation of the complex ion $[Ba_5(SO_4)_6]$, and this leads to the chief error. The author isolated the potassium salt of this complex ion $[Ba_5(SO_4)_6]K_2$. The most accurate results are obtained when barium sulphate is precipitated slowly from a dilute, boiling solution acidified with hydrochloric acid. Crystals in the precipitate have various forms; the prismatic form corresponds with the simple salt $BaSO_4$. The chlorine content of barium sulphate is not caused by the salt $SO_4(BaCl)_2$. W. T.

Application of Conductometric Titrations to Precipitation Analysis. V. Conductometric Titrations with Barium Salts. I. M. Kolthoff (*Z. anal. Chem.*, 1922, **61**, 433—448).—Sulphates may be accurately titrated conductometrically by means of barium chloride in solutions as dilute as 0·001*N*. The titration may be carried out more rapidly and exactly if alcohol is added to the solution than if an excess of barium sulphate is stirred in. The presence of mineral acids, aluminium, and calcium leads to low results, whereas the presence of iron salts generally causes the results to be too high. Nitrates in moderate amount do not interfere. The method is not applicable to the determination of sulphates in water owing to the presence of calcium.

Carbonates and chromates, as well as oxalates, tartrates, citrates, and malates in the presence of sufficient alcohol may all be titrated with barium chloride in a similar manner to sulphates, but phosphates, pyrophosphates, succinates, benzoates, and salicylates cannot be titrated by conductometric methods with barium chloride. A. R. P.

Some new Volumetric Methods. (Estimation of Sulphate, Lead, Acids, and Ammonia.) Karl Jellinek and H. Ens (*Z. anorg. Chem.*, 1922, **124**, 185—202).—The volumetric methods of estimating sulphate are unsuitable on account of the filtrations involved. The authors have worked out the following method. Excess of barium nitrate is added to a sulphate solution, to this is added excess of potassium chromate and this excess estimated by running in a barium solution until the yellow colour disappears. Error by this method 0·3%. The use of silver salt as an indicator is not possible because the solubilities of silver and barium chromates are very near to one another. The following is given as a volumetric method of estimating lead; excess of chromate is added to a lead salt, a little silver nitrate is then added, and the excess of chromate is determined by titrating against a lead salt until the disappearance of the reddish-brown silver chromate. The latter method can also be employed for the indirect estimation of sulphate. Titration of metals against arsenates and arsenites does not give positive results. The authors suggest the use of a copper solution as an indicator in acidimetry, the alkali being added until the precipitated hydroxide makes its appearance. W. T.

Estimation of Selenium. LUIGI LOSANA (*Giorn. Chim. Ind. Appl.*, 1922, **4**, 464—466).—The method used for estimating sulphur (this vol., ii, 582, 656) may be employed also for the estimation of selenium if a larger excess of iron is taken and the exclusion of air during the reduction is rendered as complete as possible. By suitable modification of the procedure, sulphur and selenium may be estimated simultaneously (cf. *J. Soc. Chem. Ind.*, 1922, Dec.). T. H. P.

Rapid Method for Estimating Ammonia in Ammonium Salts. HERMANN BURKARDT (*Chem. Ztg.*, 1922, **46**, 949).—Attention is directed to a rapid method for estimating ammonia in its salts, in which formaldehyde solution (containing no free acid) is added to the solution containing an ammonium salt, and the acid formed according to the equation $6CH_2O+4NH_4Cl=6H_2O+4HCl+(CH_2)_6N_4$ is then directly titrated with a standard solution of sodium hydroxide, using phenolphthalein as an indicator. A. J. H.

Titration of Nitrous Acid, and the Estimation of Nitrous and Arsenious Acids in the Presence of Each Other. ALFONS KLEMENC (*Z. anal. Chem.*, 1922, **61**, 448—454).—The titration of acidified solutions of nitrites with permanganate in the air is attended with possible errors due to loss of nitrogen oxides and the slowness with which the reaction proceeds towards the end. These disadvantages may be overcome by adding the nitrite solution without acidifying to a solution containing an excess of potassium permanganate and sulphuric acid and enclosed in a glass-stoppered flask containing carbon dioxide under slightly reduced pressure. The solution is warmed at 40° to complete the reaction and the excess of permanganate is then titrated with standard oxalic acid.

[With F. POLLAK.]—The method is extended to the estimation of nitrous and arsenious acids in the same solution, one portion of which is titrated in the presence of sodium hydrogen carbonate with iodine for arsenious acid and another portion with permanganate as described above to obtain the sum of the two acids. Nitrous acid is then found by difference. A. R. P.

The Use of Benzidine in the Detection of Phosphoric Acid. F. FEIGL (*Z. anal. Chem.*, 1922, **61**, 454—457).—The yellow precipitate produced by ammonium molybdate in the usual test for phosphoric acid is often contaminated with arseno-molybdate and with molybdic acid, especially if an old solution of the reagent is used. To test this precipitate for the presence of phosphoric acid, it is collected on a close, ashless filter and washed somewhat, then moistened with a solution of benzidine hydrochloride containing acetic acid. The moist paper is held over an ammonia bottle, the vapour from which turns the precipitate blue in those parts containing phosphoric acid. Even when no visible precipitate is produced in the test solution it should be poured through the paper and the paper tested as described. The blue colour is apparent when the original solution contains only 1 part of phosphorus as phosphoric acid in 460,000 parts of water. A. R. P.

The Volumetric Estimation of Phosphoric Acid and of Sodium Phosphate and Pyrophosphates. FRANK X. MOERK (*Amer. J. Pharm.*, 1922, **94**, 641—650).—Phosphoric acid and disodium hydrogen phosphate can be estimated volumetrically by titration with sodium hydroxide and hydrochloric acid, respectively, using a mixture of methyl-orange and indigo-carmine as indicator. To obtain results in consistent agreement with the silver phosphate precipitation method followed by titration of the liberated acid with alkali hydroxide until a permanent brown coloration of silver oxide is obtained, the dilution of the reacting solutions must be specified, and a definite quantity of sodium chloride must be added, the silver phosphate method being apparently unaffected by these factors. For the neutralisation method, using the indicator, the procedure is as follows. To 100 c.c. of water 0·2 c.c. each of 0·1% methyl-orange solution and 0·3% indigo-carmine solution are added, followed by dilute hydrochloric acid until the green colour changes without producing a violet colour. The solution thus prepared is divided into two equal parts, one being set aside and the other being added to the phosphoric acid or phosphate solution to be estimated, and the mixture titrated to match the tint of the reserved portion of the indicator solution with sodium hydroxide, or hydrochloric acid, as the case may be. The end-point corresponds in each case with the formation of NaH_2PO_4. Under these conditions and using $N/2$ solutions, results in agreement with the silver phosphate method were obtained by titrating in presence of 7·5% of sodium chloride for the phosphoric acid, and 2·5% for the phosphate. Under similar conditions, sodium pyrophosphate can be titrated with acid as a diacid base. G. F. M.

Methyl-red in the Assay of Phosphoric Acid and Sodium Phosphate. FRANK X. MOERK and EDWARD J. HUGHES (*Amer. J. Pharm.*, 1922, **94**, 650—655).—Of the two methods described in the preceding abstract and the U.S.P. IX method for the volumetric estimation of phosphoric acid and phosphates, the latter process always gives low results. The mixed indicator method is the most rapid, but is influenced by the weight taken, by the amount of sodium chloride present, and by the strength of the volumetric solutions. The best results when working with unknown quantities, are obtained by the silver phosphate method, titrating back the liberated acid with alkali hydroxide and using methyl-red as indicator. The procedure is as follows. To 50 c.c. of standard silver nitrate solution one drop of methyl-red and a trace of alkali to produce a yellow colour are added, followed by 10 c.c. of the solution to be assayed. The liberated nitric acid (3 mols. per mol. of H_3PO_4, or 1 mol. per mol. of Na_2HPO_4) is titrated with alkali hydroxide until the supernatant liquid is again yellow. During the neutralisation, the pink colour may fade, in which case one or two drops more of methyl-red must be added. G. F. M.

The Iodometric Micro-estimation of Phosphoric Acid, and of Phosphorus in Organic Compounds. O. Svanberg, K. Sjöberg, and G. Zimmerlund (*Arkiv Kem. Min. Geol.*, 1922, No. 10, 1—17).—An improvement on Neumann's method (A., 1903, ii, 243; 1905, ii, 68) for the micro-estimation of phosphorus is described, in which the phosphorus is precipitated as ammonium phosphomolybdate, and the nitrogen in the precipitate estimated by Bang's micro-Kjeldahl method, in which the ammonia is absorbed in acid, the excess of the latter being estimated by adding excess of potassium iodide and potassium iodate and titrating the liberated iodine with thiosulphate. If a correction is made for a systematic error, 0·05—1·00 mg. of phosphorus may be estimated to within 2—3%. W. O. K.

Titration of Boric Acid in Presence of Phosphoric Acid. I. M. Kolthoff (*Chem. Weekblad*, 1922, **19**, 449—450).—Addition of sodium citrate to solutions containing phosphoric and boric acids prevents interference by the latter in the titration of the phosphoric acid with sodium hydroxide. After the neutralisation, addition of mannitol allows of the titration of the boric acid by further addition of sodium hydroxide, addition of the alkali being continued until the pink colour of the phenolphthalein remains for at least three minutes, and is not destroyed by further addition of mannitol. Neither calcium nor magnesium interfere.

In boiling solutions containing boric acid, a reflux condenser is scarcely necessary, since after half an hour's boiling the loss is less than 1%. S. I. L.

The Estimation of Boric Acid. W. W. Deerns (*Chem. Weekblad*, 1922, **19**, 480—481).—The author's method of estimating boric acid in presence of phosphoric acid by means of potassium iodide–iodate is simpler than the method proposed by Kolthoff (preceding abstract) of adding sodium citrate and titrating with alkali, and the interference of calcium compounds is not apparent. The citrate method is not new, having been proposed by Littmann (*Chem. Ztg.*, 1898, **22**, 691) and Pfyl (A., 1914, ii, 290). S. I. L.

Quantitative Estimation of Carbon and Hydrogen by means of the Sulpho-chromic Mixture. L. J. Simon and A. J. A. Guillaumin (*Compt. rend.*, 1922, **175**, 525—527; cf. Guyot and Simon, A., 1920, i, 285, and ii, 332).—The method indicated is limited in scope, but is applicable to dibasic straight-chain acids, their methyl esters, and to all sugar derivatives which do not contain a methyl group directly linked to carbon, to aromatic acids, and to phenols which contain no alkyl substituents in the ring. The substance is completely oxidised by a known excess of reagent, the volume of carbon dioxide obtained is noted, and hydrogen estimated by determining volumetrically the excess of chromic acid. An alternative method depends on estimating the residual chromic acid by addition of a known excess of a suitable organic substance and a second reading of the volume of carbon dioxide. A table is given of results obtained by the method as compared with standard figures for the same substances. The authors suggest that the method would be more generally applicable if silver chromate were used as the oxidising agent. H. J. E.

The Function of Chromic Oxide in Oxidation by means of Sulpho-chromic Mixture. L. J. SIMON (*Compt. rend.*, 1922, **175**, 768—770; cf. preceding abstract).—Chromic oxide formed in the reaction may play an important part in the oxidation. Control experiments in which chrome alum was added to the reagent showed that, in absence of oxidisable organic matter, the addition enables the liberation of oxygen to take place more readily and that the quantity of alum added influences the amount of oxygen evolved. If sufficient chromic oxide is added, sulphuric acid will completely decompose chromic anhydride on heating at 100°. Thus the addition of chromic oxide or its derivatives, when dealing with organic substances which are only partly oxidised by sulpho-chromic mixture, transforms what would otherwise be partial into complete oxidation, and in extreme cases gives rise to the evolution of free oxygen. H. J. E.

The Tannic Acid Method for the Estimation of Carbon Monoxide in Blood. R. R. SAYERS and W. P. YANT (*U.S. Bur. Mines, Rep. Investigations*, 1922, No. 2356).—Standards are prepared containing 10—100% of carbon monoxide–hæmoglobin in 90—0% of oxyhæmoglobin as follows: 5 c.c. or more of blood are collected, 0·05 gram of potassium citrate or 0·02 gram of sodium fluoride being used for each 10 c.c. Half of the blood is saturated with carbon monoxide, and both parts are diluted to 10 vols. with water, and mixed in varying proportions. Then 0·1 c.c. of the blood to be tested is drawn from the finger into 1 c.c. of 0·05% potassium citrate or 0·03% sodium fluoride solution. To each of the blood samples contained in tubes of $\frac{5}{16}$ inch inside diameter is added 1 c.c. of 1% tannic acid in 1% pyrogallol solution. The tubes are inverted and comparison is made in eight to ten minutes. The standards, when properly sealed, may be kept for several weeks, but the reagent should be freshly prepared. CHEMICAL ABSTRACTS.

Physical Method for the Estimation of Carbon Dioxide in the Respiratory Air. A. K. NOYONS (*Arch. Néerland. physiol.*, 1922, **7**, 488—495).—A method is described for the estimation of carbon dioxide by the measurement of the heat conductivity of the mixture of gases. W. O. K.

Estimation of Silica in Filtered Sea-water. ROGER C. WELLS (*J. Amer. Chem. Soc.*, 1922, **44**, 2187—2193).—The author has investigated the estimation of silica in sea-water and finds that the most effective method is to add an aluminium salt if such is not already present and precipitate with a quantity of ammonia sufficient to produce a pink colour with rosolic acid; the silica carried down with the alumina is then recovered and estimated in the usual way. It is shown that silica cannot be estimated by the loss on evaporation with hydrofluoric acid in the presence of calcium sulphate. An excess of at least two parts of alumina to one of silica is essential for the complete inclusion of silica in the alumina precipitate. An excess of ammonia favours the inclusion of silica in the ammonia precipitate, but this has a slightly solvent action on the aluminium hydroxide. A Sörensen value of 7—8, as shown by the pink colour with rosolic acid, is advisable in making the ammonia precipitation. A very small quantity of silica, roughly 0·3 mg., escapes precipitation and an equal quantity is generally found in the wash waters from the ammonia precipitate. In rock analysis, a single evaporation with hydrochloric acid is sufficient, provided silica is also determined in the ammonia precipitate. Eleven samples of water collected one mile south of Eastern Point Light, Gloucester, Mass., during eleven months gave contents of dissolved silica varying between 0·0029 and 0·0003 gram per litre. J. F. S.

The Estimation of Alkali Carbonates in Presence of Phenolphthalein. BONNIER (*Compt. rend.*, 1922, **175**, 765—767).—Warder's method (A., 1881, 848) of estimating carbon in steel involves a titration of alkali hydroxide with sulphuric acid in presence of alkali carbonate. That of Winkler (Treadwell, "Analytische Chemie," 9th ed., **2**, 485) necessitates titration of the hydroxide in presence of barium chloride. Neither gives a sharp end-point. In the former case, the instability of the alkali hydrogen carbonate, on the formation of which the end-point depends, leads to errors and a study of the various factors which influence the result shows that the excess of sodium sulphate formed, the temperature, and the method of stirring have no effect. The initial colour of the indicator, the method of adding the acid, and the dilution (cf. Mestrezat, A., 1918, ii, 274) all affect the estimation to some extent. Winkler's method is satisfactory if carried out with normal solutions; with less concentrated solutions, however, the end-point tends to lose sharpness. H. J. E.

The Cobalt Nitrite Reaction for Potassium in Animal and Vegetable Cells. A. B. MACALLUM (*Arch. Néerland. physiol.*, 1922, **7**, 304—308).—Sodium cobaltinitrite is a very sensitive reagent for the microchemical detection of potassium in animal and vegetable cells. The possibility of ammonia being precipitated by the cobaltinitrite may be avoided by the addition of formalin to the reagent, which converts the ammonia into hexamethylenetetra-amine. The only difficulty in the use of the reagent is that in animal tissue creatine may give a precipitate likely to be mistaken for potassium. W. O. K.

The Volumetric Estimation of Calcium. A. VÜRTHEIM and G. H. C. VAN BERS (*Chem. Weekblad*, 1922, **19**, 450—452).—Excess of ammonium oxalate is added to the solution, and after heating to boiling, calcium oxalate is precipitated by addition of ammonia; after filtration, the excess of ammonium oxalate is titrated with permanganate in the usual way. It is necessary to use at least double the amount of oxalate theoretically required for the precipitation; on account of the rapid alteration of ammonium oxalate solutions, blank titrations must be carried out with each series of estimations.

The results agree very well with those obtained by the gravimetric estimation, and within very wide limits are independent of the temperature and degree of acidity of the solution to be titrated and of the strength of the permanganate solution employed.

S. I. L.

The Volumetric Estimation of Magnesium in Potassium Salts. A. Vürtheim (*Chem. Weekblad*, 1922, **19**, 461—462).—The method proposed by Precht (A., 1879, 1053), namely precitation of magnesia by addition of carbonate-free alkali, and back titration of the excess after filtration, has been examined, and found to give satisfactory results for mixtures containing very large quantities of sodium, potassium, and calcium salts. Where calcium is present, oxalate is added to the alkali to ensure complete precipitation. S. I. L.

Estimation of Lead in Lead Amalgam. M. G. Mellon (*J. Amer. Chem. Soc.*, 1922, **44**, 2167—2174).—A résumé is given of the principles of the methods which have been used previously for the estimation of lead in lead amalgams. Data are presented which show the possibility of estimating quantities of lead of about 0·5 gram of lead in 30—50 grams of mercury with an accuracy of 0·05%. The method consists in the displacement of the lead by copper from an aqueous solution of copper nitrate, followed by the precipitation of the lead as chromate from the solution. It is shown that 0·4 gram of lead may be displaced from the amalgam in thirty minutes at the ordinary temperature if the mixture is stirred, but if allowed to remain stationary many hours are required for complete precipitation. The following procedure is recommended: the sample of amalgam is covered with water containing one drop of 10% acetic acid, 10 c.c. of a 2*N*-solution of copper nitrate are added and the mixture is stirred for thirty minutes and filtered to remove any metallic copper which has not dissolved in the mercury. One drop of 10% acetic acid is added to the filtrate, and the lead is precipitated as chromate by the method usually adopted. J. F. S.

A Peculiar Catalytic Reaction for the Detection, and a Method for the Estimation, of the Smallest Traces of Copper [also a Lecture Experiment]. Friedrich L. Hahn and G. Leimbach (*Ber.*, 1922, **55**, [*B*], 3070—3074).—When a solution of a ferric salt is added to a solution of sodium thiosulphate a dark violet coloration is developed which gradually disappears as the ferric becomes reduced to ferrous salt and the sodium thiosulphate is converted into tetrathionate. The reaction is greatly accelerated by the presence of copper salts and its completion can be made more obvious by the addition of ammonium thiocyanate to the mixture; the latter substance has also the advantage of retarding the reaction.

The following solutions are required. Copper sulphate solution (3·9 grams of the hydrated salt per litre, of which 1 c.c. is diluted to 1 litre before use); ferric solution (5 grams of iron alum and 25 c.c. of $2N$-hydrochloric acid per litre); $5M$-ammonium thiocyanate solution; $1/15M$-sodium thiosulphate solution. For the recognition of the minutest traces of copper, two litres of the iron solution should be mixed with 10—20 c.c. of thiocyanate; for the estimation of larger amounts more thiocyanate (up to 200 c.c.) may be used.

A neutral solution of the substance under investigation is placed in a beaker (500 c.c. capacity) and in a similar series of beakers known quantities of copper solution are placed. The solutions are made up to a fixed volume with distilled water, and to each are added 100 c.c. of the iron thiocyanate solution. Simultaneously (by means of a row of test-tubes fastened to a rod which can be rotated horizontally) 25 c.c. of thiosulphate solution are added to each beaker and the contents well mixed. The times required for decolorisation (which are conveniently 10—20 minutes) are then compared.

The velocity of the reaction is rather greatly dependent on small variations in the ratio of the concentrations, iron : thiocyanate : thiosulphate, on the degree of acidity and the temperature, so that it is scarcely possible at present to indicate definite intervals of time for definite quantities of copper. It is necessary to observe the progressive decolorisation in the solution under investigation and in solutions of known copper content simultaneously and to use a sufficient volume of solution (about 100 c.c.) to avoid the effect of local variations of temperature. The smallest amount of copper which can be identified with certainty under these conditions is 0·002 m.g.; further refinement is probable if a thermostat is used.

A similar effect on the course of the reaction has not been observed with any other substance yet investigated. Acceleration is caused by relatively large amounts of platinum, but the effect is so little marked that a confusion with copper is impossible. Aluminium, zinc, nickel, and arsenic in particular retard the action, especially in strongly acid solution. If such metals are to be investigated with regard to their copper content, it is essential that an equal weight of "foreign" metal should be added to the control solutions; in this manner, 0·001% of copper in nickel can be rapidly and certainly detected. H. W.

Potentiometric Titration of Copper. E. ZINTL and H. WATTENBERG (*Ber.*, 1922, **55**, [*B*], 3366—3370).—The method consists in the reduction of the cupric to cuprous salt in hydrochloric acid solution by means of titanium trichloride and subsequent re-oxidation with standard potassium bromate or dichromate solution in an atmosphere of carbon dioxide.

The apparatus consists of a beaker placed on an electrically heated hot plate and covered with a clock glass provided with four holes for the introduction of the nozzle of the burette, a stirrer, a T-tube which holds the indicator electrode (a stout smooth platinum wire) and serves also for the introduction of carbon dioxide and the limb of the normal electrode (a calomel cell charged with solid potassium chloride and saturated potassium chloride solution). The *E.M.F.* of the titration cell is measured by compensation in the usual manner with the aid of a capillary electrometer. The copper solution is treated with a sufficient quantity of hydrochloric acid and reduced by a slight excess of titanium trichloride, whereby a colourless solution results if sufficient hydrochloric acid is present to prevent precipitation of cuprous chloride. The addition of standard bromate or dichromate solution causes the oxidation of the excess of tervalent titanium and subsequently that of the copper, the end-points of the two actions being marked by abrupt changes in the potential. Titration is effected at about 80°, at which temperature the potentials adjust themselves almost instantaneously; in cold solution, the bromate in particular reacts somewhat slowly with titanium trichloride. The concentration of the hydrochloric acid has not a very marked influence, and is suitably maintained at 4—8%. Considerable quantities of ammonium salts have no disturbing effect, but iron is titrated with the copper. Small quantities of nitric acid are reduced by the excess of titanium trichloride, after which they do not influence the change further. The use of stannous chloride in place of titanium chloride is not recommended, since the potentials, even in hot solution, only become constant slowly as long as an excess of stannous salt is present. H. W.

Volumetric Estimation of Copper by means of Sodium Nitroprusside. GEORGES JORET (*Ann. Falsif.*, 1922, **15**, 354—356).—A solution of the copper salt, containing about 0·1 gram of copper, is neutralised with ammonia, then acidified slightly with nitric acid, treated with 40 c.c. of *N*/10-sodium nitroprusside solution (14·895 grams per litre), diluted to 200 c.c., and filtered; 100 c.c. of the filtrate are treated with 20 c.c. of *N*/10-silver nitrate solution, the mixture is filtered, and the excess of silver nitrate titrated with *N*/10-thiocyanate solution in an aliquot portion of the filtrate. The copper solution must not contain silver, nickel, cobalt, or halogens. W. P. S.

Separation of Copper by means of Thiophenylhydantoic Acid. H. H. WILLARD and DOROTHY HALL (*J. Amer. Chem. Soc.*, 1922, **44**, 2253—2254).—In solutions slightly acidified with acetic acid, thiophenylhydantoic acid precipitates quantitatively copper, lead, mercury, cadmium, bismuth, and antimony, whilst arsenic, tin, and metals not precipitated by hydrogen sulphide are not precipitated under these conditions. When the copper precipitate is ignited to oxide, the product contains sulphate sufficient to cause an error of 0·1—0·6 mg. in the total weight. The copper compound is very unstable and quite unsuitable for direct weighing. To estimate copper by means of the precipitate with thiophenylhydantoic acid, it is best to fuse it with potassium pyrosulphate, dissolve in water, and estimate the copper by any of the well-known methods. The bismuth and antimony compounds with thiophenylhydantoic acid are soluble in alcohol. To separate copper from the metals of the iron and zinc groups, the solution is neutralised with ammonia and 5 grams of glacial acetic acid are added. If metals precipitated by ammonia are present, 7 grams of citric acid are added before neutralising for every gram of such metal present. The solution is made up to 300—400 c.c., raised to the boiling point, and treated with 0·5 gram of thiophenylhydantoic acid in a little hot water, then dilute ammonia is added until a yellow precipitate begins to form. The solution is boiled, and if all the copper is precipitated the precipitate separates at the top, leaving a clear solution below. If this does not happen, a little more ammonia is added, but this may cause the precipitate to turn brown, due to the formation of sulphide. The precipitate is filtered hot, washed with hot water, and treated as stated above. The method is very good for small quantities of copper.

J. F. S.

Contradictions and Errors in Analytical Chemistry. I. The Precipitation of Aluminium by Thiosulphate and its Separation from Iron. II. The Ageing of Volumetric Thiosulphate Solutions. FRIEDRICH L. HAHN [with G. LEIMBACH (I) and H. WINDISCH (II)] (*Ber.*, 1922, **55**, [*B*], 3161—3165).—I. The precipitation of aluminium by means of thiosulphate under the usual conditions (boiling the solution until sulphur dioxide is completely expelled and then adding ammonia) is only very incomplete; the apparent accuracy of the results is due to a balance of errors, the unprecipitated aluminium hydroxide being compensated by the alkali carried down by the precipitate. Precipitation is almost quantitative when the solution is boiled for only a short time and the remainder of the metal is precipitated by addition of a base. An almost complete separation from iron can be achieved if a very weak base, preferably phenylhydrazine, is used.

II. The addition of a very small amount of alkali enables thiosulphate solutions to be preserved without alteration in strength from the first day. The change which they otherwise suffer appears to be caused by the faintly acid reaction of distilled water; it certainly does not depend on the formation of sulphite or sulphide.

H. W.

The Separation of Ferric Oxide and Aluminium Oxide from Magnesium Oxide by the Nitrate Method. ANDRÉ CHARRIOU (*Compt. rend.*, 1922, **175**, 693—695; cf. this vol., ii, 319).—In separating the oxides of iron and aluminium from that of magnesium by heating with ammonium nitrate, the retention of magnesium oxide by the other oxides increases with the magnesium content; aluminium oxide retains a relatively smaller amount than ferric oxide. By increasing the concentration of the ammonium nitrate solution from 4% to 10%, the magnesium oxide is almost completely removed, and if the mixture is treated three times in this way, no trace of magnesium remains. H. J. E.

Separation and Estimation of Cobalt. I. Separation of Cobalt by means of Thiophenylhydantoic Acid. I. Separation of Cobalt from other Metals. H. H. WILLARD and DOROTHY HALL (*J. Amer. Chem. Soc.*, 1922, **44**, 2219—2226).—Cobalt may be quantitatively separated from arsenic, uranium, vanadium, titanium, tungsten, molybdenum, zinc, manganese, chromium, aluminium, magnesium, and calcium by precipitation with thiophenylhydantoic acid in slightly ammoniacal solution. In the presence of iron, the precipitate is rarely free from this impurity, and usually contains from one to five mg. regardless of the amount originally present. This does not, however, interfere with the volumetric estimation of cobalt. Nickel is always partly precipitated. The cobalt precipitate has not a definite composition, and is probably mixed with some cobalt sulphide, thus making it necessary to convert the cobalt into some other more definite form. The various separations of cobalt from other metals are effected as follows. *Separation from iron.* A solution containing 1 gram of iron and 25 mg. of cobalt in 300 c.c. is placed in an Erlenmeyer flask, treated with 8 grams of citric acid, and neutralised with ammonia (*d* 0·90) and 5 c.c. of excess ammonia are added. The solution is warmed at 35°, 0·7—1·0 gram of thiophenylhydantoic acid dissolved in 30 c.c. of water or alcohol added, and the mixture shaken vigorously for several minutes. The cobalt is precipitated and after boiling the precipitate may be easily filtered. *Separation from manganese.* This separation is effected as in the case of iron. *Separation from zinc.* The procedure is the same as for iron, except that an excess of 10 c.c. of ammonia is necessary and the solution must be boiled for several minutes to ensure complete precipitation of the cobalt. The other metals named are separated in the same way as zinc, except that 7 grams of citric acid are used. J. F. S.

Separation and Estimation of Cobalt. II. Gravimetric Estimation of Cobalt. H. H. WILLARD and DOROTHY HALL (*J. Amer. Chem. Soc.*, 1922, **44**, 2226—2231; cf. preceding abstract).—Various methods for the gravimetric estimation of cobalt have been examined, and it is shown that, although pure cobalt nitrate may be accurately ignited to the oxide Co_3O_4 and the latter reduced by hydrogen to the metal, the oxide obtained by the ignition of the thiophenylhydantoic acid precipitate (*vide supra*) contains a little sulphate. If the oxide obtained in this ignition is assumed, empirically, to be Co_2O_3, the results for cobalt are fairly good. The ignition of cobalt sulphate at 550° is the most accurate method for the estimation of cobalt, but when this method is applied to the thiophenylhydantoic acid precipitate the results are usually slightly high and the sulphate is not completely soluble in water. The electrolytic estimation of cobalt is very satisfactory when the proper conditions and precautions are observed. Precipitation as cobalt ammonium phosphate followed by ignition to cobalt pyrophosphate is less accurate than the preceding methods.

J. F. S.

Separation and Estimation of Cobalt. III. Volumetric Estimation of Cobalt. H. H. WILLARD and DOROTHY HALL (*J. Amer. Chem. Soc.*, 1922, **44**, 2237—2253; cf. preceding abstracts). —A number of methods have been examined for the volumetric estimation of cobalt. It is shown that in general volumetric methods are the most accurate and satisfactory for the estimation of cobalt. The most accurate method involves the oxidation of cobalt to cobaltic hydroxide in strongly alkaline solution by means of a perborate or hydrogen peroxide, followed by its volumetric reduction to a cobaltous salt. This reduction may be accomplished by the following methods: (*a*) By the addition of potassium iodide in acid solution, the iodine liberated being titrated with sodium thiosulphate; in this method iron must be absent. (*b*) By adding the cobaltic hydroxide to an acid ferrous sulphate solution, the excess of which is titrated with potassium permanganate; an empirical factor must be used in the calculation. (*c*) By the addition of a strongly acid solution of stannous chloride, the excess of which is titrated with iodine, iodate, bromate, or dichromate solution. The last, titrated electrometrically, is especially recommended. If iron is present, iodine will oxidise it quantitatively only in a neutral solution. (*d*) By adding titanous sulphate, the excess of which is titrated with permanganate. Since titanous hydroxide decomposes water with the liberation of hydrogen, the alkaline solution must be first almost completely neutralised by one of the several methods suggested. The presence of nickel does not interfere with this titration, but the oxidation is incomplete when more than 7 mg. of iron are present. In the presence of a large excess of potassium hydrogen carbonate, cobalt is oxidised by hydrogen peroxide to a green tervalent compound, which is reduced in the presence of pyrophosphate by ferrous sulphate, the excess of which is titrated with permanganate after acidifying with sulphuric acid. Iron and manganese in small amounts do not interfere in this method, but the principal source of error is in the removal of the excess of peroxide without decomposing the cobalt compound. J. F. S.

Gravimetric Estimation of Nickel as Nickel Dioxide. WILHELM VAUBEL (*Chem. Ztg.*, 1922, 46, 978).—Nickelous hydroxide is precipitated from the solution with sodium hydroxide, collected, washed, and ignited. The ignited precipitate is again washed until free from alkali metals, dried, and dissolved in nitric acid. The excess of nitric acid is evaporated and the residue heated for thirty minutes in an air-bath at 280—330°. Pure black nickel dioxide results. The oxides of nickel at present known are NiO, Ni_3O_4, and NiO_2. The oxide Ni_2O_3 has not yet been obtained. H. C. R.

Electrometric Estimation of Nickel with Silver Nitrate. ERICH MÜLLER and HANS LAUTERBACH (*Z. anal. Chem.*, 1922, **61**, 457—464).—The nickel solution is treated with a slight excess of potassium cyanide solution, sufficient to decolorise the mixture, and connected with a normal calomel electrode, a galvanometer, and a sliding resistance, the ends of which are connected with an accumulator, and one end and the sliding contact with a voltmeter. A silver wire in the solution acts as indicator electrode, and the solution is agitated by means of a motor-driven stirrer. The sliding resistance is adjusted until the voltmeter indicates 0·075 volt and silver nitrate solution is added slowly until the galvanometer indicates zero. The results are calculated as in the older chemical process. A. R. P.

Electrometric Titration of Dichromate with Ferrous Sulphate. Marion Eppley and Warren C. Vosburgh (*J. Amer. Chem. Soc.*, 1922, **44**, 2148—2156).—The conditions under which dichromate may be estimated by electrometric titration with ferrous sulphate have been investigated. The practical limits of acidity for hydrochloric and sulphuric acids have been determined. It is shown that the amount of ferrous sulphate required to titrate a given amount of chromic acid varies with the concentration of the latter. Dissolved air has a negligible effect on the titration. Hydrofluoric acid in sufficient concentration reduces the amount of ferrous sulphate required by about 0·1%. When ferrous sulphate, standardised by means of a standard solution of potassium permanganate, is used to standardise a known amount of dichromate in 0·01*N*-solution, the value found for the latter is about four parts per thousand higher than the calculated value. When the dichromate concentration is 0·003*N*, the amount of ferrous sulphate required is about 1% higher than the calculated quantity. The titration of the ferrous ion with a potassium dichromate solution gives results which agree with those obtained by the reverse titration. J. F. S.

The Analysis of High-percentage Tungsten Alloys. K. Seel (*Z. angew. Chem.*, 1922, **35**, 643—644).—The serious loss of platinum involved in the customary fusions of tungsten alloys with sodium and potassium carbonates and nitrates may be avoided by fusing the finely divided alloy with sodium hydroxide and nitrate in silver crucibles. The fusion takes about 1 hour, and the crucibles are not seriously attacked. 0·5 Gram of the finely divided alloy is fused with 6 grams of sodium hydroxide and 3 grams of sodium nitrate. The fused mass is dissolved in water and filtered, the iron oxide remaining on the filter being dissolved in hydrochloric acid containing a little potassium chlorate, filtered, and the two filtrates united. The iron is estimated as ferric oxide as usual. The aluminium and the greater part of the silica are removed from the filtrate with ammonia, filtered off, and the tungsten in the filtrate precipitated with mercurous nitrate after acidifying, boiling off the carbon dioxide and concentrating to about 150 c.c. The tungstic acid obtained by ignition of the precipitate is strongly contaminated with alkali, which is removed by repeated extractions with 7% hydrochloric acid, and traces of silica are finally removed by treatment with hydrofluoric acid. In the case of alloys rich in iron, a residue containing iron and tungsten remains after the original fusion. This is fused with pyrosulphate and the tungsten precipitated with nitric acid, estimated as tungstic acid and added to the figure obtained above. The iron in the filtrate is estimated in the usual way and added to the figure obtained above.

H. C. R.

Separation of Antimony from Arsenic and Tin. FRIEDRICH L. HAHN (*Z. anorg. Chem.*, 1922, **123**, 276).—Antimony can be separated quantitatively from arsenic and tin by oxidation to pyroantimonate (cf. A., 1916, ii, 266). This method is due to Hampe. W. T.

The Estimation of Bismuth as Metal. ALBIN KURTENACKER and FELICITAS WERNER (*Z. anorg. Chem.*, 1922, **123**, 166—170).—The authors find that metallic bismuth can be accurately estimated by dissolving it in a ferric salt and titrating the ferrous salt produced by means of potassium permanganate, the reaction being $Bi+3Fe^{\cdot\cdot\cdot}=Bi^{\cdot\cdot\cdot}+3Fe^{\cdot\cdot}$. Ferric chloride was found more suitable than the sulphate. The reduction of bismuth nitrate by formaldehyde, hypophosphorous acid, and alkali stannite gave results about 5% too low, this being due to the metal being mixed with some bismuthous oxide. Conditions for complete reduction to the metal could not be found. W. T.

New Method for Estimating Volatile Substances in Air. E. FRITZMAN and K. MACJULEVITSCH (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 212—226).—To estimate the content of light petroleum vapour in air, the latter is first freed from dust, moisture, and carbon dioxide by passing it through tubes containing, in order, soda-lime, calcium chloride, phosphoric oxide, and cotton wool, the light petroleum being retained in two **U**-tubes packed with magnesium turnings and cooled in liquid air. T. H. P.

Estimation of Toluene, Xylene, and Benzene. G. ZABOROWSKI (*Mat. grasses*, 1922, **14**, 6160—6161).—Commercial samples of the above hydrocarbons or their respective mixtures with " gasoline " may be examined, either volumetrically by sulphonation with a known quantity of sulphuric acid and titration of the excess of acid, or densimetrically. (*a*) About 3·5 grams of the sample and three times its weight (for xylene, four times) of (preferably 100%) sulphuric acid are warmed to 45° in a 50 c.c. glass-stoppered flask, shaken thoroughly for five minutes, allowed to cool, poured into 100 c.c. of water, boiled to remove light oils, and titrated with standard sodium hydroxide solution, using phenolphthalein. For toluene, the quantity of acid used is multiplied by 1·876; for xylene, by 2·163. In the case of benzene, sulphonation must be effected in a reflux apparatus. (*b*) The densimetric estimation consists in the use of the expression $T=-[100D(d_1-d_2)]/(D-d_2)d_1$, where d_1 represents the d_{15} of the sample, d_2 the d^{15} of the unsulphonated residue after sulphonation, and D the d^{15} of pure toluene (0·8706), xylene, or benzene. CHEMICAL ABSTRACTS.

The Detection of Nitro-compounds. H. J. PRINS (*Perf. Essent. Oil Rec.*, 1922, **13**, 355).—The accelerating effect of nitrobenzene on the reaction velocity of metals with weak acids is applied to the detection of this substance in benzaldehyde. The reaction is carried out by heating 2 c.c. of the oil and 6 c.c. of 80% acetic acid for one minute with a small piece of tin foil. In presence of 5% of nitrobenzene, the tin disappears immediately on boiling, with 1% the tin turns dark and disappears about ten minutes after the mixture has been heated, with 0·1% the tin turns black after about ten minutes, with 0·01% the tin becomes greyish-black after remaining over-night, whilst with pure benzaldehyde the metal retains its bright surface. In a similar way, the presence of 0·1% of artificial musk can be detected in perfumes. The reaction is not exclusively specific for nitro-compounds, as organic peroxides have the same property, but only oils rich in terpenes which contained peroxides owing to exposure to air show the reaction and then only feebly. Likewise worm-seed oil containing the peroxide caridol can scarcely give rise to confusion, as 5% of nitrobenzene in benzaldehyde reacts more rapidly than pure worm-seed oil. Peroxidised benzaldehyde does not show the nitrobenzene reaction at all. G. F. M.

Estimation of Phenol in Mixtures of Tar Acids. W. H. HOFFERT (*J. Soc. Chem. Ind.*, 1922, **41**, 334—337T).—The method proposed depends on the fact that the freezing point of phenol hydrate (16°) is lowered to the same extent by equal weights of each of the three cresols. In the case of a mixture of phenol and cresols, the freezing point may be determined directly, after the addition of water amounting to 10% of the weight of the mixture, if the quantity of phenol present exceeds 55%; if the proportion of phenol is less, a known quantity of pure phenol (m. p. 40·5°) must be added to bring the proportion above 55%. With a mixture of tar acids, it is first necessary to remove neutral hydrocarbons and pyridine bases by distilling with steam from a sodium hydroxide solution of the sample, or by extracting the same solution with ether or benzene; the recovered tar acids are then distilled. If the mixture distils completely below 203°, the estimation is made directly on the distillate, but otherwise, higher homologues must be separated by fractional distillation. A known weight of pure phenol is added to the distillate and the mixture is treated with 10% of its weight of water. Directions are given in detail regarding the procedure adopted for determining the freezing point and the amount of phenol corresponding with the freezing point obtained is found by reference to a graph. The method may be applied to the estimation of phenol in crude carbolic acid. W. P. S.

Iodometric Estimation of Sugars. FR. AUERBACH and E. BODLÄNDER (*Z. angew. Chem.*, 1922, **35**, 631—632).—In the iodometric titration of the excess of Fehling's solution used in the estimation of a reducing sugar, the volume of *N*/10-thiosulphate solution required is not strictly proportional to the amount of sugar present. A table is given showing the quantities of invert-sugar corresponding with different quantities of thiosulphate

solution. Replacement of a part of the potassium iodide used by potassium thiocyanate, as proposed by Bruhns, is not recommended.
W. P. S.

The Modified Lehmann Method for the Estimation of Dextrose. Adaptation to Small Quantities of Reducing Sugars. PAUL FLEURY and LOUIS BOUTOT (*Bull. Soc. Chim. Biol.*, 1922, **4**, 361—374).—In the estimation of dextrose by Bruhns's method (A., 1920, ii, 773) the reagents should be added to the copper solution in the following order: iodide, acid, thiocyanate. The method has been used for the estimation of small quantities of reducing sugars in biological fluids. E. S.

Trustworthiness of the Benedict and Folin-Wu Blood-sugar Estimations. F. A. CSONKA and GRACE C. TAGGART (*J. Biol. Chem.*, 1922, **54**, 1—3).—The different results obtained by the Folin-Wu (A., 1920, ii, 337) and the Benedict (A., 1918, ii, 247) methods are due to the presence in blood of a substance which reacts with picric acid but does not reduce copper solutions. The former method is thus the more trustworthy. E. S.

Estimation of Starch. I. Estimation of Starch in Barley and in Wheat. ARTHUR R. LING [with E. H. CALLOW and W. J. PRICE] (*J. Inst. Brewing*, 1922, **28**, 838—853).—The method proposed depends on the hydrolysis of the starch by malt diastase as suggested by Brown and Morris (T., 1885, **47**, 527). Since the amount of maltose yielded by a pure starch varies with the diastatic power of the malt, the authors have determined the relation between the percentage of maltose obtained from pure barley and wheat starches when these are hydrolysed under definite conditions, and the diastatic power of the malt employed. The results of these experiments are given in graphic form. To estimate starch in barley or wheat, 5 grams of the finely-powdered grain are extracted in a Soxhlet apparatus for 3—3½ hours with alcohol (*d* 0·920), the powder is then rinsed into a beaker with about 100 c.c. of water, and the mixture is boiled for ten minutes. The starch paste thus obtained is cooled to 57°, 10 c.c. of malt extract (prepared from a malt of known diastatic power) are added, the mixture is kept at 57° for one hour, then boiled, filtered, and the insoluble portion washed. The filtrate is diluted to 200 c.c. and 30 c.c. of this solution are diluted to 100 c.c. and titrated against 10 c.c. of Fehling's solution. The cupric reducing power of the malt extract is determined at the same time and under the same conditions, and the value obtained is used to correct the reducing power of the conversion product. W. P. S.

Identification of Inulin by a Mycological Method. ALDO CASTELLANI and FRANK E. TAYLOR (*Biochem. J.*, 1922, **16**, 655—658).—*Monilia macedoniensis*, Castellani, ferments inulin with the production of gas. It also ferments dextrose, lævulose, galactose, and sucrose. The method consists of the utilisation of the above mould in conjunction with other fungi. S. S. Z.

Estimation of Volatile Acids in Wine. PHILIPPE MALVEZIN (*Ann. Falsif.*, 1922, **15**, 360—362).—In reply to criticism, the author states that he sees no reason for altering the procedure described in his ether-extraction method for the estimation of volatile acids in wine. Tartaric and lactic acids are not extracted by the ether under the conditions given. W. P. S.

The Separation of Solid and Liquid Fatty Acids. W. MEIGEN and A. NEUBERGER (*Chem. Umschau*, 1922, **29**, 337—342).—The methods of Varrentrapp, Bull and Fjellanger, Farnsteiner, David, Niegemann, and Facchini and Dorta were tested on known mixtures of solid and liquid fatty acids and by none was a true quantitative separation obtained. By the methods of Bull and Fjellanger, Facchini and Dorta, and David about one-half of the liquid acids was recovered in a nearly pure state. By recrystallising the solid fraction, part of this was also obtained nearly pure. By precipitating the aqueous solution of the potassium salts with excess of thallous sulphate, however, an almost quantitative separation of stearic, palmitic, and elaidic acids from oleic acid was attained, and no recrystallisation was necessary. A mixture of 0·502 gram of oleic acid with 0·505 gram of stearic acid gave 0·509 gram of solid acids of iodine value 0·3 and m. p. 68°, whilst a mixture of 0·200 gram of oleic acid and 0·502 gram of stearic acid gave 0·529 gram of solid acids of iodine value 0·9 and m. p. 67·5°. H. C. R.

The Neutralisation of Tartaric Acid by Potassium Hydroxide in Presence of Chlorides of Alkaline Earths. L. J. SIMON and L. ZIVY (*Compt. rend.*, 1922, **175**, 620—622).—The fact that titration of alkali hydroxide against tartaric acid gives two end-points; that with helianthin indicating formation of the acid salt and that with phenolphthalein the normal salt, may be used in estimating mixtures of tartaric acid with other acids which give an end-point in presence of helianthin indicating the formation of normal salt. The presence of alkaline-earth chlorides in the solution introduces an error, as each molecule behaves towards potassium hydroxide as an equivalent quantity of hydrochloric acid. This effect is produced by any quantity and is quantitative in each case, the limiting value of the effect being the amount of tartaric acid present. Chlorides of other metals do not interfere with the titration in this manner. H. J. E.

Estimation of Salicylic Acid in Blood-serum and other Fluids of the Body. H. HERISSEY (*Compt. rend. Soc. biol.*, 1922, **87**, 333—336).—A mixture of 10 c.c. of serum, 5 c.c. of water, 0·5 c.c. of a solution of 1 gram of sulphuric acid in 5 c.c. of water, and 40 c.c. of ether is shaken together for one minute in a stoppered glass bottle of 125 c.c. capacity. After an interval of a few minutes, 4·5 c.c. of sulphuric acid solution are again added and the contents well mixed by rotation of the flask, the supernatant ethereal layer being decanted after five minutes. Of this solution, 30 c.c. are shaken in a funnel with 2—3 grams of anhydrous sodium sulphate; 3 c.c. of water containing one drop of dilute ferric chloride solution are then added, and the whole is vigorously shaken. In the presence of salicylic acid, a violet colour appears in the water layer on keeping. Should a positive reaction be given, the contents are thoroughly mixed and transferred to a small crystallising dish, the ether being allowed to evaporate spontaneously at room temperature. It is necessary to use a stirring-rod to prevent the formation of deposits on the sides of the dish. The solution is then filtered into a test-tube, together with a few drops of rinsing water, and its coloration compared with standards prepared from 10 c.c. of normal serum, 5 c.c. of water, and varying quantities of salicylic acid. A definite coloration is obtained with only 10 mg. of sodium salicylate per litre. CHEMICAL ABSTRACTS.

Substituted Naphthalenesulphonic Acids. I. A Method for Identifying H-Acid and its Intermediates Obtained from Naphthalene-2 : 7-disulphonic Acid. D. F. J. LYNCH (*J. Ind. Eng. Chem.*, 1922, **14**, 964—965).—A method for the detection of 1 : 8-dinitronaphthalene-3 : 6-disulphonic, 1 : 8-diaminonaphthalene-3 : 6-disulphonic, 1-amino-8-naphthol-3 : 6-disulphonic (H-acid), and 1 : 8-dihydroxynaphthalene-3 : 6-disulphonic (chromotropic) acids in their mixtures by means of their reactions with solutions containing 2-cymidine sulphate, cobalt chloride, zinc sulphate, or the hydrochlorides of benzidine, α-naphthylamine, ψ-cumidine, tolidine, and *p*-nitrotoluidine, is developed. The tests are carried out with 3—5 c.c. of less than one-tenth gram-molecular solutions of the naphthalenesulphonic acids. The following substances were prepared. *Benzidine* salt of 1 : 8-*dinitronaphthalene*-3 : 6-*disulphonic acid*,

$$C_{10}H_4(NO_2)_2(SO_3H)_2,NH_2\cdot C_6H_4\cdot C_6H_4\cdot NH_2,$$

light yellow prisms, m. p. 275° (decomp.). Solubility 0·036 part at 20°. *Cymidine* 1 : 8-*dinitronaphthalene*-3 : 6-*disulphonate*, $C_{10}H_4(NO_2)_2(SO_3H)_2,(C_6H_3MePr^{\beta}\cdot NH_2)_2$, straw-coloured prisms, m.p. 265° (decomp.), solubility 0·059. Benzidine salt of chromotropic acid, $C_{10}H_4(OH)_2(SO_3H)_2,NH_2\cdot C_6H_4\cdot C_6H_4\cdot NH_2$, brown prisms, m. p. 278° (decomp.), solubility 0·085. p-*Nitrotoluidine* 1 : 8-*diaminonaphthalene*-3 : 6-*disulphonate*,

$$C_{10}H_4(NH_2)_2(SO_3H)_2,(NH_2\cdot C_6H_3Me\cdot NO_2)_2,$$

greyish-tan needles, m. p. 270° (decomp.), solubility 0·186. Mono-α-naphthylamine salt of H-acid, $NH_2\cdot C_{10}H_4(OH)(SO_3H)_2,NH_2\cdot C_{10}H_7$, light violet-grey prisms, m. p. 278° (decomp.), solubility 0·1006. Mono-ψ-cumidine salt of H-acid, $C_{10}H_9O_7NS_2,NH_2\cdot C_6H_2Me_3$, grey prisms, m. p. 272° (decomp.), solubility 0·097. Mono-*p*-nitrotoluidine salt of H-acid, $C_{10}H_9O_7NS_2,NH_2\cdot C_6H_3Me\cdot NO_2,H_2O$, grey prisms, m. p. 265° (decomp.), solubility 0·106. Tolidine salt of H-acid, $C_{10}H_9O_7NS_2,NH_2\cdot C_6H_3Me\cdot C_6H_3Me\cdot NH_2,3H_2O$, greyish-violet prisms, m. p. 260° (decomp.), solubility 0·102. *Zinc* 1 : 8-*diamino*-3 : 6-*disulphonate*, $C_{10}H_4(NH_2)_2S_2O_6Zn,3H_2O$, grey needles, solubility 6·4; *cobalt* salt, $C_{10}H_4\cdot(NH_2)_2S_2O_6Co,2H_2O$, brown needles, solubility 6 at 20°. The solubilities are parts per 100 parts of water, at room temperature unless otherwise specified.

A. J. H.

Estimation of Anthraquinone. O. A. NELSON and C. E. SENSEMAN (*J. Ind. Eng. Chem.*, 1922, **14**, 956—957).—The following volumetric method has been devised for the estimation of anthraquinone in order to avoid the difficulties of filtration experienced in the method of Lewis (A., 1918, ii, 338). To about 0·5 gram of the sample of anthraquinone, intimately mixed with 3—4 grams of zinc dust, is added 100 c.c. of boiling 5% sodium hydroxide. After five minutes, the mixture is filtered through asbestos contained in a glass tube, about 24 cm. long and 3·5 cm. in diameter, and tapered at one end. This funnel is electrically heated at 90—95° and contains a mechanical stirrer. The red filtrate containing oxanthranol is received in a suction flask and is there directly titrated with a standard solution of potassium permanganate (3·8 grams per litre). Usually three to eight washings of the residue with hot sodium hydroxide solution are necessary in order completely to free it from unreduced anthraquinone, and the apparatus is arranged so that aerial oxidation of the filtrate is prevented. In the titration, the end-point is reached when the filtrate becomes colourless, except when phenanthraquinone is present when a bluish-green colour is obtained which changes to brownish-green on addition of excess of potassium permanganate. Accurate results are obtained by this method even when the anthraquinone contains phenanthraquinone, anthracene, phenanthrene, phthalic acid, phthalic anhydride, or other oxidation products of anthracene and phenanthrene. A. J. H.

A Chemical Method of Assaying the Active Principles of Digitalis. ARTHUR KNUDSON and MELVIN DRESBACH (*J. Pharm. Expt. Ther.*, 1922, **20**, 205—220).—The pharmacological activity of extracts of digitalis is found to be parallel with the colour developed on treating the digitalis preparation, decolorised with lead acetate, with an alkaline picrate solution. In order to evaluate the activity of the extract, comparison is made in the colorimeter with a standard ouabain solution treated in the same way.

W. O. K.

The Use of Sodium α-Naphthol-2-sulphonate for the Spectrophotometric Estimation of Aromatic Amino-compounds. W. E. MATHEWSON (*J. Assoc. Off. Agric. Chem.*, 1922, **6**, 16—28).—The method consists essentially of coupling the naphtholsulphonate with the diazo-compound of the amine, and determining the concentration of the dye photometrically, in comparison with a standard solution of the pure dye. Sodium α-naphtholsulphonate is suited to the purpose because of the ease with which it is to be obtained pure, and to the rapidity and completeness of its reaction with diazo-compounds in dilute solution.

"Extinction coefficients" or "transmissive indices" (Priest, *J. Opt. Soc. Amer.*, 1920, 186) are determined by the König-Martens spectrophotometer, using the light from a mercury vapour lamp. Standard figures for aniline, *o*- and *p*-toluidines, α- and β-naphthylamines, benzidine, anthranilic acid, methyl anthranilate, and *p*-sulphanilic acid are given. The dye from methyl anthranilate is saponified in alkaline solution and direct determinations of its concentration are impossible. In this case the velocity coefficient of saponification is determined; and for purposes of estimation photometric readings are taken at intervals, and the original concentration is determined by calculation. The presence of small quantities of the nitroso-compound of α-naphtholsulphonate has a negligible effect on the transmissive index. Hydrazine may be used in certain cases (for example, β-naphthylamine) to remove excess of nitrous acid, but in others (for instance naphthionic acid) the results obtained are uncertain. Details of the method for estimating amino-impurities in dyes are given. The process may also be used for the estimation of nitrites. A. G. P.

Pernitric Acid as an Analytical Reagent. IV. TRIFONOV (*Z. anorg. Chem.*, 1922, **124**, 136—139).—Pernitric acid reacts with aniline, yielding an intensely yellow product. The per-acid is formed by the action of hydrogen peroxide on an acidified solution of a nitrite. The above reaction with aniline can therefore be employed for the detection of hydrogen peroxide or a nitrite. Benzene is coloured by pernitric acid yellow, which changes into dark red on the addition of alkali. Toluene and xylene are also coloured yellow but fainter, which, however, does not change on the addition of alkali. Thus benzene in the presence of toluene, xylene, and the aliphatic hydrocarbons can be detected; the aliphatic members are not coloured. Similarly, benzene can be detected in methylated spirits. W. T.

The Analysis of β-Naphthylamine. H. R. LEE and D. O. JONES (*J. Ind. Eng. Chem.*, 1922, **14**, 961—963).—Methods for the determination of β-naphthylamine, m. p. 110·1—110·2° (corr.), in the presence of its common impurities, β-naphthol, m. p. 121·2—121·3° (corr.), ββ-dinaphthylamine, m. p. 172·2° (corr.), and α-naphthylamine, m. p. 49·2—49·3° (corr.), are suggested, using specially purified samples of these substances. The direct nitrite titration method usually gives results which are too high, due partly to oxidation of the diazo-β-naphthylamine and partly, when β-naphthol is present, to formation of nitroso-β-naphthol. A more accurate method, based on the fact that β-naphthol-1-sulphonic acid does not absorb nitrous acid, consists of sulphonating 0·65 gram of the sample of β-naphthylamine with 20 c.c. of 25% of fuming sulphuric acid at 0—5° and finally at 15°, diluting the mixture with ice, boiling it to remove sulphur dioxide and afterwards adding 15 c.c. of concentrated hydrochloric acid and estimating the β-naphthylamine by titration with 0·1*N*-sodium nitrite at 0—5°. For estimation of the β-naphthol present, the sample dissolved in dry benzene is saturated with hydrogen chloride, and after removal of β-naphthylamine hydrochloride by filtration, the β-naphthol in the filtrate is determined by titration with 0·05*N*-diazotised-*p*-nitroaniline solution. Impurities insoluble in acids are estimated by boiling 0·5 gram of the sample in 150 c.c. of 1·5% hydrochloric acid, filtering the solution through a Gooch crucible, washing the residue with hot water, and afterwards drying it to constant weight at 100°. Under these conditions, at least 10% of the β-naphthol passes into the filtrate, but only 0·10—0·20% of the ββ-dinaphthylamine is soluble, so that this may be extracted from the residue by means of solvents and weighed or analysed for nitrogen. Moisture is determined by drying 5 gram of the finely powdered sample over concentrated sulphuric acid in a vacuum. A modified Kjeldahl-Gunning method for the estimation of total nitrogen is described and the melting-point curves of the binary systems, β-naphthylamine–β-naphthol, β-naphthylamine–ββ-dinaphthylamine, and β-naphthylamine–α-naphthylamine are also given. A. J. H.

Identification of Alanine by Crystallo-chemical Analysis. IV. S. JAITSCHNIKOV (*J. Russ. Phys. Chem. Soc.*, 1920, **52**, 145—147).—Polarimetric identification of active alanine is sometimes impossible owing to the marked opalescence of the solution. In such case, use may be made of crystallographic measurements. The results of the author's measurements are compared with those of Groth and of Fischer (A., 1906, i, 145). T. H. P.

Detection of Urea. Estimation of Proteolytic Ferments. LUDWIG PINCUSSEN (*Biochem. Z.*, 1922, **132**, 242—244).—Urea is best detected in a liquid free from ammonia by addition of urease at P_H 7·0—7·2, keeping at 55° for fifteen minutes, then addition of two drops of saturated sodium carbonate solution and detection of the production of volatile ammonia by litmus paper. If the liquor contains ammonia originally, it is removed by shaking with powdered permutite, 0·2 gram per c.c.

A quantitative method for estimating proteolytic ferments is described which depends on the micro-Kjeldahl estimation of the non-protein nitrogen formed by the digestion. Unchanged protein is removed by colloidal iron. H. K.

Detection of the Veronal Group. Diagnosis of Veronal Intoxication. HEINRICH HANDORF (*Z. ges. expt. Med.*, 1922, **28**, 56—80; from *Chem. Zentr.*, 1922, iv, 576).—A modification of the murexide test is described for the detection of barbituric acid derivatives in urine. The different members of the veronal group are distinguished by their behaviour when the reaction is carried out in the presence of ammonium chloride, sodium chloride, and barium chloride, respectively. G. W. R.

Inconstancy of the Precipitation of Uric Acid from Urine in the Form of Cuprous Urate. J. KHOURI (*Bull. Soc. Chim. Biol.*, 1922, **4**, 375—378).—Denigès's method for the estimation of uric acid in urine gives low and irregular results owing to the incomplete precipitation of the copper salt. This may be remedied to some extent by first treating the urine (100 c.c.) with five drops of sulphuric acid and heating for one hour at 100°. E. S.

Use of the Newer Indicators in Titrations of Alkaloids. WILLIAM J. MCGILL (*J. Amer. Chem. Soc.*, 1922, **44**, 2156—2160).—The Sörensen values of aqueous solutions of the hydrochlorides of quinine, cinchonine, morphine, atropine, and strychnine have been determined from *E.M.F.* determinations at various dilutions; measurements were also made in the presence of such quantities of alkali salts as would normally be present in the titration of an alkaloid hydrochloride by alkali. From the results, the most suitable indicators for the titration of such alkaloids are deduced and tested experimentally. It is shown that the indicators generally used in the titration of morphine, atropine, and quinine give results which are not nearly so accurate as should be obtained. Thus in the case of morphine the average error using methyl-red is 1·4%, whereas bromophenol-blue gives an average error of 0·5%, and in some cases it is as low as 0·1%. The most trustworthy indicator for quinine is bromocresol-purple, whilst this indicator is not superior to methyl-red in the titration of cinchona residues. Cochineal and methyl-red give low results with morphine, whilst bromophenol-blue gives a satisfactory value and end-point; the same is also true for atropine and mydriatic residues. Methyl-red can best be used in the titration of strychnine. J. F. S.

The Estimation of Carnosine in Muscle Extract. GEORGE HUNTER (*Biochem. J.*, 1922, **16**, 640—654).—Further details are given for the estimation of carnosine in muscle by the application of Koessler and Hanke's diazo-method (this vol., ii, 328). Histidine can be estimated in muscle in the presence of carnosine by utilising Knoop's reaction, since the reaction is not characteristic of carnosine. This fact affords, further, the opportunity of estimating carnosine by a new method, namely, by hydrolysing it and determining the resulting histidine by Knoop's reaction. In ox-muscle, purines are responsible for about 3% of the diazo-colour value reckoned as carnosine, and 2% of the colour may be due to substances other than carnosine. The carnosine content of muscle varies both with the species of the animal and with the individual of the same species. S. S. Z.

Knoop's Test for Histidine. GEORGE HUNTER (*Biochem. J.*, 1922, **16**, 637—639).—Different intensities of colour are produced in solutions of the same concentration of histidine by Knoop's test. This is due to the variation in the excess of bromine. The proportion of three atoms of bromine per molecule of histidine is found to give the maximum colour on heating. S. S. Z.

Precipitation of Proteins by Metaphosphoric Acid. Application to the Analysis of Blood, Pathological Liquids, and Cerebrospinal Fluid. A. GRIGAUT and P. ZIZINE (*Bull. Soc. Chim. Biol.*, 1922, **4**, 388—406).—In the precipitation of proteins from serum, etc., by means of sodium metaphosphate and hydrochloric acid, the amount of acid employed, provided it is within the limits necessary for the complete precipitation of protein, has little influence on the amount of non-protein nitrogen which passes into the filtrate. Preliminary dilution of the serum, on the other hand, exerts considerable influence; the greater the dilution the smaller the amount of non-protein nitrogen which passes into the filtrate. For serum and pathological liquids the following method is recommended: The serum (10 c.c.) is diluted with water (6 c.c.). A 20% solution of sodium metaphosphate (2 c.c.) is then added, followed by 2*N*-hydrochloric acid (2 c.c.). In the case of certain liquids (for instance, whole blood, cerebrospinal fluid) modifications depending on the viscosity and content in protein must be made both in the dilution and the amount of reagents employed. Contrary to the statement of Cristol (this vol., ii, 583), metaphosphoric acid does not produce a partial hydrolysis of the proteins; the higher values obtained with this reagent are probably due to the presence of polypeptides in the filtrate. When trichloroacetic acid is employed these are retained by the proteins in the form of complexes owing to the high acidity of the solution. Metaphosphoric acid has been used for the removal of proteins in the estimation of urea, uric acid, non-protein nitrogen, and dextrose in blood and other fluids. E. S.

The Gradual Darkening of Hæmatin Solutions in Colorimetric Estimations, and its Prevention. H. C. GRAM (*Acta med. Scand.*, **56**, 52—70; from *Chem. Zentr.*, 1922, iv, 576).—The darkening of hæmoglobin solutions is not attributed to change of oxyhæmoglobin to hæmatin. It is affected by strength of acid and to a less degree by temperature. It may be prevented, in the Autenrieth method, by addition of 2 c.c. of 3% hydrogen peroxide to 98 c.c. of the hydrochloric acid used. The wedge used for comparison must be specially graduated. The modification is not applicable to the Sahli method. G. W. R.

Estimation of Pepsin. MAKI TAKATA (*Tohoku J. Exptl. Med.*, 1921, **2**, 127—130).—One gram of magenta-fibrin is added to gastric juice and the mixture incubated for thirty to forty-five minutes at 38°, then chilled, centrifuged, and the clear liquid compared colorimetrically with a magenta standard solution.

CHEMICAL ABSTRACTS.

Estimation of Total Protein, of Protein and Non-protein Nitrogen in Blood Plasma. H. BIERRY and L. MOQUET (*Compt. rend. Soc. biol.*, 1922, **87**, 329—331).—The authors found that in estimating the total proteins in blood by precipitation by heat and weighing the dry precipitate, attention must be directed to the hydrogen-ion concentration of the solution. The amount of precipitate and the quantity of nitrogen contained in it varies, the maximum being obtained at $p_H=5{\cdot}6$. Their own procedure is to neutralise 2 c.c. of plasma, diluted to 20 c.c. with water, either with 0·01*N*-hydrochloric acid or 0·1*N*-acetic acid, one drop of alizarin being used. This is then boiled for fifteen minutes, and the precipitate collected and dried. The nitrogen is estimated by the regular Kjeldahl method in a portion of the precipitate. The alternative procedure is to measure into a tall cylinder 1 c.c. of plasma, add to it 3 c.c. of acetone free from hydrogen sulphite and leave the precipitate to settle for twelve hours. This is then filtered, washed with acetone, boiling water, boiling alcohol, and finally with ethyl ether. The quantitative results are the same by both methods. CHEMICAL ABSTRACTS.

Estimation of the Total Non-protein-nitrogen of Serum. Choice of a Suitable Albumin Precipitant. P. CRISTOL and M. SIMONNET (*J. Pharm. Chim.*, 1922, [vii], **26**, 298—309).—Whilst trichloroacetic acid and tungstic acid are excellent precipitants for albumin in the estimation of the total non-protein-nitrogen of serum, and allow neither lipoid- nor protein-nitrogen to pass into the filtrate, metaphosphoric acid, on the contrary, is unsuitable as complete precipitation is not obtained and the results are always correspondingly high when estimation of total non-protein-nitrogen is in question, although the defecation with this precipitant is sufficiently good for carbohydrate or lactic acid estimations. Of all the precipitants tried, trichloroacetic acid is the best and most convenient, as the estimation of the non-protein-nitrogen can be carried out with as little as 2 c.c. of filtrate, whereas with tungstic acid 5 c.c. of filtrate are required. The evaporation and hydrolysis are more rapid and the estimation more exact. Further, any losses due to too violent ebullition are not to be feared. G. F. M.

Examination of the Duodenal Fluid obtained through a Tube. R. DAMADE (*Compt. rend. Soc. biol.*, 1922, **86**, 947—948).—With a 2% solution of methyl-orange the alkalinity of the duodenal fluid was found to vary from 1·4 to 12·5 c.c. of *N*-hydrochloric acid for 10 c.c. Amylase is estimated by determining the amount, in milligrams, of dextrose found in 5 c.c. of 2% starch solution incubated at 37° for one hour with 1 c.c. of the duodenal fluid. This value generally varies from 15 to 35. For the estimation of lipase, 10 c.c. of a 10% solution of ethyl butyrate is treated with 1 c.c. of the duodenal fluid and neutralised to phenolphthalein with 0·1*N*-sodium carbonate. After incubating the mixture at 37° for one hour, the free acid formed is titrated. Usually 1·2—3·2 c.c. are required. For the estimation of trypsin, 1 c.c. of the fluid is added to 50 c.c. of 5% gelatin solution; this is then neutralised to phenolphthalein and kept at 37° for one hour, 20 c.c. of the digested mixture being titrated with 0·1*N*-sodium hydroxide solution, whilst another portion of 20 c.c. is titrated after the addition to it of 5 c.c. of formaldehyde solution and 5 c.c. of 90% ethyl alcohol. The tryptic activity is expressed by the sum of the volumes of sodium hydroxide solution required; the value varies between 4·9 and 7·5, with an average of 5·35 c.c. CHEMICAL ABSTRACTS.

Detection of Urobilin in Urine. GEORGES RODILLON (*J. Pharm. Chim.*, 1922, **26**, 379—381).—An alcoholic solution of zinc acetate is prepared by mixing 15 grams of zinc oxide with 250 c.c. of 95% alcohol and 15 c.c. of glacial acetic acid, and, after frequently shaking during forty-eight hours, filtering the clear liquid. Equal volumes of this reagent and the urine are mixed in a test tube, 1 drop of a 1 in 10 dilution of tincture of iodine is added and a tenth of the total volume of chloroform. After shaking, the chloroform layer is allowed to separate, and if necessary is clarified by gentle warming. In presence of urobilin, an emerald-green fluorescence will be observed when a beam of light is directed on to the chloroform layer. When considerable quantities of urobilin are present, the chloroform solution will also show a rose-coloured tint. G. F. M.

Mechanical Analysis of Humus Soils. GILBERT WOODING ROBINSON (*J. Agric. Sci.*, 1922, **12**, 287—291).—The mechanical analysis of peaty soils by the usual methods is frequently of little value, owing to the cementing together of the finer soil particles by the organic colloids.

The removal of the latter by means of hydrogen peroxide causes a considerable increase in the clay fraction, which by microscopical examination is shown to consist almost entirely of mineral particles.

Ten grams of soil are heated for thirty minutes on a steam-bath with 50 c.c. of hydrogen peroxide (20 vols.). A further treatment with 25 c.c. of peroxide is usually sufficient to bring about a thorough dispersion of the soil particles. A. G. P.

A New Method for the Mechanical Analysis of Soils and Other Suspensions. GILBERT WOODING ROBINSON (*J. Agric. Sci.*, 1922, **12**, 306—321).—The existing method of soil analysis is considerably shortened by the means suggested. A suspension of soil (2%) in dilute sodium carbonate solution (about 0·025%) is placed in a cylinder and samples are withdrawn by means of a pipette at measured depths and after known periods of settling. The results are most conveniently represented by a graphical indication of summation percentages as a function of the logarithm of the settling velocity. By suitable choice of times and depths of sampling, figures corresponding with any of the systems of fractional sedimentation can be obtained. The diameter of the cylinder should not be less than 4 cm. Small errors in the depth of sampling have negligible effects on the final results.

The effect of a gel coating on the settling velocity of a particle is a reduction which is a simple function of the thickness of the gel. It is shown that below the first few centimetres of a settling column the change in concentration with depth is very small. A. G. P.

INDEX OF AUTHORS' NAMES.

TRANSACTIONS AND ABSTRACTS.

1922.

(Marked T., and A., i and A., ii respectively.)

Anonymous.
grape oil from the Canadian vine (*Vitis hederacea*), A., i, 97.

Fleisch, *Alfred*, an equilibrated sterilisable fluid of physiological hydrogen-ion concentration, A., i, 964.
  blood in impaired cell respiration; cause of avian beri-beri, A., i, 1215.
Fleischer, *Karl*, and *Gregor* **Feldmeier**, *ar*-aldehydes of tetrahydronaphthalene, A., i, 1160.
Fleischer, *Karl*, and *Ewald* **Retze**, synthesis of pyrene, A., i, 1138.
Fleischer, *Karl*, and *Karl* **Schranz**, 5-aminoacenaphthene, A., i, 1142.
Fleischhauer, *C.* See *Georg* **Schroeter**.
Fleischmann, *Walter*. See *Otto von* **Fürth**.
Fleming, *William D.*, vitamin content of rice by the yeast method; organic nitrogen as a possible factor in stimulation of yeast, A., i, 93.
Fleury, *Paul*, colorimetry, A., ii, 518.
Fleury, *Paul*, and *Louis* **Boutot**, the modified Lehmann method for the estimation of dextrose; adaptation to small quantities of reducing sugars, A., ii, 879.
Fleury, *Paul*, and *Gabriel* **Poirot**, the orcinol reaction with furfuraldehyde; application to the colorimetric estimation of small quantities of furfuraldehyde, A., ii, 595.
  estimation of small quantities of furfuraldehyde colorimetrically, A., ii, 666.
Floros, *Aristomenis*. See *Ludwig* **Pincussen**.
Flütsch, *Chr.* See *Karl W.* **Rosenmund**.
Fodor, *Andor*, colloidal chemistry of the proteins. III., A., i, 691
Fodor, *Andor*, and *B.* **Schönfeld**, dependence of the adsorption by charcoal on the quantity of charcoal and the nature of the adsorption isothermal, A., ii, 688.
Fodor, *Andor*. See also *Emil* **Abderhalden**.
Föhrenbach, *Erich*. See *Emil* **Fromm**.
Földi, *Zoltan*, alkylation of amines with sulphonic esters, A., i, 732.
Foerster, *Fritz*, nitrous anhydride, A., ii, 284.
Försterling, *Karl*, the emission of light by atoms, A., ii, 729.
Fogg, *H. C.*, and *Charles* **James**, atomic weight of yttrium, A., ii, 297.
Fogler, *M. F.* See *Roger* **Adams**.

Foix, *A.*, the determination of molecular weight by means of osmotic pressure, A., ii, 621.
the action of diamond on carbon monoxide, A., ii, 641.
the composition and calorific power of coal from the deeper strata of the Kenadza (Algerian) mine, A., ii, 713.

Foix, *A.* See also *Joseph Auguste* **Muller.**

Fokker, *A. D.*, stationary electron vibrations without radiation resistance, A., ii, 106.
electronic theory of the interior of the atom, A., ii, 137.

Folin, *Otto*, colorimetric estimation of the amino-acid nitrogen in normal urine, A., ii, 536.
the necessity of checking the quality of sodium tungstate used in the system of blood analysis, A., ii, 596.

Folin, *Otto* [with *Hsien* **Wu**], a system of blood analysis. Suppl. III. A new colorimetric method for the estimation of the amino-acid nitrogen in blood, A., ii, 540.

Folin, *Otto*, and *Hilding* **Berglund,** the transportation, retention, and excretion of carbohydrates, A., i, 487.
the retention and distribution of amino-acids with especial reference to the urea formation, A., i, 702.
a colorimetric method for the estimation of sugars in normal human urine, A., ii, 400.

Folin, *Otto*, and *Joseph M.* **Looney,** colorimetric methods for the separate estimation of tyrosine, tryptophan, and cystine in proteins, A., ii, 539.

Folkoff, *Caspar.* See *A. J.* **Schaffer.**

Fontell, *Nils.* See *Ossian* **Aschan.**

Fontès, *G.*, and *L.* **Thivolle,** micro-estimation of lactose by means of potassium permanganate; application to milk, A., ii, 323.

Foote, *Paul D.*, *W. F.* **Meggers,** and *Fred L.* **Mohler,** excitation of the enhanced spectrum of magnesium in a low voltage arc, A., ii, 4.
the excitation of the enhanced spectra of sodium and potassium in a low voltage arc, A., ii, 598.

Foote, *Paul D.*, and *Fred L.* **Mohler,** the significance of the half terms in spectral series formulæ, A., ii, 410.

Forbes, *George Shannon*, and *Harriet Isabelle* **Cole,** solubility of silver chloride in dilute chloride solutions and the existence of complex argentichloride ions. II., A., ii, 291.

Forbes, *George Shannon*, *Howard Wilmot* **Estill,** and *Osman James* **Walker,** induction periods in reactions between thiosulphate and arsenite or arsenate; a useful clock reaction, A., ii, 271.

Forbes, *H. S.*, and *Louise* **Hompe,** the effect of carbon monoxide, illuminating gas, and benzene on blood coagulation time, A., i, 483.

Ford, *G. Winifred.* See *John L.* **Haughton.**

Foresti, *B.*, preparation and mechanism of formation of phenanthroxazine, A., i, 1062.
so-called di-9:10-monohydroxyphenanthrylamine suggested as a reagent for nitric acid and phenanthroxazine. A., ii, 524.

Forrer, *Max*, the physico-chemical study of the lead chamber process, A., ii, 761.

Forssman, *J.*, effect of ether on antisubstances, A., i, 964.

Forster, *Aquila*, and *William* **Coulson,** nitro-derivatives of *m*-nitrodimethylaniline, T., 1988.

Forster, *Martin Onslow*, and *William Bristow* **Saville,** constitution of picrorocellin, a diketopiperazine derivative from *Roccella fuciformis*, T., 816.
the triazo-group. XXII. Cinnamic acid chlorohydrin and its conversion into α-triazo-β-hydroxy-β-phenylpropionic acid, T., 2595.

Forsyth, *J. A. C.* See *P. J.* **Cammidge.**

Fosse, *Robert*, the synthesis of a nitrogenous principle of plants, hydrocyanic acid, by the oxidation of ammonia and carbohydrates, glycerol, or formaldehyde, A., i, 117.

Fosse, *Robert*, and *A.* **Hieulle,** synthesis of hydrocyanic acid by oxidation, in ammoniacal silver solution, of alcohols, phenols, and amines, A., i, 117.
aptitude of formaldehyde to form hydrocyanic acid by oxidation in ammoniacal silver solutions, A., i, 523.

Foster, *A. L.* See *De Witt* **Neighbors.**

Foster, *Dorothy Lilian*, and *Dorothy Mary* **Moyle,** the interconversion of carbohydrate and lactic acid in muscle, A., i, 398.

Foster, *H. E.* See *J. B.* **Ayer.**

Foulk, *C. W.*, and *Samuel* **Morris,** comparative values of different specimens of iodine for use in chemical measurements, A., ii, 310.

Fourneau, *Ernest,* and *José* **Puyal,** the amino-alcohols; homologues of novocaine, A., i, 639.

Fournier, *Louis,* and *L.* **Guénot,** treatment of syphilis by bismuth, A., i, 301.

Fournier, *Louis, L.* **Guénot,** and *A.* **Schwartz,** first results of the treatment of syphilis by sodium *p*-hydroxy-*m*-aminophenylarsinate or "189," A., i, 300.

Fowler, *R. H.* See *Francis William* **Aston.**

Fox, *Francis William.* See *John Addyman* **Gardner.**

Foxwell, *G. E.,* thermal dissociation of ammonia with special reference to coke oven conditions, A., ii, 431.

Fränkel, *Sigmund,* and *Emil* **Feldsberg,** a new function of the tryptic ferment (anhydrase) and the preparation of *d*-tyrosine anhydride and *d*-tryptophan anhydride from the products of tryptic digestion, A., i, 184.

Fränkel, *Sigmund,* and *Oskar* **Gilbert,** lipoids. XVIII. The preparation of phosphosulphatides from brain, A., i, 294.

Fränkel, *Sigmund,* and *Josef* **Hager,** vitamins. II. Acceleration of fermentation by extracts of animal organs, A., i, 409.

Fränkel, *Sigmund,* and *Paul* **Jellinek,** products of prolonged tryptic digestion of casein, A., i, 965.

Fränkel, *Sigmund,* and *Artur* **Kasz,** lipoids. XIX. A lecithin from human brain, A., i, 294.

Fränkel, *Sigmund,* and *Albert* **Scharf,** vitamins. III. Acceleration of fermentation by extracts of plants and the action of choline and aminoethyl alcohol on fermentation, A., i, 409.

vitamins. IV. The adsorption of vitamins, A., i, 409.

vitamins. V. Further experiments on the chemistry of vitamins, A., i, 409.

Fraenkel, *Walter,* the recrystallisation of pure mechanically unworked gold, obtained by solidification from the fused mass, A., ii, 778.

Fraenkel, *Walter.* See also *Richard* **Lorenz.**

France, *Wesley G.* See *Alfred L.* **Ferguson.**

Francis, *Francis Ernest* [with *John Clifford* **Pope,** and *Reginald Henry* **Coysh**], the composition of paraffin wax. I., T., 496.

Francis, *Francis Ernest, Cyril Mercer* **Watkins,** and *Reginald Wilfred* **Wallington,** the composition of paraffin wax. II. and III., T., 1529, 2294.

Franck, *J.,* the broadening of spectral lines, A., ii, 241.

the theory of Klein and Rosseland applied to fluorescence, photochemical processes, and the electron emission from hot substances, A., ii, 464.

resonance and ionisation potentials of helium, A., ii, 811.

Franck, *J.,* and *Walter* **Grotrian,** the absorption of mercury vapour, A., ii, 728.

Franck, *J.* See also *G.* **Cario.**

François, *Maurice,* estimation of mercury in the mercurial pills of the [French] codex, A., ii, 87.

François, *Maurice,* and *Louis Gaston* **Blanc,** preparation of the alkaloidal mercuri-iodides in crystalline form, A., i, 851.

preparation of the alkaloidal bismuthic iodides in a crystalline form, A., i, 851.

François, *Maurice,* and *Ch.* **Lormand,** the photography of opaque crystals, A., ii, 127.

stereoscopic photography of crystals, A., ii, 127.

François, *Maurice,* and *Émile* **Luce,** analysis of camphor preparations, A., ii, 667.

Franke, *Adolf,* and *Gerald* **Groeger,** action of α-bromo*iso*butaldehyde on sodiomalonic ester, A., i, 808.

Franke, *Elizabeth.* See *Stanley Rossiter* **Benedict.**

Frankenthal, *Kate.* See *Martin* **Jacoby.**

Franklin, *Edward Curtis,* ammono-carbonic acids, A., i, 440.

Franzen, *Hartwig,* a shaking machine for large quantities of fluid, A., ii, 759.

Franzen, *Hartwig,* and *Fritz* **Helwert,** the chemical constituents of green plants. XX. The acids of the cherry (*Prunus avium*), A., i, 1102.

Franzen, *Hartwig,* and *Ernst* **Keyssner,** the chemical constituents of plants. XVII. The presence of lactic acid in the leaves of the blackberry (*Rubus fructicosus*), A., i, 310.

Franzen, *Hartwig,* and *Rudolf* **Ostertag,** the chemical constituents of green plants. XVIII. The acids from the berry of the mountain ash (*Pyrus aucuparia*) which are precipitated by lead acetate, A., i, 616.

Franzen, *Hartwig,* and *Rudolf* **Ostertag,** chemical constituents of green plants. XXI. The non-existence of Crassulaceæ malic acid, A., i, 1223.

Franzen, *Hartwig,* and *Eugen* **Schumacher,** the chemical constituents of green plants. XIV. The acids in the currant (*Ribes rubrum*) which are precipitated by lead acetate, A., i, 310.

Franzen, *Hartwig,* and *Gustav* **Stäuble,** influence of substituents on reactions. VII. The preferential points of substitution in the naphthols and in α-naphthylamine, A., i, 450.

Franzen, *Hartwig,* and *Emmi* **Stern,** the chemical constituents of green plants. XV. The presence of lactic acid in the leaves of the raspberry (*Rubus idæus*), A., i, 311.
chemical constituents of green plants. XIX. Occurrence of lactic acid and succinic acid in the leaves of the raspberry (*Rubus idæus*), A., i, 975.

Fraps, *George Stronach,* relation of the phosphoric acid of the soil to pot experiments, A., i, 616.

Fraser, *Ronald,* the constitution of benzene, T., 188.

Frassineti, *Mario.* See *Luigi* **Rolla.**

Frazer, *Joseph Christie Whitney.* See *Paul* **Lotz.**

Fred, *Edwin Broun, W. H.* **Peterson,** and *J. J.* **Anderson,** characteristics of certain pentose-destroying bacteria, especially as concerns their action on arabinose and xylose, A., i, 201.

Fred, *Edwin Broun.* See also *O. R.* **Brunkow,** and *W. H.* **Peterson.**

Fredenhagen, *Karl,* theory of the electrolytic ionic condition and the calculation of the electrolytic solution constants, and of the related quantities from the chemical relationships, A., ii, 112.

Freeman, *Benjamin.* See *Howard Waters* **Doughty.**

Freeth, *F. A.,* system Na_2O–CO_2–NaCl–H_2O, considered as two four-component systems, A., ii, 627.

Freise, *R.* See *Hermann* **Steudel.**

Fréjacques, *M.* See *Camille* **Matignon.**

Fresenius, *Ludwig.* See *Otto* **Lemmermann.**

Fresenius, *Wilhelm,* and *Leo* **Grunhüt,** estimation of tannin and colouring matters in wines, A., ii, 96.
detection of formic acid in wine, A., ii, 234.

Freudenberg, *Ernst,* and *Paul* **György,** fixation of lime by animal tissues. III.—VIII., A., i, 87, 291, 299, 608.

Freudenberg, *Karl,* catechin, A., i, 756.

Freudenberg, *Karl, Otto* **Böhme,** and *Ludwig* **Purrmann,** tannins and similar compounds. IX. Stereoisomeric catechins. II., A., i, 756.

Freudenberg, *Karl,* and *Fritz* **Brauns,** the configuration of the simple α-hydroxy-acids, A. i, 628.
acetone sugars. I. Transformations of diacetoneglucose, A., i, 1117.

Freudenberg, *Karl,* and *Otto* **Ivers,** syntheses of mixed acylated halogen sugars, A., i, 523.

Freudenberg, *Karl,* and *Ludwig* **Orthner,** reduction of flavanone, A., i, 757.

Freudenberg, *Karl,* and *Wilhelm* **Scilasi,** tannins and similar substances. II. Chinese tannin, A., i, 1169.

Freudenberg, *Karl,* and *Olof* **Svanberg,** acetone sugars. II. Diacetonexylose, A., i, 1116.

Freudenberg, *Karl,* and *Erich* **Vollbrecht,** tannase, A., i, 285.
tannins and similar compounds. X. The tannin of the native oak, A., i, 1046.

Freuler, *A.* See *W. D.* **Treadwell.**

Freund, *M.* See *Paul* **Jacobsen.**

Freund, *Walter.* See *Fritz* **Mayer.**

Freundler. See *Gabriel* **Bertrand.**

Freundler, *P.,* (*Mlle*) *Y.* **Menager,** and (*Mlle*) *Y.* **Laurent,** iodine in the *Laminaria,* A., i, 98.
the composition of the *Laminaria,* A., i, 98.

Freundlich, *Herbert,* concentration and potential fall at boundary surfaces, A., ii, 19.
effective potential difference of electro-osmosis and allied phenomena, A., ii, 189.

Freundlich, *Herbert,* and *R.* **Bartels,** kinetics of reactions in which halogen atoms pass from the inner sphere of activity to the outer, A., ii, 489.

Freundlich, *Herbert,* and *A.* **Gyemant,** thermodynamic and electrokinetic potential difference at the surface of two liquids, A., ii, 842.

Freundlich, *Herbert,* and *E.* **Loening,** the protective and flocculating action of hydrophilic colloids and hydrophobic sols, A., ii, 856.
behaviour of Carey Lea's silver sol towards electrolytes and hydrophilic colloids, A., ii, 696.

Freundlich, *Herbert,* and *P.* **Scholz,** flocculation by mixtures of electrolytes, A., ii, 828.
hydrophobic and hydrophilic sols of sulphur, A., ii, 841.

Freundlich, *Leo.* See *Siegfried* **Skraup.**

Fricke, *Hugo.* See *William* **Duane.**

Fricke, *Robert,* the analytical detection and differentiation of acetaldehyde, aldol, glyoxylic acid, and their presence in the urine of diabetic patients, A., i, 300.

the presence of pyruvic acid in normal and diabetic urines, A., i, 495.

use of the "silver method" in the estimation of acetaldehyde; its application in the estimation of other aldehydes; a convenient method of accumulation of aldehyde and other volatile substances from body fluids, A., ii, 326.

the detection of aldol in the urine of diabetic patients, A., ii, 326.

energy principle of the coagulation of colloids, particularly of the thermokinetic mechanism, A., ii, 484.

glass suspensions produced by rubbing glass walls with glass rods, A., ii, 692, 744.

Fricke, *Robert.* See also *Wilhelm* **Stepp.**

Fricker, *Kurt.* See *Hermann* **Leuchs.**

Frieber, *Walther,* formation of indole, and indole reactions; behaviour of indole-negative bacteria, A., i, 901.

Friedberg, *Eduard,* quantitative measurement of the transient excretion of caffeine in man by a new biological method, A., i, 88.

Friedebach, *M.* See *H. P.* **Kaufmann.**

Friedel, *Georges,* and *L.* **Royer,** mixtures of anisotropic liquids and the identity of Grandjean's stratified liquids with liquids of the azoxyphenetole type, A., ii, 129.

Friedemann, *W. G.,* nitrogen distribution of proteins extracted by 0·2 per cent. sodium hydroxide solution from cotton-seed meal, the soja bean, and the coconut, A., i, 505.

Friedländer, *Paul,* the dyes from *Purpura aperta* and *Purpura lapillus,* A., i, 793.

Friedländer, *Paul, Walter* **Herzog,** and *G. von* **Voss,** indigoid dyes of the phenanthrene and indene series, A., i, 764.

Friedländer, *Paul, S.* **Karamessinis,** and *O.* **Schenk,** certain chloronaphthalene derivatives, A., i, 244.

Friedländer, *Paul,* and *K.* **Kunz,** 1:1′-diphenylindigotin, A., i, 765.

Friedrich, *Alfred.* See *Alois* **Zinke.**

Friedrich, *Walter.* See *Julius* **Meyer,** and *Robert* **Schwarz.**

Friend, *Herman,* clinical method for the estimation of chlorides in blood, A., ii, 389.

Friend, *John Albert Newton,* lecture experiment; protective colloids, A., ii, 267.

Friend, *John Albert Newton,* and *John Horace* **Dennett,** the rate of solution of iron in dilute sulphuric acid both when stationary and under rotation, T., 41.

Friend, *John Albert Newton,* and *Reece Henry* **Vallance,** the influence of protective colloids on the corrosion of metals and on the velocity of chemical and physical change, T., 466.

Fries, *Karl,* 1:2-naphthaquinols, A., i, 42.

Fries, *Karl,* and *H.* **Hasenjäger,** the course of the reaction in the synthesis of oxindigo (2:2′-diketo-$\Delta^{1\,1'}$-dicoumaran), A., i, 45.

Fries, *Karl,* and *F.* **Kerkow,** linear benzonaphtha-*p*-thiazine [ββ-naphthaphenthiazine], A., i, 577.

Fries, *Karl,* and *H.* **Leue,** autoxidation of 2-acetyl-α-naphthol in alkaline solution, A., i, 462.

Fries, *Karl,* and *W.* **Lohmann,** the 2-methylnaphthalene series, A., i, 29.

Frister, *Fritz.* See *Otto* **Dimroth.**

Fritsch, *Albert.* See *Albin* **Kurtenacker.**

Fritschi, *J.* See *Hermann* **Staudinger.**

Fritzmann, *E.,* preparation of hydrocyanic acid in large quantities in the laboratory, A., i, 1128.

Fritzmann, *E.,* and *K.* **Macjulevitsch,** new method for estimating volatile substances in air, A., ii, 877.

Froboese, *Kathe.* See *Victor* **Froboese.**

Froboese, *Victor,* and *Kathe* **Froboese,** estimation of aluminium in tungsten, A., ii, 397.

Frölich, *Per.* See *Sven* **Bodforss.**

Froelicher, *Victor,* and *Julius Berend* **Cohen,** the nitro- and amino-derivatives of *o*- and *p*-methoxybenzoic acids and of α- and β-methoxynaphthoic acids, T., 1652.

Froeschl, *Norbert.* See *Ernst* **Philippi.**

Frog, *F.,* and *S.* **Schmidt-Nielsen,** fatty acids of butter, A., i, 494.

Froidevaux, *J.,* the estimation of ammoniacal nitrogen in nitrogenous organic substances, and particularly in proteins and their products of decomposition, A., ii, 454.

Fromherz, *Konrad,* the action of different groups of local anæsthetics, A., i, 705.

Fromholdt and **Nersessov,** pigment metabolism. I. and II., A., 387, 404.

Fromm, *Emil*, ring closure with hydrazinedicarbonamides containing sulphur; dithiourazole and iminothiourazole, A., i, 62.

Fromm, *Emil* [with *Hermann* **Wenzl**], syntheses from cyanamide; preparation of thiocarbamine cyanides, carbamine cyanides, and biurets, A., i, 437.

Fromm, *Emil*, and *Ernst* **Honold**, synthesis with cyanamide; cyanamido ethyl alcohol and guanidoethyl alcohol, A., i, 529.

Fromm, *Emil*, *Erich* **Kayser**, *Karl* **Briegleb**, and *Erich* **Föhrenbach**, disulphides with neighbouring single and multiple linkings; syntheses of triazoles and thiodiazoles, A., i, 377.

Fromm, *Emil*, and *Erich* **Siebert**, derivatives of dithioethylene and dithioacetylene and the additive capacity of multiple bonds, A., i, 542.

Fuchs, *August*, melting point tubes as reaction vessels, A., ii, 759.

Fuchs, *Berthold*. See *Siegfried* **Edlbacher**.

Fuchs, *Edgar*. See *Percy* **Brigl**.

Fuchs, *Friedrich*, anhydrides of *N*-carboxylic acid, A., i, 1152.

Fuchs, *Francis J.* See *James* **Kendall**.

Yabuta, *Teijiro*, a new organic acid (kojic acid) formed by *Aspergillus oryzae*, A., i, 939.
Yamada, *Nobuo*, heat of transformation of austenite into martensite and of martensite into pearlite, A., ii, 475.
Yamaguchi, *Yohei*, determination of high temperatures by effusion of gases, A., ii, 470.
Yamazaki, *Eiichi*, the successive stages in the hydrolysis of triacetin, A., i, 422.
Yanagisawa, *Hidekichi*, estimation of cyanogen, A., ii, 667.
Yanagisawa, *Hidekichi*, and *Norikazu* **Takashima,** Japanese bird-lime. II., A., i, 652.
Yant, *W. P.* See *R. R.* **Sayers.**
Yeh, *Yu Liang*. See *Duncan A.* **MacInnes.**
Yngve, *Victor*. See *Arthur Becket* **Lamb.**
Yntema, *L. F.*, and *B. Smith* **Hopkins,** observations on the rare earths. XI. The arc spectrum of yttrium, A., ii, 462.
Yoder, *Lester*. See *Arthur Wayland* **Dox.**
Yoshida, *Usaburo*, and *Shinsuke* **Tanaka,** the tungsten X-ray spectrum with a mica spectrometer, A., ii, 805.
Young, *Elrid Gordon*, the optical rotatory power of crystalline ovalbumin and serum-albumin, A., i, 279.
  the coagulation of protein by sunlight, A., i, 386.
Youngken, *Heber W.*, and *Charles H.* **La Wall,** sand spur, *Cenchrus tribuloides*, L., A., i, 1100.
Yovanovitch, *D.*, the chemical properties of mesothorium. II., A., ii, 712.

Z.

Zaar, *H.* See *Paul* **Jacobsen.**
Zaborowski, *G.*, estimation of toluene, xylene, and benzene, A., ii, 877.
Zalkind, *J. S.*, union of hydrogen with acetylene derivatives. XIV. Hydrogenation of phenylacetylene, A., i, 1134.
  union of hydrogen with acetylene derivatives. XV. Velocities of catalytic reactions, A., ii, 835.
Zambonini, *Ferruccio*, ardennite from Ceres, in the Ala valley (Piedmont), A., ii, 577.
Zanetti, *Joaquin Enrique*, *J. R.* **Suydam,** *jun.*, and *M.* **Offner,** the formation of butadiene from ethylene, A., i, 977.
Zawidzki, *Jan*, equation for the velocity of reaction of hydrogen peroxide and potassium permanganate, A., ii, 207.
Zawodsky, *Othmar*. See *Robert* **Kremann.**
Zeckendorf, *Kurt*. See *Johannes* **Kerb.**
Zehnder, *Ludwig*, conclusions from the spherical form of the simplest atom, A., ii, 208.
Zeitfuchs, *Eduard H.* See *Charles August* **Kraus.**
Zelenka, *J.* See *Julius* **Stoklasa.**
Zelinsky, *Nicolai E.*, and *E. F.* **Dengin,** synthesis of aminohydroxy-acids and the amino-acid from *cyclo*propyl methyl ketone [acetyltrimethylene], A., i, 1126.
Zellner, *Julius*, comparative plant chemistry. I. *Lythrum salicaria*, L., A., i, 799.
  plant chemistry. IV. *Juncus effusus*, L., A., i, 1098.
Zellner, *Julius*. See also *Rudolf* **Hasenöhrl,** and *Gisela* **Nowak.**
Zemplén, *Géza*, and *Alex.* **Hoffmann,** salicin thiocyanate and disalicin sulphide, A., i, 563.
Zemplén, *Géza*, and *Alphons* **Kunz,** new derivatives of salicin containing nitrogen and polynuclear hydroxybenzylamines, A., i, 564.

Zerevtinov, *Nik.* See *Nikolai* **Schilov.**

Zerner, *Ernest*, and *Robert* **Hamburger**, the action of silver compounds on yeast, A., i, 307.

Zerweck, *Werner.* See *Hans* **Fischer.**

Zetzsche, *Fritz.* See *Karl W.* **Rosenmund.**

Zeynek, *R.*, the preparation of chloro- and bromo-tyrosine and the analogous tyramines, A., i, 254.

Ziegler, *Karl*, and *Kurt* **Ochs**, halochromic phenomena with diarylstyrylcarbinols, A., i, 151.
  poly-arylated vinyl carbinols and their derivatives. II. Diarylstyrylcarbinols and the products of their transformations, A., i, 1047.

Ziegler, *Karl.* See also *Karl von* **Auwers.**

Ziegner, *Heinrich.* See *Helmut* **Scheibler.**

Zielaskowski, *Margarete.* See *Bruno* **Leichtentritt.**

Zijp, *C. van*, benzidine hydrochloride as a reagent for wood cells, A., ii, 94.

Zilva, *Sylvester Solomon*, conditions of inactivation of the accessory food factors, A., i, 488.

Zilva, *Sylvester Solomon*, and *Masataro* **Miura**, quantitative estimation of the fat-soluble factor, A., i, 194.

Zimmerlund, *G.* See *Hans von* **Euler**, and *Olof* **Svanberg.**

Zimmermann, *Kurt.* See *Erwin* **Ott.**

Zimmermann, *L.* See *A.* **Reis.**

Zimmermann, *Walther.* See *Hans Theodor* **Bucherer.**

Zimmern, *A.*, and *Edouard* **Salles**, spectrographic study of the de-intensifying of barium platinocyanide in the Villard effect, A., ii, 104.

Zincke, *Theodor*, and *H.* **Greune**, sulphamidophthalic acid and sulphimidophthalic acid, A., i, 550.

Zinke, *Alois*, preparation of dihydroxyperylene, A., i, 132.
  preparation of perylene, A., i, 132.

Zinke, *Alois*, and *Rupert* **Dengg**, synthesis of 1:12-dihydroxyperylene and perylene, A., i, 1013.

Zinke, *Alois*, *Alfred* **Friedrich**, *Otto* **Johannsen**, and *Rudolf* **Richter**, resin constituents. VIII. The amyrins from elemi resin. II. α-Amyrin, A., i, 667.

Zinke, *Alois*, *Franz* **Hanselmayer**, and *Wilhelmine* **Ehmer**, resin constituents. IX. The decomposition of *d*-siaresinolic acid and lubanyl benzoate, A., i, 668.

Zintl, *E.*, and *H.* **Wattenberg**, potentiometric titration of copper, A., ii, 871.

Zisch, *W.* See *Fritz* **Haber.**

Zivy, *L.* See *Louis Jacques* **Simon.**

Zizine, *P.* See *A.* **Grigaut.**

Zobel, *H.* See *H. P.* **Kaufmann.**

Zocher, *H.*, sols with non-spherical particles, A., ii, 102.

Zocher, *H.* See also *Hans* **Kautsky.**

Zoder, *A.* See *Georg* **Weissenberger.**

Zoff, *Alfred.* See *Robert* **Kremann.**

Zollinger-Jenny, *Ernst*, improvements in the process of converting organic acids into esters, A., i, 914.

Zolotarev, *P. V.* See *P. P.* **Budnikov.**

Zondek, *S. G.*, potassium and radioactivity, A., i, 296.
  the ionic equilibrium of cells; the physiology of sodium, A., i, 296.
  the rôle of inorganic salts in the functions of the cell, A., i, 399.

Zorn, *Bernhard.* See *Emil* **Abderhalden.**

Zorn, *H.* See *Walter* **König.**

Zschokke, *H.*, and *L.* **Häuselmann**, estimation of free acid in acid aluminium sulphate solutions, A., ii, 397.

Zsigmondy, *Richard*, some fundamental conceptions of colloidal chemistry, A., ii, 129.
  fundamental principles of colloidal chemistry. I. Electrical charge of the particles and new conceptions of micellæ, A., ii, 484.

Zubkowa, *Sophie.* See *Alexis* **Bach.**

Zuckmayer, *Fritz*, preparation of hydrogenated 2-phenylquinoline-4-carboxylic acid, its homologues, and their salts, A., i, 574.
  preparation of substituted derivatives of hydrogenated 2-phenylquinoline-4-carboxylic acid, and their salts, A., i, 952.

Zunz, *Edgard*, chemical composition of the thyroid gland, A., i, 397.

Zunz, *Edgard*, and *J.* **La Barre**, the action of the phosphatides on the coagulation of blood, A., i, 697.

Zwaardemaker, *Hendrik*, odour and chemical structure, A., i, 607.
  potassium–calcium equilibrium in animal systems, A., i, 1213.

Zweigle, *A.* See *Alexander* **Gutbier.**

Zwikker, *J. J. Lijnst*, starch, A., i, 10.
  the constitution of polysaccharides A., i, 230, 434.
  space structural formulæ of chemical substances in general, and of some alkaloids in particular, A., i, 567.

INDEX OF SUBJECTS.

TRANSACTIONS AND ABSTRACTS.

1922.

(Marked T., and A., i and A., ii respectively.)

A.

Abies pindrow, oil from the leaves of (Simonsen), A., i, 753.
Abietic acid, preparation of, and its salts (Steele), A., i, 739.
  constitution of (Madinaveitia), A., i, 829; (Aschan, Fontell, and Simola), A., i, 1152.
  and its isomerides and derivatives (Ruzicka and Meyer), A., i, 547.
  crystallography and optical activity of (Duffour), A., i, 829.
  cetyl and myricyl esters (Kaufmann and Friedebach), A., i, 740.
Abietine, constitution of (Aschan, Fontell, and Simola), A., i, 1152.
Abietinol (Ruzicka and Meyer), A., i, 830.
Absorption spectra. See under Spectra.
Acacia cambagei (gidgee wattle), calcium oxalate in (Steel), A., i, 310.
Acanthias vulgaris, oil from the liver of (Lexow), A., i, 490.
Acenaphthene, synthesis of (Schonberg), A., i, 27.
  catalytic hydrogenation of (v. Braun and Kirschbaum), A., i, 727.
  equilibria of, with nitrobenzenes and nitrotoluenes (Kremann and Strzelba), A., i, 176.
  compounds of, with chloranil and dichlorophthalic anhydride (Pfeiffer and Flater), A., i, 342.
Acenaphthene, 5-amino-, derivatives of (Fleischer and Schranz), A., i, 1142.
Acenaphthene series (Mayer and Schonfelder), A., i, 1166.
Acenaphthenequinone phenylhydrazones (Charrier and Speirani), A., i, 772.
Acenaphthenesulphonic acids, 5-amino-, and their derivatives (Fleischer and Schranz), A., i, 1142.
Acenaphthenone, 5-bromo-, and its oxime (Mayer and Steglitz), A., i, 742.
Acenaphthenone-7-aldehyde, and its derivatives (Friedlander, Herzog, and v. Voss), A., i, 764.
5-Acenaphthylglycine (Fleischer and Schranz), A., i, 1144.
Acenaphthyl-5-sulphamic acid, and its sodium salt (Fleischer and Schranz), A., i, 1142.
Acer ginnala (Korean maple), crystalline tannin in the leaves of (Perkin and Uyeda), T., 66.
Acer saccharum, organic acids of (Sando and Bartlett), A., i, 100.
Aceritol, and its tetra-acetyl derivative (Perkin and Uyeda), T., 70.
Acertannin, and its acetyl derivative (Perkin and Uyeda), T., 68.
Acetaldehyde, formation of, in fermentation by micro-organisms (Neuberg and Cohen), A., i, 304.
  preparation of (Adams and Williams), A., i, 222; (Wohl), A., i, 430.
  preparation of, from acetylene (Vogt and Nieuwland), A., i, 110; (Ochi, Onozawa, and Tokyo Industrial Laboratory), A., i, 523.
  preparation of, from ethylidene diacetate (Société Chimique des Usines du Rhône), A., i, 915.
  vapour pressure of (Gilmour), A., i, 918.
  equilibrium of phenylhydrazine and (Hammarsten), A., ii, 830.
  preparation of aldol from (Grünstein), A., i, 111.
  condensation of collidine with (Kondô and Takahashi), A., i, 1177.
  formation of vinyl alcohol from, in presence of alkali (Evans and Looker), A., i, 102.
  rôle of, in alcoholic fermentation (Fernbach and Schoen), A., i, 203.

- **Acetaldehyde** in normal urine (Stepp and Feulgen), A., i, 495.
  - detection of, in urine (Stepp), A., ii, 403.
  - detection of, in urine in diabetes (Fricke), A., i, 300.
  - estimation of (Smitt), A., ii, 402.
  - estimation of, by the "silver" method (Fricke), A., ii, 326.
  - estimation of, in presence of acetone (Stepp and Fricke), A., ii, 236.
- **Acetals**, preparation of (Haworth and Lapworth), T., 76.
  - velocity of hydrolysis of (Skrabal and Schiffrer), A., ii, 134.
- **Acetamide**, catalysis by acetic acid of the formation and hydrolysis of (Noyes and Goebel), A., i, 1127.
  - kinetics of the reaction of acetic anhydride with (Kremann, Zoff, and Oswald), A., ii, 748.
- **Acetamide**, *tri*bromo-, and bromocyano- (Gupta and Thorpe), T., 1900.
- **Acetanilide**, (*antifebrin*), equilibrium of water and (Schoorl and de Weerd), A., i, 247.
  - detection of, colorimetrically (Ekkert), A., ii, 169.
- **Acetanilide**, *p*-chloro-, formation of, from *N*-chloroacetanilide (Harned and Seltz), A., ii, 631.
- **Acetanilide-ω-pyridinium** salts, and *m*- and *p*-nitro- (Barnett and Cook), T., 794.
- **Acetanilide-*p*-sulphonyl chloride**, preparation of (Stewart), T., 2558.
- **Acetic acid**, preparation of (Wohl), A., i, 430.
  - preparation of, and its anhydride, from ethylidene diacetate (Société Chimique des Usines du Rhône), A., i, 915.
  - and *tri*chloro-, viscosity and compound formation in mixtures of, with esters and with ketones (Kendall and Brakeley), A., ii, 126.
    - equilibria of, with their ethyl and methyl esters (Sudborough and Karvé), A., ii, 749.
  - equilibrium of epichlorohydrin, water and (Leone and Benelli), A., ii, 744.
  - decomposition of methyl oxalate by (Turner and Wilson), A., i, 916.
  - and its methyl ester, pyrogenic decomposition of (Peytral), A., i, 219.
- **Acetic acid**, *N*-acetatomercuri-*m*-nitrophenylammonium salt (Kharasch, Lommen, and Jacobsohn), A., i, 604.
- **Acetic acid**, alkali salts, solubility of, in water (Sidgwick and Gentle), T., 1837.
  - basic ferric salt, adsorption of radioactive substances by (Brown), T., 1736.
  - guaiacol-4:6-dimercuri-salt (Mameli), A., i, 1083.
  - lead salt (Dundon and Henderson), A., ii, 552.
    - complex compounds of (Weinland and Stroh), A., i, 981.
  - basic lead salt, precipitation of (Langecker), A., i, 315.
  - mercuric salt, action of, on aminoazo-compounds (Vecchiotti), A., i, 478.
    - action of carbon disulphide on (Bernardi and Rossi), A., i, 421.
    - complex compound of mercuric sulphide and (Miolati), A., i, 982.
    - action of nitrobenzene with (Wibaut and Jürgens), A., i, 694.
  - potassium salt, oxidation of, to potassium oxalate (Evans and Hines), A., i, 803.
  - sodium hydrogen salt, crystal structure of (Wyckoff), A., ii, 710.
  - thymolmercuric salts (Mameli and Mameli-Mannessier), A., i, 1080.
  - uranyl salt, photolysis of (Baur and Rebmann), A., ii, 337.
    - action of, on organic compounds (Kopatschek), A., i, 984.
- **Acetic acid**, esters, dielectric constants of (Jackson), A., ii, 252.
  - esters of multivalent alcohols (Smith), A., i, 915.
  - bromoaminotolyl esters (Raiford and Couture), A., i, 931.
  - and chloro-, bromoethyl and chloroethyl esters, preparation of (Altwegg and Landrivon), A., i, 315.
  - cellulose ester, preparation of, from wood cellulose (Hägglund, Löfmann, and Farber), A., i, 323.
    - solubility of, in alkali and alkaline-earth salts (Schweiger), A., i, 324.
    - detection and estimation of sulphuric acid and sulphoacetates (Entat and Vulquin), A., ii, 533.
  - ethyl ester, physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.
    - as an amphoteric electrolyte (v. Euler and Svanberg), A., i, 219.
    - velocity of hydrolysis of (Åkerlöf), A., ii, 134; (Harned and Pfanstiel), A., ii, 832.

Acetic acid, ethyl and methyl esters, effect of hydrogen-ion concentration on the stability of (Karlsson), A., ii, 40.
ethyl and *iso*propyl esters, action of alumina, titania and thoria on (Adkins and Krause), A., i, 422.
ethylidene ester, preparation of acetic acid and its anhydride and acetaldehyde from (Société Chimique des Usines du Rhône), A., i, 915.
glycogen ester (Pringsheim and Lassmann), A., i, 634.
β-naphthyl and phenyl ester pyridinium chlorides (Barnett and Cook), T., 797.
2:5-*di*nitro-4-aminophenyl ester (Reverdin and Roethlisberger), A., i, 538.
Acetic acid, detection of, and its homologues, by their sodium uranyl salts (Barlot and Brenet), A., ii, 167.
estimation of, in mixtures with butyric acid (Notenbaart), A., ii, 791.
Acetic acid, bromo-, thymyl ester, compound of hexamethylenetetramine and (Riedel), A., i, 991.
bromo-, and chloro-, sodium salts, separation of halogens from (v. Euler and Fahlander), A., ii, 360.
chloro-derivatives, penetration of cells by (Crozier), A., i, 1090.
chloro-, *p*-chloroacetylaminophenyl ester (Barnett and Cook), T., 795.
*di*chloro-, dissociation of (Schreiner), A., ii, 736.
*tri*chloro-, action of, with copper (Dougherty and Freeman), A., i, 427.
lead diphenyl salt (Goddard, Ashley, and Evans, T., 981.
cyano-, ethyl ester, sodium derivative, condensation of, with ethyl muconate (Farmer), T., 2015.
Acetic anhydride, kinetics of the reaction of acetamide with (Kremann, Zoff, and Oswald), A., ii, 748.
kinetics of the reaction of benzamide with (Kremann, Rösler, and Penkner), A., ii, 748.
action of, on benzylideneanthranilic acids (Ekeley, Rogers, and Swisher), A., i, 934.
analysis of (Reclaire), A., ii, 532; (Sage), A., ii, 593.
Acetic-*p*-α-hydroxy*iso*propylbenzoic acid, *o*-amino- (Phillips), A., i, 955.
Acetoacetanilide, *di*thio-, and its *di*nitro-derivative (Naik and Avasare), T., 2594.
Acetoacetic acid, production of, from phenyl-lactic acids in the liver (Mori), A., i, 1217.
production of, from urocanic acid in the liver (Konishi), A., i, 1211.
catalytic decomposition of (Widmark and Jeppsson), A., ii, 437.
ethyl ester, synthesis of (Scheibler and Ziegner), A., i, 426.
action of halogens on (Smith), A., i, 318.
compound of methyl azodicarboxylate and (Diels), A., i, 774.
Acetoaceto-*o*- and -*p*-toluidides, and *di*thio-, and *di*nitro-derivative of the latter (Naik and Avasare), T., 2594.
Aceto-*p*-anisidide, amino-, and its derivatives (Hill and Kelsey), A., i, 1141.
Acetobromoglucoses (Karrer, Nageli, and Smirnov), A., i, 253.
Aceto-*p*-chloroanilide, amino-, and its derivatives (Hill and Kelsey), A., i, 1141.
Acetol. See Acetylcarbinol.
Aceto-α- and -β-naphthalide-ω-pyridinium salts (Barnett and Cook), T., 795.
Acetone in commercial ammonia (Bougault and Gros), A., ii, 709.
partition of compounds between glycerol and (Smith), A., ii, 270.
equilibrium of phenylhydrazine and (Hammarsten), A., ii, 830.
oxidation of, with potassium permanganate (Evans and Sefton), A., i, 1115.
pyrogenic decomposition of (Peytral), A., i, 222.
compounds of cresols and (Berl and Schwebel; C. and W. v. Rechenberg), A., i, 932.
sugar derivatives of (Irvine and Patterson), T., 2146; (Freudenberg and Svanberg), A., i, 1116; (Freudenberg and Brauns), A., i, 1117.
excretion of (Briggs and Shaffer), A., i, 190.
pharmacological action of (Salant and Kleitman), A., i, 794.
picrate, compounds of thiocarbamides and (Taylor), T., 2271.
detection of, in alcohol (Harrisson), A., ii, 667.
detection of, in presence of caoutchouc (Pittarelli), A., ii, 95.
detection of, in urine (Troise), A., ii, 595.
estimation of, in urine (Lax), A., ii, 326; (Käding), A., ii, 793.

Acetone, chloro-oximino-, compound of sodium hydrogen sulphite with (Gastaldi and Braunizer), A., i, 626.

Acetone substances in blood in diabetes (Fitz), A., i, 192.
  estimation of, in blood and urine (Hubbard), A., ii, 234.

Acetone-δ-benzylsemicarbazone (Wilson, Hopper, and Crawford), T., 867.

Acetone-*S*-benzylthiosemicarbazone (Wilson and Burns), T., 873.

Acetonedicarboxylic acid, and its ethyl ester (Ingold and Nickolls), T., 1642.

αβ-Acetoneglucose, αβ-iso*propylideneglucose*, phosphoric and sulphuric esters of (Levene, Meyer, and Weber), A., i, 987.

Acetone-α-naphthil, and its salts (Knoevenagel), A., i, 1061.

Acetoneoxalic acid. See Acetylpyruvic acid.

Acetone-δ-α-phenylethylsemicarbazones (Wilson, Hopper, and Crawford), T., 869.

Acetone-*ar*-tetrahydro-α-naphthil, and its hydrochloride (Knoevenagel), A., i, 1061.

Acetonethiosemicarbazone, silver and sodium derivatives, and their derivatives (Wilson and Burns), T., 873.

Acetonitrotetrahydronaphthalides (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 124.

Aceto*di*nitrotetrahydronaphthalides (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 125.

Acetonuria (Hubbard and Wright; Porges), A., i, 496.
  in diabetes (Hubbard and Nicholson), A., i, 969.

Acetonylmalonic acid, diethyl ester, and its phenylhydrazone (Gault and Salomon), A., i, 428.

Acetophenone, condensation of (Gastaldi), A., i, 367.
  benzoylphenylhydrazone (v. Auwers, Hilliger, and Wulf), A., i, 1193.
  picrate, compound of thiocarbamide and (Taylor), T., 2272.

Acetophenone, *o*-chloro- (Farbwerke vorm. Meister, Lucius, and Brüning), A., i, 469.

Acetophenoneanil, and its salts (Knoevenagel and Goos), A., i, 751.

Acetophenone-2-nitro-4-cyanophenylhydrazone (Mattaar), A., i, 252.

Aceto-*m*-toluidide, amino-, and its derivatives (Hill and Kelsey), A., i, 1141.

Aceto-*p*-toluidide, 2:6 *di*chloro-3-nitro- (Davies), T., 813.
  2:3- and 2:5-*di*nitro- (Scott and Robinson), T., 845.

Aceto-*m*-toluidides, nitro- (Brady, Day, and Rolt), T., 529, 532.

Aceto-*o*- and -*p*-toluidide-ω-pyridinium salts (Barnett and Cook), T., 794.

*iso***Acetovanillone**, and its derivatives (Schneider and Kraft), A., i, 749.

α-Acetoxyacetic acid, αββ-*tri*chloro-, iminoether hydrochloride (Kötz and Rathert), A., i, 237.

Acetoxyacetyl chloride, chloro- (Blaise and Montagne), A., i, 520.

3-Acetoxy-2-acetyl-5-methylpyrrole-4-carboxylic acid, ethyl ester (Kuster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

α-Acetoxyacrylamide, ββ-*di*chloro- (Kötz and Rathert), A., i, 236.

Acetoxyanthraquinone, 1-*mono*- and 1:5-*di*-hydroxy-, and the diboroacetate of the latter (Dimroth and Faust), A., i, 157.

7-Acetoxy-3-benzenesulphonylcoumarin (Tröger and Bolte), A., i, 268.

***o*-Acetoxybenzoic acid** (*acetylsalicylic acid; aspirin*), ω-pyridinium chloride (Barnett and Cook), T., 797.

α-Acetoxybenzoylethylhydrocupreine hydrochloride (Merck, Diehl, and Mayen), A., i, 47.

***o*-Acetoxybenzoylquinine** hydrochloride (Merck, Diehl, and Mayen), A., i, 46.

Acetoxycamphane-*epi*-carboxylic acids. See Acetylborneolcarboxylic acids.

***i*-Acetoxydecoic acid**, and its amyl and methyl esters (Grün and Wirth), A., i, 805.

3-Acetoxy-2:4-dimethoxyacetophenone, and its phenylhydrazone (Brand and Collischonn), A., i, 452.

4′-Acetoxy-3′:4-dimethylazobenzene (Jacobsen), A., i, 592.

2-Acetoxy-4:6-dimethylbenzonitrile (v. Auwers and Saurwein), A., i, 1032.

4′-Acetoxy-3′:4-dimethylhydrazobenzene, isomerisation of (Jacobsen), A., i, 592.

4′-Acetoxyhydrazobenzene, 4-bromo-, isomerisation of (Jacobsen), A., i, 593.

α-Acetoxymercuri-γ-*o*-anisylpropan-β-ol (Adams, Roman, and Sperry), A., i, 947.

p-**Acetoxymercuridimethylaniline,** *o*- and *m*-nitro- (Kharasch and Jacobsohn), A., i, 189.

o-**Acetoxymercuriethylaniline,** *p*-nitro- (Kharasch and Jacobsohn), A., i, 189.

Acetoxymercuri-*m*-hydroxybenzaldehyde (Henry and Sharp), T., 1059.

o-**Acetoxymercurimethylaniline,** *p*-nitro- (Kharasch and Jacobsohn), A., i, 189.

1-Acetoxymercurimethyl-1:2-dihydrobenzofuran (Adams, Roman, and Sperry), A., i, 947.

Acetoxymercurinitroacetanilides (Kharasch, Lommen, and Jacobsohn), A., i, 604.

Acetoxymercurinitroanilines (Kharasch, Lommen, and Jacobsohn), A., i, 603.

p-**Acetoxymercuri-*o*-nitrodiacetanilide** (Kharasch, Lommen, and Jacobsohn), A., i, 604.

4-Acetoxymercuri-2-nitroresorcinol (Raiziss and Proskouriakoff), A., i, 604.

3-Acetoxy-4-methoxycinnamic acid, α-amino-, benzoyl derivative, lactone (Späth and Lang), A., i, 568.

2-Acetoxy-5-methoxycoumaranone(Sonn and Falkenheim), A., i, 1163.

2-Acetoxy-3-methoxyphenyl-*n*-octaldehyde (Majima and Takayama), A., i, 263.

β-**Acetoxy-α-methylcinnamic acid,** methyl ester (Dieckmann and Wittmann), A., i, 1157.

4′-Acetoxy-4-methylhydrazobenzene, isomerisation of (Jacobsen), A., i, 592.

3-Acetoxy-5-methylpyrrole-4-carboxylic acid, ethyl ester (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

2-Acetoxynaphthalene, 3:6-*di*bromo- (Franzen and Stauble), A., i, 450.

5-Acetoxy-1:4-naphthaquinone, 2:3-*di*bromo-8-hydroxy-, and 8-chloro-2:3-*di*bromo- (Wheeler and Andrews), A., i, 354.

β-**4-Acetoxyphenylpropionolactone,** β-2-hydroxy- (Langley and Adams), A., i, 1153.

α-**Acetoxypropionitrile,** ββ-*di*chloro- and αββ-*tri*chloro- (Kötz and Rathert), A., i, 236.

p-**Acetoxystyrene,** ω-nitro- (Rosenmund and Pfannkuch), A., i, 1030.

2-Acetoxytoluene, bromoamino-derivatives, acetyl derivatives of (Raiford), A., i, 335.

7-Acetoxy-3-*p*-toluenesulphonylcoumarin (Tröger and Bolte), A., i, 268.

Acetyl chloride, preparation of chloro-derivatives of (Consortium für Elektrochemisce Industrihe), A., i, 315.
  chlorosulphonyl derivative (Blaise and Montagne), A., i, 520.

Acetyl chloride, chloro-, syntheses with (Barnett), A., i, 232.

Acetylacetones, metallic (Morgan, Drew and Barker), T., 2433.

4 Acetyl-3-2′-acetoxy-4′-methoxyphenyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

4-Acetyl-3-β-acetoxynaphthyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

4-Acetyl-3-*o*-acetoxy-*p*-tolyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 936.

Acetylaminoanthraquinone, 2-chloro-, and its pyridinium salts (Barnett and Cook), T., 796.

Acetylaminoazobenzene, *p*-chloro-, and its pyridinium chloride (Barnett and Cook), T., 795.

Acetylaminonaphthalene-1-azobenzene, 4-chloro-, and its pyridinium chloride (Barnett and Cook), T., 795.

p-**Acetylbenzeneazo-β-naphthylamine,** and its derivatives (Charrier and Crippa), A., i, 771.

9 *p*-Acetylbenzeneazo-10-phenanthrol (Charrier and Demichelis), A., i, 772.

N-**Acetyl-*N*-benzylglycine** (Scheibler and Baumgarten), A., i, 655.

N-**Acetyl-*N*-benzylidenebetaine** (Scheibler and Baumgarten), A., i, 656.

Acetylbenzylideneresorcinol (Fabre), A., i, 1148.

Acetylborneolcarboxylic acids (Bredt), A., i, 937.

δ-**Acetyl-*n*-butyl alcohol,** and its semi-acetal (Bergmann and Miekeley), A., i, 618.

Acetylbutylenes (Baudrenghien), A., i, 710.

Acetylcarbinol (*acetol*), production of, from carbohydrates (Baudisch and Deuel), A., ii, 664.
  oxidation of, with potassium permanganate (Evans and Hoover), A., i, 911.

4-Acetyl-3-*o*-carboxyphenyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

Acetylcinnam*anti*aldoximes (Brady and Thomas), T., 2107.

4-Acetyl-3-*p*-diethylaminophenyldihydro-2:4-benzoxazine-1-one (EKELEY, ROGERS, and SWISHER), A., i, 935.

4-Acetyl-3-*mp*-dimethoxyphenyldihydro-2:4-benzoxazine-1-one (EKELEY, ROGERS, and SWISHER), A., i, 935.

5-Acetyl-2:4-dimethylpyrrole-3-azobenzenesulphonic acid (KUSTER, WEBER, MAURER, NIEMANN, SCHLACK, SCHLAYERBACH, and WILLIG), A., i, 858.

5-Acetyl-2:4-dimethylpyrrole-3-azonaphthalenesulphonic acid (KÜSTER, WEBER, MAURER, NIEMANN, SCHLACK, SCHLAYERBACH, and WILLIG), A., i, 858.

4-Acetyl-2:5-dimethylpyrrole-3-carboxylic acid, 4-chloro-, ethyl ester (FISCHER, SCHNELLER, and ZERWECK), A., i, 1056.

5-Acetyl-2:4-dimethylpyrrole-3-carboxylic acid, 5-chloro-, ethyl ester, and its phenylhydrazone (FISCHER, SCHNELLER, and ZERWECK), A., i, 1056.
  5-cyano- (FISCHER, SCHNELLER, and ZERWECK), A., i, 1056.

3-Acetyl-2:4-dimethylpyrrole-5-glyoxylic acid, and its ethyl ester (FISCHER, SCHNELLER, and ZERWECK), A., i, 1057.

Acetyldiphenylamine, *tri*chloro- (STOLLÉ), A., i, 762.

4′-Acetyldiphenylamine, 5-bromo- 2:4-*di*nitro- (GIUA and ANGELETTI), A., i, 650.

Acetyldiphenylamine-ω-pyridinium salts (BARNETT and COOK), T., 796.

Acetylene, formation of, in combustion of air flames (HOFMANN and WILL), A., i, 1107.
  preparation of, acetaldehyde from (VOGT and NIEUWLAND), A., ii, 110; (OCHI, ONOZAWA, and TOKYO INDUSTRIAL LABORATORY), A., i, 523.
  explosion of nitrogen and (GARNER and MATSUNO), T., 1729.
  condensations of (KAUFMANN and SCHNEIDER), A., i, 245.
  hydrogenation of derivatives of (ZALKIND), A., i, 1134; ii, 835.
  reduction of (CHEVALIER and BOURCET), A., i, 801.
  action of, on pyrites (STEINKOPF and HEROLD), A., i, 850.
  compounds of, with silver arsenate and phosphate (OBERDOERFER and NIEUWLAND), A., i, 515.
  action of, on sodium derivatives of ketones (LOCQUIN and WOUSENG), A., i, 617.

Acetylene, narcotic action of (WIELAND), A., i, 497.

4-Acetyl-3-*p*-ethoxyphenyldihydro-2:4-benzoxazine-1-one (EKELEY, ROGERS, and SWISHER), A., i, 935.

6-Acetyl-4-ethyl-*m*-xylene (PHILIPPI, SEKA, and FROESCHL), A., i, 837.

Acetyl*iso*eugenol, *di*bromo- and *di*iodo- (RASTELLI), A., i, 1010.

Acetylglycollylsalicylic acid (H. P. and W. KAUFMANN, and GÖTTING), A., i, 253.

Acetylhexoyldioxime, nickel compound (PONZIO), A., i, 18.

***N*′-Acetylhydrazobenzene**, *N*-nitroso- (GOLDSCHMIDT and EULER), A., i, 475.

***N*-Acetylhydrazo-*p*-toluene**, and its compound with triphenylmethyl (GOLDSCHMIDT and EULER), A., i, 476.

β-Acetylindene and its phenylhydrazone (RUPE and MULLER), A., i, 41.

1-Acetylisatin-acetylhydrazone (BORSCHE and MEYER), A., i, 54.

Acetylmalonic acid, ethyl ester, arylthioamides of, action of hydrazine and of hydroxylamine with (WORRALL), A., i, 874.
  menthyl ester (SHIMOMURA and COHEN), T., 2054.

4-Acetyl-3-*o*-methoxyphenyldihydro-2:4-benzoxazine-1-one (EKELEY ROGERS, and SWISHER), A., i, 935.

4-Acetyl-3-*p*-methoxy-*n*-tolyldihydro-2:4-benzoxazine-1-one (EKELEY, ROGERS, and SWISHER), A., i, 935.

5-Acetylmethylaminoacenaphthene (FLEISCHER and SCHRANZ), A., i, 1144.

Acetylmethylfurazan, and its derivatives (PONZIO and RUGGERI), A., i, 630.

Acetylmethylglyoxime, preparation of, and its diacetyl derivative (PONZIO and RUGGERI), A., i, 629.

3-Acetyl-2-methyl-5-αβγδ-*tetra*hydroxybutylpyrrole (PAULY and LUDWIG), A., i, 954.

***N*-Acetyl-7-methylisatin** (HELLER, BENADE and HOCHMUTH), A., i, 1060.

2-Acetyl-5-methylpyrrole-4-carboxylic acid, 3-hydroxy-, ethyl ester and its semicarbazone (KÜSTER, WEBER, MAURER, NIEMANN, SCHLACK, SCHLAYERBACH, and WILLIG), A., i, 858.

***N*-Acetyl-*O*-methyl-*l*-tyrosine** (KARRER, GISLER, HORLACHER, LOCHER, MÄDER, and THOMANN), A., i, 814.

2-Acetyl-α-naphthol, autoxidation of, in alkaline solution (FRIES and LEUE), A., i, 462.

Acetyl-β-naphthylmethylamine-6-sulphonyl chloride (MORGAN and ROOKE), A., i, 134.

4-Acetyl-3-3′- and-3-5′-nitro-2′-acetoxyphenyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

Acetyl-2-nitro-3-anilino-*p*-phenetidine (Reverdin and Roethlisberger), A., i, 538.

Acetyl-*p*-nitrobenzaldehyde methylhydrazone (Brady and McHugh), T., 1652.

Acetyl-2:4-*di*nitrohydrobenzoin (Bishop and Brady), T., 2367.

4-Acetyl-3-nitro-3′ : 4′-methylenedioxyphenyldihydro-2 : 4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

4-Acetyl-3-2′:4′-*di*nitrophenyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

Acetyl-*n*-nonoyldioxime, nickel compound (Ponzio), A., i, 18.

Acetyloxyhaemin (Kuster and Gerlach), A., i, 597.

Acetylpalmityldioxime, nickel compound (Ponzio), A., i, 18.

***l*-Acetylphenylcarbinol**, production of, during fermentation, and its derivatives (Neuberg and Ohle), A., i, 540.

4-Acetyl-3-*p*-phenylenebisdihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 935.

Acetyl-*m*-phenylenediamine, *mono-* and *di*-thio- (Edge), T., 774.

2-*p*-Acetylphenyl-*aβ*-naphthatriazole, and its phenylhydrazones (Charrier and Crippa), A., i, 771.

Acetylpyruvic acid (*acetoneoxalic acid*), ethyl ester, action of *p*-anisidine with (Thielepape), A., i, 271.
  monthyl ester (Shimomura and Cohen), T., 2053.

Acetylquinizarin (Dimroth and Hilcken), A., i, 158.

λ-Acetylricinoleoacetylhydroxamic acid (Nicolet and Pelc), A., i, 644.

Acetylsalicylic acid. See *o*-Acetoxybenzoic acid.

Acetylstearyldioxime, nickel compound (Ponzio), A., i, 18.

Acetylsuccinic acid, *γ*-bromo- ethyl ester, preparation of (Hirst and Macbeth), T., 2175.

5-Acetyltetrahydroacenaphthene, and its derivatives (v. Braun and Kirschbaum), A., i, 728.

1-Acetyl-2-thiohydantoin-5-propionamide (Thierfelder), A., i, 326.

4-Acetyl-2:4:5-trimethoxyphenyldihydro-2:4-benzoxazine-1-one (Ekeley, Rogers, and Swisher), A., i, 936.

1-Acetyl-1:2:2-trimethyl*cyclo*pentane-3-carboxylic acid, and its methyl ester, and their derivatives (Rupe and Jäggi), A., i, 841.

3-Acetyl-2:4:5-trimethylpyrrole, 3-chloro-, and 3-cyano- (Fischer, Schneller, and Zerweck), A., i, 1056.

***N*-Acetyl-*l*-tyrosine** (Karrer, Gisler, Horlacher, Locher, Mäder, and Thomann), A., i, 814.

Acetylvanillin (Sievers and Givaudan & Co.), A., i, 38.

Achillea millefolium (milfoil), constituents of oil from (Kremers), A., i, 505.

Acid, $C_5H_6O_6$, from hydrolysis of the cyanide from methyl hydrogen diglycollate (Anschutz and Jaeger), A., i, 429.
  $C_5H_8O_3$, and its calcium salt, from oxidation of *iso*propyl*iso*crotylcarbinol (Krestinski), A., i, 1130.
  $C_9H_6O_4N_2$, from hydrolysis of methyl isatogenate oxime (Heller and Boessneck), A., i, 369.
  $C_{14}H_{11}N_9$, and its salts and esters, from dibenzhydrazide chloride and sodium azide (Stollé and Netz), A., i, 690.
  $C_{18}H_{34}O_4$, from dehydration of trihydroxystearic acid (Reinger), A., i, 624.
  $C_{18}H_{34}O_5$, from dehydration of sativic acid (Reinger), A., i, 624.
  $C_{19}H_{22}O_6N_2$, and its derivatives, from cacotheline and bromine (Leuchs, Mildbrand, and Leuchs), A., i, 1052.
  $C_{20}H_{30}O_2$, and its phenylhydrazone, from oxidation of caoutchouc (Kirchhof), A., i, 563.
  $C_{20}H_{32}O_2$, and its derivatives, from reduction of abietic acid (Ruzicka and Meyer), A., i, 547.
  $C_{20}H_{34}O_2$, from reduction of abietic acid (Ruzicka and Meyer), A., i, 548.
  $C_{21}H_{30}O_5$, from oxidation of *d*-siaresinolic acid (Zinke, Hanselmayer, and Ehmer), A., i, 668.
  $C_{22}H_{32}O_6$, obtained by reduction of pyroprosolannellic acid (Wieland and Schulenburg), A., i, 346.
  $C_{22}H_{44}O_2$, from the oxidation of paraffin (Granacher and Schaufelberger), A., i, 514.

***A*-Acid.** See *a*-Naphthol-5-sulphonic acid, 6-amino-.

***H*-Acid.** See *a*-Naphthol-3:6-disulphonic acid, 8-amino-.

Acids, relation of the affinity of, to their constitutional formulæ (Oddo), A., ii, 367.
  conductivity of mixtures of, with acids, esters, and ketones (Kendall and Gross), A., ii, 33.

- **Acids**, solubility of, in aqueous solutions of other acids (Kendall and Andrews), A., ii, 34.
  - taste of, and their swelling power (Ostwald and Kuhn), A., i, 84.
  - device for removal of fumes of, during oxidation (Fischler), A., ii, 388.
  - from sugars, oxidation of (Greinert), A., i, 1111.
  - estimation of, volumetrically (Lizius and Evers), A., ii, 654.
  - aliphatic, ionisation and surface activity of (Windisch and Osswald), A., ii, 123.
    - partition of, between water and organic solvents (Gordon and Reid), A., ii, 824.
    - oxidation of, with chromic acid (Simon), A., i, 803.
    - catalytic decomposition of (Mailhe), A., i, 803.
    - lower, reactions between salts of, and higher fatty acids (Knapp and Wadsworth), A., i, 219.
    - saturated, amides and anilides of (Asano), A., i, 437.
  - *di*basic, second dissociation constants of (Duboux), A., ii, 346.
    - and their esters, adsorption and orientation of the molecules of, in solutions (King and Wampler), A., ii, 741.
  - carboxylic, electrolytic reduction of (Inoue), A., i, 36.
  - *N*-carboxylic, anhydrides of (Fuchs), A., i, 1152.
  - fatty, preparation of, from mineral and tar oils (Harries), A., i, 514.
    - and their glycerides, action of the brush discharge on (Eichwald), A., i, 982.
    - properties and molecular structure of thin films of (Adam), A., i, 424; ii, 687.
    - catalytic oxidation of (Salway and Williams), T., 1343.
    - with branched chains, oxidation of (Kay and Raper), A., i, 1093.
    - with eighteen carbon atoms (Nicolet), A., i, 106; (Nicolet and Cox), A., i, 320; (Nicolet and Jurist), A., i, 622; (Nicolet and Pelc), A., i, 643.
    - degradation of, in the animal organism (Woringer), A., i, 90.
    - estimation of, by distillation in steam (Arnold), A., ii, 324.
    - estimation of, in blood (Bloor, Pelkan, and Allen), A., ii, 593.
- **Acids**, fatty, higher, formation of, by sugar fermentation (Neuberg and Arinstein), A., i, 91.
      - electrical conductivity of anhydrides of (Holde and Tacke), A., ii, 109.
      - reactions between salts of lower aliphatic acids and (Knapp and Wadsworth), A., i, 219.
    - solid and liquid, separation of (Meigen and Neuberger), A., ii, 880.
    - volatile, estimation of (Wiegner and Magasanik), A., ii, 532.
  - mineral, detection of, in vinegar (Kling and Lassieur), A., ii, 234; (Kling, Lassieur, and Lassieur), A., ii, 519.
  - organic, and their salts, action of ultra-violet light on aqueous solutions of (Jaeger and Berger), A., i, 316.
    - bromination of, in the α-position (Ward), T., 1161.
    - esterification of (Zollinger-Jenny) A., i, 914.
  - phenolic, formation of (Langley and Adams), A., i, 1153.
  - strong, estimation of, volumetrically, in presence of weak acids (Kolthoff), A., ii, 223.
  - $\alpha\beta$-unsaturated, esters of, formation of substituted succinic acids from (Higginbotham and Lapworth), T., 49.
  - weak, alcoholysis of the salts of (Goldschmidt, Gorbitz, Hougen, and Pahle), A., ii, 135.
- **Acid amides.** See Amides, acid.
- **Acid chlorides**, reduction of (Rosenmund, Zetzsche, and Enderlin), A., i, 431; (Schliewiensky), A., i, 938; (Rosenmund), A., i, 939.
  - action of zinc organic compounds on (Mauthner), A., i, 457.
- **Acid haloids**, condensation products of (Wedekind and Weinand), A., i, 234, 548.
- **Acidity** (Keller), A., ii, 131.
- **Acidolysis** (Sudborough and Karvé), A., ii, 749.
- **Acidosis** (van Slyke; Cullen), A., ii, 672.
- **Aconite**, estimation of alkaloids in extract of (Astruc, Canals, and Bordier), A., ii, 404.
- **Acraldehyde** (*acrolein*), interaction of aniline and (Mann), T., 2178.
  - antiseptic action of (Berthelot), A., i, 903.

Acridine, amino-, chloro-, chloroamino-, chloronitro-, and nitroamino- derivatives (FARBWERKE VORM. MEISTER, LUCIUS, and BRUNING), A., i, 468.
  2:7-*di*amino-, and its diacetyl derivative, chloroacetates and chloroacetanilide (BROWNING, COHEN, GAUNT, and GULBRANSEN), A., i, 612.
  *di*amino*di*thiol- (WATSON and DUTT), T., 1943.
Acridine-9-carboxylic acid, derivatives of, and 2-chloro- (FARBWERKE VORM. MEISTER, LUCIUS, and BRUNING), A., i, 469.
Acrylic acid, and its derivatives, preparation of (VAN DER BURG), A., i, 220.
Actinium, disintegration series of (HAHN and MEITNER), A., ii, 185; (NEUBURGER), A., ii, 340.
Actinomometers, chemistry of (BENRATH, HESS, and OBLADEN), A., ii, 731.
Acyl groups, migration of, from nitrogen to oxygen (RAIFORD and COUTURE), A., i, 931.
Additive compounds in solution and their influence on ionisation (KENDALL and GROSS), A., ii, 32.
Address, presidential (WALKER), T., 735.
Adhesion in solutions (SCHILOV and others), A., ii, 350.
Adipenic acid (CARRIÈRE), A., i, 319.
Adipic acid, $\alpha\beta$-*di*bromo-$\gamma\delta$-*di*hydroxy-, ethyl ester (CHANDRASENA and INGOLD), T., 1316.
  *tri*hydroxy-, salts of (KILIANI), A., i, 225.
Adrenaline (*suprarenine; epinephrine*), effect of, on blood pressure (RICHAUD), A., i, 891.
  effect of, in health (BJURE and SVENSSON), A., i, 970.
Adsorption (SCHILOV and others), A., ii, 350.
  theory of (EUCKEN), A., ii, 262, 550; (POLÁNYI), A., ii, 479.
  electrical theory of (MUKHERJEE; HARRISON), A., ii, 198.
  kinetic theory of (HENRY), A., ii, 740.
  relation between electrolytic dissociation and (RAKUZIN), A., ii, 619.
  effect of, on catalysis (GUICHARD), A., ii, 630.
  and hydrolysis (MOELLER), A., ii, 689.
  chemical (STADNIKOFF), A., ii, 619.
  negative (RAKUZIN and GÖNKE), A., ii, 821.
Adsorption by charcoal (HERBST), A., ii, 30; (FODOR and SCHÖNFELD), A., ii, 688.
  by sugar charcoal (BARTELL and MILLER), A., ii, 741.
  by fuller's earth (RIDEAL and THOMAS), T., 2119.
  of gases, calculation of (BERÉNYI), A., ii, 426.
    by charcoal (GUSTAVER), A., ii, 479.
  of saturated vapours by charcoal (DRIVER and FIRTH), T., 2409.
  of ions (KOLTHOFF), A., ii, 197; (MUKHERJEE), A., ii, 689.
  of liquids by charcoal (HARKINS and EWING), A., ii, 123, 197.
  by precipitates (WEISER), A., ii, 262.
  of radioactive substances (EBLER and VAN RHYN), A., ii, 16.
  at solid surfaces (LANGMUIR), A., ii, 629.
  of solutions (OSTWALD and DE IZAGUIRRE), A., ii, 480.
    of dibasic acids and their esters (KING and WAMPLER), A., ii, 741.
Aerinite, analyses of (ORCEL), A., ii, 651.
"**Aeronom**," use of the (RAUCH), A., ii, 316.
Affinity, conception of (PLANK), A., ii, 357.
  chemical, studies on (BRÖNSTED), A., ii, 132.
  residual, and co-ordination (MORGAN and SMITH), T., 160, 1956, 2866; (MORGAN and DREW), T., 922; (MORGAN and KING), T. 1723; (MORGAN, DREW, and BARKER), T., 2432; (MORGAN and MOSS), T., 2857; (MORGAN and LEDBURY), T., 2882.
Agar, composition of (SAMEC and SSAJEVIČ), A., i, 231.
  swelling of (MACDOUGALL), A., i, 204.
  sulphur compounds in (NEUBERG and OHLE), A., i, 323.
Agave lechuguilla, **saponin from** (JOHNS, CHERNOFF, and VIEHOVER), A., i, 797.
Agmatine, action of arginase in plants on (KIESEL), A., i, 413.
Air. See Atmospheric air.
Alanine, detection of, by crystallographic measurements (JAITSCHNIKOV), A., ii, 884.
Alanine-choline, and its salts (KARRER, GISLER, HORLACHER, LOCHER MADER, and THOMANN), A., i, 814.
dl-**Alanine**-*N*-**methylamidine, salts** of (PYMAN), T., 2623.

- **Albumin**, adsorption in solutions of (Clark and Mann), A., ii, 550.
  - action of sulphosalicylic acid on the swelling of (Ostwald and Kuhn), A., i, 598.
  - effect of, on the conductivity of sodium chloride solutions (Palmer, Atchley, and Loeb), A., i, 692.
  - precipitation of (Cristol and Simonnet), A., ii, 887.
  - egg, effect of salts on the heat coagulation of (Loeb), A., i, 881.
    - toxicity of (Pentimalli), A., i, 302.
  - serum, crystalline, rotation of (Young), A., i, 279.
  - **Ovalbumin**, crystalline, rotation of (Young), A., i, 279.
- **Albumin**, detection of, in urine (Renoux), A., ii, 797.
  - estimation of, microchemically (Vallée and Polonowski), A., ii, 406.
  - estimation of, in cerebrospinal fluid (Ayer and Foster), A., ii, 798.
  - estimation of, in urine (Gérard), A., ii, 670.
- **Albumoses**, diastatic action of (Biedermann), A., i, 1200.
- **Albumose-silver**, estimation of (Herzog), A., ii, 798.
- **Alcaptonuria**, metabolism in (Gibson and Howard), A., i, 401.
- **Alcohol**, $C_{30}H_{50}O$, and its derivatives, from saponification of bird-lime (Nishizawa), A., i, 652.
- **Alcohols**, preparation of (Badische Anilin- & Soda-Fabrik), A., i, 218.
  - catalytic preparation of, from aldehydes (Milligan and Reid), A., i, 337.
  - electrolytic oxidation of (Koizumi), A., i, 979.
  - dehydroxidation of (Muller), A., i, 102.
  - action of ammonia on (E. and K. Smolenski), A., i, 234.
  - introduction of the chloroethyl group into (Clemo and Perkin), T., 642.
  - sensory stimulation by (Irwin), A., i, 899.
  - estimation of, by acetylation (Wolff), A., ii, 165.
  - aliphatic halogenated, preparation of aryl sulphonic esters of (v. Kereszty and Wolf), A., i, 1131.
  - ethylenic tertiary, conversion of, into primary ethylenic alcohols (Locquin and Wouseng), A., i, 710.
  - primary, synthesis of (Oddo and Binaghi), A., i, 314.
- **Alcohols**, secondary, conversion of, into ketones (Hunt), A., i, 810.
  - tertiary, conversion of, into aldehydes (Locquin and Wouseng), A., i, 810.
- **Alcoholimetry** by means of miscibility temperatures (Lévêque), A., ii, 723.
- **Alcoholysis**, determination of the degree of (Goldschmidt, Görbitz, Hougen, and Pahle), A., ii, 135.
- **Aldehydes**, preparation of (Locquin and Wouseng), A., i, 810.
    - from acid chlorides (Rosenmund, Zetzsche, and Flütsch), A., i, 39; (Rosenmund, Zetzsche, and Enderlin), A., i, 431; (Schliewiensky), A., i, 938; (Rosenmund), A., i, 939.
    - from mineral and tar oils (Harries), A., i, 514.
  - catalytic preparation of alcohols from (Milligan and Reid), A., i, 337.
  - condensation of primary aromatic arsines with (Palmer and Adams), A., i, 785.
  - condensation of *o*-aminoazo-compounds with (Fischer), A., i, 956.
  - condensation of α-halogenated ketones with (Bauer and Werner), A., i, 1034.
  - conversion of, into acetals (Haworth and Lapworth), T., 76.
  - action of phosphorus trichloride on (Conant, MacDonald, and Kinney), A., i, 186.
  - compounds of salvarsan with (Raiziss and Blatt), A., i, 1079.
  - interaction of thiocarbamides and (Taylor), T., 2267.
  - action of yeast on (Kumagawa), A., i, 305.
  - aromatic, in eucalyptus oils (Penfold), T., 266.
    - kinetics of the reaction of ammonia with (Dobler), A., ii, 435.
  - halogenated, conversion of, into aldehydes and acids (Kotz and Rathert), A., i, 236.
  - estimation of (Bougault and Gros), A., ii, 666.
  - estimation of, with hydroxylamine (Bennett and Donovan), A., ii, 585.
- **Aldehyde-amines**, phototropy of (Gallagher), A., ii, 11.
- **9-Aldehydoacridine**, 2-chloro-, and its derivatives (Farbwerke vorm. Meister, Lucius, and Brüning), A., i, 470.
- **Aldehydobenzoic acids**, solubility of (Sidgwick and Turner), T., 2256.
- **Aldehydosalicylic acids**, and their derivatives, and bromo- and nitro- (Wayne and Cohen), T., 1022.

- **Aldol** (*β-hydroxybutaldehyde*), preparation of (Grunstein), A., i, 111.
  - detection of, in urine in diabetes (Fricke), A., i, 330 ; ii, 326.
- **Aleuritic acid,** and its methyl ester and acetyl derivative (Harries and Nagel), A., i. 522.
- **Alexin,** physical chemistry of fixation of (Kiss), A., i, 706.
- **Alfalfa.** See Lucerne.
- **Algæ,** marine, arsenic content of (Jones), A., i, 905.
- **Alizarin** (1:2-*dihydroxyanthraquinone*), preparation of (Davies and Scottish Dyes, Ltd.), A., i, 355.
  - synthesis of (Grandmougin), A., i, 44.
  - constitution of the iron lakes of (Bull and Adams), A., i, 355.
  - boroacetate, and its acetyl derivative (Dimroth and Faust), A., i, 157.
- **Alizarin,** 3-*mono*- and 3:4-*di*-bromo- (Dimroth, Schultze, and Heinze), A., i, 158.
- **Alizarin colouring matters,** cobalt derivatives (Morgan and Smith), T., 160.
- **Alizarindipyridinium** bromides, and their derivatives (Barnett and Cook), T., 1386.
- **Alizarinpyridinium** bromide, bromo-, and its phenobetaine (Barnett and Cook), T., 1385.
- **Alizarinpyridiniumnitrolbetaines** (Barnett and Cook), T., 1388.
- **Alizarinquinone** ethoxybromide, methoxybromide, and 3-*mono*-, and 3:4-*di*-bromo- (Dimroth, Schultze, and Heinze), A., i, 158.
- **Alkali** bromates, preparation and properties of (Buell and McCrosky), A., ii, 146.
  - carbonates, estimation of, in presence of phenolphthalein (Bonnier), A., ii, 869.
  - chlorides, action of heated copper oxide with (Hedvall and Booberg), A., ii, 68.
  - fluorides, vapour pressure of (Ruff, Schmidt, and Mugdan), A., ii, 818.
  - haloids, crystalline structure of (Wyckoff), A., ii, 214; (Posnjak and Wyckoff), A., ii, 499.
  - hydroxides, infra-red absorption spectra of (Grantham), A., ii, 244.
    - reactions between nitrogen oxides and (Sanfourche), A., ii, 762.
    - compounds of anhydro-sugars and (Karrer, Staub, and Wälti), A., i, 229.
- **Alkali** iodides, purity of (Winkler), A., ii, 762.
  - metals, atomic and ionic radii of (Lorenz), A., ii, 211.
    - alloys of mercury with (Bain and Withrow), A., ii, 145.
  - nitrophenoxides (D. and A. E. Goddard), T., 54.
  - hydrogen sulphites, equilibria of, in aqueous solutions (Baly and Bailey), T., 1813.
  - ruthenium sulphites (Remy), A., ii, 857.
  - silver thiosulphites, compounds of ammonia with (Jonsson), A., ii, 57.
- **Alkaligenesis** (Lee and Tashiro), A., i, 1089.
- **Alkaline earth** carbonates, formation of, from the oxides (Hedvall and Heuberger), A., ii, 766.
  - hydrides (Ephraim and Michel), A., ii, 58.
  - metals, qualitative separation of (Polonovski), A., ii, 720.
  - phosphors, photoelectric effect of (Göggel), A., ii, 732.
- **Alkaloids,** space formulæ for (Zwikker), A., i, 567.
  - constitution of, which give Vitali's reaction (Hardy), A., i, 948.
  - extraction of, and their characterisation (Colledge), A., ii, 327.
  - in plants, biological significance of (Ciamician and Ravenna), A., i, 797.
  - bismuthi-iodides and mercuri-iodides of (François and Blanc), A., i, 851.
  - salts of, with aminohydroxysuccinic acids (Dakin), A., i, 430.
  - excretion of, in the saliva and in the stomach (Huber), A., i, 1214.
  - toxicity of, effect of hydrogen-ion concentration on (Crane), A., i, 404.
  - anhalonium. See Cactus.
  - belladonna. See Belladonna.
  - cactus. See Cactus.
  - calumba root (Späth and Böhm), A., i, 1174.
  - cinchona. See Cinchona.
  - pareira root (Faltis and Neumann), A., i, 569.
  - quinine. See Quinine.
  - detection of, by means of their picrate crystals (Nelson and Leonard), A., ii, 327.
  - detection of, with iodic acid (Rosenthaler), A., ii, 327.
  - estimation of (Herzig), A., ii, 538.
  - estimation of, volumetrically, indicators for (McGill), A., ii, 835.

Alkyl haloids, action of silver sulphate in sulphuric acid solution on (Schilov), A., i, 913.
iodides, reactivity of, with sodium benzyloxide (Haywood), T., 1904.
sulphates, preparation of (Dreyfus), A., i, 517.
Alkylamines, preparation of (Takeda and Kuroda), A., i, 272.
Alkylamines, hydroxy-, benzoic and tropic esters of, and their pharmacological action (v. Braun, Braunsdorf, and Rath), A., i, 759.
*cyclo***Alkylamines**, preparation of (Mailhe), A., i, 832.
Alkylarylamines, hydroxy-, esters of (Saunders), T., 2667.
Alkylation (Baggesgaard-Rasmussen and Werner), A., i, 104.
Alkylhydrazones (Brady and McHugh), T., 1648.
N-**Alkylideneamino-acids**, synthesis of, and their hydrogenation (Scheibler and Baumgarten), A., i, 655.
Alkylidenecyanoacetic acids, syntheses of (Lapworth and McRae), T., 1699, 2741.
Alligator oil, constituents of (Kobayashi), A., i, 792.
Allotropy, theory of (Copisarow), A., ii, 137.
and the electromotive behaviour of metals (Smits), A., ii, 110.
Alloxan, action of diazomethane on (Herzig), A., i, 373.
Alloys, formation of (Mansuri), T., 2272.
mechanical properties of (Guillet and Cournot), A., ii, 261.
metallic, chemical and electrical behaviour of (Tammann), A., ii, 63; (Jenge), A., ii, 64.
Allyl alcohol, conversion of, into glyceryl bromo- and chloro-hydrins (Read and Hurst), T., 989.
Allylamino-oxides, action of sodium hydroxide with (Meisenheimer, Greeske, and Willmersdorf), A., i, 334.
Allylarsinic acid, and its salts (Hoffmann, LaRoche & Co.), A., i, 818, 926.
5-Allylimino-2-thio-3-phenyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
5-Allylimino-2-thio-3-tolyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
β-Allyloxybutylonitrile (Bruylants), A., i, 924.
6-Allyloxy-2-methylquinoline, and its ethiodide (Gutekunst and Gray), A., i, 951.
6-Allyloxy-2-*p*-nitrobenzylthiol-4-methylpyrimidine (Horn), A., i, 375.
Allylthiocarbimide, estimation of, in mustard flour (Luce and Doucet), A., ii, 537.
2-Allylthiol-3-phenyl-5-anilinomethylene-4-glyoxalone (Dains, Thompson, and Asendorf), A., i, 1186.
Allyl-*p*-toluidine (Foldi), A., i, 732.
Altitudes, high, effect of, on absorption of oxygen (Bayeux), A., i, 79.
Alum, action of, on animal glue (Gutbier, Sauer, and Schelling), A., i, 783.
Alumina. See Aluminium oxide.
Aluminates. See under Aluminium.
Aluminioxalic acid, potassium salt, crystallography and optical properties of (Knaggs), T., 2072.
Aluminium, spectrum of, in relation to the spectrum of glucinum (Glaser), A., ii, 675.
electromotive behaviour of (Smits), A., ii, 20; (Smits and de Gruyter), A., ii, 21; (Gunther-Schulze), A., ii, 110.
and its amalgams, electromotive properties of (Muller and Holzl), A., ii, 341.
cathodic deposition of (Kyropoulos), A., ii, 22.
solubility of gases of (Czochralski), A., ii, 646.
formation of large crystals of (Carpenter and Elam), A., ii, 69.
Aluminium alloys, corrosion of (Rolla), A., ii, 379.
complex, thermal treatment of (Guillet), A., ii, 69.
analysis of (Mende), A., ii, 162; (Brenner), A., ii, 319; (Costavet), A., ii, 528.
with arsenic (Mansuri), T., 2272.
with magnesium, heat of formation of (Biltz and Hohorst), A., ii, 350.
Aluminium compounds, effect of, on growth of plants (Conner and Sears), A., i, 613.
Aluminium salts, reactions of sodium hydroxide with (Grobet), A., ii, 573.
in soils (Denison), A., i, 512.
absorption of, by the roots of plants (Stoklasa, Šebor, Týmich, and Cwacha), A., i, 502.
Aluminium carbide, preparation of (Ohmann), A., i, 2.
chloride, union of aromatic nuclei by means of (Scholl and Schwarzer), A., i, 331; (Scholl and Seer), A., i, 258, 336.
condensations with (Pummerer and Binapfl), A., i, 24.

Aluminium haloids, densities of (Biltz and Wein), A., ii, 505.
hydroxide, colloidal, preparation of (Bradfield), A., ii, 507.
crystalline, dehydration of (Milligan and Mead), A., ii, 447.
adsorption of proteins, enzymes, toxins, and sera by (Rakuzin), A., i, 1199.
solubility of, in water (Massink), A., ii, 299.
nitrate, solubility of, in solutions of nitric acid (Milligan), A., ii, 380.
nitride, heat of formation of (Fichter and Jenny), A., ii, 615.
oxide (*alumina*), adsorption of, by cellulose (Tingle), A., i, 434.
activation of, for decarboxylation or for dehydration (Adkins), A., ii, 834.
catalytic action of, on acetates (Adkins and Krause), A., i, 422.
use of, as a mordant (Bancroft), A., ii, 646.
separation of, from calcium oxide (Charriou), A., ii, 319.
separation of ferric oxide and, from magnesium oxide (Charriou), A., ii, 873.
oxychloride, composition of sols of (Adolf, Pauli, and Jandraschitsch), A., ii, 149.
selenate (Meyer and Speich), A., ii, 71.
sulphate, equilibrium of potassium sulphate, water and (Britton), T., 982.
estimation of free acid in acid solutions of (Zschokke and Häuselmann), A., ii, 397.
chlorosulphoxide and sulphur chloride, preparation of (Silberrad), T., 1017.
Aluminates, constitution of (Heyrovsky), A., ii, 771.
Aluminium organic compounds (Faillebin), A., i, 119.
with methylene iodide (Thomas), A., i, 330.
Aluminium estimation and separation:—
estimation of, volumetrically (Kraus), A., ii, 87.
estimation of, and its oxide, in the commercial metal (Churchill; Capps), A., ii, 319.
estimation of, in tungsten (V. and K. Froboese), A., ii, 397.
estimation of sodium in, and in its oxide (Geith), A., ii, 720.
estimation and separation of (Jander and Wendehorst), A., ii, 529.
Aluminium estimation and separation:—
estimation of, and its separation from iron (Hahn and Leimbach), A., ii, 873.
separation of glucinum and (Britton), A., ii, 228.
separation of iron and (Chalupny and Breisch), A., ii, 588.
Amalgams. See Mercury alloys.
Amanita muscaria, isolation of muscarine from (King), T., 1743.
Ambrosia artemisifolia. See Ragweed.
Ambrosterol, and its acetate (Heyl), A., i, 1224.
Amides, formation of, from alkylmalonic esters (Dox and Yoder), A., i, 816.
action of hydrogen peroxide on (Oliveri-Mandalà), A., i, 544.
acid, Hofmann's conversion of, to amines (Beckmann, Correns, and Liesche), A., i, 544.
acid optically active, catalytic racemisation of (McKenzie and Smith), T., 1348.
Amidines, aromatic, condensation of alkyl malonic esters with (Dox and Yoder), A., i, 374.
Amine, $C_{20}H_{38}O_2N_4$, and its salts, from ethylene and nitrogen (Miyamoto), A., i, 418.
Amines, preparation of, from alcohols and ammonia (E. and K. Smolenski), A., i, 234.
Hofmann's conversion of acid amides to (Beckmann, Correns, and Liesche), A., i, 544.
equilibria of triphenylmethane with (Kremann, Odelga, and Zawodsky), A., i, 131.
oxidation of (Goldschmidt and Euler), A., i, 475; (Goldschmidt and Renn), A., i, 476, 478; (Goldschmidt and Wurzschmitt), A., i, 1139.
decomposition of the vapour of (Upson and Sands), A., i, 1121.
reactions of, with azodicarboxylic esters (Diels), A., i, 774, 1194.
action of *o*-halogenated ketones with (Mayer and Freund), A., i, 865.
action of ozone on (Strecker and Baltes), A., i, 14.
action of, on semicarbazones (Wilson, Hopper and Crawford), T., 866.
alkylation of, with sulphonic esters (Földi), A., i, 732.
compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.
hydroferricyanides and hydroferrocyanides of (Cumming), T., 1287.

Amines, aromatic, mercuric compounds of (Kharasch and Jacobsohn), A., i, 189.
  action of sulphuryl chloride on (Eller and Klemm), A., i, 448.
  preparation of *o*-sulphonic acids of (British Dyestuffs Corporation, Ltd., Baddiley, Payman, and Wignall), A., i, 448.
  influence of *s*-trinitrobenzene on reactions involving (Sudborough and Shah), A., ii, 757.
 proteinogenous (Hanke and Koessler), A., i, 406, 408; ii, 322.
  occurrence of, in the thyroid (Sammartino), A., i, 966.
  physiological action of (Abelin), A., i, 610.
 secondary, dealkylation of, by phosphorus chloride (v. Braun and Weismantel), A., i, 1150.
  N-nitroso-derivatives (Schmidt and Fischer), A., i, 822.
Amine oxides, optically active (Meisenheimer; Meisenheimer and Bernhard), A., i, 813; (Meisenheimer and Lohsner), A., i, 813, 822.
Amino-acids, synthesis of, in the animal organism (Shiple and Sherwin), A., i, 492.
 from hydrolysis of proteins (Burton and Schryver; Jones and Johns), A., i, 182.
 refraction of (Hirsch and Kunze), A., i, 781.
 diastatic action of (Biedermann), A., i, 1200.
 alkylation of the anhydrides of (Karrer, Gränacher, and Schlosser), A., i, 235.
 action of, on sugars (Grünhut and Weber), A., i, 235.
 action of micro-organisms on (Hanke and Koessler), A., i, 406.
 retention and distribution of, in reference to urea formation (Folin and Berglund), A., i, 702.
 distribution of, in blood (Costantino), A., i, 81.
 content of, in blood (Okada and Hayashi), A., i, 483.
 in muscle (Rosedale), A., i, 492.
 behaviour of, in vitally stained animals (Kotake, Masai, and Mori), A., i, 1217.
 deamination of, in the animal organism (Kotake), A., i, 1218.
 degradation of, in the animal organism (Woringer), A., i, 90.
 phenylacetyl derivatives, fate of, in the organism (Shiple and Sherwin), A., i, 1093.
Amino-acids, aliphatic, rate of reaction of nitrous acid with (Dunn and Schmidt), A., i, 1124.
 aromatic, preparation of (Lewcock, Adam, Siderfin, and Galbraith), A., i, 650.
 detection and estimation of (Engeland), A., ii, 536.
 estimation of, by alkalimetry (Willstätter and Waldschmidt-Leitz), A., ii, 169.
 estimation of, by the ninhydrin reaction (Riffart), A., ii, 718.
 estimation of, in blood (Petitjean), A., ii, 536.
 estimation of, in feeding stuffs (Hamilton, Nevens, and Grindley), A., ii, 92.
α-**Amino-acids**, conversion of alkylated malonic acids into (Curtius and Sieber), A., i, 721.
Amino-alcohols (Fourneau and Puyal), A., i, 639.
 preparation of (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 813; (Karrer), A., i, 991.
Amino-aldehydes, preparation of (Radde), A., i, 1154.
Amino-compounds, introduction of the chloroethyl group into (Clemo and Perkin), T., 642.
 diphenylphosphoric acid as a reagent for (Bernton), A., i, 1146.
 aromatic, action of sulphates on (Bucherer and Wahl), A., i, 464; (Bucherer and Zimmermann), A., i, 465.
  estimation of, spectrophotometrically (Mathewson), A., ii, 882.
Aminohydroxy-acids, synthesis of (Zelinsky and Dengin), A., i, 1126.
α-**Amino-*β*-hydroxy-acids**, preparation of, from olefinecarboxylic acids (Schrauth and Geller), A., i, 1125.
Ammines, metallic, physiological action of (Oswald), A., i, 498.
 complex (Duff), T., 450.
Ammonia, formation of, during combustion of air flames (Hofmann and Will), A., i, 1107.
 synthesis of (Andersen), A., ii, 562; (Pring and Ransome), A., ii, 639.
 removal of the heat of reaction in the synthesis of (Claude), A., ii, 284.
 thermal dissociation of (Foxwell), A., ii, 431.
 specific heat of (Partington and Cant), A., ii, 191.
 vapour pressure of (Bergstrom), A., ii, 423.

Ammonia, vapour pressure curves of, with salt solutions (Davis, Olmstead, and Lundstrum), A., ii, 49.
- vapour pressure of liquid mixtures of *m*-xylene and (Kraus and Zeitfuchs), A., i, 725.
- solubility of, in water (Neuhausen and Patrick), A., ii, 264.
- solubility of, in lithium nitrate (Davis, Olmstead, and Lundstrum), A., ii, 56.
- adsorption of, by silica gels (Davidheiser and Patrick), A., ii, 262.
- kinetics of the reaction of aromatic aldehydes with (Dobler), A., ii, 435.
- equilibrium of, with magnesium amalgam (Loomis), A., ii, 294.
- liquid, equilibrium of mixtures of sodium and (Kraus and Lucasse), A., ii, 764.
  - equilibrium of sodium and tellurium in (Kraus and Chiu), A., ii, 765.
- ignition of mixtures of, with air and oxygen (White), T., 1688.
- reactivity of (Baly and Duncan), T., 1008.
- effect of gaseous impurities on the catalytic oxidation of (Decarrière), A., ii, 284.
- use of manganese dioxide as catalyst in oxidation of (Piggot), A., ii, 142.
- oxidation of, by persulphates in presence of copper (Scagliarini and Torelli), A., ii, 81.
- compounds of calcium haloids with (Hüttig), A., ii, 849.
- conversion of, into carbamide (Matignon and Fréjacques), A., i, 723; ii, 272.
- action of, on copper (Bassett and Durrant), T., 2630.
- compounds of cuprous and thallous haloids with (Biltz and Stollenwerk), A., ii, 67.
- compounds of lead haloids with (Biltz and Fischer), A., ii, 851.
- compounds of magnesium haloids with (Biltz and Huttig), A., ii, 59.
- compounds of mercuric cyanide with (Brinkley), A., i, 724.
- compounds of alkali silver thiosulphates with (Jonsson), A., ii, 57.
- action of, on reducing sugars (Ling and Nanji), A., i, 631.
- in blood (Nash and Benedict), A., i, 191; (Nash), A., i, 483.
- excretion of, in urine, following administration of acids (Keeton), A., i, 300.

Ammonia, nesslerisation of solutions of (May and Ross), A., ii, 312.
- commercial, acetone in (Bougault and Gros), A., ii, 709.
- estimation of, in its salts (Burkardt), A., ii, 865.
- estimation of, in blood (Gad-Andresen), A., ii, 523.
- estimation of, in nitrogenous organic substances (Froidevaux), A., ii, 454.
- estimation of, in urine (Mestrezat and Janet), A., ii, 453.

Ammoniates (Biltz and Stollenwerk), A., ii, 67.
- solubility of (Ephraim and Mosimann), A., ii, 574.

Ammonium (Schlubach and Ballauf), A., ii, 55.
- calcium (Botolfsen), A., ii, 570.

Ammonium salts, absorption of, by soils (Aarnio), A., i, 1227.
- estimation of nitrogen in (Meurice), A., ii, 225.

Ammonium borate, equilibrium of the formation of (Sborgi and Ferri), A., ii, 568, 764.
- antimoniodobromide (Vournazos), A., ii, 651.
- carbonate, equilibrium of, with ammonium carbamate (Faurholt), A., ii, 272, 747; (Wegscheider), A., ii, 376.
- *per*chlorate, density of aqueous solutions of (Mazzucchelli and Anselmi), A., ii, 376.
- chloride, preparation of (Mondain-Monval), A., ii, 444, 642.
  - crystallography and symmetry of (Wyckoff), A., ii, 290.
  - equilibrium in the systems of, with water and ferrous, cobaltous or nickel chloride (Clendinnen), T., 801.
- chloride and sulphate, equilibrium of, with sodium chloride and sulphate and water (Rivett), T., 379.
- platinichloride, crystalline structure of (Wyckoff and Posnjak), A., ii, 214.
- silver auric chloride (Wells), A., ii, 449.
- stannichloride, crystal structure of (Dickinson), A., ii, 287.
- chlorite (Levi), A., i, 527.
- diamminotetranitrocobaltiate (Knaggs), T., 2078.
- fluosilicate, crystal structure of (Bozorth), A., ii, 499.
- nitrate, properties of (Millican, Joseph, and Lowry), T., 959; (Early and Lowry), T., 963; (Perman), T., 2473; (Wurmser), A., ii, 499.

Ammonium nitrate, stability of (FINDLAY and ROSEBOURNE), A., ii, 291.
- decomposition of, by heat (SAUNDERS), T., 698.
- action of, on copper (BASSETT and DURRANT), T., 2630.

nitrite, action of, on copper (DHAR), A., ii, 49.
cadmium nickel nitrite (CUTTICA), A., ii, 449.
potassium phosphates (CORELLI), A., ii, 287.
sulphate, preparation of, from gypsum and ammonium carbonate (MATIGNON and FRÉJACQUES), A., ii, 570.
- melting point of (KATTWINKEL), A., ii, 445.
- equilibrium of copper sulphate, potassium sulphate, water, and (HAYAMI), A., ii, 748.
- equilibrium of glucinum sulphate, water, and (BRITTON), T., 2612.
- equilibrium of magnesium and potassium sulphates, water, and (WESTON), T., 1228.

Ammonium organic compounds, quaternary, influence of solvents on the velocity of formation of (HAWKINS), T., 1170.
Ammonium radicle, the free (WEITZ and LUDWIG), A., i, 365; (WEITZ and KÖNIG), A., i, 1186; (SCHLUBACH and BALLAUF), A., ii, 55.
Ammone-carbonic acids (FRANKLIN), A., i, 440.
Amniotic fluid, composition of (LABAT and FAVREAU), A., i, 894.
Amorphous condition, distinction between the crystalline and the (HABER), A., ii, 553.
Ampelopsis hederacea, formation of anthocyanin in (JONESCO), A., i, 97.
Amygdalin, decomposition of, by emulsin (GIAJA), A., i, 185.
- biose from (HAWORTH and LEITCH), T., 1921.

Amyl alcohol, pure, preparation of, and conductivity of sodium iodide in it (KRAUS and BISHOP), A., ii, 813.
*iso***Amyl alcohol**, electrolytic oxidation of (KOIZUMI), A., i, 979.
- preparation of β-methyl-Δ^{α}-butylene from (PUYAL), A., i, 617.

n- and *iso*-**Amyl** fluorides (SWARTS), A., i, 101.
4-*iso*Amylamino-5-carboxybenzeneazobenzene-4′-arsinic acid, and its salts (JACOBS and HEIDELBERGER), A., i, 75.
*iso***Amylammonium** ruthenibromides (GUTBIER and KRAUSS), A., i, 16.
Amylase, genesis of, in plants (PALLADIN and POPOV), A., i, 614.
- chemical investigation of (SHERMAN), A., i, 66.
- from different sources, characteristics of (EFFRONT), A., i, 184, 1076.
- effect of filtration on (EFFRONT), A., i, 1076.
- conditions of activity of (BIEDERMANN and RUEHA), A., i, 65.
- inhibition of the action of (OLSSON), A., i, 390.
- effect of antiseptics on the action of (SHERMAN and WAYMAN), A., i, 282.
- effect of cobaltammines on (FUNK), A., i, 481.
- of cereals (BAKER and HULTON), T., 1929.
- pancreatic, effect of hydrogen-ion concentration on the action of (GROLL), A., i, 600.
  - hydrolysis of starch by, in presence of amino-acids (SHERMAN and CALDWELL), A., i, 283.

*iso***Amylboric acid** (KRAUSE and NITSCHE), A., i, 22.
Amylene, action of selenium chloride on (BOORD and COPE), A., i, 421.
sec.-*iso***Amyl methyl ketone**, chloro- (WIELAND and BETTAG), A., i, 1034.
Amylocellulose, constituents of (MALFITANO and CATOIRE), A., i, 527.
Amylodextrin, oxidation of (SYNIEWSKI), A., i, 1120.
Amylophosphoric acid, synthetic (SAMEC and MAYER), A., i, 921.
Amyloses (KARRER and BÜRKLIN), A., i, 485; (KARRER and FIORONI), A., i, 1119.
6-*iso*Amyloxy-2-methylquinoline, and its ethiodide (GUTEKUNST and GRAY), A., i, 951.
*iso***Amylpyridinium salts** (EMMERT and PARR), A., i, 179.
α-Amyranone, and bromo-, and their oximes (ZINKE, FRIEDRICH, JOHANNSEN, and RICHTER), A., i, 667.
α-Amyrene, and its dibromide (ZINKE, FRIEDRICH, JOHANNSEN, and RICHTER), A., i, 667.
α-Amyrenol benzoate, and bromo- (ZINKE, FRIEDRICH, JOHANNSEN, and RICHTER), A., i, 667.
α-Amyrilene, preparation of (VESTERBERG and WESTERLIND), A., i, 825.
α-Amyrin from elemi resin (ZINKE, FRIEDRICH, JOHANNSEN, and RICHTER), A., i, 667.
Amyrins, extraction and separation of (VESTERBERG; VESTERBERG and WESTERLIND), A., i, 825.

- **Amyrols**, isomeric, and their esters (Paolini), A., i, 754.
- **Anæmia** in carcinoma (Robin and Bournigault), A., i, 497.
- **Anæsthesia**, ether, effect of, on the acid-base balance of blood (van Slyke, Austin, and Cullen; Stehle, Bourne, and Barbour), A., i, 1085.
- **Anæsthetics**, effect of, on the output of carbon dioxide (Bodine), A., i, 889.
  - local, action of (Fromherz), A., i, 705.
- **Analysis**, contradictions and errors in (Hahn, Leimbach, and Windisch), A., ii, 873.
  - with the interferometer (Bečka), A., ii, 715.
  - use of membrane filters in (Jander), A., ii, 457.
  - catalytic (Hakomori), A., ii, 389.
  - colorimetric, buffer solution for (McIlvaine), A., ii, 78.
  - dispersoid, of non-aqueous solutions (Ostwald), A., ii, 199.
  - electrolytic (Kling and Lassieur), A., ii, 587.
  - electrolytic precipitation (Kolthoff), A., ii, 452.
  - electro-volumetric, apparatus for (Goode), A., ii, 307; (Garner and Waters), A., ii, 862.
    - electrodes for (Sharp and MacDougall), A., ii, 579.
    - in alcoholic solution (Bishop, Kittredge, and Hildebrand), A., ii, 308.
    - with barium salts (Kolthoff), A., ii, 864.
  - gravimetric (Winkler), A., ii, 589.
  - microchemical (Benedetti-Pichler), A., ii, 656.
    - Pregl's (Schoeller), A., ii, 160; (Holtz), A., ii, 521; (Nicloux and Welter), A., ii, 779.
    - of organic compounds (Welter), A., ii, 399.
  - physico-chemical volumetric (Dutoit and Grobet), A., ii, 578.
  - qualitative (Macri), A., ii, 779.
    - separation of phosphoric acid in (Balareff), A., ii, 525.
    - inorganic, use of resorcinol in (Lavoye), A., ii, 779.
  - quantitative, by centrifuge (Arrhenius), A., ii, 309.
    - by measurement of the degree of supersaturation (Höppler), A., ii, 863.
  - refractometric (Bečka), A., ii, 715.
  - sedimentation. See Sedimentation.
  - volumetric (Jellinek and Ens), A., ii, 864.
- **Analysis**, volumetric, use of amalgams in (Kikuchi), A., ii, 519, 721; (Kanô), A. ii, 529, 721.
- ***Andropogon Jwarancusa***, terpene from the essential oil of (Simonsen), T., 2292.
- **Anemone**, white, calcium succinate on leaves of (v. Lippmann), A., i, 311.
- **Anemonins** (Asahina and Fujita), A., i, 946.
- **Anethole**, colour reaction of (Adler), A., ii, 401.
- ***o*-Anethole**, β-nitro- (Schmidt, Schumacher, Bájen, and Wagner), A., i, 733.
- **β-Anetholealkamine**, and bromo-, and their salts (Takeda and Kuroda), A., i, 273.
- **Anethole-2-imino-oxazolidine**, bromo-, derivatives of (Takeda and Kuroda), A., i, 273.
- **Angelica root oil** (Roure-Bertrand Fils), A., i, 847.
- **Anhalamine**, constitution of (Späth), A., i, 163.
  - synthesis of (Späth and Röder), A., i, 853.
- **Anhaline**, constitution of (Späth), A., i, 567.
- **Anhalonidine**, constitution of (Späth), A., i, 163.
- **Anhalonium alkaloids.** See Cactus alkaloids.
- **4:5-Anhydro-3-acetoxymercuri-4-hydroxybenzaldehyde** (Henry and Sharp), T., 1058.
- **Anhydrobiose**, and its hexa-acetyl derivative (Hess), A., i, 13.
- **Anhydro-αα-dimethylaconitic acid** (Farmer, Ingold, and Thorpe), T, 149.
- **Anhydroecgonine**, constitution of (Gadamer and John), A., i, 167.
  - ethyl ether, and its salts (Gadamer and John), A., i, 675.
- **Anhydroenneaheptitol**, diacetone derivative of (Mannich and Brose), A., i, 1118.
- **Anhydroglucose**, constitution of (Karrer and Smirnov), A., i, 228.
- **Anhydroglycollic acid.** See Diglycollic acid.
- **Anhydrohæmatein.** See *iso*Hæmatein.
- **Anhydro-β-*di*hydroxydinaphthylbutane.** See 7-Methyl-7-ethyl-α-dinaphthaxanthen.
- **Anhydro-β-1:1-*di*hydroxydinaphthylpentane.** See 7-Methyl-7-*n*-propyl-α-dinaphthaxanthen.
- **Anhydro-γ-1:1-*di*hydroxydinaphthylpentane.** See 7:7-Diethyl-α-dinaphthaxanthen.

Anhydro-β-1:1-*di*hydroxydinaphthylpropane. See 7:7-Dimethyl-α-dinaphthaxanthen.

Anhydroindoxyl-α-anthranilide (Heller and Benade), A., i, 582.

Anhydro-6:7-methylenedioxy-2:3-indeno-(2:1)-quinoline methohydroxide (Armit and Robinson), T., 834.

Anhydro-6:7-methylenedioxy-2:3-(3-methylindeno)(2:1)-quinoline methohydroxide (Armit and Robinson), T., 834.

Anhydropicrorocellin (Forster and Saville), T., 821.

Anhydrosalicylic acid. See Disalicylic acid.

Anhydro-sugars, constitution of (Karrer and Smirnov), A., i, 228.

Aniline, catalytic preparation of (Brown and Henke), A., i, 445, 535, 586; (Henke and Brown), A., i, 1196.
  emulsions of water and, coagulation of (Bhatnagar), A., ii, 268.
  oxidation of (Goldschmidt and Wurzschmitt), A., i, 1139.
  interaction of acraldehyde and (Mann), T., 2178.
  action of, with arsenious chloride (Schmidt), A., i, 285.
  action of, with sulphur monochloride (Coffey), A., i, 132.
  and *p*-bromo-, compounds of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.
  arsenates (Schmidt), A., i, 285; (Paternò), A., i, 731.
  hydrochloride, action of sodium formylacetone with (Thielepape), A., i, 271.
  hydroferrocyanide (Cumming), T., 1293.

ψ-Aniline, and its picrate (Schmidt), A., i, 778.

Anilines, *di*-ω-chloro*penta*chloro- and *di*-ω-chloronitro- (Goldschmidt and Strohmenger), A., i, 1004.
  nitro-, tautomerism of, and their mercurisation (Kharasch, Lommen, and Jacobsohn), A., i, 603.
    action of sodium hydrogen sulphite on (Weil and Wassermann), A., i, 1006.

Aniline-*d*-glucoside, and its tetra-acetyl derivative (Sabalitschka), A., i, 247.

Aniline-*o*-sulphonic acid, *p*-bromo-, *p*-iodo-, and *p*-nitro-, salts of (Scott and Cohen), T., 2038.

Anilinesulphonitrile, salts of (Oliveri-Mandalà), A., i, 1008.

5-Anilinoacenaphthene, 2′:4′-*di*- and 2′:4′:6′-*tri*-nitro- (Fleischer and Schranz), A., i, 1144.

6-Anilinoanthracoumarin (Minaeff and Ripper), A., i, 163.

Anilinoanthraquinones, amino- (Badische Anilin- & Soda-Fabrik), A., i, 942.

4-Anilinobenzonitrile, 3-nitro-4-*p*-amino- (Mattaar), A., i, 252.

***o*-Anilinobenzoylbenzene**, 3-chloro-1-nitro- and 2′:4′-*di*nitro- (Mayer and Freund), A., i, 866.

5-Anilino-3 benzylthiol-1:2:4-triazole, and its dibenzyl derivative (Fromm, Kayser, Briegleb, and Föhrenback), A., i, 378.

2-Anilino-5:5-dimethylthiazoline (Dersin), A., i, 142.

2-Anilinodiphenyleneglycollic acid, 2-*op*-*di*- and 2-*oo′p* *tri*-nitro-, and their lead salts (Brass and Ferber), A., i, 356.

Anilinoethylitaconic acid, ethyl **ester** (Carrière), A., i, 319.

1-Anilino-4-hydroxynaphthalene, and 1-*p*-*mono*- and 1-*op*-*di*-chloro- (Kalle & Co.), A., i, 824.

1-Anilino-4-hydroxynaphthalene-2-carboxylic acid (Kalle & Co.), A., i, 824.

Anilinohydroxysuccinic acid, anil and dianilide of (Dakin), A., i, 143.

Anilinoitaconic acid, ethyl ester (Carrière), A., i, 318.

3-Anilino-5-keto*iso*oxazole, and its salts and 3-*p*-bromo- (Worrall), A., i, 874.

3-Anilino-5-ketopyrazole, and its salts and derivatives, and 3-*p*-bromo- (Worrall), A., i, 874.

2-Anilino-3-mercapto-1:4-naphthaquinone (Fries and Kerkow), A., i, 577.

***o*-Anilinomethylacetophenones**, *o*-2′:4′-*di*nitro- (Mayer and Freund), A., i, 866.

***o*-Anilinomethylbenzophenones**, *o*-2′:4′-*di*nitro- (Mayer and Freund), A., i, 866, 867.

5-Anilinomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1186.

7-Anilino-2-methylxanthone (v. dem Knesebeck and Ullmann), A., i, 360.

3-Anilinonaphthaflavinduline nitrate (Dutt), T., 1953.

2-Anilino-1:4-naphthaquinone, 3-chloro-2-*p*-amino-, and its 2-*p*-acetyl derivative (Fries and Kerkow), A., i, 578.

8-Anilino-1:4-naphthaquinone, 2:3-*di*- and 2:3:8-*tri*-bromo-5-hydroxy- (Wheeler and Andrews), A., i, 354.

1-Anilino-α-naphthiminazole, and its derivatives (Fischer and Schwappacher), A., i, 957.

6-Anilino-α-naphthol, benzoyl derivative (BUCHERER and WAHL), A., i, 464.

3-Anilino-4-oximino-5-keto*iso*oxazole (WORRALL), A., i, 874.

5-Anilinophenanthranaphthazine, 4-nitro- (SIRCAR and DUTT), T., i, 949.

2-Anilinophenanthraquinone, and 2-*op-di*- and 2-*oo'p-tri*-nitro- (BRASS and FERBER), A., i, 356.

β-Anilino-*p*-phenetolecarbamide (SPECKAN), A., i, 580.

6-Anilino-1-phenyl-2:3-dibenzylquinoxalinium chloride, αα'-*di*cyano- (DUTT and SEN), T., 2667.

7-Anilino-*N*-phenyl-2-methyl-pyridazonexanthone (V. DEM KNESEBECK and ULLMANN), A., i, 360.

5-Anilino-1-phenyltetrazole, and its derivatives (OLIVERI-MANDALÀ), A., i, 1069.

***o*-Anilinophenyl-*p*-tolylsulphone**, and *p*-amino-, and *p*-nitroso- (HALBERKANN), A., i, 1132.

α-Anilinopropion-amide and **-anilide** (DUBSKY, HOHER, and DINGEMANSE), A., i, 58.

4:8-Anilino-1:3:5:7-tetramethoxyanthraquinone, 2:6-*di*nitro- (HELLER and LINDNER), A., i, 1040.

5-Aniline-1:2:4-triazole, 3-amino-, 3-hydroxy-, and 3-thio-, and their derivatives (FROMM, KAYSER, BRIEGLEB, and FÖHRENBACH), A., i, 378.

Anilinourazole (ARNDT, MILDE, and TSCHENSCHER), A., i, 376.

1-Aniloethoxymethylamino-5-phenyl-1:2:3:4-tetrazole (STOLLÉ and NETZ), A., i, 690.

1-Anilomethoxymethylamino-5-phenyl-1:2:3:4-tetrazole (STOLLÉ and NETZ), A., i, 690.

Anilothiourazole, and its derivatives (ARNDT, MILDE, TSCHENSCHER, BIELICH, and ECKERT), A., i, 277.

Anils (*Schiff's bases*), hydrolysis of (REDDELIEN and DANILOF), A., i, 147.

Animals, zinc in the feeding of (BERTRAND and BENZON), A., i, 893.
  cold-blooded, effect of temperature on the oxygen consumption of (DIRKEN), A., i, 1207.
  marine, of the Delphinidæ, oil from (NAKATOGAWA and KOBAYASHI), A., i, 701.

Animal heat, effect of intermediary metabolites on the production of (LUSK and EVENDEN), A., i, 292.
  tissues, effect of heat and light on rate of reduction by (VALLOT), A., i, 87.

Animal tissues, fixation of calcium by (FREUDENBERG and GYÖRGY), A., i, 87, 291, 299, 608.
  zinc in (ROST), A., i, 87.
  detection and estimation of morphine in (WACHTEL), A., ii, 171.
  estimation of bromine and iodine in (DAMIENS), A., ii, 79.

***o*-Anisidine** hydroferrocyanide (CUMMING), T., 1295.

***p*-Anisidine**, action of ethyl acetoneoxalate with (THIELEPAPE), A., i, 271.

Anisole (*phenyl methyl ether*), ultra-violet absorption spectrum of (DURRANS), A., ii, 7.

Anisole, nitro-, equilibrium of the formation of, from nitrochlorobenzene (BLOM), A., ii, 38.
  *s.-tri*nitro-, additive compound of pyridine and (GIUA), A., i, 572.

Anisotropy of molecules (RAMAN), A., ii, 102.

Anisylacetone. See *p*-Methoxybenzyl methyl ketone.

1-*p*-Anisyl-4-benzylidenehydantoin, and 2-thio- (HILL and KELSEY), A., i, 1141.

***o*-Anisylcarbamine** cyanide (FROMM and WENZL), A., i, 438.

***p*-Anisyldimethylcarbinol** (SKRAUP and FREUNDLICH), A., i, 540.

1-*p*-Anisylhydantoin, and 2-thio- (HILL and KELSEY), A., i, 1141.

1-Anisylideneamino-5-anisyl-1:2:3:4-tetrazole (STOLLÉ and NETZ), A., i, 690.

4-*p*-Anisyl-5-methyloxazolidone, and its acetyl derivative (TAKEDA and KURODA), A., i, 273.

4-*p*-Anisyl-5-methyloxazoline mercaptan, and its acetyl derivative (TAKEDA and KURODA), A., i, 273.

α-Anisyl-β methylpropane (LE BRAZIDEC), A., i, 457.

β-Anisyl-α-methylpropionic acid, α-hydroxy-, and its amide and nitrile (LE BRAZIDEC), A., i, 456.

α-***o*-Anisylnaphthylamine**, β-hydroxy- (WAHL and LANTZ), A., i, 823.

***p*-Anisyl*iso*nitroacetonitrile**, potassium and sodium salts (MEISENHEIMER and WEIBEZAHN), A., i, 177.

***p*-Anisylnitromethane** (MEISENHEIMER and WEIBEZAHN), A., i, 177.

***o*-Anisylsulphamic acid**, sodium salt (WEIL and MOSER), A., i, 444.

Annam brier oil (ROURE-BERTRAND FILS), A., i, 846.

Annual General Meeting, T., 722.

Anode, lead, use of, in electrolysis of solutions of alkali nitrites (JEFFERY), A., ii, 611.

Anode, silver, effect of telluric acid on the potential of (Jirsa), A., ii, 418.
Ants, toxicity of the venom of (Stumpner), A., i, 400.
Antagonism of ions (Brennar), A., i, 907.
Anthochlor (Klein), A., i, 1099.
Anthocyanidins, distribution of, in the coloured organs of plants (Jonesco), A., i, 797.
detection of the ψ-bases of, in plants (Combes), A., i, 206.
Anthocyanins in plants (Andrews; Kozlowski), A., i, 96; (Jonesco), A., i, 97; (Combes), A., i, 412.
development of, in lily bulbs (Mirande), A., i, 1224.
tinctorial properties of (Everest and Hall), A., i, 265.
physiology of (Costantin), A., i, 162.
Anthracene, melting and boiling points of (Kirby), A., i, 27.
vapour pressure of (Nelson and Senseman), A., i, 245.
velocity of dissociation of, in hexane solution (Volmer and Riggert), A., ii, 336.
equilibria of nitrobenzenes with (Kremann and Müller), A., i, 131.
Anthracene, *di*bromo-, *di*chloro-, and *di*nitro-, preparation of (Barnett, Cook, and Grainger), T., 2065.
9-nitro-, action of light on (Battegay, Brandt, and Moritz), A., i, 1001.
Anthracene series, studies in the (Barnett and Cook), T., 1376; (Barnett, Cook, and Grainger), T., 2059.
Anthrachrysone (1:3:5:7-*tetrahydroxyanthraquinone*), *tri*amino- and *tetra*nitro-derivatives (Heller and Lindner), A., i, 1040.
Anthracite, constitution of (Grounds), A., ii, 385.
Anthracoumarin, 6-chloro- (Minaeff and Ripper), A., i, 162.
Anthradiquinones, *tri*- and *tetra*-hydroxy- (Dimroth and Hilcken), A., i, 159.
Anthranilic acid, cobalt salt (Morgan and Moss), T., 2866.
methyl ester, in grape juice (Power and Chesnut), A., i, 97.
Anthranilic acid, *tetra*bromo-, glycine and formalide of (Grandmougin), A., i, 55.
Anthranyl-10-pyridinium salts, 9-hydroxy- and 9-nitro- (Barnett, Cook, and Grainger), T., 2064.
Anthraquinone, preparation of (Downs), A., i, 1039.
Anthraquinone, and its derivatives, preparation of (Chemische Fabrik Worms), A., i, 559.
vapour pressure of (Nelson and Senseman), A., i, 245.
benzoyl derivatives, coloured reduction products of (Schaarschmidt), A., i, 355.
hydroxy- and sulphohydroxy-derivatives, manufacture of (Segaller, Peacock, and British Dyestuffs Corporation, Ltd.), A., i, 560.
carbamides and urethanes of (Battegay and Bernhardt), A., i, 1041.
mono- and di-alkyl thioethers and sulphones (Reid, Mackall, and Miller), A., i, 154.
estimation of (Nelson and Senseman), A., ii, 882.
Anthraquinone, *di*amino-derivatives, and their dibenzoyl derivatives (Battegay and Claudin), A., i, 43.
*di*bromo-derivatives (Battegay and Claudin; Grandmougin), A., i, 43.
1-chloro-2-amino-, preparation of (Fyfe and British Dyestuffs Corporation, Ltd.), A., i, 260.
action of dimethylaniline with, in presence of copper (Kopetschni and Wiesler), A., i, 844.
3-chloro-2-amino- and 3-chloro-1-bromo-2-amino- (Atack and Soutar), A., i, 259.
2-hydroxy-, reduction of (Perkin and Whattam), T., 289.
1:2-*di*hydroxy-. See Alizarin.
1:5-*di*hydroxy-. See Anthrarufin.
1:3:5:7-*tetra*hydroxy-. See Anthrachrysone.
1-hydroxylamino-, potassium salt, 1-nitro-, and 1-nitroso- (Beisler and Jones), A., i, 1166.
Anthraquinones, hydrogenated, preparation of (Tetralin G. m. b. H), A., i, 1039.
Anthraquinones, amino-, preparation of (Thomas, Davies and Scottish Dyes, Ltd.), A., i, 260.
preparation of aryl derivatives of (Lüttringhaus and Eifflaender), A., i, 355; (Badische Anilin- & Soda-Fabrik), A., i, 942.
hydroxy-, preparation of (Schwenk), A., i, 153; (Davies and Scottish Dyes, Ltd.), A., i, 354.
boric esters of (Dimroth and Faust), A., i, 155.
Anthraquinone-2-aldehyde, 1-amino- (Cassella & Co.), A., i, 942.

Anthraquinone-1-carboxylic acid, 6-chloro- (Scholl, Seer, and Dalmer), A., i, 253.

Anthraquinonedihydro-5-phenylphenazine (Badische Anilin- & Soda-Fabrik), A., i, 942.

Anthraquinone-2:1:6:5-di-*ms*-phenylacridine (Mayer and Freund), A., i, 866.

1:2-Anthraquinonemethyl*iso*oxazole (Wilke), A., i, 943.

1:2-Anthraquinone*iso*oxazole, and 5:6:7:8-*tetra*chloro-, and 5-nitro- (Wilke), A., i, 943.

Anthraquinone-2:1-*ms*-phenylacridine, and its derivatives (Mayer and Freund), A., i, 866.

Anthraquinone-3:2-*ms*-phenylacridine, 1-nitro- (Mayer and Freund), A., i, 866.

Anthraquinonesulphonic acid, *mono*- and *di*-alkyl thioethers and sulphones (Reid, Mackall, and Miller), A., i, 154.

o-**Anthraquinonyl-1′-aminobenzoylbenzene** (Mayer and Freund), A., i, 866.

o-**Anthraquinonyl-1′-amino-5-methylacetophenone**, and *o*-4′-hydroxy- (Mayer and Freund), A., i, 866.

αβ-Anthraquinonyl*iso*oxazoles, and 7:8:9:10-*tetra*chloro-, and 7-nitro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 178.

Anthraquino-1-thiazole, 2-amino-, and its acetyl derivative, and 3-chloro-2-amino- (Kopetschni and Wiesler), A., i, 868.

Anthrarufin (1:5-*dihydroxyanthraquinone*) *di*boroacetate (Dimroth and Faust), A., i, 157.

Anthrax spores, effect of formaldehyde on (Hailer), A., i, 408.

Anti-bodies, effect of ether on (Forssman), A., i, 964.

Antigens, heterogenic (Landsteiner), A., i, 195.

Antiketogenesis (Schaffer), A., i, 83.

Antimonic acid. See under Antimony.

Antimony, native, from California (Behre), A., ii, 76.

absorption spectrum of (Lindsay), A., ii, 599.

L series spectrum of (Dauvillier), A., ii, 101.

volatilisation of, by means of methyl alcohol (Duparc and Ramadier), A., ii, 640.

Antimony alloys with tellurium (Dreifuss), A., ii, 503.

Antimony compounds, chemotherapy of (Fargher and Gray), A., i, 404.

Antimony iodobromides, complex mixed (Vournazos), A., ii, 650.

Antimony:—

Antimonic acid, and its salts, constitution of (Tomula), A., ii, 74.

*tri*sulphide, polymorphism of (Wilson and McCrosky), A., ii, 154.

estimation of, iodometrically (Nikolai), A., ii, 585.

estimation of available sulphur in (Luff and Porritt), A., ii, 225.

*penta*sulphide, preparation of stable sols of (v. Hahn), A., ii, 856.

Antimony organic compounds, aromatic (Schmidt), A., i, 482, 1203.

Antimonyltartaric acid, salts of, and their chemotherapy (Fargher and Gray), A., i, 705.

Antimony detection, estimation, and separation:—

detection of (Sabalitschka and Schmidt), A., ii, 531.

detection of, by mirrors (Scheucher), A., ii, 526.

estimation of, in antimonates (Tomula), A., ii, 74.

estimation of, in copper and brass (Evans), A., ii, 231.

estimation of, volumetrically, in red brass (Mück), A., ii, 722.

estimation of, and its separation from copper, lead and tin (Kling and Lassieur), A., ii, 86.

separation of, from arsenic and tin (Hahn), A., ii, 877.

Antioxidants (Seyewetz and Sisley), A., ii, 628.

Anti-oxygens (Moureu and Dufraisse), A., i, 250; (Seyewetz and Sisley), A., ii, 628.

Antipyrine (1-*phenyl*-2:3-*dimethyl*-5-*pyrazolone*), salicylate, solubility of (Kolthoff), A., i, 471.

Antiseptics, action of, in relation to chemical constitution (Browning, Cohen, Gaunt, and Gulbransen), A., i, 612.

effect of, on amylases (Sherman and Wayman), A., i, 282.

Antitoxins, chemical nature of (Salkowski), A., i, 1216.

Aphthitalite from Kilauea (Washington and Merwin), A., ii, 386.

*iso***Apiole**, β-nitro- (Schmidt, Schumacher, Bajen, and Wagner), A., i, 733.

Apophyllenic acid, constitution of (Mumm and Gottschaldt), A., i, 862.

Apples, odorous constituents of (Power and Chesnut), A., i, 96.

estimation of pectin in (Carré and Haynes), A., ii, 401.

Apples, disappearance of free sulphurous acid in preserved juice of (Warcollier and Le Moal), A., i, 415.
Aquopentamminecobaltiselenate. See under Cobalt.
Aquopentamminocobaltic 2:4-dinitro-α-naphthoxide (Morgan and King), T., 1727.
Aquopentamminocobaltic dipicrylamine (Morgan and King), T., 1726.
Aquopentapyridinemagnesium iodide (Spacu), A., i, 859.
Aquotetramminecobaltichloride selenate. See under Cobalt.
Arabic acid, and its mixtures with gelatin (Tiebackx), A., i, 638.
Arabinose, action of lactic bacteria on (Fred, Peterson, and Anderson), A., i, 201.
Arachidic acid, estimation of (Pritzker and Jungkunz), A., i, 208.
Arachin, digestibility of (Jones and Waterman), A., i, 893.
Arachis oil, catalytic decomposition of (Mailhe), A., i, 712.
β-Aracyl-α-dialkylaminoethylbutyric acids, esters, preparation of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 639.
Aragonite, crystal structure of (Huggins), A., ii, 643.
  equilibrium of calcium with, in aqueous solution (Bäckström), A., ii, 849.
Aralia montana, saponins from the leaves of (van der Haar), A., i, 1168.
Araligenin, and its derivatives (van der Haar), A., i, 1169.
Ardennite, from Ceres in Piedmont (Zambonini), A., ii, 577.
Arginase in plants (Kiesel), A., i, 413.
Arginine, degradation of, in plants (Kiesel), A., i, 413.
Argon, free paths of electrons in (Townsend and Bailey), A., ii, 494, 836.
  ionisation of, by electron collision (Horton and Davies), A., ii, 811.
  excitation and ionisation potentials of (Hertz), A., ii, 733.
  specific heat and heat of vaporisation of (Mathias, Crommelin, and Onnes), A., ii, 472.
  rectilinear diameter of (Mathias, Onnes, and Crommelin), A., ii, 565.
Aromadendral, true nature of (Penfold), T., 266.
Aromadendrin, constitution of (Nishikawa and Robinson), T., 839.
Aromatic compounds, application of the octet theory to (Crocker), A., i, 927.
Aromatic compounds, elimination of hydrogen from (Scholl and Seer), A., i, 258, 336; (Scholl and Neumann), A., i, 261; (Scholl and Schwarzer), A., i, 331.
  catalytic nitration of, by means of mercuric nitrate (Davis), A., i, 818.
  reduction of (de Pommereau), A., i, 825.
  polynuclear, molecular configuration of (Christie and Kenner), T., 614.
  heterocyclic (Armit and Robinson), T., 827.
Arsenates. See under Arsenic.
Arsenic, polymorphism of (Laschtschenko), T., 972.
  melting point of (Heike), A., ii, 25.
  volatilisation of, by means of methyl alcohol (Duparc and Ramadier), A., ii, 640.
  toxicology of (Tarugi), A., ii, 84.
Arsenic alloys with aluminium (Mansuri), T., 2272.
  with zinc (Heike), A., ii, 60.
Arsenic compounds, magnetic susceptibilities of (Pascal), A., ii, 564.
  in marine algæ (Jones), A., i, 905.
  effect of, on plant growth (Stewart), A., i, 1221; (Stewart and Smith), A., i, 1222.
  poisoning by. See Poisoning.
Arsenic carbide (de Mahler), A., i, 101.
  *tri*chloride, solubility of, in concentrated hydrochloric acid (Treadwell and Mussler), A., ii, 763.
  *tri*hydride (*arsine*), toxicity of (Fühner), A., i, 499.
  Arsenic acid, estimation of (Rosenthaler), A., ii, 584.
  Arsenates, periodicity of reactions between thiosulphates and (Forbes, Estill, and Walker), A., ii, 271.
  Arsenious acid, reducing action of (Kohn), A., ii, 148.
  estimation of, in presence of nitrous acid (Klemenc), A., ii, 865.
  Arsenites, periodicity of reactions between thiosulphates and (Forbes, Estill, and Walker), A., ii, 271.
  effect of iron salts on the iodometric estimation of (Melvill), A., ii, 784.
Arsenic *tri*sulphide, coagulation of sols of, by electrolytes (Burton and MacInnes), A., ii, 130.
  colloidal, flocculation of (Boutaric and Vuillaume), A., ii, 498.
  pharmacological action of (Meneghetti), A., i, 301.

Arsenic *tri*sulphide, precipitation of, from arsenates (Reedy), A., ii, 225.
  estimation of, iodometrically (Nikolai), A., ii, 585.
Arsenic organic compounds (Mann and Pope), T., 1754; (Steinkopf and Schwen), A., i, 71, 72, 118; (Jacobs and Heidelberger), A., i, 73, 74; (Lewis and Cheetham; Johnson and Adams: Lewis and Hamilton) A., i, 187; (Raiziss and Blatt), A., i, 1079; (Steinkopf, Donat, and Jaeger), A., i, 994; (Bart), A., i, 1201, 1202.
  with aniline (Schmidt), A., i, 285; (Paterno), A., i, 731.
  Arsenious acids (Quick and Adams), A., i, 600.
Arsenic detection, estimation, and separation:—
  detection of (Kolthoff; Romijn), A., ii, 455.
  detection of, microchemically (Piutti and Boggio-Lera), A., ii, 584.
  detection of, by mirrors (Scheucher), A., ii, 526.
  estimation of, colorimetrically (Chouchak), A., ii, 526.
  estimation of, iodometrically, in presence of copper (Kolthoff and Cremer), A., ii, 84.
  estimation of, in presence of nitrates and nitrites (Graham and Smith), A., ii, 314.
  estimation of, in silicate rocks (Hackl), A., ii, 159.
  estimation and separation of (Moser and Ehrlich), A., ii, 315.
  separation of germanium and (Müller), A., ii, 320.
  separation of, from molybdenum, tungsten, and vanadium (Moser and Ehrlich), A., ii, 314.
Arsenious acid. See under Arsenic.
Arsenobenzene, 3:3′-*di*amino-4:4-*di*hydroxy-, synthesis of (Bart), A., i, 1202.
  preparation of derivatives of (Speyer-Haus), A., i, 481.
  dihydrochloride. See Salvarsan.
Arseno-compounds, aromatic, preparation of (Rockefeller Institute for Medical Research), A., i, 962.
Arsenopyrite, crystal structure of (Huggins), A., ii, 651.
Arsine. See Arsenic *tri*hydride.
Arsine hydroxybromides, alkylated and arylated, decomposition of (Steinkopf and Schwen), A., i, 71.
Arsines, primary aromatic, condensation of, with aldehydes (Palmer and Adams), A., i, 785.
Arsines, tertiary, action of cyanogen bromide on (Steinkopf, Donat, and Jaeger), A., i, 994.
  tertiary phenylated, action of cyanogen bromide on (Steinkopf and Schwen), A., i, 72.
Arsinetri-1-piperidinium chloride, (Leonard), A., i, 363.
Arsinic acids (Quick and Adams), A., i, 600.
  aromatic, synthesis of (Bart), A., i, 1201, 1202.
Arsinic acids, amino-, aromatic, preparation of (Rockefeller Institute for Medical Research), A., i, 961.
Arsphenamine. See Salvarsan.
Artemisia afra, constituents of (Goodson), A., i, 1099.
Aryl alkyl ethers, preparation of (Farbenfabriken vorm. F. Bayer & Co.), A., i, 934.
  preparation of water-soluble derivatives of (Elektrochemische Werke, Bosshard, and Strauss), A., i, 913.
β-Arylhydroxylamines, preparation of (Brand and Steiner), A., i, 536.
Asarone, β-nitro- (Schmidt, Schumacher, Bäjen, and Wagner), A., i, 733.
Asparagus officinalis, carbohydrates in the seeds of (Cake and Bartlett), A., i, 504.
Aspartic acid, dipeptides of (Ravenna), A., i, 180
Aspartic acids, hydroxy-. See Succinic acids aminohydroxy-.
Aspergillus glaucus, action of, on glycerol (Traetta-Mosca and Preti), A., i, 91.
Aspergillus niger (*Sterigmatocystis nigra*), acid fermentation produced by (Molliard), A., i, 611.
  effect of the nutritive media on the composition of (Terroine, Wurmser, and Montané), A., i, 1220.
  energy yield in the growth of (Terroine and Wurmser), A., i, 706.
  effect of hydrogen-ion concentration on the amylase of (Funke), A., i, 796.
  lipase from (Schenker), A., i, 208.
  toxicity of nitrophenols towards (Plantefol), A., i, 204.
  formation of oxalic acid and ammonia in growth of, on peptone (Butkewitsch), A., i, 707.
Aspergillus oryzæ, formation of kojic acid by (Yabuta), A., i, 939.
Assimilation of nitrates and nitrites (Baudisch), A., i, 194.
  plant. See Plants.

- **Asymmetric compounds**, synthesis of, (Pirak), A., i, 810.
  - synthesis of, by means of enzyme action (Rosenthaler), A., i, 480.
- **Atmospheric air**, identification of the lines of, in spark spectra (Merrill, Hopper, and Keith), A., ii, 802.
  - positive ray analysis of (Thomson), A., ii, 565.
  - Joule-Thomson coefficients for (Keyes), A., ii, 24.
  - velocity of sound in (Grüneisen and Merkel), A., ii, 190.
  - propagation of flame in mixtures of gases with (Payman and Wheeler), T., 363; (White), T., 1244, 1688, 2561.
  - ignition of mixtures of methane and (Mason and Wheeler), T., 2079.
  - liquid, use of, as a refrigerant (Ferguson), A., ii, 614.
  - apparatus for analysis of (Guthrie), A., ii, 78.
  - estimation of injurious acids in (Lambris), A., ii, 390.
  - estimation of carbon dioxide in (Rauch), A., ii, 316; (Noyons), A., ii, 868.
  - apparatus for estimation of carbon dioxide in (Lundegårdh), A., ii, 719.
  - estimation of nitrogen oxides in (Allison, Parker, and Jones), A., ii, 313.
  - estimation of petroleum vapour in (Fritzmann and Macjulevitsch), A., ii, 877.
- **Atoms**, structure of (Dauvillier; Bury), A., ii, 43; (Zehnder), A., ii, 208; (Neuburger), A., ii, 208, 365; (Chwolson), A., ii, 209; (Bohr), A., ii, 277, 363; (Marsh), A., ii, 277; (Crehore), A., ii, 438; (Huggins), A., ii, 632; (Lodge), A., ii, 701.
    - and refraction (Wasastjerna), A., ii, 2, 491.
    - in relation to spectra (King), A., ii, 277.
    - and Röntgen spectra (Coster), A., ii, 491, 677; (Dauvillier), A., ii, 678.
    - relation between magnetism and (Weiss), A., ii, 23; (Cabrera; Oxley), A., ii, 469.
  - electronic structure of (Fokker), A., ii, 187; (Dauvillier), A., ii, 559; (Pease), A., ii, 737; (Huggins), A., ii, 838.
  - periodic structure of (Allen), A., ii, 758.
- **Atoms**, models of (Hughes), A., ii, 632; (van Vleck), A., ii, 838; (Neuburger), A., ii, 839.
    - for lecture demonstration (King), A., ii, 705.
  - Bohr's model of (Brillouin), A., ii, 438.
  - Neuburger model of (Valeras; Meitner; Neuburger), A., ii, 702.
  - Whittaker model of (Peddie), A., ii, 633.
  - constitution of, and structure of crystals (Niggli), A., ii, 36.
  - emission of light by (Försterling), A., ii, 729; (Seeliger), A., ii, 804.
  - radiations from (Gehrcke), A., ii, 210.
  - thermodynamic equilibrium of electrons, radiation and (de Broglie), A., ii, 249.
  - dimensions of (Richards), A., ii, 42.
    - in diamond type crystals (Pease), A., ii, 634.
    - and their ionisation potentials (Eve), A., ii, 364.
    - in relation to the properties of elements and compounds (Clark), A., ii, 634.
  - radii of (Saha), A., ii, 278; (Huggins), A., ii, 634.
  - stability of the nuclei of (Harkins and Madorsky), A., ii, 490; (Harkins), A., ii, 702.
  - induced polarity of (Lapworth), T., 416; (Kermack and Robinson), T., 427.
  - binding of electrons by (Nicholson), A., ii, 544.
  - motion of electrons in (Townsend and Bailey), A., ii, 277.
  - disintegration and transformation of (Meitner), A., ii, 15.
  - collisions between molecules and (Franck), A., ii, 464.
  - electrical doublet theory of the attraction between (Kleeman), A., ii,366.
  - quantum mechanism within (Whittaker), A., ii, 632; (Ewing; Houstoun), A., ii, 633.
  - energy of the linkings between (Padoa), A., ii, 27.
  - stopping power and atomic number of (Glasson), A., ii, 250.
- **Atomic number**, scattering of β-rays and (Glasson), A., ii, 183.
  - and stopping power (Glasson), A., ii, 250.
- **Atomic weight** of boron (Baxter and Scott), A., ii, 285; (Hönigschmid and Birckenbach), A., ii, 641.
  - of bromine (Moles), A., ii, 140; (Baxter), A.. ii, 370.

Atomic weight of carbon (Moles), A., ii, 51.
  of chlorine (Gleditsch and Samdahl), A., ii, 281.
  of glucinum (Hönigschmid and Birckenbach), A., ii, 214.
  of *iso*helium (Neuburger), A., ii, 365.
  of lanthanum (Baxter), A., ii, 298; (Hopkins and Driggs), A., ii, 770.
  of mercury (Brönsted and v. Hevesy), A., ii, 645.
  of yttrium (Fogg and James), A., ii, 297.
Atomic weights, report of the Committee on (Baxter), A., ii, 366.
  calculation of (Reychler), A., ii, 279.
  determination of, from gas densities (Baxter), A., ii, 370.
  determination of, by vapour density measurements (Magnus and Schmid), A., ii, 260.
  purity of silver for use in determination of (Baxter and Woodman), A., ii, 376; (Baxter), A., ii, 377.
"**Atophan.**" See 2-Phenylquinoline-4-carboxylic acid.
Atoxyl (*sodium* p-*aminophenylarsinate*), crystallography of (Gilta), A., i, 961.
Atrolactic acid, fate of, in the body (Kay and Raper), A., i, 1093.
l-**Atrolactinamide**, preparation and rotation of (McKenzie and Smith), T., 1356.
Atropic acid, fate of, in the body (Kay and Raper), A., i, 1093.
Atropine, estimation of (Hardy), A., ii, 796.
  estimation of, in blood-serum (van der Heyde), A., ii, 669.
Aucubin from seeds of *Melampyrum arvense* (Bridel and Braecke), A., i, 209.
  comparison of rhinanthin and (Bridel and Braecke), A., i, 1168.
Augite from Hawaii (Washington and Merwin), A., ii, 220.
Austenite, heat of transformation of, into martensite (Yamada), A., ii, 475.
Autoclave (Gross), A., ii, 561.
Autolysis (Bradley), A., i, 896.
Autoxidation (Moureu and Dufraisse), A., i, 250, 824.
Autunite, calcium uranium, analyses of (Henrich), A., ii, 516.
Azelaic acid, preparation of (Asahina and Ishida), A., i, 520.
  electro-synthesis of (Carmichael), T., 2545.
Azens (Staudinger), A., i, 238.
Azides, formation of (Oliveri-Mandalà), A., i, 473.
  lecture experiments with (Browne and Hoel), A., ii, 840.
Azidoanisylideneanishydrazide (Stollé and Netz), A., i, 690.
Azidodibenzhydrazide (Stollé and Netz), A., i, 690.
Aziminobenzene. See 1:2:3-Benztriazole.
αβ-**Aziminonaphthalenecarboxylic acid**, methyl ester (Diels and Wackermann), A., i, 1069.
p-**Azoanisole**, oxonium salts of (Kehrmann and van der Laar), A., i 384.
Azobenzene, catalytic preparation of (Henke and Brown), A., i, 586 1196.
  electrochemical oxidation of (Fichter and Jaeck), A., i, 62.
  hydrochloride, reaction of aromatic hydrocarbons with (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1196.
Azobenzene, amino-, action of mercuric acetate on (Vecchiotti), A., i, 478.
  *deca*chloro- (Goldschmidt and Strohmenger), A., i, 1006.
Azobenzolyl-*p*-aminophenyl ether (Fichter and Jaeck), A., i, 62.
Azobenzolyl-*p*-nitrophenyl ether (Fichter and Jaeck), A., i, 62.
Azo-colouring matters (Jacobs and Heidelberger), A., i, 74.
  calculation of the colour of (Moir), T., 1555.
  from bilirubin (Fischer and Barrenscheen), A., i, 278.
  from naphthalene (Voroshcov), A., i, 956.
  action of phenylhydrazine-bisulphite mixture on (Bucherer and Zimmermann), A., i, 465.
  vat (Mukerji), T., 2879.
  estimation of, electrometrically (Jones and Lee), A., ii, 239.
  apparatus for estimation of intermediates for manufacture of (Atkinson), A., ii, 237.
Azo-colouring matters, *o*-hydroxy-, preparation of (Society of Chemical Industry in Basle), A., i, 385.
Azo-compounds, action of, with aromatic hydrocarbons and aluminium chloride (Pummerer and Binapfl), A., i, 24; (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1196.
  coupling of, with 1:8-naphthasultam and its derivatives (König and Köhler), A., i, 879.

- **Azo-compounds**, *o*-amino-, condensation of aldehydes with (Fischer), A., i, 956.
  - amino-, and hydroxy- (Charrier), A., i, 769.
  - hydroxy-, constitution of (Puxeddu and Gennari), A., i, 587.
    - hydrolysis of alkali salts of (Puxeddu), A., i, 589.
- **Azodicarboxylic acid**, esters, reactions of amines and enols with (Diels), A., i, 774.
  - ethyl and methyl esters, additive compounds of β-naphthylamine with, and their oxidation products (Diels and Wackermann), A., i, 1068.
- **Azoimide** (*hydrazoic acid*), lecture experiments with (Browne and Hoel), A., ii, 840.
  - addition of, at contiguous double linkings (Oliveri-Mandalà), A., i, 1069.
- **Azomethine compounds** (Morgan and Reeves), T., 1.
- **1:1′-Azonaphthalene-4:4′-disulphonic acid** (Kalle & Co.), A., i, 867.
- **1:1-Azo-*ar*-tetrahydronaphthalene** (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.
- *Azotobacter*, effect of hydrogen-ion concentration on the growth of (Gainey and Batchelor), A., i, 1096.
- **Azoxyamides** (Pieroni), A., i, 1071.
- **Azoxybenzene**, 3-nitro-4:4′-*di*hydroxy- (Angeli, Bigiavi, and Carrara), A., i, 879.
- **Azoxyphenol**, 3-nitro-4-hydroxy- (Angeli, Bigiavi, and Carrara), A., i, 879.
- **Azoxyphenols** (Angeli, Bigiavi, and Carrara), A., i, 878.
- *o*-**Azoxyphenylacetic acid**, and its esters (Neber), A., i, 546.
- **1:1-Azoxy-*ar*-tetrahydronaphthalene** (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.

B.

- **Babingtonite** from Japan (Watanabé), A., ii, 651.
- **Bacilli**, diphtheria, effect of manganous chloride on formation of (Walbum), A., i, 795.
    - action of the oxy-acids of selenium and tellurium on (Joachimoglu and Hirose), A., i, 406.
  - influenza, growth of (Jacoby and Frankenthal), A., i, 302.
- **Bacilli**, paratyphoid-enteritidis, fermentation of tetralose by (Koser), A., i, 407.
  - pyocyanic, decomposition of sugars by (Aubel), A., i, 201.
  - tetanus, growth of (Dernby and Allander), A., i, 303.
  - Timothy grass, fat metabolism of (Stephenson and Whetham), A., i, 500.
  - tubercle, bacteriology of (Long), A., i, 1095.
    - action of tribromoxylenol on (Duboc), A., i, 972.
    - utilisation of dextrose by (Gamble and Herrick), A., i, 902.
  - typhoid, production of carbon dioxide by (Nichols), A., i, 501.
- *Bacillus butyricus*, production of carbon dioxide by (Brooks), A., i, 201.
- *Bacillus coli*, effect of colloidal substances on the growth of (Labes), A., i, 902.
  - experiments on disinfection with (Vermast), A., i, 406.
  - Endo's reaction with (Fernández and Garmendia), A., i, 405.
- *Bacillus diphtheriæ*, reversal of reaction in media by the growth of (Wolf), A., i, 1218.
- *Bacillus lactis aerogenes*, decomposition of inositol and glycerol by (Kumagawa), A., i, 972.
- *Bacillus mesentericus niger*, darkening of carbohydrates by growth of (Muschel), A., i, 1095.
- *Bacillus proteus*, action of, on *dl*-α-naphthylalanine (Sasaki and Kinose), A., i, 303.
  - action of, on *l*-tryptophan (Sasaki and Otsuka), A., i, 302.
- *Bacillus pyocyaneus*, culture of, and the production of hydrocyanic acid (Goris and Liot; Patty), A., i, 407.
- *Bacillus subtilis*, production of carbon dioxide by (Brooks), A., i, 201.
- **Bacteria**, formation of hydrogen peroxide by (McLeod and Gordon), A., i, 1095.
  - formation of indole by (Frieber), A., i, 901.
  - formation of phenol by (Sieke), A., i, 902.
  - formation of toxins from (Walbum), A., i, 902.
  - action of, on racemic acids (Condelli), A., i, 410.
  - importance of sequence in the action of antiseptics on (Karczag), A., i, 302.
  - influence of arsenious acid on the growth of (Cobet and van der Reis), A., i, 611.

Bacteria, decomposition of citric acid in milk by (Kickinger), A., i, 1219.
effect of formaldehyde on (Hailer), A., i, 408.
action of, on minerals (Helbronner and Rudolfs), A., i, 706.
nucleic acid in (Schaffer, Folkoff, and Jones), A., i, 1095.
influence of the reaction of the solution on the action of poisons or drugs on (Labes), A., i, 901.
proteases in (Dernby), A., i, 405.
destruction of, by quinones (Morgan and Cooper), A., i, 204.
oxidation of sulphur by, in soils (Waksman), A., i, 706.
colon-typhoid, action of tellurium salts on (Joachimoglu), A., i, 1095.
intestinal, action of, on bile pigments (Passini), A., i, 966.
lactose-fermenting (Levine), A., i, 901.
pentose-fermenting (Fred, Peterson, and Anderson), A., i, 201, 971.
purple, microchemistry of (Gicklhorn), A., i, 303.
soil, oxidation of sulphur compounds by (Lipman, Waksman, and Joffe), A., i, 303.
estimation of substances which inhibit the reducing action of (Schnabel), A., i, 304.
Balance, micro-, Steele-Grant (Hartung), A., ii, 495.
Westphal, accuracy of the (Tschudy), A., ii, 820.
Barbel, constituents and toxicity of the roes of the (McCrudden), A., i, 194.
Barbituric acid, action of diazomethane on (Herzig), A., i, 373.
detection of, and its derivatives (Fabre), A., ii, 795.
Barbituric acids, substituted, as hypnotics (Carnot and Tiffeneau), A., i, 900.
Barium, absorption spectrum of (Lindsay), A., ii, 599.
L-spectrum of (Dauvillier; de Broglie and Dauvillier), A., ii, 542.
Barium salts, conductometric titrations with (Kolthoff), A., ii, 864.
poisoning by. See Poisoning.
Barium carbonate, action of nitrogen on carbon and, at high temperatures (Askenasy and Grude), A., ii, 445.
platinichloride, dissociation of (Gire), A., ii, 551.
chromate, solvolysis of (Hicks and Craig), A., ii, 622.
platinocyanide, de-intensifying of, in the Villard effect (Zimmern and Salles), A., ii, 104.
Barium nitrate, crystal structure of (Vegard), A., ii, 503.
thallous nitrite (Cuttica and Paciello), A., ii, 378.
*per*oxide, velocity of formation of (Sasaki), A., ii, 273.
catalytic influence of oxides on the decomposition of (Kendall and Fuchs), A., ii, 147.
silicate (Eskola), A., ii, 849.
sulphate, adsorption of radium by (Germann), A., ii, 16.
equilibrium of potassium carbonate with (Ramann and Sallinger), A., ii, 131.
tungstate (Smith), A., ii, 774.
Barium selenic acid (Meyer and Friedrich), A., ii, 644.
Barium sulphuric acid (Meyer and Friedrich), A., ii, 644; (Balareff), A., ii, 864.
Barium estimation:—
estimation of, volumetrically (Polonovski), A., ii, 720.
Barley, amylase of (Baker and Hulton), T., 1929.
germinated, velocity of action of enzymes of (Maestrini), A., i, 507, 508.
estimation of starch in (Ling, Callow, and Price), A., ii, 879.
Base, C_8H_9N, and its salts, from *p*-xylene and sulphuryl azide (Curtius and Schmidt), A., i, 777.
$C_8H_{15}ON$, and its salts and derivatives (Troger and Schwarzenberg), A., i, 167.
$C_{10}H_8ON_2$, and its salts, from *l*-tartardialdehydephenylhydrazone and hydrogen chloride (Bergmann), A., i, 8.
$C_{11}H_{17}O_2N$, and its salts and derivatives, from hydrolysis of *N*-γ-benzoxypropyldihydro*iso*indole (v. (Braun, Braunsdorf, and Räth), A., i, 760.
$C_{13}H_{13}ONS$, and its salts, from thiodiphenylamine and sodium hydroxide (Kehrmann and Dardel), A., i, 1063.
$C_{18}H_{20}ON_2$ and its salts, from aniline and acraldehyde (Mann), T., 2179.
$C_{20}H_{24}ON_2$, from *p*-toluidine and acraldehyde (Mann), T., 2182.
$C_{22}H_{26}N_2$, from acetoneanil and methyl iodide (Knoevenagel and Bähr), A., ii, 750.
$C_{36}H_{38}O_3N_4$ and its salts, from oxidation of base $C_{18}H_{20}ON_2$ (Mann), T., 2180.
Bases, Werner's theory of (Lamb and Yngve), A., ii, 217.

Bases, heterocyclic, reactivity of methyl groups in (Mills and Smith), T., 2724.

organic, additive compounds of metallic salts with (Peters), A., i, 48.

detection of, with iodic acid (Rosenthaler), A., ii, 327.

detection and separation of, by means of glyoxalinedicarboxylic acid (Pauly and Ludwig), A., i, 953.

strong, estimation of, volumetrically, in presence of weak bases (Kolthoff), A., ii, 223.

weak, alcoholysis of the salts of (Goldschmidt, Görbitz, Hougen, and Pahle), A., ii, 135.

estimation of, volumetrically (Lizius and Evers), A., ii, 654.

Basilicum oil, constants of (Gattefossé), A., i, 1167.

Basicity (Keller), A., ii, 131.

Bauxite, estimation of titanium dioxide in (Winch and Chandrateeya), A., ii, 459

Bean, adsuki. See *Phaseolus angularis.*

lima. See *Phaseolus lunatus.*

navy, carbohydrates in (Eichelberger), A., i, 799.

pichurim. See Pichurim bean.

runner, nitrogen distribution in leaves of (Chibnall), A., i, 908, 1225.

soja. See Soja beans.

Beckmann transformation (Meisenheimer), A., i, 152.

Becquerelite, radioactive (Schoep), A., ii, 450.

Beechnut oil, constituents of (Heiduschka and Roser), A., i, 945.

characteristics and utilisation of (B), A., i, 96.

Bees-wax. See under Wax.

Beetroot (*Beta vulgaris*), anthocyanin from (Andrews; Kozlowski), A., i, 96.

wild, composition of (Saillard), A., i, 415.

Behenic acid, anilide and esters of (Toyama), A., i, 1111.

sodium salt, properties of solutions of (Flecker and Taylor), T., 1101.

docosyl and phenyl esters (Brigl and Fuchs), A., i, 713.

Belladonna, chemical constituents of the leaves of (Goris and Larsonneau), A., i, 1099.

alkaloids from (Ripert), A., i, 96.

Benzaldehyde, solubility of copper in dilute solutions of (Bernoulli and Schaaf), A., i, 1029.

reduction of, by sodium in alcohol (de Pommereau), A., i, 339.

Benzaldehyde and *p*-nitro-, alkylhydrazones of (Brady and McHugh), T., 1650.

picrate, compound of thiocarbamide and (Taylor), T., 2269.

estimation of chlorine in (Schimmel & Co.), A., ii, 78.

Benzaldehyde, 2:4-*di*hydroxy-. See *β*-Resorcylaldehyde.

iodo-*m*-hydroxy- (Henry and Sharp), T., 1059.

nitro-derivatives, solubility and volatility of (Sidgwick and Dash), T., 2586.

2:4:6-*tri*nitro-, derivatives of (Lowy and Baldwin), A., i, 134.

Benzaldehydes, hydroxy-, mercury derivatives (Henry and Sharp), T., 1055.

nitro-, reactivity of (Heller, Lauth, and Buchwaldt), A., i, 348.

Benzaldehyde-*S*-benzylthiosemicarbazone (Wilson and Burns), T., 874.

Benzaldehydecyanohydrin, action of emulsin in synthesis of (Nordefeldt), A., i, 1077.

Benzaldehyde-2-nitro-4-cyanophenylhydrazone (Mattaar), A., i, 252.

Benzaldehyde-*p*-nitrophenylmethylhydrazone (Ciusa and Rastelli), A., i, 1073.

Benzaldehydephenylhydrazone, additive compounds of, with aromatic polynitro-compounds (Ciusa and Vecchiotti) A., i, 474.

Benzaldoximes, 2:4- and 2:6-*di*nitro-, *N*-aryl ethers of (Barrow, Griffiths, and Bloom), T., 1714.

Benzamide, kinetics of the reaction of acetic anhydride with (Kremann, Rösler, and Penkner), A., ii, 748.

equilibria of, with dihydroxynaphthalenes (Kremann, Hemmelmayr, and Riemer), A., i, 1012.

Benzamidine, action of cyanogen and nitrogen iodides on (Robin), A., i, 36.

α-Benzamido-β-methylpropane, *β*-chloro- (Dersin), A., i, 142.

Benzanilide, 2:4-*di*nitro- (Barrow, Griffiths, and Bloom), T., 1714.

Benzanthrone, amino-, and hydroxy- (British Dyestuffs Corporation, Ltd., Perkin and Spencer), A., i, 941.

2-amino-, and its derivatives, and 2-hydroxy-, preparation of (Perkin and Spencer), T., 479.

2-hydroxy-, derivatives of (Bradshaw and Perkin), T., 911.

1:9-Benzanthrone, 6- and 7-chloro- (Scholl, Seer, and Daimer), A., i, 258.

Benzanthronecarboxylic acid, hydroxy-, and its salts and derivatives (BRADSHAW and PERKIN), T., 913.
m-*a*-**Benzbispyrrole**, 2:6-*di*hydroxy-, and its sodium salt (DAVIES and HICKOX), T., 2652.
Benzbisthiazoles (EDGE), T., 772.
*meso***Benzdixanthylene** (ECKERT and ENDLER), A., i, 941.
Benzene, constitution of (FRASER), T., 188.
  structure of (CROCKER), A., i, 927; (HUGGINS), A., i, 928, 997.
  nucleus, structure of the (INGOLD), T., 1133, 1143.
    formation of rings attached to the (PERKIN and TITLEY), T., 1562.
    existence and reactions of positive halogen attached to the (NICOLET), A., i, 121.
    migration of methyl into the (BECKMANN, CORRENS, and LIESCHE), A., i, 535.
    substitution in the (DAVIES), T., 806.
    effect of the mobility of chlorine in the side-chain on substitution in the (OLIVIER), A., i, 646.
    influence of the chlorine atom and the methyl and sulphonyl chloride groups on substitution in the (DAVIES), T., 785.
    influence of nitro-groups on the reactivity of substituents in the (BURTON and KENNER), T., 489, 675.
  compounds, structure of molecules of (ROBINSON; KENNER), A., i, 533.
  variation of the refractive index and density of, with temperature (PARKER and THOMPSON), T., 1341.
  absorption and fluorescence spectra of (HENRI), A., ii, 679.
  ultra-violet absorption spectrum of the vapour of (HENRI), A., ii, 331.
  specific heat of the saturated vapour of (BRUHAT and DELAYGUE), A., ii, 348.
  compressibility of (RICHARDS, BARTLETT, and HODGES), A., ii, 28.
  equilibrium of ethyl alcohol, water and (ORMANDY and CRAVEN), A., i, 215.
  equilibrium in the system, silver perchlorate, water and (HILL), A., ii, 555.
  action of benzyl chloride and, in presence of iron pyrites (SMYTHE), T., 1276.
Benzene, reaction of carbon dioxide with, under the electric discharge (MIYAMOTO), A., i, 418.
  action of carbonyl chloride on, in presence of aluminium chloride (WILSON and FULLER), A., i, 827.
  compounds of cresols with (BERL and SCHWEBEL; C. and W. v. RECHENBERG), A., i, 932.
  ethylation of (MILLIGAN and REID), A., i, 330.
  action of sulphuryl azide on (SCHMIDT), A., i, 777.
  chlorination of, with sulphuryl chloride (SILBERRAD), T., 1015.
  derivatives, action of sulphuryl chloride on (DURRANS), T., 44.
  detection of, in light petroleum (SCHWARZ), A., ii, 531.
  estimation of (ZABOROWSKI), A., ii, 877.
  estimation of, in gases (BERL), A., ii, 591.
Benzene, *tri*bromo-derivatives, action of sodium with (FUCHS and METZL), A., i, 442.
  5-bromo-1:2·4-*tri*nitro-, action of amines on (GIUA and ANGELETTI), A., i, 649.
    action of hydrazines and of pyridine on (GIUA), A., i, 691.
  chloro-, physical constants of (TIMMERMANS, VAN DER HORST, and ONNES), A., ii, 258.
  p-*di*chloro-, nitration of (MACLEOD, PFUND, and KILPATRICK), A., i, 1131.
  chloro*tri*nitro-derivatives (HOLLEMAN), A., i, 997.
  halogen derivatives, corresponding states of (PRUD'HOMME), A., ii, 426.
  1:2:4:5-*tetra*hydroxy-, colouring matters from (MUKERJI), T., 545.
  nitro-derivatives, equilibrium of anthracene with (KREMANN and MÜLLER), A., i, 131.
    equilibrium of, with carbazole and acenaphthene (KREMANN and STRZELBA), A., i, 176.
    equilibria of triphenylcarbinol with (KREMANN, HOHL, and MÜLLER), A., i, 138.
  nitro-, action of mercuric acetate with (WIBAUT and JÜRGENS), A., i, 694.
    catalytic reduction of (BROWN and HENKE), A., i, 445, 535; (HENKE and BROWN), A., i, 586, 1196.
    reduction of, by sodium in alcohol (DE POMMEREAU), A., i, 339.
    action of sodium sulphite on (SEYEWETZ and VIGNAT), A., i, 241.

Benzene, *m*-*di*nitro-, equilibrium in the system, urethane and (Pushin and Fioletova), T., 2822.
  nitrochloro-, equilibrium of the formation of nitroanisole from (Blom), A., ii, 38.
5-Benzene(4′-arsinic acid)azo-4-amino-1:2-bisphenoxyacetic acid, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-3-amino-6-methoxyphenoxyacetic acid, and its hydrochloride (Jacobs and Heidelberger), A., i, 75.
6-Benzene(4′-arsinic acid)azoaminomethylphenoxyacetic acids, and their salts (Jacobs and Heidelberger), A., i, 75.
Benzene(4-arsinic acid)azo-α-aminonaphthoxyacetic acids, and their sodium salts (Jacobs and Heidelberger), A., i, 75.
6-Benzene(4′-arsinic acid)azo-3-aminophenoxyacetic acid, and its salts (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-2-ethoxyphenylglycine, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
5-Benzene(4′-arsinic acid)azo-2-hydroxy-phenoxyacetic acid, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-2-methoxyphenylaminomethanesulphonic acid, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-2-methoxyphenylglycine, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-2-methylphenylglycine, and its hydrochloride (Jacobs and Heidelberger), A., i, 75.
α′-Benzene(4-arsinic acid)azo-α-naphthylglycine, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-phenylaminomethanesulphonic acid, and its sodium salt (Jacobs and Heidelberger), A., i, 75.
4-Benzene(4′-arsinic acid)azo-phenylglycine, and its hydrochloride (Jacobs and Heidelberger), A., i, 75.
1-Benzeneazo-2-*p*-aminophenylamino-6-sulphonic acid (Bucherer and Zimmermann), A., i, 466.
Benzeneazo-6-amino-2-phenylbenzthiazole, *p*-nitro-; and its acetyl derivative (Bogert and Abrahamson), A., i, 576.
7-Benzeneazo-6-amino-2-*p*-tolyl αβ-naphthatriazole, 7-*p*-nitro- (Morgan and Chazan), A., i, 181.
4-Benzeneazo-3-anilino-5-keto*iso*oxazole (Worrall), A., i, 874.
6-Benzeneazohemimellitenol (v. Auwers and Saurwein), A., i, 1033.
6-Benzeneazo-α-hexahydrodeoxycinchonine (Jacobs and Heidelberger), A., i, 672.
5-Benzeneazo-2-hydroxy-4:6-dimethylbenzaldehyde, and its sodium salt (v. Auwers and Saurwein), A., i, 1032.
Benzeneazo-4-hydroxy-2-phenyl mercaptan, 3-nitro-4-thiol- (Watson and Dutt), T., 2417.
Benzeneazohydroxyquinol (Mukerji), T., 551.
4-Benzeneazo-1-methylaminonaphthalene-8-sulphonic acid, 4-*op*-*di*nitro- (Konig and Kohler), A., i, 880.
4-Benzeneazo-*N*-methyl-1:8-naphthasultam, 4-*p*-*mono*- and 4-*op*-*di*-nitro- (Konig and Kohler), A., i, 880.
4-Benzeneazo-1:8-naphthasultam, 4-*p*′-*mono*- and 4-*op*-*di*-nitro- (Konig and Kohler), A., i, 880.
2-Benzeneazo-1:8-naphthasultam-4-sulphonic acid, 2-*p*′-nitro- and its potassium salt (Konig and Keil), A., i, 823.
Benzeneazo-β-naphthol, *p*-amino-, and its derivatives (Charrier and Cortassa), A., i, 771.
2-Benzeneazo-α-naphthol-3:6-disulphonic acid, 7:8-*di*amino- (Bucherer and Zimmermann), A., i, 466.
Benzeneazo-β-naphthylamine, *p*-amino-, acetyl derivative (Charrier and Viola), A., i, 771.
Benzeneazo-β-naphthylglycine, and *p*-nitro-, ethyl ester (Fierz and Sallmann), A., i, 870.
4-Benzeneazo-1-naphthyl mercaptan (Watson and Dutt), T., 1940.
Benzeneazo-β-naphthylmethylamine-6-sulphonic acid, sodium salt (Morgan and Rooke), A., i, 134.
4-Benzeneazo-1-naphthylxanthic acid, ethyl ester (Watson and Dutt), T., 1940.
Benzeneazo-4-nitro-α-naphthol, *p*-nitro- (Mukerji), T., 2880.
Benzeneazo-4-oxybenzene-2′:3- and 3:3′-dicarboxylic acids, cobaltammine salts of (Morgan and Smith), T., 2872.
Benzeneazoxycarboxylic acid, potassium salt (Pieroni), A., i, 1073.
Benzene-1-azo-2-oxy-3-naphthoic acid, *m*-nitro-, and its cobaltammine salt (Morgan and Smith), T., 2873.

9-Benzeneazo-10-phenanthrol, *p*-bromo- and *o*-, *m*-, and *p*-nitro- (Charrier and Demichelis), A., i, 772.

Benzeneazophenol, and its derivatives, absorption spectra of (Smith and Boord), A., ii, 602.

2-Benzeneazophenol, 4′-bromo-, 4′-chloro-, and 4′-iodo- (Chattaway and Hill), T., 2757.

3-Benzeneazophenylarsinic acid, 4-hydroxy- (Bart), A., i, 1202.

1-*p*-Benzeneazophenylpiperidine, 4-hydroxy-, and its derivatives (Borsche and Bonacker), A., i, 51.

5-Benzeneazosalicylaldehyde-4′-sulphonic acid, and its derivatives (Weil, Traun, and Marcel), A., i, 1024.

Benzeneazosalicylic acid, *m*-nitro-, chromic, and cobaltammine salts of (Morgan and Smith), T., 2870.

Benzeneazo-*ar*-tetrahydro-β-naphthols (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 128.

Benzeneazo-*p*-tolueneazophenols, *p*-bromo- (Chattaway and Hill), T., 2760.

Benzenedialdehydes, hydroxy-, and their derivatives (Weil and Brimmer), A., i, 350.

2-Benzenediazoamino-3-bromo-*p*-cymene, and its hydrochloride and 2-*p*-nitro- (Wheeler and Smithey), A., i, 333.

Benzenediazonium chloride, compound of bismuth trichloride and (Challenger and Wilkinson), T., 102.

Benzenedi-*m*-thiobenzoic acid, and its sodium salt (Smiles and Graham), T., 2508.

Benzenedi-*p*-thiodimethylaniline (Smiles and Graham), T., 2510.

Benzenehydrazo-4-nitro-α-naphthol, *p*-nitro- (Mukerji), T., 2881.

Benzenehydrazo-*o*-nitrophenol, *p*-nitro- (Mukerji), T., 2881.

Benzenesulphamphthalein, 1:2:4:5-*tetra*hydroxy-, and its acetyl derivative (Dutt), T., 2392.

Benzenesulphonic acid, *N*-allylbrucinium, *N*-allylpapaverinium, and 1-allylpyridinium salts (Földi), A., i, 732.

Benzenesulphonic acid, bromoethyl, chloroethyl and dichloropropyl esters (v. Kereszty and Wolf), A., i, 1131.

Benzenesulphonpropyl-*n*-butylamide (v. Braun and Weismantel), A., i, 1151.

Benzenesulphonyl chloride, 2:5-*di*chloro- (Stewart), T., 2557.

5-Benzenesulphonylaminoacenaphthene (Fleischer and Schranz), A., i, 1144.

3-Benzenesulphonylcoumarin, 7-hydroxy- and 7-hydroxy-3-*p*-chloro- (Tröger and Bolte), A., i, 268.

Benzenesulphonyldiallylamine (Földi), A., i, 733.

3-Benzenesulphonyl-2-methylquinoline, and 3-*p*-chloro-, and their salts and derivatives (Tröger and Menzel), A., i, 270.

3-Benzenesulphonylquinophthalone, and 3-*p*-chloro- (Tröger and Menzel), A., i, 270.

Benzhydroxamic acid, thienoyl ester, and its salts (Jones and Hurd), A., i, 250.

Benzidine, compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.

hydrochloride, action of, with lignin (van Zijp), A., ii, 94.

hydroferrocyanide (Cumming), T., 1296.

Benzil (*dibenzoyl*), action of aluminium chloride with (Scholl and Schwarzer), A., i, 331.

conversion of, into benzilic acid (Lachman), A., i, 459.

alkali salts of (Staudinger and Binkert), A., i, 1016.

Benzil, 4:4′-*di*hydroxy-, and its dibenzoate (Schönberg and Kraemer), A., i, 664.

nitro-, preparation of, and its phenylhydrazone (Barnett and Kay), A., i, 844.

2:4-*di*nitro-, and its derivatives (Bishop and Brady), T., 2364.

ψ-Benzils (Schönberg and Kraemer), A., i, 663.

Benzilic acid, conversion of benzil into (Lachman), A., i, 459.

α-Benzilmonoxime, cobaltic salt (Ponzio), A., i, 662.

Benziloximes, isomerism of (Meisenheimer), A., i, 152.

Benzochloroamides, preparation and properties of (Elliott), T., 202.

1:2:3:4-Benzodiquinone-1:3-dioxime (*dinitrosoresorcinol*), cobaltammine and ferric salts of (Morgan and Moss), T., 2857.

Benzoethylpropylamide (v. Braun and Weismantel), A., i, 1151.

Benzofuran series, syntheses in the (Mameli), A., i, 669.

Benzoic acid, and *p*-nitro-, chloroethyl esters, preparation of (Altwegg and Landrivon), A., i, 315.

effect of substitution on the absolute affinity of (Rørdam), A., i, 338.

heat of combustion of (Verkade, Coops, and Hartman), A., ii, 474; (Swientoslawski and Starczewska), A., ii, 616.

Benzoic acid, compounds of carbamide and (OSAKA and ANDO), A., i, 1127.

Benzoic acid, and hydroxy-derivatives, alkali salts, solubility of, in water (SIDGWICK and EWBANK), T., 1844.

Benzoic acid, *o*-aminophenyl ester, hydrochloride, and its derivatives (BERGMANN, ULPTS, and CAMACHO), A., i, 1181.
- *a*-amyrenol and bromo-*a*-amyrenol esters (ZINKE, FRIEDRICH, JOHANNSEN, and RICHTER), A., i, 667.
- benzylidene-*p*-aminophenyl ester (REDDELIEN and DANILOF), A., i, 148.
- cinnamyl ester (RUPE and MULLER), A., i, 40.
- ethyl ester, reduction of, by sodium in alcohol (DE POMMEREAU), A., i, 338.
- lubanyl ester, constitution of (ZINKE, HANSELMAYER, and EHMER), A., i, 668.
- and nitro-, tribromo- and trichloro-*tert.*-butyl esters (ALDRICH and BLANNER), A., i, 910.
- *p*-chlorosulphonyl derivative (SMILES and HARRISON), T., 2023.

Benzoic acid, *p*-amino-, *p*-chloroacetyl derivative (QUICK and ADAMS), A., i, 601.
  - and *p*-nitro-, esters of, and their derivatives (v. BRAUN, BRAUNSDORF, and RÄTH), A., i, 760.
  - benzyl ester (SOCIETY FOR CHEMICAL INDUSTRY IN BASLE), A., i, 828.
  - *n*-butyl ester, and its hydrochloride (SOCIÉTÉ CHIMIQUE DES USINES DU RHÔNE), A., i, 827.
  - *γ*-diallylaminopropyl ester, preparation of (KAMM and VOLWILER), A., i, 654.
  - *γ*-dibutylaminopropyl ester (KAMM and ADAMS), A., i, 828.
- chloro*di*hydroxy-derivatives (FABRE), A., i, 1148.
- *m*-hydroxy-, bromo-, chloro- and hydroxy-derivatives of (BEYER), A., i, 37.
- iodo-*m*-hydroxy- (HENRY and SHARP), T., 1059.
- *p*-nitro-, lead diphenyl salt (GODDARD, ASHLEY, and EVANS), T., 982.
- 3:5-*di*nitro-, compound of diethylaniline and (LEY and GRAU), A., i, 536.
- 2:4:6-*tri*nitro-, mercuric salt (KHARASCH), A., i, 190.
- *p*-*di*thio-. See *p*-Disulphidobenzoic acid.
- *p*-thiol- (SMILES and HARRISON), T., 2024.

Benzoic acids, substituted, ethyl esters, velocity of saponification of (CASHMORE, MCCOMBIE, and SCARBOROUGH), T., 243.
- nitro-, estimation of nitrogen in, by the Kjeldahl method (MARGOSCHES and VOGEL), A., ii, 522.

4:5-Benzoindan-1-one (MAYER and SIEGLITZ), A., i, 743.

5:6-Benzoindan-1-one, 4-bromo-, and its oxime (MAYER and SIEGLITZ), A., i, 744.

Benzonaphtha-*p*-thiazine. See *ββ*-Naphthaphenthiazine.

Benzonitrile, 4-bromo-3-nitro-, and 4-chloro-3-nitro-, replacement of halogen in (MATTAAR), A., ii, 275.
- 2:5-*di*hydroxy- (FICHTER and GRISARD), A., i, 37.

***γ*-Benzophenarsazinic acid**, and its sodium salt (LEWIS and HAMILTON), A., i, 188.

Benzophenone, latent heat of fusion of (STRATTON and PARTINGTON), A., ii, 258.
- chloride, action of sodium methoxide and its homologues on (MACKENZIE), T., 1695.
- diphenylhydrazone (CIUSA and VECCHIOTTI), A., i, 475.

Benzophenone, substituted derivatives of, crystallography of (JAEGER), A., i, 353.
- 2:4:6:2′-*tetra*hydroxy-, and its ketimide hydrochloride (KARRER), A., i, 40.
- 2:4:6:3′- and 2:4:6:4′-*tetra*hydroxy- (NISHIKAWA and ROBINSON), T., 842.

Benzophenoneanil methiodide (KNOEVENAGEL and BÄHR), A., i, 750.

Benzophenoneanil-*p*′-carboxylic acid, salts of (REDDELIEN), A., i, 146.
- ethyl and methyl esters (REDDELIEN and DANILOF), A., i, 147.

Benzophenone-*p*-anilinoanil (REDDELIEN), A., i, 146.

Benzophenone-*p*-arsenious acid and -*p*-**arsenious oxide** (LEWIS and CHEETHAM), A., i, 187.

Benzophenone-*p*-arsinic acid, and nitro- (LEWIS and CHEETHAM), A., i, 187.

Benzophenonebenzoylhydrazone (REDDELIEN), A., i, 146.

Benzophenonebenzoylimide (REDDELIEN and DANILOF), A., i, 148.

Benzophenone-*p*-hydroxyanil, acetate and benzoate of (REDDELIEN and DANILOF), A., i, 148.

Benzophenonemethylimide (REDDELIEN), A., i, 146.

Benzophenone-*β*-naphthil (REDDELIEN), A., i, 146.

Benzophenone-*p*-tolil methiodide (KNOEVENAGEL and BÄHR), A., i, 750.

Benzopolymethylene compounds (v. Braun, Hahn, and Seemann), A., i, 728; (v. Braun, Moldaenke, Dirlam, and Gruber), A., i, 748; (v. Braun and Gruber), A., i, 762.

Benzopropyl-*n*-butylamide (v. Braun and Weismantel), A., i, 1151.

α-Benzopyrone, synthesis of derivatives of (Tröger and Bolte), A., i, 267.

Benzopyrylium compounds, ring opening in (Decker and Becker), A., i, 358.

***p*-Benzoquinone,** electromotive equilibria of quinol with (Granger and Nelson), A., i, 43.
  addition of benzene to (Pummerer and Prell), A., i, 1164.
  derivatives, oxidation-reduction potentials of (LaMer and Baker), A., ii, 785.
  diphenylhydrazone, and its leuco-derivative (Goldschmidt and Renn), A., i, 476.

Benzoselenamide, *o*-amino- (Bogert and Chen), A., i, 1182.

Benzotrichloride-*o*-carboxylic acid, anilide and methyl ester (Ott), A., i, 836.

Benzoxazole-2-aldehydeanil and -2-carboxyanilide (Skraup and Moser), A., i, 575.

Benzoxazole-2-carboxyl chloride (Skraup and Moser), A., i, 575.

Benzoxazole-2-carboxylic acid (Skraup), and Moser), A., i, 575.

Benzoxazyldiphenylcarbinol (Skraup and Moser), A., i, 575.

Benzoxazyl phenyl ketone, and its oxime (Skraup and Moser), A., i, 575.

5-Benzoxy-1-benzoyl-3-methylpyrazole, and 4-bromo- (Rojahn), A., i, 373.

β-Benzoxy-α-diethylaminoethylbutyric acid, ethyl ester, and its hydrochloride (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 640.

β-Benzoxyethylconiine hydrochloride (v. Braun, Braunsdorf, and Räth), A., i, 760.

***N*-β-Benzoxyethyldihydro*iso*indole** hydrochloride (v. Braun, Braunsdorf, and Räth), A., i, 760.

***N*-β-** and **-γ-Benzoxyethyltetrahydro*iso*quinoline** hydrochlorides (v. Braun, Braunsdorf, and Räth), A., i, 761.

2-Benzoxynaphthalene, 3:6-*di*bromo- (Franzen and Stäuble), A., i, 450.

***N*-γ-Benzoxypropylconiine** hydrochloride (v. Braun, Braunsdorf, and Räth), A., i, 760.

***N*-β-Benzoxypropyldihydro*iso*indole,** and its derivatives (v. Braun, Braunsdorf, and Rath), A., i, 760.

***N*-γ-Benzoxypropylpiperidine** hydrochloride (v. Braun, Braunsdorf, and Räth), A., i, 760.

Benzoyl chloride, chlorination of (Hope and Riley), T., 2510.
  *per*oxide, action of cholesterol on (Windaus and Lüders), A., i, 453.
    Golodetz's reaction for (Gelissen), A., ii, 460.

Benzoylacetone, 3-chloro-, and its copper derivative (Morgan, Drew, and Barker), T., 2456.

Benzoylacetones, selenium (Morgan, Drew, and Barker), T., 2453.

Benzoylacetyldiazomethane, interaction of triphenylphosphine with (Staudinger and Lüscher), A., i, 238.

Benzoyl acetyl ketone, hydrazone of (Staudinger and Lüscher), A., i, 238.

1-Benzoyl-1-allyl*cyclo*propane (Haller and Benoist), A., i, 350.

δ-Benzoylamino-γ-ketovaleric acid, ethyl ester, and its semicarbazone (Windaus, Dörries, and Jensen), A., i, 61.

α-Benzoylamino-β-[6-methoxyindyl(3)]-acrylic acid (Kermack, Perkin, and Robinson), T., 1883.

***N*-Benzoylanhalamine,** *m*-nitro-, and its methyl ether (Spath), A., i, 166.

1-Benzoyl-5-anilinomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1186.

***o*-Benzoylbenzoic acid,** *o*-3′:5′-*di*bromo-4′-hydroxy-, *o*-3′chloro-4′-hydroxy-, and *o*-3′:5′-*di*chloro-4′-hydroxy- (Thiel and Müller), A., i, 660.
  o-3′:5′-*di*bromo-4′-hydroxy-, and *o*-4′-hydroxy-, and its salts and derivatives (Orndorff and Kelley), A., i, 833.

Benzoylbenzoin, mechanism of the formation of (Greene and Robinson), T., 2182.

Benzoyl-β-benzoxyethylcarbamide (Fromm and Honold), A., i, 530.

Benzoyl-3-benzoyloxy-4-methoxymandelonitrile (Greene and Robinson), T., 2195.

γ-Benzoyl-β-benzylcrotonic acid, γ-*p*-chloro- (Kohler and Smith), A., i, 458.

1-Benzoylbenzyl*cyclo*propane (Haller and Benoist), A., i, 350.

2-Benzoyl-4-bromobenzoic acid (Stephens), A., i, 141.

α-Benzoyl-β-butoxy-β-phenylethanes, α-bromo- (Dufraisse and Gérald), A., i, 843.

α-Benzoyl-β-butoxy-β-phenylethylenes (Dufraisse and Gérald), A., i, 843.

1-Benzoyl-2-*p*-chlorophenyl*cyclo*propane, 3-nitro- (Kohler and Smith), A., i, 458.

Benzoylcinchonidine dihydrochloride (Heidelberger and Jacobs), A., i, 673.

Benzoylcinnam*anti*aldoxime (Brady and Thomas), T., 2104.

Benzoyldiazoacetic acid, methyl ester, interaction of triphenylphosphine with (Staudinger and Lüscher), A., i, 237.

4-Benzoyl-3:5-dibenzylthiol-1:2:4-triazole (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 379.

Benzoyldihydrocinchonidine hydrochloride (Heidelberger and Jacobs), A., i, 673.

Benzoyldihydroquinine hydrochloride (Heidelberger and Jacobs), A., i, 673.

1-Benzoyl-3:5-diketo-1:4-hexahydrodiazine, attempts to prepare (Dubsky and Hoher), A., i, 57.

***N*-Benzoyl-5:7-dimethylisatoic** acid (Heller, Benade, and Hochmuth), A., i, 1060.

1-Benzoyl-3:4-dimethylpyrazole, 5-chloro- (Rojahn), A., i, 1184.

5-Benzoyl-2:4-dimethylpyrrole-3-carboxylic acid, ethyl ester (Fischer, Schneller, and Zerweck), A., i, 1056.

4-Benzoyl-1:3-diphenylpyrazole, 5-chloro- (Rojahn), A., i, 373.

α-Benzoyl-β-ethoxy-β-phenylethane, α-bromo- (Dufraisse and Gérald), A., i, 39.

1-Benzoyl-3-*p*-ethoxyphenyl-4-glyoxalone, 2-thiol- (Dains, Thompson and Asendorf), A., i, 1186.

Benzoyl*iso*eugenol, *di*bromo- and *di*iodo- (Rastelli), A., i, 1010.

Benzoyl-*p*-hydroxyphenylbenzoylcarbamide (Speckan), A., i, 580.

Benzoyl-*p*-hydroxyphenylcarbamide (Speckan), A., i, 580.

Benzoyliminodiacetic acid, and its salts and methyl ester (Dubsky and Hoher), A., i, 57.

Benzoylkynurenic acid, methyl ester (Späth), A., i, 173.

Benzoylmandelonitrile, action of alcoholic sodium ethoxide on (Greene and Robinson), T., 2182.

α-Benzoyl-β-methoxy-β-phenylethane, α-bromo- (Dufraisse and Gérald), A., i, 843.

α-Benzoyl-β-methoxy-β-phenylethylene (Dufraisse and Gérald), A., i, 843.

α-Benzoyl-α-methylacetoacetic acid, methyl ester (Dieckmann and Wittmann), A., i, 1157.

Benzoylmethylfuroxan (Ponzio), A., i, 1038.

α- and **β-Benzoylmethylglyoximes**, and their salts and derivatives (Ponzio), A., i, 1038.

Benzoylmethylnaphthalenes (Mayer and Sieglitz), A., i, 740, 743.

1-Benzoyl-1-methyl*cyclo*propane, and its derivatives (Haller and Benoist), A., i, 350.

Benzoyl-β-naphthylmethylamine-6-sulphonyl chloride (Morgan and Rooke), A., i, 135.

Benzoyl-2-nitro-3-methylamino-*p*-phenetidine (Reverdin and Roethlisberger), A., i, 538.

Benzoyl-2:3-*di*- and **-2:3:5-*tri*nitro-*p*-phenetidines** (Reverdin and Roethlisberger), A., i, 538.

Benzoyloxydiethylaminobutane, amino- and nitro-, hydrochlorides (Fourneau and Puyal), A., i, 639.

Benzoyloxydiethylaminopropane, amino- and nitro-, hydrochlorides (Fourneau and Puyal), A., i, 639.

Benzoyloxydimethylaminopropane, nitro-, hydrochloride (Fourneau and Puyal), A., i, 639.

Benzoylphenylacetylene, addition of malonic esters to (Kohler), A., i, 461.

1-Benzoyl-3-phenyl-5-anilinomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1186.

Benzoylphenylbenzylcarbinol, and its derivatives (García Banús and Pascual Vila), A., i, 734.

γ-Benzoyl-β-phenylbutyrolactone-α-carboxylic acid, methyl ester (Kohler), A., i, 552.

Benzoylphenylcarbamide (Fromm and Honold), A., i, 530.

γ-Benzoyl-β-phenylcrotonic acid, and its methyl ester (Kohler), A., i, 461.

γ-Benzoyl-β-phenylethylmalonic acid, methyl ester, and its bromo-derivatives (Kohler), A., i, 552.

1-Benzoyl-3-phenyl-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1186.

γ-Benzoyl-β-phenyl-α-methylbutyrolactone-α-carboxylic acid, methyl ester (Kohler), A., i, 552.

1-Benzoyl-2-phenyl*cyclo*propane, 3-nitro-1-*p*-chloro- (Kohler and Smith), A., i, 458.

Benzoylphloroglucinols, hydroxy- (NISHIKAWA and ROBINSON), T., 839.
Benzoylpiperoin (GREENE and ROBINSON), T., 2187.
α-Benzoyl-β-propoxy-β-phenylethane, α-bromo- (DUFRAISSE and GÉRALD), A., i, 843.
α-Benzoyl-β-propoxy-β-phenylethylenes (DUFRAISSE and GÉRALD), A., i, 843.
Benzoyl*iso*propylsemicarbazide (NEIGHBORS, FOSTER, CLARK, MILLER, and BAILEY), A., i, 881.
Benzoyl-5-quindoline, *o*-amino- (GRANDMOUGIN), A., i, 584.
***N*-α-Benzoylstyryl-*p*-aminophenol** (RUPE and WITTWER), A., i, 449.
β-Benzoyl-α-styrylethylphosphinic acid (CONANT, BUMP, and HOLT), A., i, 68.
1-Benzoyl-3-*m*-tolyl-5-anilinomethylene-4-glyoxalone, 2-thiol- (DAINS, THOMPSON, and ASENDORF), A., i, 1186.
1-Benzoyl-3-*m*-tolyl-4-glyoxalone, 2-thiol- (DAINS, THOMPSON, and ASENDORF), A., i, 1186.
4-Benzoyl-1-*p*-tolyl-3-methylpyrazole, 5-chloro- (ROJAHN), A., i, 373.
Benzoyltriacetylbromoglucose (FREUDENBERG and IVERS), A., i, 524.
Benzthiazole, derivatives of (ROMANI), A., i, 466.
    ethiodide (MILLS), T., 460.
Benzthiazole series, cyanine dyes of the (MILLS), T., 455.
Benzthiazolyl-1-*p*-benzoic acid (BOGERT and MEYER), A., i, 868.
1:2:3-Benztriazole, preparation of, and its benzoyl derivative (CHARRIER and BERETTA), A., i, 61.
1:3:5-Benztriazole, physiological action of (DALE and DUDLEY), A., i, 403.
Benzyl acetonyl sulphide and sulphoxide, and their derivatives (WAHL), A., i, 653.
Benzyl alcohol, instability of, and of its esters (MESSNER), A., i, 138.
    velocity of hydrolysis of esters of (VOLWILER and VLIET), A., ii, 41.
    catalytic action of (JACOBSON), A., i, 652.
Benzyl azide, decomposition of (CURTIUS and EHRHART), A., i, 775.
    bromides, *o*- and *p*-nitro- (MOUREU and BROWN), A., i, 23.
    chloride, chlorination of (OLIVIER), A., i, 726.
        action of benzene and, in presence of iron pyrites (SMYTHE), T., 1276.
        p-nitro-, condensation of, with cinnamaldehyde and furfuraldehyde (KLEUCKER), A., i, 734.
Benzyl chloroethyl ether (CLEMO and PERKIN), T., 649.
    cyanide. See Phenylacetonitrile.
    methyl ether, *p*-nitro- (KLEUCKER), A., i, 734.
    phenacyl sulphide and sulphoxide, and their derivatives (WAHL), A., i, 653.
    sulphide, compounds of gold haloids with (SMITH), A., i, 933.
    *di*sulphoxide, decomposition of (SMYTHE), T., 1400.
Benzylacetonylsulphone, and its derivatives (WAHL), A., i, 654.
Benzylamine hydroferrocyanide (CUMMING), T., 1294.
Benzylamine, *m*- and *p*-nitro-, preparation of (INGOLD and PIGGOTT), T., 2384.
Benzylaminoacetic acid, cyano-, ethyl ester, and its derivatives (SCHEIBLER and BAUMGARTEN), A., i, 656.
Benzylaminoitaconic acid, ethyl ester (CARRIÈRE), A., i, 318.
Benzylaminomethylmalonic acid, and its ethyl ester (CURTIUS and EHRHART), A., i, 776.
Benzylamino-oxides, action of sodium hydroxide with (MEISENHEIMER, GREESKE, and WILLMERSDORF), A., i, 334.
α-Benzylaminopropionic acid, hydrochloride (CURTIUS and EHRHART), A., i, 776.
1-Benzylaminopyrroline-5-one-3-carboxylic acid, ethyl ester (CARRIÈRE), A., i, 318.
5-Benzyl-5-*iso*amylbarbituric acid (DOX and YODER), A., i, 682.
Benzyl*iso*amylmalonic acid, ethyl ester (DOX and YODER), A., i, 682.
2-Benzylbenzoxazole, derivatives of (SKRAUP and MOSER), A., i, 575.
Benzylbenzylideneamine, polymeric (CURTIUS and EHRHART), A., i, 775.
γ-Benzylbutane-αβ-dicarboxylic acid, αβ-*di*cyano-γ-hydroxy-, and γ-hydroxy-, lactone (BIRCH and THORPE), T., 1833.
γ-Benzylbutane-ααβ-tricarboxylic acid, γ-hydroxy-, lactone (BIRCH and THORPE), T., 1833.
5-Benzyl-5-*n*- and -*iso*-butylbarbituric acids (DOX and YODER), A., i, 682.
Benzyl-*n*- and -*iso*-butylmalonic acids, ethyl esters (DOX and YODER), A., i, 681.
Benzylcamphor, *p*-amino-, and its acetyl derivative, *p*-bromo-, *p*-chloro, *p*-cyano- and *p*-hydroxy- (HALLER and OUDIN), A., i, 356.
Benzyldextrin (GOMBERG and BUCHLER), A., i, 112.

_N_-Benzyldihydroquinicine hydrochloride (Heidelberger and Jacobs), A., i, 673.
Benzyldimethylamine, *o*-hydroxy- (Madinaveitia), A., i, 133.
Benzyl diphenylmethyl ketone, formation of (Orékhoff and Tiffeneau), A., i, 458.
5-Benzyl-5-ethylbarbituric acid (Dox and Yoder), A., i, 682.
α-Benzyl-α-ethylbutyric acid, and its amide and acid chloride (Haller and Bauer), A., i, 259.
Benzylethylmalonic acid, ethyl ester (Dox and Yoder), A., i, 681.
Benzyl α-furyl ketone, *p*-nitro-, and its oxime (Kleucker), A., i, 735.
β-Benzylglucoside, toxicity of (Richaud), A., i, 1094.
β-Benzyl-_d_-glucoside, action of digestive juices on (Richaud), A., i, 1094.
β-Benzylglutaric acid, and αα′-*di*cyano-, diamide of (Stevenson and Thorpe), T., 1720.
_N_-Benzylglycine hydrochloride (Scheibler and Baumgarten), A., i, 656.
Benzyl_cyclo_hexane series, semipinacolic transposition in (Tiffeneau and Porcher), A., i, 537.
1-Benzyl_cyclo_hexan-1-ol, 2-iodo- (Tiffeneau and Porcher), A., i, 537.
1-Benzyl_cyclo_hexan-2-one, and its semicarbazone (Tiffeneau and Porcher), A., i, 537.
Benzylhydrobenzoin. See αβγ-Triphenylpropane-αβ-diol.
β-Benzylhydrocarbostyril-β-carboxylic acid, β-*o*-nitro-, ethyl ester (Leuchs, v. Katinsky, and Conrad), A., i, 473.
Benzylidene chloride, action of sodium methoxide and its homologues on (Mackenzie), T., 1695.
Benzylideneacenaphthenone, 2-hydroxy-, glucoside of (Bruni and Romani), A., i, 756.
α-Benzylideneacetoacetic acid, α-*p*-nitro-, ethyl ester (Heller, Lauth, and Buchwaldt), A., i, 348.
Benzylideneacetoneglucosamic acid (Levene), A., i, 1028.
Benzylideneacetoneglucose (Levene, Meyer, and Weber), A., i, 987.
Benzylideneacetophenone. See Phenyl styryl ketone.
5-Benzylideneaminoacenaphthene, and chloro-, hydroxy-, and nitro-derivatives (Fleischer and Schranz), A., i, 1143.
Benzylideneaminoacetic acid, metallic salts (Scheibler and Baumgarten), A., i, 656.
Benzylidene-_p_-aminobenzoic acid, ethyl ester (Reddelien and Daniloff), A., i, 148.
1-_p_-Benzylideneaminophenyl-5-methylbenzthiazole (Bogert and Meyer), A., i, 869.
Benzylidene-αβ-anhydrogluconic acid, ethyl ester and amide (Levene), A., i, 1029.
4-Benzylidene-3-anilino-5-keto_iso_oxazole, and its derivatives (Worrall), A., i, 874.
Benzylidene-_o_- and -_p_-anisidines, 2:4:6-*tri*nitro- (Lowy and Baldwin), A., i, 134.
Benzylideneanthranilic acid, 2:4-*di*nitro- (Ekeley, Rogers, and Swisher), A., i, 935.
Benzylideneanthranilic acids, action of acetic anhydride on (Ekeley, Rogers, and Swisher), A., i, 934.
Benzylidenebenzhydrazide chloride, action of sodium azide with (Stollé and Netz), A., i, 690.
Benzylidenebenzylamine, isomeric *mono*- and *di*-nitro-derivatives of (Ingold and Piggott), T., 2385.
Benzylidenebis-_p_-nitrobenzaldehyde, *p*-nitro-, methylhydrazone (Brady and McHugh), T., 1651.
Benzylidene-_p_-bromoaniline, *p*-hydroxy-, and *m*-nitro- (Ingold and Piggott), T., 2798.
Benzylidenecamphor, *p*-amino-, and its salts, and *p*-chloro-, and *p*-cyano- (Haller and Boudin), A., i, 356.
Benzylidenechitosamic acid. See Benzylideneglucosamic acid.
Benzylidene-_o_- and -_p_-chloroanilines, 2:4:6-*tri*nitro- (Lowy and Baldwin), A., i, 134.
Benzylidene-2:4-_di_chloroaniline, 2:4:6-*tri*nitro- (Lowy and Baldwin), A., i, 134.
1-Benzylidenecoumaran-2-ones, 4- and 6-chloro-, and their dibromides (Minton and Stephen), T., 1602.
Benzylidenedeoxygluconic acid, ethyl ester (Levene), A., i, 1029.
Benzylidenediacetoneglucose (Freudenberg and Brauns), A., i, 1117.
Benzylidenedicarbamic acid, ethyl ester (Datta and Chatterjee), A., i, 816.
Benzylidenefluorene, 2-hydroxy-, glucoside of (Bruni and Romani), A., i, 755.
9-Benzylidenefluorene-2-carboxylic acid, 2:7-*di*bromo-, and its ethyl ester (Sieglitz and Jassoy), A., i, 821.
Benzylidenegluconic acid, β-bromo-, ethyl ester (Levene), A., i, 1029.

Benzylidenegluconic acid, α-chloro-, ethyl ester and amide (Levene), A., i, 1029.

Benzylideneglucosamic acid, and its ethyl ester (Levene), A., i, 1028.

Benzylideneglycine (Scheibler and Baumgarten), A., i, 656.

1-Benzylideneimino-5-phenyl-1:2:3:4-tetrazole, and its iodochloride (Stollé and Netz), A., i, 690.

Benzylideneindene, 2-hydroxy-, glucoside of (de Fazi), A., i, 755.

Benzylideneisatinazine, and *p*-nitro- (Borsche and Meyer), A., i, 54.

δ-Benzylidenelævulic acid, and its ethyl ester, and their semicarbazones (Kleucker), A., i, 785.

Benzylidenemannonic acid. See Benzylidenegluconic acid.

Benzylidenemethyl α-hydroxy*iso*propyl ketone. See α-Phenyl-δ-methyl-Δ^{α}-penten-δ-ol-γ-one.

Benzylidene-1-methylisatinazine, and *p*-nitro- (Borsche and Meyer), A., i, 55.

2-Benzylidene-5-methylpyrrole-4-carboxylic acid, 3-hydroxy-, ethyl ester (Fischer and Herrmann), A., i, 1054.

Benzylidene-β-naphthylamine, dimeride of (Ciusa), A., i, 1062.

Benzylidene-*o*-nitroaniline, and *m*- and *p*-nitro- (Ingold and Piggott), T., 2799.

Benzylidene-*m*-nitroaniline, *p*-hydroxy- (Ingold and Piggott), T., 2799.

Benzylidene-*p*-nitroaniline, *m*-nitro- (Ingold and Piggott), T., 2802.

Benzylidenenitrobenzylamines, *m*- and *p*-nitro- (Ingold and Piggott), T., 2801.

Benzylidene-*o*- and -*p*-phenetidines, 2:4:6-*tri*nitro- (Lowy and Baldwin), A., i, 134.

Benzylidenephthalide-*o*-carboxylic acid, methyl ester, and its dibromide (Ruggli and Meyer), A., i, 344.

Benzylidene-*dl*-piperitone (Read and Smith), T., 574.

Benzylidene-*p*-toluidine, *p*-nitro- (Bogert and Meyer), A., i, 868.

4-Benzylidene-1:2:3-triethylresorcinol (Fabre), A., i, 1148.

Benzyliminodiacetic acid, and its salts and derivatives (Dubsky and Dingemanse), A., i, 56.

Benzyliminodiacetimide. See 3:5-Diketo-1-benzyl-1:4-hexahydrodiazine.

Benzyliminodiacetonitrile, and its hydrochloride (Dubsky and Dingemanse), A., i, 56.

3-Benzyl-2-indolinone, and its 1-acetyl derivative, and 5:7-*di*bromo- (Tomiček), A., i, 679.

Benzylmalonazidic acid (Curtius and Sieber), A., i, 722.

Benzylmalonhydrazidic acid, and its potassium salt and benzylidene derivative (Curtius and Sieber), A., i, 722.

Benzylmalonic acid, *o*-nitro-, methyl ester (Leuchs, v. Katinsky, and Conrad), A., i, 473.

Benzyl-*p*-menthenol, and its phenylurethane (Read and Smith), T., 581.

Benzylmethylamine, *o*-hydroxy-, salts of (Zemplén and Kunz), A., i, 564.

Benzylmethylaniline, and its oxide, picrates of (Meisenheimer and Willmersdorf), A., i, 334.

5-Benzyl 5-methylbarbituric acid (Dox and Yoder), A., i, 682.

2-Benzyl-2-methyl-2:3-dihydrofuran, and 4(?)bromo- (Helferich and Gehrke), A., i, 9.

Benzylmethylethylamine, and its oxide and their picrates (Meisenheimer and Lohsner), A., i, 822.

Benzylmethylethylhydroxylammonium salts (Meisenheimer and Lohsner), A., i, 822.

β-Benzylmethylheptenol (Helferich and Gehrke), A., i, 9.

4-Benzyl-1-methyl*cyclo*hexan-4-ol, and 3-iodo- (Tiffeneau and Porcher), A., i, 537.

4-Benzyl-1-methyl*cyclo*-Δ^{3}-hexene (Tiffeneau and Porcher), A., i, 537.

3-Benzylmethyl-2-indolinones (Tomiček), A., i, 679.

Benzyl methyl ketone, *p*-hydroxy-, and its semicarbazone (Le Brazidec), A., i, 456.

1-Benzyl-1-methyl*cyclo*propane-2-carboxylic acid, 2:3-*di*cyano-, and its amide (Birch and Thorpe), T., 1830.

1-Benzyl-1-methyl*cyclo*propane-2:3-dicarboxylic acid, *cis*- and *trans*- forms, and their derivatives and 2:3-*di*cyanoimide of (Birch and Thorpe), T., 1830.

***N*-Benzylnortropinone**, and its dibenzylidene derivative (Merck, Wolfes, and Maeder), A., i, 1173.

Benzyloxide, sodium, reactivity of alkyl iodides with (Haywood), T., 1904.

7-Benzyloxy-7:12-dihydro-γ-benzophenarsazine (Lewis and Hamilton), A., i, 188.

5-Benzyloxy-3:4-dimethoxybenzaldehyde (Späth and Röder), A., i, 853.

5-Benzyloxy-3:4-dimethoxybenzoic acid (Spath and Röder), A., i, 853.

β-5-Benzyloxy-3:4-dimethoxyphenylethylamine, and its picrate (Späth and Röder), A., i, 853.

5-Benzyloxy-3:4-dimethoxystyrene, ω-nitro- (Späth and Roder), A., i, 853.

β-Benzyloxytetraethylammonium iodide (Clemo and Perkin), T., 649.

β-Benzyloxytriethylamine (Clemo and Perkin), T., 649.

Benzylphenacylsulphone, and its derivatives (Wahl), A., i, 654.

1-Benzyl*cyclo*propane-1-carboxylic acid, and its amide (Haller and Benoist), A., i, 350.

5-Benzyl-5-*n*-propylbarbituric acid (Dox and Yoder), A., i, 682.

Benzyl*iso*propylmalonic acid, ethyl ester (Dox and Yoder), A., i, 681.

Benzylpyrazoleanthrone-yellow, and *p*-chloro- and *o*-nitro- (Mayer and Heil), A., i, 878.

1-Benzylpyridinium, existence of (Weitz and Ludwig), A., i, 365.

hydrogen carbonate (Weitz and König), A., i, 1187.

3-Benzylsemicarbazide, and its hydrochloride and benzylidene derivative (Wilson, Hopper, and Crawford), T., 868.

Benzyl styryl ketone, *p*-nitro-, and its oxime (Kleucker), A., i, 735.

2-Benzylthiol-1-*p*-anisyl-4-benzylidenehydantoin (Hill and Kelsey), A., i, 1141.

Benzylthiol-ψ-carbazinocarbothioxylic acid, benzyl ester, and its benzoyl derivative (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 380.

2-Benzylthiol-1-*p*-chlorophenyl-4-benzylidenehydantoin (Hill and Kelsey), A., i, 1141.

2-Benzylthiol-1:4-dimethyldihydro-6-pyrimidone, 2-*p*-nitro- (Horn), A., i, 375.

2-Benzylthiol-3-*p*-ethoxyphenyl-5-anilinomethylene-4-glyoxalone (Dains, Thompson, and Asendorf), A., i, 1186.

2-Benzylthiol-4-methyldihydro-6-pyrimidone, 2-*p*-nitro- (Horn), A., i, 375.

2-Benzylthiol-3-phenyl-5-anilinomethylene-4-glyoxalone (Dains, Thompson, and Asendorf), A., i, 1186.

2-Benzylthiol-3-tolyl-5-anilinomethylene-4-glyoxalones (Dains, Thompson, and Asendorf), A., i, 1186.

2-Benzylthiol-1-*m*-tolyl-4-benzylidenehydantoin (Hill and Kelsey), A., i, 1142.

***S*-Benzylthiosemicarbazide** hydrochloride and sulphate (Wilson and Burns), T., 874.

Benzyltrimethylammonium chloride, *o*-hydroxy- (Zemplén and Kunz), A., i, 565.

Benzylvinyl bromide (Porcher), A., i, 539.

Berberine, conversion of, into palmatine (Späth and Lang), A., i, 166.

Beri-beri, avian, decrease in cell oxidation as the cause of (Fleisch), A., i, 1215.

Beryl, Japanese (Shibata and Uemura), A., ii, 305.

Beryllium. See Glucinum.

Beta vulgaris. See Beetroot.

Betaines (Pfeiffer), A., i, 720; (Pfeiffer and Haefelin), A., i, 738.

Betulin, and its silver salt and hydrogen phthalate (Schulze and Pieroh), A., i, 1045.

***allo*Betulin,** and its salts and esters (Schulze and Pieroh), A., i, 1045.

***apoallo*Betulin** (Schulze and Pieroh), A., i, 1046.

***allo*Betulone,** and its derivatives (Schulze and Pieroh), A., i, 1046.

Bile acid, unsaturated, preparation of an (Riedel), A., i, 1160.

Bile acids (Borsche, Weickert, and Meyer), A., i, 255; (Wieland and Schlichting), A., i, 554, 838; (Riedel), A., i, 554; (Wieland and Adickes), A., i, 838.

constitution of (Borsche and Hallwass), A., i, 1158, 1159.

unsaturated (Boedecker and Volk), A., i, 1027.

detection of (Lepehne), A., ii, 800.

Bile pigments (Küster), A., i, 885; (Küster and Herrmann), A., i, 886.

action of intestinal bacteria on (Passini), A., i, 966.

reactions of (Rosenthal and Meier), A., i, 198.

detection of (Ionescu and Pop), A., ii, 671.

detection of, in gastric juice (Utz), A., ii, 799.

detection of, in urine (Silberstern), A., ii, 799.

Bile salts (Wieland and Schulenburg), A., i, 346.

Bilianic acid, disemicarbazone of (Borsche and Hallwass), A., i, 1159.

Bilirubin, preparation and reactions of (Küster), A., i, 885.

constitution of (Fromholdt and Nersessov), A., i, 387.

formation of, in the spleen (Ernst and Szappanyos), A., i, 1089.

azo-dyes from (Fischer and Barrenscheen), A., i, 278.

effect of injection of (Fromholdt and Nersessov), A., i, 404.

Bilirubin, estimation of, in blood (Holzer and Mehner), A., ii, 799.
  estimation of, in serum (Thannhauser and Andersen), A., ii, 671.
Biliverdin, reactions of (Kuster), A., i, 885.
Biloidanic acid (Borsche, Weickert, and Meyer), A., i, 255; (Wieland and Schlichting), A., i, 554.
Binary systems, influence of substitution on equilibria in (Kremann and Müller; Kremann, Odelga, and Zawodsky), A., i, 131; (Kremann, Hohl, and Müller), A., i, 138; (Kremann and Odelga), A., i, 159; (Kremann and Strzelba), A., i, 176; (Kremann, Hemmelmayr, and Riemer), A., i, 1010.
Biocolloids, action of bases and salts on (MacDougall), A., i, 204.
Biological reactions, physico-chemical studies on (Hirsch and Kunze), A., i, 781; (Hirsch), A., i, 785.
Biology, importance of sequence in (Karczag; Karczag and Hajós), A., i, 302.
Bioluminescence (Harvey), A., i, 299.
Bird-lime, Japanese (Yanagisawa and Takashima; Nishizawa), A., i, 652.
Birds' nests, edible Chinese, constituents of (Wang), A., i, 299.
Bis-5-acetyl-2:4-dimethylpyrrole 3′-*di*-sulphide (Fischer and Herrmann), A., i, 1055.
4:4″-Bisazo-benzolyl ether, 4′-hydroxy- and its acetyl derivative (Fichter and Jaeck), A., i, 62.
2:4-Bisbenzeneazophenol, *mono*- and *di*-bromo-, -chloro-, and -iodo-derivatives (Chattaway and Hill), T., 2758.
Bis-1-benzyl-2:4-dimethylpyridinium (Weitz and König), A., i, 1188.
Bis-1-benzyl-2:4:6 trimethylpyridinium (Weitz and König), A., i, 1188.
Bis(3-carbethoxy-2:4- and -2:5-dimethylpyrryl)furylmethanes (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.
Bis-3-carbethoxy-2:4-dimethylpyrrylmethane. See Methenylbis-2:4-dimethylpyrrole-3-carboxylic acid, ethyl ester.
p-**Bis(3-carbethoxy-2:5-dimethylpyrryl)-methylbenzaldehyde**, and its hydrazone (Fischer and Kaan), A., i, 869.
Bis(3-carbethoxy-2:4-dimethylpyrryl)-*m*-nitrophenylmethane (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.
Bis-ββ′-*di*chlorodivinylchloroarsine-bis-ββ′-*di*chlorodivinylhydroxyarsine platinichloride (Mann and Pope), T., 1759.
Bis-β-chlorovinylbis-ββ′β″-*tri*chlorotrivinylarsine, platinum compound (Mann and Pope), T., 1758.
Biscoumaric acids (de Jong), A., ii, 1049.
Bisdiazobenzoylhistidine (Hermanns), A., i, 1092.
Bis-4:4′-dibenzthiazole, 1:1′-*di*thiol- (Romani), A., i, 467.
s.-**Bisdibenzylmethylcarbamide** (Jones and Scott), A., i, 454.
Bisdiethylaminoethyldiketo*cyclo*hexanedicarboxylic acid, ethyl ester (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 525.
Bisdihydrocarbostyril-3:3′-spiran-6:6′-disulphonic acids, and their barium salts (Leuchs, Conrad, and v. Katinszky), A., i, 874.
αζ-**Bisdimethylamino-γδ-diphenylhexane-γδ-diols** (Mannich and Heilner), A., i, 351.
Bis-*p*-dimethylaminotriphenylmethyl *per*oxide (Wieland, Popper, and Seefried), A., i, 773.
Bisdiphenyldibiphenylenehydrazine (Wieland, Wecker, and Albert), A., i, 779.
Bis-5-ethyl-5-methyltetrahydro-2 furyl ether (Helferich and Weidenhagen), A., i, 1115.
Bisglucosyl ζ-selenides and ζ-sulphide, and their derivatives (Wrede), A., i, 226.
Bishydrocarbostyril-3:3-spiran, and *p*-*mono*- and *pp′*-*di*hydroxy-, and their derivatives (Leuchs, v. Katinsky, and Conrad), A., i, 471.
Bishydrocoumarin-3:3-spiran (Leuchs, v. Katinsky, and Conrad), A., i, 473.
3:3′-Bis-*o*-α-*di*hydroxybenzylamino-*di*-hydroxyarsenobenzene, and its dihydrochloride (Raiziss and Blatt), A., i, 1079.
p-**Bis-β-hydroxyethylaminobenzoic acid**, ethyl ester (Altwegg and Landrivon), A., i, 1023.
3:3′-Bis-α-hydroxy-*p*-methoxybenzylamino-4:4′-*di*hydroxyarsenobenzene (Raiziss and Blatt), A., i, 1079.
3:3′-Bis-*p*-α-*di*hydroxy-*m*-methoxybenzylamino-4:4′-*di*hydroxyarsenobenzene (Raiziss and Blatt), A., i, 1079.
3:3′-Bishydroxymethylamino-4:4′-*di*-hydroxyarsenobenzene dihydrochloride (Raiziss and Blatt), A., i, 1079.

Bishydroxymethyleneacetonedianilide. See Dianilinovinyl ketone.

3:3′-Bis-α-hydroxy-*m*-nitrobenzylamino-4:4′-*di*hydroxyarsenobenzene (Raiziss and Blatt), A., i, 1079.

3:3′-Bis-α-hydroxy-γ-phenylallylamino-4:4′-*di*hydroxyarsenobenzene (Raiziss and Blatt), A., i, 1080.

Bis-1:3′-indil(*bis*-1:3-*di-indoyl*) (Oddo and Sanna), A., i, 371.

2:2′-Bis-*p*-methoxybenzylideneamino-1:1′-dinaphthyl (Jacobsen), A., i, 594.

Bis-2-methyl-1-naphthoylhydrazine (Mayer and Sieglitz), A., i, 742.

Bis-5-methyltetrahydro-2-furyl ether (Helferich and Weidenhagen), A., i, 1115.

Bis-6-methyltetrahydro-2-α-pyryl ether (Helferich and Weidenhagen), A., i, 1115.

Bismuth, spectrum of (Nagaoka and Sugiura), A., ii, 101.
  L-series spectrum of (Duane and Patterson), A., ii, 463.
  N-series spectrum of (Dolejšek), A., ii, 463.
  anodic corrosion of (Prideaux and Hewis), A., ii, 511.
  liquid, density and surface tension of (Hogness), A., ii, 29.
  solubility of lead in (Di Capua), A., ii, 576.

Bismuth compounds, preparation of (Prideaux and Hewis), A., ii, 511.

Bismuth salts, treatment of syphilis with (Sazerac and Levaditi), A., i, 89; (Fournier and Guénot), A., i, 301.

Bismuth thallous bromide and iodide (Canneri and Perina), A., ii, 512.
  *tri*chloride, compounds of diazonium chlorides with (Challenger and Wilkinson), T., 102.
  hydrides (Paneth, Johannsen, and Matthies; Paneth, Matthies, and Schmidt-Hebbel), A., ii, 383.
  *sub*iodide and *sub*oxyiodide (Denham), A., ii, 218.
  oxide, fusion diagram of mixtures of lead oxide and (Belladen), A., ii, 777.

Bismuth organic compounds (Challenger and Wilkinson), T., 91; (Challenger and Ridgway), T., 104.
  action of thallic chloride on (D. and A. E. Goddard), T., 260.
  dimethoxide and dimethyl (Denham), A., ii, 218.
  Bismuthi iodides of alkaloids (François and Blanc), A., i, 851.

Bismuth detection and estimation:—
  detection of, by mirrors (Scheucher), A., ii, 526.
  detection of, in urine (Aubry), A., ii, 165.
  detection of, in urine and in saliva (Ganassini), A., ii, 590.
  detection and estimation of (Canneri and Perina), A., ii, 512.
  estimation of (Critchett), A., ii, 90.
  metallic, estimation of (Kurtenacker and Werner), A., ii, 877.

Bismuth minerals, Spanish, chemical and spectrographic study of (Piña de Rúbies and Gila Esteban), A., ii, 576.

Bismuthines, tertiary aromatic (Challenger and Wilkinson), T., 91; (Challenger and Ridgway), T., 104.

αα′-Bisphenacylmethylmethylamine, and its hydrochloride (Mannich and Heilner), A., i, 351.

Bis-γ-phenoxy-*n*-butyrylamine (Putochin), A., i, 1176.

s.-**Bistriphenylmethylhydrazine**, molecular rearrangement of (Stieglitz and Brown), A., i, 778.

Bisulphites. See Sulphites under Sulphur.

Bis*iso*valerylaminoethane (Windaus, Dörries, and Jensen), A., i, 60.

Bis*iso*valerylaminoethylene, and its dibromide (Windaus, Dorries, and Jensen), A., i, 60.

Biuret, preparation of derivatives of (Fromm and Wenzl), A., i, 437.
  compound of copper ethylenediamine hydroxide with (Traube), A., i, 719.

Blackberry. See *Rubus fructicosus*.

Bladder, silica calculus in the (Schlicht), A., i, 496.

Bleaching chlorides, estimation of the available chlorine in (Royer), A., ii, 581.

Blende, oxidation of (Helbronner and Rudolfs), A., i, 706.

Blood, effect of poisons on the absorption spectrum of (Lewin and Stenger), A., ii, 414.
  effect of radium emanation on (Hauenstein), A., i, 80.
  condition of electrolytes in (Neuhausen), A., i, 891; (Neuhausen and Marshall), A., i, 1085.
  viscosity of, in relation to the distribution of cholesterol and of uric acid between plasma and corpuscles (Rouzaud and Thiéry), A., i, 394.

Blood, osmotic resistance and phosphatides of (Brinkman), A., i, 1086.
- increased supply of, during muscular activity (Harris), A., i, 696.
- effect of profuse perspiration on (Wilbrand), A., i, 79.
- chemistry of (Egerer-Seham and Nixon), A., i, 395.
  - in pregnancy (Killian and Sherwin; Caldwell and Lyle), A., i, 489.
- acetone substances in, after injection of adrenaline (Hubbard and Wright), A., i, 288.
  - in diabetes (Fitz), A., i, 192.
- neutralisation of acids by (Kennaway and McIntosh), A., i, 788.
- effect of ether anæsthesia on the acid-base balance of (van Slyke, Austin, and Cullen; Stehle, Bourne, and Barbour), A., i, 1085.
- amino-acids in (Costantino), A., i, 181; (Abderhalden), A., i, 287; (Okada and Hayashi), A., i, 483.
- ammonia in (Nash and Benedict), A., i, 191; (Nash), A., i, 483.
- calcium in (Mazzocco), A., i, 788, 891; (van Paassen), A., i, 1208.
  - of the new-born (Jones), A., i, 80.
- distribution of calcium, magnesium, potassium and sodium in (Kramer and Tisdall), A., i, 1087.
- carbon dioxide equilibrium and hydrogen-ion concentration in (Warburg), A., i, 788.
- effect of potassium cyanide on catalase in (Welker and Bollman), A., i, 192.
- distribution of chlorides in (Mukai; van Creveld; Norgaard and Gram), A., i, 287; (Muresanu), A., i, 290; (Dische), A., i, 1086.
- distribution of chlorine in (Siebeck and Hackmack), A., i, 1208.
- chloroform in, after death (Gibson and Laidlaw), A., i, 1218.
- cholesterol derivatives in (Lifschütz), A., i, 392.
- coagulation of (Funck), A., i, 290; (Heller), A., i, 291; (Stuber and Funck), A., i, 393; (Pickering and Hewitt), A., i, 393, 1208.
  - effect of carbon monoxide, illuminating gas and benzene on (Forbes and Hompe), A., i, 483.
  - effect of alkaline earth chlorides on (Lehmann), A., i, 892.
  - by euphylline (Meissner), A., i, 193.

Blood, action of nucleic acids on (Doyon), A., i, 82, 1087.
  - action of phosphatides on (Zunz and La Barre), A., i, 697.
- presence of cyanic acid in (Nicloux and Welter), A., i, 789.
- enzymes in (Compton), A., i, 392, 1087; (Bach and Zubkowa), A., i, 393; (Pincussen), A., i, 393.
- transformation of the fat in (Lifschütz), A., i, 392.
- action of germanium oxide on (Hammett, Nowrey, and Müller), A., i, 1086.
- physical chemistry of hæmoglobin in (Brown and Hill), A., i, 1199.
- preparation of histidine from (Demjanovski), A., i, 1052.
- distribution of hormones and drugs in (Schaeppi), A., i, 290.
- reaction of, with nascent hydrogen peroxide (Patzauer), A., ii, 172.
- inorganic ions in, in tetany (Gross and Underhill), A., i, 1210.
- lipoids of in tuberculosis (Henning), A., i, 963.
- nitrogen constituents of, in chronic nephritis (Williams), A., i, 401.
- inorganic phosphates in (Lehman), A., i, 191.
- effect of pilocarpine on the composition of (Bornstein and Vogel), A., i, 80.
- proteins of, and their part in the transport of carbon dioxide (Ausenda), A., i, 1209.
- action of purine diuretics on the concentration of (Nonnenbruch), A., i, 79.
- distribution of quinine in (Rona and Bloch), A., i, 290.
- hæmolysis of, by quinine (Luger), A., i, 81.
- action of salvarsan on the serum and corpuscles of (Kritschevsky), A., i, 394.
- effect of administration of sodium chloride on (Samson), A., i, 82.
- sugar in (Cammidge, Forsyth, and Howard), A., i, 81; (Falta and Richter-Quittner), A., i, 696; (Rosenberg), A., i, 789; (Stasiak), A., i, 1208.
  - in narcosis and disease (Chantraine), A., i, 192.
  - action of adrenaline on (Petényi and Lax), A., i, 403.
  - effect of amino-acids and fatty acids on (Pollak), A., i, 483.
  - effect of carbon dioxide on (Binswanger), A., i, 962.
  - action of phosphates on (Elias and Weiss), A., i, 1085.

- **Blood**, effect of sugar injection on the sugar content and the white corpuscles of (Moraczewski and Lindner), A., i, 402.
  - arterial and venous, distribution of sugar in (Henriques and Ege), A., i, 191; (Turban), A., i, 482.
  - capillary and venous, sugar distribution in (Neuwirth and Kleiner), A., i, 1208.
  - fate of sulphides in (Haggard and Charlton), A., i, 287.
  - distribution of urea in (Etienne and Vérain), A., i, 963.
  - distribution of uric acid in (Theis and Benedict), A., i, 82; (Chauffard, Brodin, and Grigaut), A., i, 1086.
  - free and bound water in (Neuhausen), A., i, 696.
  - morphological changes of (Pentimalli), A., i, 302.
  - defecation of, for the estimation of carbamide (Ionescu), A., ii, 596.
  - respiratory changes in (Austin, Cullen, Hastings, McLean, Peters, and van Slyke; Peters, Cullen, and Austin), A., i, 1207.
  - calves', concentration of proteins in (Howe), A., i, 1084.
    - effect of ingestion of colostrum on (Howe), A., i, 80.
  - of children in tetany, calcium in (Robles), A., i, 192
  - dogs', lactic acid in (Hastings), A., i, 81.
  - human, hydrogen-ion concentration in (Barcroft, Bock, Hill, Parsons, and Shoji), A., i, 891.
    - partial pressure of oxygen in (Barcroft and Nagahashi), A., i, 890.
    - reducing power of (Cooper and Walker), A., i, 1084.
    - uric acid in (Morris and Macleod), A., i, 392.
  - shed, acid-production in (Evans), A., i, 890.
  - reaction of (de Corral), A., i, 79; (Conway and Stephen), A., i, 892.
- **Blood detection and estimation**:—
  - analysis of (Richter-Quittner), A., ii, 240, 407; (Pincussen and Floros; Pincussen and Momferratos-Floros), A., ii, 408; (Folin and Wu), A., ii, 540; (Folin), A., ii, 596; (Utz), A., ii, 800.
  - analyses of the corpuscles and plasma of (Wu), A., i, 483.
  - analysis of gases of (Meier and Krönig), A., i, 191.

- **Blood detection and estimation**:—
  - collection and analysis of (Austin, Cullen, Hastings, McLean, Peters, and van Slyke), A., i, 1207.
  - detection and estimation of, in urine (Johannessen), A., ii, 724.
  - estimation of acetone substances in (Hubbard), A., ii, 284.
  - estimation of fatty acids in (Bloor, Pelkan and Allen), A., ii, 598.
  - estimation of amino-acids in (Petitjean), A., ii, 536.
  - estimation of ammonia in (Gad-Andresen), A., ii, 523.
  - estimation of bilirubin in (Holzer and Mehner), A., ii, 799.
  - estimation of calcium in (Weiss; Clark), A., ii, 227; (Ling and Bushill), A., ii, 587.
  - estimation of carbon monoxide in (Sayers and Yant), A., ii, 868.
  - estimation of chlorides in (Friend), A., ii, 389; (Petschacher; Isaacs), A., ii, 716.
  - estimation of creatine and creatinine in (Behre and Benedict), A., i, 789.
  - estimation of ethyl alcohol in (Widmark), A., ii, 789.
  - estimation of fibrin in (Gram), A., ii, 240.
  - estimation of fibrinogen in (Gram), A., i, 288; (Leendertz and Gromelski), A., ii, 798.
  - estimation of gases in (van Slyke and Stadie; Stadie), A., ii, 78.
  - apparatus for estimation of gases in (van Slyke), A., ii, 158.
  - estimation of hydrogen ions in (Lindhard), A., ii, 240.
  - estimation of hydrogen carbonate and hydrogen ions in plasma and (van Slyke; Cullen), A., ii, 672.
  - estimation of iron in (Brown), A., ii, 319.
  - estimation of lecithin in (Randles and Knudson), A., ii, 719.
  - estimation of lipoids in (Lemeland), A., ii, 666.
  - estimation of magnesium in (Denis), A., ii, 659.
  - estimation of non-protein nitrogen in (Ponder), A., ii, 583; (Richter-Quittner and Hoenlinger), A., ii, 717.
  - estimation of the oxygen-combining power of (Lundsgaard and Möller), A., ii, 724.
  - estimation of phenols in (Pelkan), A., ii, 399.
  - estimation of phosphoric acid in (Bloor), A., ii, 84.

Blood detection and estimation:—
  estimation of proteins in (Howe), A., ii, 171, 172.
  estimation of proteins and nitrogen in (Bierry and Moquet), A., ii, 886.
  estimation of sugar in (Rosenberg), A., i, 482; (Guy), A., ii, 94; (Tervaert), A., ii, 166; (Reist), A., ii, 323; (Stepp), A., ii, 592; (Labbé, Nepveux, and Nomidis), A., ii, 663; (Ernst and Weiss), A., ii, 724; (Csonka and Taggart), A., ii, 879.
  estimation of sulphates in (Denis), A., ii, 225.
  estimation of urea in (Nicloux and Welter), A., ii, 170; (Gad-Andresen), A., ii, 536.
  ureometer for estimation of urea in (Clogne), A., ii, 237.
  estimation of uric acid in (Guillaumin), A., ii, 170; (Grigaut; Benedict), A., ii, 405; (Pucher), A., ii, 668.
  estimation of uric acid and urates in (Bauman and Keeler; Guillaumin), A., ii, 796.
Blood-corpuscles, effect of narcotics on the charge on (Meier and Krönig), A., i, 191.
  agglutination and sedimentation of (Starlinger; Runnstrom), A., i, 289.
  volume curve of, in hypertonic solutions (Takei), A., i, 289.
  stability of suspensions of (Brinkman and Wastl), A., i, 289.
  effect of extirpation of glands on the development of (Asher and Matsumo), A., i, 298.
  permeability of, for dextrose (van Creveld and Brinkman), A., i, 192.
  hæmolysis of, by eosin (Schmidt and Norman), A., i, 892.
  fixation of quinine by (Rona and Block), A., i, 484.
  red, colloidal structure of (Hattori), A., i, 192.
    osmotic resistance curves of (Hamburger), A., i, 606.
    permeability of (Wiechmann), A., i, 80, 289.
    influence of potassium and radioactive substances on the oxidation velocity of (Ellinger), A., i, 288.
    human, dextrose content of (Bönniger), A., i, 606.
  white, glycogen content of (de Haan), A., i, 484.
Blood-corpuscles, estimation of non-hæmoglobin nitrogen in (Schoen), A., i, 484.
Blood-louse. See *Schizoneura lanigera.*
Blood-pigments (Küster and Gerlach), A., i, 596; (Kuster), A., i, 884.
Blood-plasma, combination of, with carbon dioxide (Taistra; Chanutin), A., i, 288.
  sugar in, in relation to sugar in cerebrospinal fluid and aqueous humour (de Haan and van Creveld), A., i, 295.
  human, flocculation of (Starlinger), A., i, 288.
  estimation of phosphates in (Denis and v. Meysenbug), A., ii, 584.
  estimation of inorganic phosphorus in (Myers and Shevky), A., ii, 455.
Blood pressure, effect of adrenaline on (Richaud), A., i, 891.
Blood-serum, ultra-violet absorption spectra and optical rotation of the proteins of (Lewis), A., ii, 245.
  buffer systems in (Doisy, Eaton, and Chouke), A., i, 963.
  calcium in, in pregnancy (Mazzocco and Moron), A., i, 892.
Blood-serum, cholesterol in (Strauss and Schubardt), A., i, 1209.
  isolation of the coagulating enzyme from (Bleibtreu), A., i, 1084.
  colloidal equilibrium of (Fischer), A., i, 1209.
  action of soaps with (Jarisch), A., i, 1087.
  estimation of atropine in (van der Heyde), A., ii, 669.
  estimation of globulins in (Henley), A., ii, 671.
  estimation of indican in (Snapper and van Vloten), A., ii, 793.
  estimation of salicylic acid in (Herissey), A., ii, 880.
Blood-vessels, action of calcium and potassium ions on (Hamburger), A., i, 606.
Blumea Malcomii, essential oil from (Simonsen and Rau), T., 876.
Body fluids, physical chemistry of (Rusznyák and Hetényi), A., i, 291.
  sulphates and sulphuric acid in (Heubner and Meyer-Bisch), A., i, 291.
Boiling point, relation of melting point to (Lorenz and Herz), A., ii, 739.
  relation between melting point, critical temperature and (Prud'homme), A., ii, 349.
Boldo leaf oil, constituents of (Roure-Bertrand Fils), A. i, 846.

Bone fat, analytical constants of (Eckart), A., i, 967.

Borneol, preparation of (Fabriques de Produits chimiques de Thann et de Mulhouse), A., i, 560.

from pinene hydrochloride (Vavon and Berton), A., i, 943.

Borneolcarboxylic acids (Bredt), A., i, 937.

n- and *iso*-**Bornyl** chloride, equilibrium of camphene hydrochloride with (Meerwein, van Emster, and Joussen), A., ii, 751.

Bornylene, preparation of (Meerwein and Joussen), A., i, 1042.

Bornylsemicarbazide (Neighbors, Foster, Clark, Miller, and Bailey), A., i, 881.

Boric acid. See under Boron.

Boroacetic acid, hydroxyanthraquinone esters of (Dimroth and Faust), A., i, 156.

Boron, atomic weight of (Baxter and Scott), A., ii, 285; (Hönigschmid and Birckenbach), A., ii, 641.

New Zealand, isotopes of (Monro), T., 986.

Röntgen rays from (Hughes), A., ii, 184; (Holtsmark), A., ii, 543.

Boron alloys with carbon and iron (Vogel and Tammann), A., ii, 852.

Boron nitride, reaction of, with metallic oxides (Sborgi and Nasini), A., ii, 564.

*tri*oxide, phosphorescence of hydrated (Tiede and Wulff), A., ii, 245.

Boric acid, organic phosphors of (Tiede, Wulff, and Ragoss), A., ii, 8; (Tomaschek), A., ii, 763.

effect of hydroxy-organic compounds on the hydrogen-ion concentration of (Rimbach and Ley), A., ii, 342.

and its salts, complex compounds of, with fructose and with mannitol (Gilmour), T., 1333.

action of, on mannitol (Dubrisay), A., i, 1110.

hydroxyanthraquinone esters of (Dimroth and Faust), A., i, 155.

estimation of (Strecker and Kannappel), A., ii, 784.

estimation of, in presence of phosphoric acid (Kolthoff; Deerns), A., ii, 867.

Borates (Sborgi and Ferri), A., ii, 568, 764.

dissociation and hydrolysis of, in solution (Menzel), A., ii, 345.

Polyborates (Rosenheim and Leyser), A., ii, 50.

Boron:—

Hexahydrodioxydiboron, potassium salt (Ray), T., 1088.

Boron organic compounds, preparation of (Krause and Nitsche), A., i, 22.

trialkyls (Krause and Nitsche), A., i, 22.

mono- and di-phenyl fluorides and triphenyl (Krause and Nitsche), A., i, 694.

Brain, constituents of (Shimizu), A., i, 85.

phosphosulphatides and lecithin from (Fränkel and Gilbert; Fränkel and Käsz), A., i, 294.

zinc and copper compounds in (Bodansky), A., i, 194.

Brass, protection of, from corrosion (Manley), A., ii, 840.

estimation of antimony in (Evans), A., ii, 231.

red, estimation of antimony and tin in (Mück), A., ii, 722.

Brassidic acid, ethyl ester and anhydride of (Holde and Schmidt), A., i, 982.

*iso*Brazilein, synthesis of (Crabtree and Robinson), T., 1033.

Bridge linkings, rupture of (Wahl), A., i, 653.

Bromates. See under Bromine.

Brometone. See *tert.*-Butyl alcohol, *tri*bromo-.

Bromic acid and **Bromides.** See under Bromine.

Bromination of organic acids (Ward), T., 1161.

Bromine, atomic weight of (Moles), A., ii, 141; (Baxter), A., ii, 370.

spectrum of the vapour of (Ribaud), A., ii, 3.

solid, vapour pressure of (Henglein, v. Rosenberg, and Muchlinski), A., ii, 760.

water, action of, on indene (Read and Hurst), T., 2550.

Hydrobromic acid, heats of neutralisation of (Richards and Rowe), A., ii, 425.

gaseous, density of (Moles), A., ii, 140.

Bromides, retention and excretion of, in the organism (Baur and Oppenheimer), A., i, 968.

estimation of, with silver nitrate (Kolthoff), A., ii, 581.

estimation of chlorides and, in presence of iodides (Kolthoff), A., ii, 79.

Bromic acid, estimation of (Kikuchi), A., ii, 519.

Bromine:—
  Bromates, reflection spectra of (Schaefer and Schubert), A., ii, 180.
Bromine organic compounds, preparation of, without production of hydrogen bromide (Gupta and Thorpe), T., 1896.
Bromine estimation:—
  estimation of, in animal tissues (Damiens), A., ii, 79.
Bromoform, vapour pressure of mixtures of ethyl ether and (Dolezalek and Schulze), A., ii, 118.
  action of, on magnesium alkyl haloids (Binaghi), A., i, 1002.
Brownian movement, theory of (Jäger), A., ii, 30.
Brucine hexosophosphate (Neuberg and Dalmer), A., i, 920.
Brucinesulphonic acid, quinols and quinones from, and their derivatives (Leuchs and Fricker), A., i, 677.
*iso***Butaldehyde**, α-bromo-, action of sodiomalonic ester with (Franke and Groeger), A., i, 808.
Butane, $\alpha\beta\delta$-*tri*amino-, salts of (Windaus, Dorries, and Jensen), A., i, 60.
  β-bromo- and β-chloro-hydroxy- (Fourneau and Puyal), A., i, 639.
  α-chloro-β-hydroxy- (Helferich and Speidel), A., i, 6.
*cyclo***Butane-1-carboxylic acid**, 1-hydroxy-, pyrogenic decomposition of, and its anhydrides (Demjanov and Dojarenko), A., i, 1161.
*cyclo***Butane-1:1-dicarboxylamide** (Ingold, Sako, and Thorpe), T., 1191.
*cyclo***Butane-1:1-dicarboxylbromoamide** (Ingold, Sako, and Thorpe), T., 1191.
Butane-$\alpha\gamma$**-diol-**$\alpha\beta$**-dicarboxylic acid**, and its salts and derivatives (Ingold), T., 2694.
5-*cyclo***Butane***spiro***hydantoin** (Ingold, Sako, and Thorpe), T., 1191.
*cyclo***Butanone**, preparation of (Demjanov and Dojarenko), A., i, 1161.
Δ^{α}**-Butene-**$\alpha\delta$**-dicarboxylic-**β**-acetic acids**, and their silver salts and derivatives (Farmer), T., 2019.
Δ^{α}**-Butene-**$\alpha\delta$**-dicarboxylic-**β**-malonic acid**, ethyl esters, and sodium salt (Farmer), T., 2017.
Δ^{α}**-Buten-**γ**-ol**, properties of (Baudrenghien), A., i, 710.
Butenonitriles (Bruylants), A., i, 817, 924.
β**-Butoxybutyronitriles** (Bruylants), A., i, 924.
7-*n***-Butoxy-7:12-dihydro-**γ**-benzophenarsazine** (Lewis and Hamilton), A., i, 188.
6-*n***- and -***iso***-Butoxy-2-methylquinoline**, and its ethiodide (Gutekunst and Gray), A., i, 951.
Butter, fatty acids of (Frog and Schmidt-Nielsen), A., i, 494.
  detection of coconut oil in (Muttelet), A., ii, 236.
*iso***Butylacetonylmalonic acid**, ethyl ester, and its phenylhydrazone (Gault and Salomon), A., i, 428.
*n***-Butylalanine**. See α-Methyl-*n*-hexoic acid, α-amino-.
*n***-Butyl alcohol** (Tsujimoto and Toyama), A., i, 297.
  preparation of (Grünstein), A., i, 112.
  chlorination of (Gault and Guillemet), A., i, 910.
*iso***Butyl alcohol**, solubility of, in water (Michels), A., ii, 486.
*tert.***-Butyl alcohol**, *tri*bromo-, and *tri*chloro-, benzoyl and nitrobenzoyl esters (Aldrich and Blanner), A., i, 910.
n- and *iso***-Butylammonium** ruthenipentabromides (Gutbier and Krauss), A., i, 16.
*dl-p-sec.***-Butylaniline**, resolution of (Glattfield and Wertheim), A., i, 385.
5-*n***-Butylbarbituric acid**, and 5-bromo-, ethyl ester (Dox and Yoder), A., i, 808.
5-*sec.***-Butylbarbituric acid** (Dox and Yoder), A., i, 817.
*iso***Butylboric acid** (Krause and Nitsche), A., i, 22.
Butyl*di***chloroarsine** (Quick and Adams), A., i, 601.
Buchu-camphor, preparation of (Asahina and Mituhori), A., i, 667.
Buckwheat, glutencasein of (Kiesel), A., i, 412.
Buffer solutions (van Slyke), A., i, 893.
  for colorimetry (Acree, Mellon, Avery, and Slagle), A., ii, 157.
  systems in blood-serum (Doisy, Eaton, and Chouke), A., i, 963.
Bufotalan (Wieland), A., i, 200.
Bufotalidin (Wieland), A., i, 200.
Bufotalin, and its acetyl derivative (Wieland), A., i, 200.
Bufotalone (Wieland), A., i, 200.
Bufotoxin (Wieland and Alles), A., i, 784.
Burner, rotary (Lockemann), A., ii, 43.
Butadiene, formation of, from ethylene (Zanetti, Suydam, and Offner), A., i, 977.

Butaldehyde, preparation of (Grünstein), A., i, 112; (Adam and Legg), A., i, 222.
n-**Butyl-*NN'*-dimethylmalonamide** (Dox and Yoder), A., i, 808.
Δ^{α}-**Butylene**, action of selenium chloride on (Boord and Cope), A., i, 421.
Δ^{α}-**Butylene**, γ-chloro- (Baudrenghien), A., i, 710.
  α-iodo- (Kaufmann and Schweitzer), A., i, 214.
Δ^{β}-**Butylene**, α-bromo-, and α-chloro- (Baudrenghien), A., i, 710.
*iso***Butylene-αγγγ'-tetracarboxylic acid**, ethyl ester (Ingold and Nickolls), T., 1643.
*iso***Butylene-αγγ'-tricarboxylic acid**, and its ethyl ester (Ingold and Nickolls), T., 1644.
Butylhydroxymalonic acid, β-hydroxy-, and its barium salt (Helferich and Speidel), A., i, 7.
γ-*iso***Butylidenemalonolactone**, ethyl ester (Franke and Groeger), A., i, 808.
sec.-**Butylmalonamide** (Dox and Yoder), A., i, 816.
n-**Butylmalonic acid**, and bromo-, derivatives of (Dox and Yoder), A., i, 808.
sec.-**Butylmalonic acid**, methyl ester (Dox and Yoder). A., i, 816.
*cyclo***Butylmethyldimethylamine**, and its salts (Demjanov and Dojarenko), A., i, 997.
*iso***Butyl methyl ketone**, α-chloro-β-hydroxy- (*mesityl oxide chlorohydrin*) (Pastureau and Bernard), A., i, 717.
dl-p-sec.-**Butylphenylhydrazine**, and its derivatives (Glattfield and Wertheim), A., i, 386.
tert.-**Butyl propyl ketone** (Leroide), A., i, 216.
2-*n*-Butylthiol-3-phenyl-5-anilinomethylene-4-glyoxalone (Dains, Thompson, and Asendorf), A., i, 1186.
Butyranilide, *tri*bromo- (van Peski), A., i, 106.
*iso***Butyrhydroxamic acid**, and its salts and derivatives (Jones and Scott), A., i, 454.
Butyric acid, preparation of (Adam and Legg), A., i, 222.
  formation of, by fermentation (Neuberg and Arinstein), A., i, 91.
  oxidation of, by hydrogen peroxide (Witzemann), A., i, 6.
  estimation of, in mixtures with acetic acid (Notenbaart), A., i, 791.
n-**Butyric acid**, α-amino-, and its derivatives (Curtius and Sieber), A., i, 723.
  β-hydroxy-, estimation of (Hubbard), A., ii, 234.
dl-**Butyric acid**, αγ-*di*hydroxy-, preparation and resolution of (Glattfield and Sander), A., i, 318.
*iso***Butyric acid**, α-hydroxy-, action of thionyl chloride on (Blaise and Montagne), A., i, 715.
Butyrolactone, chloro-, and its acetal (Carrière), A., i, 319.
Butyrophenol, *tri*bromo- (van Peski), A., i, 106.
*iso***Butyryl** chloride, α-chloro-, and its anilide (Blaise and Montagne), A., i, 716.
*iso***Butyryloxy*iso*butyryl** chloride, α-chloro-, and its anilide (Blaise and Montagne), A., i, 716.
n-**Butyrylsulphuric acid** (van Peski), A., i, 106.
Bystropogon canus, constituents of (Whelan), A., i, 847.

C.

Cacotheline, preparation and derivatives of (Leuchs, Osterburg, and Kaehrn), A., i, 362.
  degradation of, by bromine, and its derivatives (Leuchs, Mildbrand, and Leuchs), A., i, 1052.
  colour reactions of (Leuchs and Kaehrn), A., i, 463.
Cactus alkaloids (Späth), A., i, 163, 567; (Späth and Röder), A., i, 852.
Cadalene, and its synthesis and derivatives (Ruzicka, Meyer, and Mingazzini), A., i, 560; (Ruzicka and Seidel), A., i, 562.
  methylisopropylnaphthalenes from (Ruzicka and Mingazzini), A., i, 1001.
Cade oil from *Juniperus oxycedrus* (Huerre), A., i, 505.
Cadmium, band spectrum of (Hulthén and Bengtsson), A., ii, 677.
  fluorescence of the vapour of (van der Lingen), A., ii, 181.
  heat of solution of, in hydrochloric acid (Richards and Tamaru), A., ii, 475.
  rate of solution of, in ferric alum (Collenberg and Bodforss), A., ii, 431.
  solubility of lead in (Di Capua), A., ii, 576.
  reductions with, in volumetric analysis (Treadwell), A., ii, 780, 788.

Cadmium alloys with magnesium (Guillet), A., ii, 570.
heat of formation of (Biltz and Hohorst), A., ii, 350.
with mercury, use of, in analysis (Kanô), A., ii, 529.
Cadmium iodide, crystal structure of (Bozorth), A., ii, 851.
nitrate, mixed crystals of calcium nitrate and (Hasselblatt). A., ii, 61.
nickel nitrites, complex (Cuttica), A., ii, 449.
alkali selenates (Tutton), A., ii, 502.
sulphate, specific heat of (Cohen and Moesveld), A., ii, 347.
Cadmium organic compounds:—
dimethyl, preparation of (de Mahler), A., i, 240.
Cadmium estimation:—
estimation of, volumetrically, with ferrocyanides (Treadwell and Chervet), A., ii, 786.
Cadmium cells. See Cells.
Cæsium, absorption spectrum of (Lindsay), A., ii, 599.
induction spectrum of (Dunoyer), A., ii, 729.
photoelectric effect in the vapour of (Williams and Kunz), A., ii, 809.
density of, at absolute zero (Herz), A., ii, 289.
Cæsium silver gold bromides (Suschnig), A., ii, 514.
chloride, use of, in microchemistry (Ducloux), A., ii, 77.
auric chlorides, complex (Wells), A., ii, 449, 514.
Cæsium detection:—
detection of (Missenden), A., ii, 658.
Caffeine, chloroform extraction apparatus for (Schaap), A., ii, 797.
in the blood and urine after parenteral administration (Loeb), A., i, 705.
excretion of, in urine (Friedberg), A., i, 88.
in urine after tea and coffee drinking (Okushima), A., i, 703.
estimation of, with silicotungstic acid (Azadian), A , ii, 237.
Calcite, equilibrium of aragonite with, in aqueous solution (Backstrom), A., ii, 849.
Calcium, exploded-wire spectrum of (Sawyer and Becker), A., ii, 803.
vapour pressure of (Pilling), A., ii, 291.
and its alloys, absorption of nitrogen by (Ruff and Hartmann), A., ii, 377.
Calcium alloys with mercury, electrolytic preparation of (Neuhausen), A., ii, 643.
Calcium salts, antagonism of potassium salts and (Spiro), A., i, 85.
fixation of, by animal tissues (Freudenberg and György), A., i, 87, 291, 299, 608.
distribution of, in blood (Jones), A., i, 80; (Mazzocco), A., i, 788, 891; (Kramer and Tisdall), A., i, 1087; (van Paassen), A., i, 1208.
in blood of children with tetany (Robles), A., i, 192.
in blood serum in pregnancy (Mazzocco and Moron), A., ii, 892.
metabolism of. See Metabolism.
precipitation of, in the presence of hydroxyl ions (Mattson), A., i, 800.
Calcium carbide, preparation of (Bolfsen), A., i, 1107.
carbonate, solubility of, in water (Osaka), A., ii, 830.
precipitation of, to resemble mother-of-pearl (Clément and Rivière), A., ii, 500.
estimation of alkali in, by the A.R. method (Singleton and Williams), A., ii, 527.
chlorite (Levi), A., ii, 567.
haloids, ammonia compounds of (Hüttig), A., ii, 849.
hydroxide, colloidal (v. Glasenapp), A., ii, 848.
nitrate, crystal structure of (Vegard), A., ii, 503.
mixed crystals of cadmium nitrate and (Hasselblatt), A., ii, 61.
oxide, precipitation of, with ferric oxide (Charriou), A., ii, 163.
phosphate, liquid crystals of (Gaubert), A., ii, 445.
phosphates. equilibrium of formation of, and their solubility (Dieckmann and Houdremont), A., ii, 292.
silicides (Wöhler and Müller), A. ii, 293.
sulphate, equilibrium of sodium carbonate and (Syrkin), A., ii, 699.
See also Gypsum.
tungstate (Smith), A., ii, 774.
Calcium organic compounds:—
cyanide, pure, preparation of (Pincass), A., i, 532.
Calcium estimation:—
estimation of (Laidlaw and Payne), A., ii, 786.
estimation of, volumetrically (Vürtheim and van Bers), A., ii, 869.
estimation of, in blood (Weiss; Clark), A., ii, 227; (Ling and Bushill), A., ii, 587.
estimation of, in natural phosphates (Meurice), A., ii, 658.

Calcium estimation:—
  estimation of, in presence of magnesium and phosphates (Shohl), A., ii, 395.
  estimation of, in soils (Shedd), A., ii, 527.
  estimation of, in urine (Shohl and Pedley), A., ii, 395.
Calcium ammonium (Botolfsen), A., ii, 570.
Calorimeter, continuous flow (Keyes, Gillespie, and Mitsukuri), A., ii, 424.
Calorimetry, researches on (Verkade, Coops and Hartman), A., ii, 474, (Verkade), A., ii, 740.
  of slow processes (Barry), A., ii, 473.
  animal (Taistra; Chanutin), A., i, 288; (Lusk and Evenden), A., i, 292; (Atkinson, Rapport, Lusk, Soderstrom, and Evenden), A., i, 966.
  bomb, correction for temperature in (Engstrom), A., ii, 27.
Calves, blood of. See Blood.
Camel, colostrum of. See Colostrum.
Camera inodorata, use of the (Komuro), A., i, 84.
Campanula rotundifolia, constituents of (Springer), A., i, 797.
Camphene, hydrochloride, preparation of (Chemische Fabrik auf Aktien vorm. E. Schering), A., i, 943.
    equilibrium of *n*- and *iso*-bornyl chlorides with (Meerwein, van Emster and Joussen), A., ii, 751.
Camphenecarboxylic acids, and their salts and derivatives (Bredt), A., i, 937.
Camphene glycol, chlorohydrin of (Detœuf), A., i, 327.
Camphenilone group (Komppa and Roschier), A., i, 1167.
Camphenilylxanthic acid, methyl ester (Komppa and Roschier), A., i, 1167.
p-**Camphocarboxylic acid** (Bredt), A., i, 938.
trans-α-**Campholanamide** (Kleucker), A., i, 736.
dl-*cis*- and *trans*- α-**Campholanic acids**, and their derivatives (Kleucker), A., i, 736.
Campholic acid, hydroxy- (Palfray), A., i, 548.
*iso***Campholic acid**, and bromo- and their salts and derivatives (Rupe and Briellmann), A., i, 1017.
dl-*iso***Campholic acid**, derivatives of (Kleucker), A., i, 736.
α-**Campholytic acid, intra-annular tautomerism of** (Chandrasena, Ingold, and Thorpe), T., 1542.
Camphopropan β-ol, and its phenylurethane (Haller and Ramart-Lucas), A., i, 460.
Camphor, and α-bromo-, rotation of, in various solvents (Wetterfors), A., ii, 247.
  equilibrium of ethyl alcohol, water and (Scheringa), A., ii, 535.
  equilibria of phenols with (Kremann and Odelga), A., i, 159.
  analysis of preparations of (François and Luce), A., ii, 667.
d **Camphor**, catalytic reduction of (Komatsu and Masumoto), A., i, 752.
Camphor, bromo-, estimation of (Eaton), A., ii, 326.
  α′-bromo- (Lowry, Steele, and Burgess), T., 633.
Camphor oil, constants of (Gattefossé), A., i, 1167.
Camphor-β-allylaminoethylimide, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 255.
Camphor-β-aminoethylimide, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 255.
Camphor-β-bromoethylimide (Society of Chemical Industry in Basle), A., i, 255.
Camphor-β-chloroethylimide (Society of Chemical Industry in Basle), A., i, 255.
Camphor-β-diethylaminoethylimide, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 255.
Camphor-β-dimethylaminoethylimide, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 255.
α-**Camphordioxime**, nickel compound (Bigiavi), A., i, 353.
Camphoreins (Singh, Rai, and Lal), T., 1421.
Camphoreosin. See Resorcinolcamphorein, *tetra*bromo-.
Camphor-β-hydroxyethylimide (Society of Chemical Industry in Basle) A., i, 255.
Camphoric acid, preparation of derivatives of (Society of Chemical Industry in Basle), A., i, 254; (Faust), A., i, 748.
Camphoric anhydride, action of *p*-cresol with (Krishna), T., 255.
dl-**Camphorimine** nitrite (Kleucker), A., i, 736.

Camphor-β-piperidylethylimide, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 255.
Camsellite, from British Columbia (Ellsworth and Poitevin), A., ii, 304.
Cancer. See Carcinoma.
Candlenut oil. See Lumbang oil.
Caoutchouc (*india-rubber*), structure of (Olivier), A., i, 45; (Kirchhof), A., i, 945.
  constitution and hydrogenation of (Staudinger and Fritschi), A., i, 1043.
  size of molecules of (Harries and Evers), A., i, 357.
  problem of the synthesis of (Plotnikow), A., i, 419.
  action of concentrated sulphuric acid on (Kirchhof), A., i, 562.
  vulcanisation of (Boiry), A., i, 848.
   use of mercaptothiazoles in (Bruni and Romani), A., i, 755.
  analysis of articles made of (Dubosc), A., ii, 91.
  vulcanised, estimation of sulphur in (Dyer and Watson), A., ii, 656, 782.
Caprifoliaceæ, constituents of the berry fruits of (Nowak and Zellner), A., i, 615.
Capsaicin, constitution of (Ott and Zimmermann), A., i, 137.
Capsella bursa pastoris, use of, as an ergot substitute (Wasicky), A., i, 907.
Capsularin, and its derivatives (Saha and Choudhury), T., 1044.
Carbamic acid, ammonium salt, equilibrium of formation and stability of (Faurholt), A., ii, 272, 747; (Wegscheider), A., ii, 376; (Matignon and Fréjacques), A., ii, 445, 499.
Carbamic acid, *di*chloro-, methyl ester (Datta and Chatterjee), A., i, 818.
Carbamic acids, formation of azides of (Oliveri-Mandalà), A., i, 473.
Carbamic acids, thio-. See Thiocarbamic acids.
Carbamide (*urea*), preparation of (Badische Anilin- & Soda-Fabrik), A., i, 992.
   from cyanamide (Farbwerke vorm. Meister, Lucius & Brüning), A., i, 993.
  synthesis of (Bailey), A., i, 815.
   from ammonia (Matignon and Fréjacques), A., i, 723; ii, 272.
  compounds of benzoic acid and (Osaka and Ando), A., i, 1127.
  estimation of, with sodium hypobromite (Werner), T., 2318.
Carbamide (*urea*), estimation of, in blood (Ionescu), A., ii, 596.
  See also Urea.
Carbamide, chloro- (Detœuf), A., i, 236, 327.
Carbamides, constitution of (Werner), T., 2318.
Carbamides, substituted, preparation of (Albert), A., i, 370; (Tanberg and Winkel), A., i, 1009.
  thio-. See Thiocarbamides.
3:3-Carbamidebis-6-methoxybenzoic acid (Hermann), A., i, 1151.
***o*-Carbamidobenzenesulphonic acid**, and its salts and acetyl derivative, potassium salt (Scott and Cohen), T., 2042.
3-Carbamido-1-*o*-carboxybenzylphthalazone (Ruggli and Meyer), A., i, 345.
3-Carbamido-6-ethoxybenzoic acid, and its ethyl ester, and 3-thio- (Hermann), A., i, 1151.
4-Carbamido-1-ethoxynaphthalene, and 4-thio- (Hermann), A., i, 1151.
6-Carbamido-2-hydroxy-3-naphthoic acid (Froelicher and Cohen), T., 1660.
3-Carbamido-4-methoxybenzoic acid (Froelicher and Cohen), T., 1656.
3-Carbamido-6-methoxybenzoic acid, and its ethyl ester (Hermann), A., i, 1151.
Carbamidomethoxynaphthoic acids (Froelicher and Cohen), T., 1658.
***p*-Carbamidophenoxyacetone**, and its derivatives (Speckan), A., i, 580.
***p*-Carbamidophenoxyacetophenone** (Speckan), A., i, 580.
α-*p*-Carbamidophenoxybutyric acid, ethyl ether (Speckan), A., i, 580.
***p*-Carbamidophenyl** ethyl carbonate and diphenylcarbamate (Speckan), A., i, 580.
***p*-Carbamidophenylglycide** ether (Speckan), A., i, 580.
1-Carbamido*cyclo*propane-1-carboxylic acid, and 1-nitroso- (Ingold, Sako, and Thorpe), T., 1195.
***p*-Carbamido-*m*-sulphonic acid**, and its salts, and acetyl derivative, potassium salt (Scott and Cohen), T., 2039.
Carbamine cyanides, preparation of (Fromm and Wenzl), A., i, 437.
Carbamylazopropane (Neighbors, Foster, Clark, Miller, and Bailey), A., i, 881.
Carbanilide, thio-. See Thiocarbanilide.
Carbanilinocinnamaldoximes (Brady and Thomas), T., 2104.
Carbanilinonitrocinnam*anti*aldoximes (Brady and Thomas), T., 2108.

Carbazinic acid, *di*thio-, salts, decomposition of, and its thioanhydride (Losanitch), T., 2542.

Carbazole, melting and boiling points of (Kirby), A., i, 27.

equilibria of, with nitrobenzenes and nitrotoluenes (Kremann and Strzelba), A., i, 176.

Carbazole, *N*-nitroso- (Morgan and Read), T., 2712.

Carbazole series, diazo-reaction in the (Morgan and Read), T., 2709.

Carbazole-3-azoacetoacetic acid, ethyl ester (Morgan and Read), T., 2715.

Carbazole-3-azoimide. See 3-Triazocarbazole.

Carbazole-3-azo-β-naphthol (Morgan and Read), T., 2713.

Carbazole-3-azo-β-naphthylamine (Morgan and Read), T., 2714.

Carbazole-3-azoresorcinol (Morgan and Read), T., 2713.

Carbazole-*o*-benzoic acid, and its derivatives (Eckert, Seidel, and Endler), A., i, 952.

Carbazole-3-diazocyanide (Morgan and Read), T., 2714.

Carbazole-3-diazoimine (Morgan and Read), T., 2712.

Carbazole-3-diazonium salts (Morgan and Read), T., 2711.

Carbethoxyaminoaceto-*p*-anisidide (Hill and Kelsey), A., i, 1141.

Carbethoxyaminoaceto-*p*-chloroanilide (Hill and Kelsey), A., i, 1141.

Carbethoxyaminoaceto-*m*-toluidide (Hill and Kelsey), A., i, 1141.

***m*-Carbethoxyamino-*p*-hydroxyphenylarsinic acid** (Bart), A., i, 1202.

3-Carbethoxyamino-4-methoxybenzoic acid (Froelicher and Cohen), T., 1656.

Carbethoxyaminomethoxynaphthoic acids (Froelicher and Cohen), T., 1658.

***o*-Carbethoxyaminophenol**, *p*-amino- (Bart), A., i, 1202.

3-Carbethoxyaminophenylphosphinic acid, and nitro- (Nijk), A., i, 961.

ω-Carbethoxyaminoresacetophenone (Sonn and Falkenheim), A., i, 1164.

***o*-Carbethoxybenzylmalonamic acid**, ethyl ester (Davies and Perkin), T., 2210.

Carbethoxydihydrosinapic acid. See β-4-Ethylcarbonato-3:5-dimethoxyphenylpropionic acid.

3-Carbethoxy-2:4-dimethylpyrrole-5-acetic acid, ethyl ester (Fischer, Schneller, and Zerweck), A., i, 1056.

3-Carbethoxydimethylpyrroleglyoxylic acids, and their ethyl esters (Fischer, Schneller, and Zerweck), A., i, 1056.

3-Carbethoxy-2:4-dimethylpyrrole-5-glyoxylonitrile (Fischer, Schneller, and Zerweck), A., i, 1056.

3-Carbethoxy-2:4-dimethylpyrryldiphenylcarbinol, and its derivatives (Fischer and Kaan), A., i, 869.

α-Carbethoxy-γ-hexolactone, and α-bromo- (Helferich and Speidel), A., i, 7.

4-Carbethoxy-5-methylpyrrolenyl-3-*p*-dimethylaminophenylmethane, 3-hydroxy- (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

4-Carbethoxy-5-methylpyrrolenyl-3-furylmethane, 3-hydroxy- (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

4-Carbethoxy-5-methylpyrrolenyl-3-*p*-methoxyphenylmethane, 3-hydroxy- (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

***o*-Carbethoxy-β-phenylpropionic acid**, α-cyano-, ethyl ester (Davies and Perkin), T., 2210.

Carbides of metalloids, preparation of (de Mahler), A., i, 101.

Carbinols, and their corresponding dienes, physical constants of (v. Auwers and Westermann), A., ii, 97.

halochromism of (Skraup and Freundlich), A., i, 539.

optically active, lubricating power of (Doubleday), T., 2875.

Carboceric acid (Tropsch and Kreutzer), A., i, 804.

Carbocerinic acid (Tropsch and Kreutzer), A., i, 317.

Carbocyanines, isomeric (Braunholtz), T., 169.

Carbodi-imides, condensation of hydrochlorides of, with phenols (Short and Smith), T., 1803.

Carbodilactic acids, *tri*thio-, stereoisomeric, and their salts (Holmberg), A., i, 1113.

Carbohydrates (Brigl), A., i, 1117.

in dead leaves (Combes and Kohler), A., i, 1222.

acetone and butyl alcohol fermentation of (Robinson), A., i, 971.

reduction of, with hydriodic acid and phosphorus (Willstätter and Kalb), A., i, 989.

Carbohydrates, assimilation of, in man (Sakaguchi, Asakawa, and Matsuyama), A., i, 699.
transportation, retention and excretion of (Folin and Berglund), A., i, 487.
metabolism of. See Metabolism.
relations between fats and (Muller), A., i, 486.
degradation of, in muscle (Laquer), A., i, 298, 1089.
sulphates of (Ohle), A., i, 986.
benzyl ethers of (Gomberg and Buchler), A., i, 112.
detection of (Baudisch and Deuel), A., ii, 664.
Carboligase (Neuberg and Liebermann), A., i, 305; (Neuberg and Ohle), A., i, 480, 540; (Rosenthaler; Neuberg and Hirsch); A, i, 600; (Hirsch), A., i, 973.
Carbomethoxybenzoyl chlorides, reactions of, with aromatic hydrocarbons (Smith), A., i, 140.
4-Carbomethoxyphenylarsinic acid, 3-nitro- (Christiansen), A., i, 1203.
Carbon, atomic weight of (Moles), A., ii, 51.
hexavalency of (Hantzsch), A., i, 24.
pure, preparation of (Wibaut), A., ii, 565.
spectrum of (Muller), A., ii, 725.
Röntgen rays from (Hughes), A., ii, 184; (Holtsmark), A., ii, 543.
atoms, linkings of, in organic compounds and in graphite (Wibaut; Beutler), A., ii, 259; (v. Steiger), A., ii, 618.
kinetics of, open saturated chains of (Wojnicz-Sianozencki), A., i, 330.
and the related elements in the periodic system (Stock), A., ii, 564.
co-ordination number of (Hantzsch), A., i, 26.
behaviour of, at high temperatures (Sauerwald; Ryschkewitsch), A., ii, 443.
diffusion of, in metals (Tammann and Schönert), A., ii, 772.
solubility limits of, in ternary steels (Daeves), A., ii, 70.
colloidal, cataphoresis of (Goldberg), A., ii, 429.
solutions of (Thorne), A., ii, 695.
oxidation of (Philippi; Philippi and Rie; Philippi and Thelen), A., i, 837.
and its oxides, equilibrium of, with iron and its oxides (Reinders and van Groningen), A., ii, 153; (Eastman), A., ii, 506.
Carbon, action of nitrogen on barium carbonate and (Askenasy and Grude), A., ii, 445.
action of nitrogen on sodium carbonate and (Ingold and Wilson), T., 2278.
catalysis of the reaction of steam with (Taylor and Neville), A., ii, 143.
behaviour, of, when heated with sulphur (Wibaut), A., ii, 373.
Carbon alloys with boron and iron (Vogel and Tammann), A., ii, 852.
with chromium and iron (Daeves), A., ii, 70.
with iron (Honda), A., ii, 711.
with iron and tungsten (Daeves), A., ii, 70.
Carbon compounds, synthesis of, from air, by means of radium (Glew), A., ii, 607.
natural system of (Decker), A., i, 417, 513.
bivalent (Gillet), A., i, 213, 513.
Carbon *tetra*chloride, physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.
thermal constants of (Latimer), A., ii, 256.
action of fuming sulphuric acid on (Lepin), A., ii, 847.
*sub*oxide, preparation and properties of (Ott and Schmidt), A., ii, 641.
*mon*oxide, equilibrium of the formation of, from carbon dioxide and carbon (Jellinek and Diethelm), A., ii, 833.
origin of the spectrum of (Duffieux), A., ii, 597.
electrical moment of (Weigt), A., ii, 109.
solubility of, in serum and plasma (O'Brien and Parker), A., i, 394.
viscosities of nitrogen and (Smith), A., ii, 549.
absorption of, by acid cuprous chloride (Kropf), A., ii, 657.
action of, on diamond (Foix), A., ii, 641.
action of oxygen with, on platinum (Langmuir), A., ii, 629.
catalytic combustion of, in hydrogen (Lamb, Scalione, and Edgar), A., ii, 443.
catalytic oxidation of (Rogers, Piggot, Bahlke, and Jennings; Merrill and Scalione), A., ii, 136.
in tobacco smoke (Armstrong and Evans), A., i, 1226.

Carbon *mon*oxide, estimation of, with an iodine pentoxide indicator (Katz and Bloomfield), A., ii, 585.
estimation of, in blood (Sayers and Yant), A., ii, 868.
*di*oxide, air-free, apparatus for preparation of (Schoeller), A., ii, 159.
ultra-red absorption spectra of (Barker), A., ii, 805.
movement of electrons in (Skinker), A., ii, 837.
electrical moment of (Weigt), A., ii, 109.
moment of inertia and structure of molecules of (Eucken), A., ii, 349.
specific heat of (Partington and Cant), A., ii, 191.
compressibility of (Guye and Batuecas), A., ii, 618.
solubility of, in various solvents (Kunerth), A., ii, 823.
aqueous solutions of (Wilke), A., ii, 52.
viscosities of nitrogen monoxide and (Smith), A., ii, 549.
absorption of, by alkaline solutions (Riou), A., ii, 433, 487.
absorption of, by ammoniacal solutions (Riou), A., ii, 742.
rate of evolution of, from solution in presence of colloids (Findlay and Howell), T., 1046.
reaction of benzene with, under the electric discharge (Miyamoto), A., i, 418.
assimilation of, by plants (Molisch; Müller and Warburg), A., i, 411; (Warburg and Negelein), A., i, 1097.
effect of anæsthetics on the output of (Bodine), A., i, 889.
relation between oxygen and, in respiration (Thunberg), A., i, 889.
content of, in blood (Peters, Cullen, and Austin), A., i, 1207.
estimation of (Shaw), A., ii, 226.
estimation of, in air (Rauch), A., ii, 316; (Noyons), A., ii, 868.
apparatus for estimation of, in air (Lundegårdh), A., ii, 719.
estimation of, in carbonates (Sayce and Crawford), A., ii, 316.
oxides, reactions with, in blast furnaces and gas generators (v. Juptner), A., ii, 374.
Carbonic acid, velocity of the formation of (Faurholt), A., ii, 272.
state of, in aqueous solution (Thiel), A., ii, 374.

Carbon :—
Carbonates, dissociation and hydrolysis of, in solution (Menzel), A., ii, 345.
oxychloride and oxysulphide. See Carbonyl chloride and sulphide.
*di*sulphide, molecular structure of (Rankine), A., ii, 704.
physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.
properties of (Schulze), A., ii, 53.
equilibrium of ethyl alcohol, water, and (Schoorl and Regenbogen), A., i, 419.
equilibrium of, with ethyl and methyl alcohols (McKelvy and Simpson), A., ii, 271.
compound of azoimide and (Oliveri-Mandalà), A., i, 1070.
action of, on mercuric acetate (Bernardi and Rossi), A., i, 421.
action of, with thallous β-diketones (Morgan and Ledbury), T., 2892.
sulphides (Wibaut), A., ii, 52.
Carbon estimation:—
estimation of, in cast iron and steel (Batta and Thyssen), A., ii, 395.
estimation of, in organic compounds (Klein and Steuber), A., ii, 159; (Wrede), A., ii, 316; (Simon and Guillaumin), A., ii, 867; (Simon), A., ii, 868.
estimation of, volumetrically, in organic compounds (Lindner), A., ii, 657.
Carbonatotetramminecobaltiselenate. See under Cobalt.
Carbonic acid. See under Carbon.
Carbonium colouring matters, constitution of (Kauffmann), A., i, 820.
Carbonium salts, constitution of (Hantzsch) A., i, 24, 820; (Kehrmann), A., i, 259, 331.
Carbonyl chloride, mechanism of the formation of (Lepin), A., ii, 847.
pressure of the saturated vapour of (Nikitin), A., ii, 847.
adsorption of, by beechwood charcoal (Bunbury), T., 1525.
action of, with benzene and *m*-xylene, in presence of aluminium chloride (Wilson and Fuller), A., i, 827.
sulphide, molecular structure of (Rankine), A., ii, 704.
viscosity and molecular dimensions of (Smith), A., ii, 686.
pharmacology of (Fischer) A., i, 402.

Carbonyls, metallic (Mond and Wallis), T., 29.
  action of nitric oxide on (Mond and Wallis), T., 32.
Carbonyl compounds, metallic compounds of the enolic forms of (Scheibler and Ziegner), A., i, 426.
  additive reactions of, with phosphorus haloids (Conant), A., i, 41.
Carbonylens (Staudinger) A., i, 239.
  action of, on phosphazines (Staudinger and Braunholtz), A., i, 70.
o-**Carboxybenzylideneanthranilic acid** (Ekeley, Rogers, and Swisher), A., i, 935.
2-*o*-Carboxybenzyl-2-methyl*cyclo*propane-1-carboxylic acid, 3-hydroxy-, lactone, and its silver salt (Kon, Stevenson, and Thorpe), T., 662.
α-*o*-**Carboxybenzyl**-*α*-**methylsuccinic acid** (Kon, Stevenson, and Thorpe), T., 662.
Carboxycamphenecamphoric acid, (Bredt), A., i, 937.
Carboxycinnamic acids, hydroxy- (Wayne and Cohen), T., 1028.
2-Carboxy-3:4-dimethoxyphenyl-3-carboxy-2-hydroxy-*α*-naphthylcarbinol, and its sodium salt and methyl ester (Stosius), A., i, 746.
d-**3-Carboxy-1 1-dimethyl*cyclo*propane-2-propionic acid** (Simonsen), T., 2297.
α-**Carboxyglutaconolactone**, *γ*-hydroxy-, diethyl ester (Faltis and de Roxas), A., i, 625.
Carboxyhæmoglobin, dissociation of (Hill), A., i, 193.
cis- and *trans*-**2-Carboxy*cyclo*hexane-1-acetic acids** (Windaus and Hückel), A., i, 658.
trans-**2-Carboxy*cyclo*hexane-1-propionic acid**, and its dianilide (Windaus and Hückel), A., i, 658.
1-Carboxy*cyclo*hexyl-1-acetic acid (Lapworth and McRae), T., 2754.
2-Carboxyindole-1:3-diacetic acid, and its diethyl ester (Kermack, Perkin, and Robinson), T., 1893.
Carboxylase of yeast, action of (Abderhalden and Fodor), A., i, 92.
4-Carboxy-6-methoxyquinoline-2 *β*-acrylic acid (Halberkann), A., i, 175.
β-**Carboxymethylbutan**-*αδ*-**dicarboxylic acid**, and its derivatives (Carrière), A., i, 319.
4-Carboxy-3-methylphenylacetic acid (v. Auwers and Jülicher), A., i, 842.
β-*o*-**Carboxy*tri*nitrophenylpropionic acid** (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.
m-**Carboxyphenylarsinic acid** (Bart), A., i, 1201.
vic-2 *p*-**Carboxyphenylbenztriazole-4:5-dicarboxylic acid**, and its anhydride (Charrier and Crippa), A., i, 771.
m-**Carboxyphenyl-6-methyl**-*ψ*-**aziminobenzene**, 5-amino-2-*p*-hydroxy- (Kalle & Co.), A., i, 62.
α-**Carboxy**-*β*-**phenyl**-*α*-**methylglutaconic acid**, ethyl ester, ozonides of (Feist, Breuer, and Lubricht), A., i, 553.
4-Carboxy-2-phenylquinoline-6-arsinic acid, and its salts (Johnson and Adams), A., i, 187.
2-Carboxyphenyl*di*thioglycollic acid (Smiles and McClelland), T., 88.
Carcinoma, anæmia in (Robin and Bournigault), A., i, 497.
  zinc content of tumours in (Cristol), A., i, 497.
Carnosine, distribution of, in muscle of various animals (Clifford), A., i, 398.
  in muscle after cold storage (Clifford), A., i, 791.
  estimation of, in muscle (Hunter), A., ii, 328, 885.
Carnotite, estimation of uranium in (Scott), A., ii, 788.
Carp. See *Cyprinus carpio*.
Carrageen, constituents of (Russell-Wells), A., i, 1223.
  as a protective colloid (Gutbier and Huber; Gutbier, Wolf, and Kiess), A., ii, 203.
tert.-**Carvomenthyl** chloride (Maxwell), A., i, 753.
d-**Carvotanacetone**, and its derivatives (Simonsen and Rau), T., 879.
Caryophyllaceæ, glucosides from (Vergelot), A., i, 207.
Caryophyllene, hydration of (Asahina and Tsukamoto), A., i, 845.
Casein. See Caseinogen.
Caseinogen from cow's milk (Bleyer and Seidl), A., i, 479.
  ultramicroscopic investigation of (Bleyer and Seidl), A., i, 886.
  effect of electrolytes on the solution and precipitation of (J. and R. F. Loeb), A., i, 182.
  hydrolysis of, with alkalis (Griggs), A., i, 182.
  hydrolysis of, by proteolytic enzymes (Dunn and Lewis), A., i, 292.
  action of nitrous acid on (Dunn and Lewis), A., i, 279.

Caseinogen, digestion of, with trypsin (Frankel and Feldsberg), A., i, 184; (Frankel and Jellinek), A., i, 965.
Cassiterite, occurrence of germanium in (Hadding), A., ii, 855.
Castela Nicholsoni, castelin from (Bosman), T., 969.
Castelagenin (Bosman), T., 971.
Castelamarin (Bosman), T., 970.
Castelin (Bosman), T., 969.
Catalase, influence of the medium on the action of (Sammartino), A., i, 391.
  effect of cobaltammines on the action of (Funk), A., i, 481.
  in blood, effect of potassium cyanide on (Welker and Bollman), A., i, 192.
  of flour (Merl and Daimer), A., i, 184.
Catalase, effect of metals on the action of, and its estimation (Santesson), A., i, 1077.
  estimation of, in blood (Bach and Zubkowa), A., i, 393.
Catalysis (Gilfillan), A., i, 709; (Purkayostha and Dhar), A., ii, 362; (Perrin; Lewis; Baly; Lowry), A., ii, 628; (Langmuir), A., ii, 629; (Dhar), A., ii, 730; (Böeseken), A., ii, 755; (Banerji and Dhar), A., ii, 756.
  studies in (Taylor and Lewis), T., 665; (Moran and Lewis), T., 1613.
  ionic activity in (Harned and Seltz), A., ii, 631.
  by ions, effect of a magnetic field on, in presence of a paramagnetic salt (Garner and Jackman), T., 1298.
  effect of adsorption on (Guichard), A., ii, 630.
  rôle of protective colloids in (Iredale), T., 1536.
  in fuller's earth (Rideal and Thomas), T., 2119.
  in homogeneous gas reactions (Herzfeld), A., ii, 136.
  hydrogen-oxygen, by means of platinum (Hofmann), A., ii, 490.
  negative (Dhar and Mittra), A., ii, 630.
  by platinum black (Vavon and Husson), A., ii, 631.
  at solid surfaces (Armstrong and Hilditch), A., ii, 41, 756, 757.
Catalysts, influencing of the activity of (Rosenmund and Zetzsche), A., ii, 41, 834; (Abel), A., ii, 276.
  influence of, on the thermodynamics of velocity of reaction (van Thiel), A., ii, 754.
Catalysts, influence of, on equilibrium (Clarens), A., ii, 436; (Durand), A., ii, 701.
  behaviour of metals as (Sandonnini), A., ii, 557.
Catalytic analysis. See Analysis.
  hydrogenation (Skita), A., ii, 207.
    in presence of nickel salts (v. Braun and Kirschbaum), A., i, 727.
    with reduced nickel (Rideal), T., 309.
    of liquids in presence of nickel (Armstrong and Hilditch), A., ii, 41.
    with exclusion of oxygen (Normann), A., ii, 631.
    of phenols (Senderens and Aboulenc), A., i, 136.
  oxidation (Karczag), A., ii, 42, 137.
  reactions, course of (Zalkind), A., ii, 835.
Catechin (v. Euler), A., i, 45; (Freudenberg), A., i, 756.
  constitution of (Nierenstein), T., 604.
Catechins, optical activity of (Feist and Futtermenger), A., i, 565.
  stereoisomeric, and their derivatives (Freudenberg, Bohme, and Purrmann), A., i, 756.
Catechol (*pyrocatechol*), compound of diketopiperazine and (Povarnin and Tichomirov), A., i, 1185.
Catecholcamphorein (Singh, Rai, and Lal), T., 1427.
Catecholsulphamphthalein (Dutt), T., 2392.
Catechu (v. Euler), A., i, 45.
Catechutannins (Nierenstein), T., 23.
Cathetus fasciculata, oil from (Gattefossé), A., i, 1167.
Cathodes, deposits on, from electrolysis of mixed salts (Creutzfeldt), A., ii, 347.
  mercury, overvoltage of (Newbery), T., 7.
Cell or **Cells, electrochemical**, intensification of the current in (Reichinstein and Klement), A., ii, 112; (Reichinstein and Rothschild), A., ii, 736.
  electromotive force of (Wasastjerna), A., ii, 815.
  temperature coefficients of electromotive force of (Gerke), A., ii, 682.
  cadmium low-voltage (Oblata) A., ii, 343.
  carbon monoxide-oxygen (Kallmann), A., ii, 467.

Cell or Cells, electrochemical, hydrogen-calomel, effect of hydrogen pressure on electromotive force of (Hainsworth and MacInnes), A., ii, 467.

Cell or Cells, photo-electric, measurement of light absorption by (v. Halban and Siedentopf), A., ii, 332.
  alkali metal, fatigue of (Rosenberg), A., ii, 189.
  selenium (Späth), A., ii, 189.

Cell or Cells, physiological, permeability of (Schaeppi), A., i, 290.
  permeability of, to acids (Crozier), A., i, 897, 1090.
  influence of optical activity on the permeability of (Kotake and Okagawa), A., i, 696.
  living, surface reactions in (Warburg), A., i, 787.
  respiration of (Warburg), A., i, 190.
  pharmacology of the respiration of (Ellinger), A., i, 492.
  rôle of inorganic salts in (Zondek), A., i, 399.
  sensitiveness to poisons (Handovsky), A., i, 697.
  animal, absorption of potassium by (Mitchell, Wilson, and Stanton), A., i, 196.
  function of vitamins in (Hess), A., i, 399, 788; (Abderhalden), A., i, 607.
  detection of potassium in (Macallum), A., ii, 869.
  estimation of the reducing power of (Lipschitz and Gottschalk), A., i, 298.
  estimation of substances which injure (Schnabel), A., i, 304.

Cellobiase in yeast (Groenewege), A., i, 903.

Cello*iso*biose (Ost and Knoth), A., i, 526.

Cellosan, constitution of (Karrer and Smirnov), A., i, 435.

Cellulose (Hess), A., i, 12; (Hess and Wittelsbach), A., i, 116.
  preparation and properties of solutions of (Waentig), A., i, 988.
  fluorescence of (Lewis), A., ii, 334.
  constitution and nitration of (de Bruin), A., i, 13.
  structure of, and its compound with alkali (Karrer), A., i, 231.
  action of heat on (Justin-Mueller), A., i, 11.
  solubility of, in alkaline copper hydroxide and copper oxide-ammine solutions (Traube), A., i, 115.
  viscosity of (Joyner), T., 1511, 2395.
  adsorption of alumina by (Tingle), A., i, 434.
  degradation products of (Karrer), A., i, 231.
  complex copper compounds of (Hess, Messmer, and Jagla), A., i, 988.
  action of formaldehyde on (Samec and Ferjančič), A., i, 115.
  action of iodine on (Huebner and Sinha), A., i, 434.
  oxidation of (Knecht and Thompson), A., i, 637.
  reactions of, with sodium chloride and neutral salt solutions (Masters), T., 2026.
  saccharification of (Wohl and Krull), A., i, 232; (Budnikov and Zolotarev), A., i, 922.
  effect of water and organic salts on (Huebner and Kaye), A., i, 435.
  fermentation of, in the paunch of the ox (Klein), A., i, 82.
  alkali-soluble (Knoevenagel and Busch), A., i, 636.
  benzyl derivatives of (Gomberg and Buchler), A., i, 112.
  cotton, properties of (Collins), A., i, 1120.
    glucose from (Irvine and Hirst), T., 1585.
  estimation of, in wood (Heuser and Casseus), A., ii, 664.

Cellulose esters, preparation of (Grün and Wittka), A., i, 114.
  acetate, preparation of, from wood cellulose (Hagglund, Löfmann, and Farber), A., i, 323.
    solubility of, in alkali and alkaline-earth salts (Schweiger), A., i, 324.
    viscosity of solutions of (Barr and Bircumshaw), A., i, 232.
  nitrate (Angeli), A., i, 922.
    as an emulsifying agent (Holmes and Cameron), A., ii, 268.

α-, β-, and γ-**Celluloses** (Opfermann), A., ii, 665.

Celtium, *L*-series spectrum of, and its atomic number (Dauvillier), A., ii, 463.
  atomic number of (Urbain), A., ii, 505.

Cement, equilibrium between lime-water and (Lorenz and Haegermann), A., ii, 59.

Cenchrus tribuloides (sand spur), constituents of the fruit of (Youngken and La Wall), A., i, 1100.

Cephalin, brain, composition and properties of (Fenger), A., i, 315.

Cereals, effect of application of nitrogen on the protein content of (GERICKE), A., i, 1226.

Cerebronic acid, constitution of (LEVENE and TAYLOR), A., i, 714.

dl-**Cerebronic acid** (LEVENE and TAYLOR), A., i, 715.

Cerebrospinal fluid, chemistry of (EGERER-SEHAM and NIXON), A., i, 395.

acetone in (KOOPMAN), A., i, 194.

combined carbon dioxide in (TOKUOKA and OGASAWARA), A., i, 895.

cholesterol in (FABRIS), A., i, 969.

sugar in (COOPER ; DE HAAN and VAN CREVELD ; STEVENSON), A., i, 295.

testing of, with colloidal gold solutions (GETTLER and JACKSON), A., ii, 240.

estimation of albumin in (AYER and FOSTER), A., ii, 798.

Cerium, arc spectra of (KIESS, HOPKINS, and KREMERS), A., ii, 244.

L-series spectrum of (DAUVILLIER), A., ii, 101.

Cerium alloys (GUILLET), A., ii, 572.

Cerium compounds, pure, preparation of (MANSKE), A., ii, 646.

Cerium *di***oxide**, action of light on (RENZ), A., ii, 61.

Cerous salts, electrolysis of aqueous solutions of (SCHIØTZ), A., ii, 22.

Cerium separation:—

separation of, from the other earths (PRANDTL and LÖSCH), A., ii. 770.

Ceruleofibrite (HOLDEN), A., ii, 516.

Cetene, compounds of, with zinc and nitrogen tetroxide (SCHAARSCHMIDT, VEIDT, and SCHLOSSER), A., i, 646.

ψ-nitrosite (SCHAARSCHMIDT, VEIDT, and SCHLOSSER), A., i, 646.

Cetyl. See Hexadecyl.

Cetylsulphonic acid. See Hexadecanesulphonic acid.

Cevadine, and its *o*-nitrobenzoyl derivative (MACBETH and ROBINSON), T., 1571.

Cevine, preparation of, and its di-*o*-nitrobenzoyl derivative (MACBETH and ROBINSON), T., 1574.

Chætopterus variopedatus, manganese in the tube of (BERKELEY), A., i, 493.

Chalcedony, comparison of, with other forms of silica (WASHBURN and NAVIAS), A., ii, 804.

Charcoal, adsorption by (HERBST), A., ii, 30; (FODOR and SCHÖNFELD), A., ii, 688.

adsorption of gases by (MCLEAN), A., ii, 352; (GUSTAVER), A., ii, 479.

adsorption of saturated vapours by (DRIVER and FIRTH), T., 2409.

Charcoal, pressure and volume of liquids adsorbed by (HARKINS and EWING), A., ii, 123.

oxidising properties of (FEIGL), A., ii, 51.

effect of heating sulphur with (WIBAUT), A., ii, 52.

beechwood, adsorption of carbonyl chloride by (BUNBURY), T., 1525.

sugar, adsorption by (BARTELL and MILLER), A., ii, 741.

is **Chavicic acid** (OTT, EICHLER, LÜDEMANN, and HEIMANN), A., i, 1027.

Chavicine from pepper-resin (OTT, EICHLER, LUDEMANN, and HEIMANN), A., i, 1026.

Chemical compounds, classification of (LANGMUIR), A., ii, 138.

graphic representation of the composition of (HUBSCHER), A., ii, 156.

space formulæ for (ZWIKKER), A., i, 567.

constitution and antiseptic action (BROWNING, COHEN, GAUNT, and GULBRANSEN), A., i, 612.

and colour (MOIR; KEHRMANN), A., ii, 333.

in relation to lubricating power (DOUBLEDAY), T., 2875.

and odour (ZWAARDEMAKER), A., i, 607.

relation between pharmacological action and (V. BRAUN, BRAUNSDORF, and RÄTH), A., i, 759.

and formation of resins (HERZOG and KREIDL), A., i, 1168.

and rotatory power (RUPE and JAGGI), A., i, 840; (RUPE), A., ii, 602.

relation between peppery taste and (OTT and ZIMMERMANN), A., i, 137.

reactions and radiation (TAYLOR; LEWIS), A., ii, 336.

influence of substitution on (FRANZEN and STAUBLE), A., i, 450; (BODFORSS), A., ii, 698.

occurrence of free radicles in (WIELAND, POPPER, and SEEFRIED), A., i, 773.

valency in relation to the mechanism of (PERKINS), A., ii, 438.

induced (MITTRA and DHAR), A., i, 1210; (DHAR and MITTRA), A., ii, 630.

theory of (WINTHER), A., ii, 336.

simultaneous, course of (WEGSCHEIDER), A., ii, 489.

theory, rôle of the physicist in development of (WALKER), T., 735.

Chemistry, Arabic (Holmyard), A., ii, 686.
Chemoluminescence (Grinberg), A., ii, 806.
Cherry. See *Prunus avium.*
Cherry laurel, constituents of distillate from (Pecker), A., ii, 537.
Chetoptera, chetopterin from, and its spectrum (Romieu and Obaton), A., i, 793.
Chickens, enzymes in the alimentary canal of (Plimmer and Rosedale), A., i, 485.
Children, underweight, basal metabolism in (Blunt, Nelson, and Oleson), A., i, 83.
China wood oil, constituents of (Bauer and Herberts), A., i, 806.
Chloranil, compound of acenaphthene with (Pfeiffer and Flater), A., i, 342.
Chlorates. See under Chlorine.
Chlorella vulgaris, assimilation of carbon by (Müller and Warburg), A., i, 411.
Chloric acid. See under Chlorine.
Chlorides. See under Chlorine.
Chlorination, by a mixture of carbon monoxide and chlorine (Venable and Jackson), A., ii, 73.
  by means of nitrogen trichloride (Coleman and Noyes), A., i, 133.
  with sulphuryl chloride (Silberrad), T., 1015.
Chlorine from apatite, atomic weight of (Gleditsch and Samdahl), A., ii, 281.
  Röntgen ray absorption spectrum of (Lindh), A., ii, 177.
  isotopes of (Bronsted, Harkins; Hartley, Ponder, Bowen, and Merton), A., ii, 280; (Ludlam), A., ii, 497; (Ishino), A., ii, 760.
  separation of isotopes of (Harkins and Hayes), A., ii, 140.
  distribution of electrons in the atom of (Bragg, James, and Bosanquet), A., ii, 703.
  decomposition of, into atoms (Trautz and Stäckel), A., ii, 760.
  dissociation of (v. Wartenberg and Henglein), A., ii, 441.
  thermal decomposition of (Henglein), A., ii, 823.
  solid vapour pressure of (Henglein, v. Rosenberg, and Muchlinski), A., ii, 760.
  photochemical reactions between hydrogen and (Gohring), A., ii, 9; (Weigert and Kellermann), A., ii, 808.
Chlorine, distribution of, between water and air (Titov), A., ii, 269.
  distribution and estimation of, in plants (Jung), A., i, 1098.
  distribution of, in blood (Siebeck and Hackmack), A., i, 1208.
  metabolism. See Metabolism.
Chlorine *di*oxide, structure of (Perkins), A., ii, 441.
    action of, on organic compounds (Schmidt and Braunsdorf), A., i, 781.
  Hydrochloric acid, synthesis of, from its elements without explosion (Neumann, Bergdahl, Broy, and Karwat), A., ii, 44.
    absorption spectrum of (Colby and Meyer), A., ii, 5; (Randall, Colby, and Paton), A., ii, 805.
    electrical conductivity of, in presence of sucrose (Kifran), A., ii, 812.
    heats of neutralisation of (Keyes, Gillespie, and Mitsukuri), A., ii, 424; (Richards and Rowe), A., ii, 425.
    formation of complex ions in solutions of (Hixon), A., ii, 815.
  Chlorides, contact potentials of solutions of (MacInnes and Yeh), A., ii, 252.
    inorganic, dissociation of, in aqueous solution (Günther-Schulze), A., ii, 765.
    effect of sucrose on the ionic activity of (Corran and Lewis), A., ii, 691.
    distribution of, in blood (Mukai; van Creveld; Norgaard and Gram), A., i, 287; (Mureşanu), A., i, 290; (Dische), A., i, 1086.
    metabolism of. See Metabolism.
    estimation of, by Bang's micro-method (Prigge), A., ii, 715; (Petschacher), A., ii, 716.
    estimation of, with silver nitrate (Kolthoff), A., ii, 581.
    estimation of, in blood (Friend), A., ii, 389; (Isaacs), A., ii, 716.
    estimation of, in presence of iodides (Bonino), A., ii, 78.
    estimation of bromides and, in presence of iodides (Kolthoff), A., ii, 79.
  Chloric acid, estimation of (Hakomori), A., ii, 389; (Kikuchi), A., ii, 519.
  Chlorates, reflection spectra of (Schaefer and Schubert), A., ii, 180.
    effect of chromates on the electrolysis of (Pamfilov), A., ii, 712.

Chlorine:—
  Chlorates, estimation of, by reduction (Treadwell, Hristie, Egger, and Sturzenegger), A., ii, 780.
  Perchloric acid, and its salts, velocity of reduction of (Bredig and Michel), A., ii, 359.
    estimation of (König), A., ii, 310; (Lenher and Tosterud), A., ii, 395.
  Hypochlorous acid, ionisation constant of (Noyes and Wilson), A., ii, 692.
    estimation of, in concentrated salt solutions (Taylor and Gammal), A., ii, 581.
  Chlorites (Levi), A., ii, 567.
Chlorine estimation:—
  estimation of, in benzaldehyde (Schimmel & Co.), A., ii, 78.
  estimation of, in organic compounds (Klimont), A., ii, 580; (Votocek), A., ii, 863.
  estimation of, in organic matter (v. Bogdándy), A., ii, 519.
  estimation of, in concentrated salt solutions (Taylor and Gammal), A., ii, 581.
  estimation of, in gastric juice (Malgoyre), A., ii, 780.
  estimation of, in tissues (Pico and Murtagh), A., ii, 716.
Chlorites, white (Shannon and Wherry), A., ii, 517.
  See also under Chlorine.
Chloro-acids, preparation of (Ikeda and Kodama), A., i, 219.
Chloroamines, preparation of (Coleman and Noyes), A., i, 133.
  aromatic (Goldschmidt and Strohmenger), A., i, 1004.
Chloroform, physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.
  equilibrium of ethyl alcohol, water and (Schoorl and Regenbogen), A., i, 215.
  action of, on magnesium alkyl haloids (Binaghi), A., i, 1002.
  derivatives as narcotics (Joachimoglu), A., i, 199.
  in blood after death (Gibson and Laidlaw), A., i, 1218.
  effect of, on peptic digestion (Astruc and Renaud), A., i, 281.
Chlorohydrins, preparation of (Detœuf), A., i, 236, 327.
  sensory stimulation by (Irwin), A., i, 899.
β-Chlorohydrins, preparation of (Smith), A., i, 3.
Chloropentamminocobaltic 2:4-dinitro-α-naphthoxide, and its 7-sulphonic acid (Morgan and King), T., 1727.
Chloropentamminocobaltic dipicrylamine (Morgan and King), T., 1726.
Chlorophyll, chemistry of (Costantin), A., i, 162.
  photoelectric properties of (Dixon and Ball), A., ii, 248.
  effect of sucrose on the formation of, in etiolated cotyledons (Mansky), A., i, 1222.
Chloropicrin, action of, with mercaptans (Rây and Das), T., 323.
Chloroplatinic acid. See under Platinum.
Chlorosulphonic acid, mechanism of the formation of (Lepin), A., ii, 847.
  analysis of (Weissenberger and Zoder), A., ii, 390.
Cholesterol (Windaus), A., i, 541.
  action of benzoyl peroxide on (Windaus and Luders), A., i, 453.
  iodine value of (Holde, Werner, Tacke, and Wilke), A., ii, 728.
  origin and destiny of, in the animal organism (Gardner and Fox), A., i, 89, 790.
  distribution of, in blood (Rouzaud and Thiéry), A., i, 394.
  in blood serum (Strauss and Schubardt), A., i, 1209.
  derivatives of, in blood (Lifschutz), A., i, 392.
  *di*bromide (Lifschütz). A., i, 251.
  detection of, colorimetrically (Kahlenberg), A., ii, 591.
α-Cholesterol oxide, chlorohydrin of (Windaus and Luders), A., i, 541.
Cholic acid, oxidation of (Wieland and Schlichting), A., i, 554.
  preparations of derivatives of (Riedel), A., i, 553; (Farbenfabriken vorm. F. Bayer & Co), A., i, 554.
*apo*Cholic acid, additive compounds of (Riedel), A., i, 554.
Choline, production of peristalsis by (Arai), A., i, 970.
  effect of, on movements of the intestines and stomach (Le Heux), A., i, 85.
Cholines, preparation of, from amino-acids (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 813.
  proteinogenous, decomposition of (Karrer and Horlacher), A., i, 825.
*iso*Chondodendrine (Faltis and Neumann), A., i, 569.
Chondrus crispus. See Carrageen.

- **Chromioxalic acid**, potassium salt, autoracemisation of (Rideal and Thomas), T., 196.
- **Chromiselenates.** See under Chromium.
- **Chromithiocyanates** (Bjerrum), A., i, 18.
- **Chromium**, preparation of (Fujibayashi), A., ii, 647.
  - Röntgen-ray spectrum of (Duane and Fricke), A., ii, 804.
  - cathodic deposition of metals on (Kyropoulos), A., ii, 22.
  - expansion of, and of its alloys with nickel (Chevenard), A., ii, 153.
- **Chromium alloys** with carbon and iron (Daeves), A., ii, 70.
  - with nickel, estimation of chromium in (Loffelbein; Hild), A., ii, 660.
- **Chromium bases** (*chromiumammines*), solubilities of salts of (Bronsted and Petersen), A., ii, 199.
  - complex chloroiridiates of (Benrath, Bücher, and Eckstein), A., ii, 515.
- **Chromium** azide, and its complex derivatives (Oliveri-Mandalà and Comella), A., ii, 382.
  - *sesqui*oxide (*chromic oxide*) as a mordant (Bancroft), A., ii, 822.
    - oxidation of organic compounds by (Simon), A., ii, 868.
  - *tri*oxide, equilibrium of sulphur trioxide, water and (Gilbert, Buckley, and Masson), T., 1934.
  - oxides, hydrated (Weiser), A., ii, 575.
  - **Chromic acid**, constitution of (Dhar), A., ii, 382.
  - **Chromates**, reflection spectra of (Schaefer and Schubert), A., ii, 179.
    - magnetic susceptibility of solutions of, and sulphuric acid (Cabrera and Piña de Rubies), A., ii, 612.
    - electrolysis of, with diaphragms (Lottermoser and Falk), A., ii, 736.
    - effect of, on the electrolysis of chlorates (Pamfilov), A., ii, 712.
    - estimation of, iodometrically (Vosburgh), A., ii, 863.
  - **Dichromates**, estimation of, acidimetrically (Kolthoff and Vogelenzang), A., ii, 88.
    - estimation of, electro-volumetrically (Eppley and Vosburgh), A., ii, 876.
- **Chromium** sulphate, green (Recoura), A., ii, 508.
  - **Chromic** chloride, electrolytic reduction of (Taylor, Gersdorff, and Tovrea), A., ii, 382.
- **Chromium**:—
  - **Hexamminechromiselenate** (Meyer and Speich), A., ii, 71.
  - **Pentamminechromiselenate**, chloro- (Meyer and Speich), A., ii, 71.
  - **Pentaquochromiselenate**, chloro- (Meyer and Speich), A., ii, 71.
  - **Tetraquochromihexaquochromiselenate**, *di*chloro- (Meyer and Speich), A., ii, 71.
- **Chromium organic compounds**:—
  - penta-, tetra-, and tri-phenyl salts (Hein), A., i, 77.
  - tetraphenylchromitetrathiocyanatodiammine (Hein), A., i, 76.
  - triphenylchromitetrathiocyanatodiammine (Hein), A., i, 78.
  - **Chromic salts** with azosalicylic acids (Morgan and Smith), T., 2866.
  - **Chromiselenates** of carbamide and triethylenediamine (Meyer and Speich), A., ii, 71.
- **Chromium estimation**:—
  - estimation of, in metals (Löffelbein; Hild), A., ii, 660.
  - estimation of, in ferrochromium (Kelley and Wiley), A., ii, 164.
  - estimation of, in ferrovanadium (Kelley, Wiley, Bohn, and Wright), A., ii, 89.
  - estimation of, in steel (Simion), A., ii, 529; (Losana and Carozzi), A., ii, 589.
- **Chromo-isomerism**, theory of (Lucas and Kemp), A., i, 30.
- **Chrysazin** boroacetate, and its acetyl derivative (Dimroth and Faust), A., i, 157.
- **Chrysoidine**, action of mercuric acetate on (Vecchiotti), A., i, 478.
- **Chrysophanic acid.** See 3-Methylanthraquinone, 1:8-*di*hydroxy-.
- **Chymosin.** See Rennin.
- **Ciloidanic acid** (Wieland and Schlichting), A., i, 838.
- **Cinchona alkaloids** (Rabe), A., i, 360; (Rabe, Kindler, and Wagner), A., i, 361; (Acton), A., i, 610.
  - stereochemistry of (King and Palmer), T., 2577.
  - action of hydrogen peroxide on (Speyer and Becker), A., i, 674.
  - pharmacology of (Acton), A., i, 899.
  - distribution of, in the organism (Schnabel), A., i, 290.
  - syntheses of derivatives of (Jacobs and Heidelberger), A., i, 671, 672, 673.
  - hydrogenated, preparation of amino-derivatives of (Howard & Sons, Blagden, and Nierenstein), A., i, 853.

Cinchona alkaloids, hydrogenated, aminosulphonic acids from (Boehringer & Söhne), A., i, 46.
estimation of, volumetrically (Schoorl), A., ii, 538.
Cinchonidine hexosephosphate (Neuberg and Dalmer), A., i, 920.
salt of tropic acid with (King and Palmer), T., 2585.
Cinchonine ferrioxalate (Burrows and Turner), A., i, 916.
Cinchotenine, ethyl and methyl ethers (Heidelberger and Jacobs), A., i, 673.
Cinchotoxine, salt of tropic acid with (King and Palmer), T., 2584.
Cinnamaldehyde, condensation of *p*-nitrobenzyl chloride with (Kleucker), A., i, 734.
and nitro-, oximes of (Brady and Thomas), T., 2098.
picrate, compound of thiocarbamide and (Taylor), T., 2270.
Cinnamaldehyde, *m*-nitro-, diethylhydrazone (Brady and McHugh), T., 1651.
Cinnamaldoxime *O*-and-*N*-benzyl ethers (Brady and Thomas), T., 2106.
Cinnam*anti*aldoxime 2:4-*di*nitrophenyl ether (Brady and Thomas), T., 2106.
Cinnam*anti*aldoxime, *o*-, *m*- and *p*-nitro- (Brady and Thomas), T., 2106.
Cinnamic acid, use of, in cryoscopy (Falciola), A., ii, 421.
sulphonation of (Moore and Thomas), A., i, 454.
condensation of resorcinol with (Short and Smith), T., 1808.
chlorohydrin, preparation and reactions of (Forster and Saville), T., 2595.
4-chlorosulphonyl derivative, preparation of (Stewart), T, 2561.
cholesteryl ester, inversion of rotation of (Royer), A., ii, 415.
vanillylamide of (Ott and Zimmermann), A., i, 137.
***trans*-Cinnamic acid**, *p*-amino-, α-chloro-*p*-amino-, α-chloro-*p*-nitro-, and *p*-nitro-, and their salts and derivatives (Pfeiffer and Haefelin), A., i, 738.
Cinnamic acids, action of light on (de Jong), A., i, 339.
photo-reactions of (Stobbe and Steinberger), A., i, 1018.
Cinnamic acids, *trans*-substituted, addition of bromine to (van Duin), A., i, 737.
nitro-, estimation of nitrogen in, by the Kjeldahl method (Margosches and Vogel), A., ii, 522.
Cinnamon bark oil (Roure-Bertrand Fils), A., i, 847.
Cinnamonitrile, *m*- and *p*-nitro- (Brady and Thomas), T., 2107.
Cinnamoyldiazoacetic acid, methyl ester, interaction of triphenylphosphine with (Staudinger and Luscher), A., i, 238.
Cinnamoylformic acids, nitro- (Heller, Lauth, and Buchwaldt), A., i, 1024.
Cinnamylidenemethyl α-hydroxy*iso*propyl ketone. See α-Phenyl-ζ-methyl-$\Delta^{\alpha\gamma}$-heptadien-ζ-ol-ε-one.
Cinnamylidenequinaldine ethohaloids (Mills and Hamer), T., 2012.
Citraconic acid, *p*-chlorophenylhydrazine ester and phenyl- and tolyl-hydrazides (Chattaway and Parkes), T., 285.
Citraconyl-*mono*- and -*di*-bromophenylhydrazides (Chattaway and Parkes), T., 286.
Citraconyl-*mono*- and -*di*-chlorophenylhydrazides (Chattaway and Parkes), T., 286.
Citraconylhydrazides, isomeric (Chattaway and Parkes), T., 283.
Citraconyltolylhydrazides (Chattaway and Parkes), T., 288.
Citric acid, dissociation constants of (Hastings and van Slyke), A., i, 985.
formation of, in Citromyces cultures, and its estimation (Butkewitsch), A., i, 973.
in milk and milk products (Supplee and Bellis), A., i, 197.
of cows' milk, decomposition of, by bacteria (Kickinger), A., i, 1219.
ammonium salt, preparation of a neutral solution of (Robinson), A., ii, 84.
analysis of (Robinson and Bandemar), A., ii, 460.
cobalt salt, tetrammine (Clark and Buckner), A., ii, 300.
zirconyl salt (Venable and Lineberry), A., i, 917.
estimation of, in urine (McClure), A., ii, 791.
Citromyces, formation of oxalic acid and ammonia in growth of, on peptone (Butkewitsch), A., i, 707.
cultivation of, on sugar, and the formation and estimation of citric and oxalic acids (Butkewitsch), A., i, 973.
Citronella oil, estimation of geraniol content of (de Jong and Reclaire), A., ii, 790.
Clays, formation of layers in (Ungerer), A., ii, 96.
amphoteric action of (Arrhenius), A, i, 707.

- **Clupanodonic acid** (Tsujimoto), A., i, 917.
- *Clupea alosa* (shad), chemistry of the spermatozoa of (Steudel), A., i. 294.
- **Cnidic acid** (Murayama), A., i, 310.

o-**Cresol-5-sulphonic acid**, 3-nitro-, salts of (Davies), T., 791.
o-**Cresolsulphonphthalein**, absorption spectra of (Orndorff, Gibbs, Scott, and Jackson), A., ii, 806.
Cristobalite from Washington (Shannon), A., ii, 450.
Critical temperature, relation between boiling and melting points and (Prud'homme), A., ii, 349.
Croceine, action of phenylhydrazine and sulphite on (Bucherer and Zimmermann), A., i, 466.
Crocidolite from Pennsylvania (Wherry and Shannon), A., ii, 518.
Crocodile oil, constituents of (Kobayashi), A., i, 792.
Croconic acid, constitution of (Homolka), A., i, 630.
Crops, effect of silicic acid on production of (Lemmermann and Wiessmann), A., i, 1103.
Crotonaldehyde, preparation of (Consortium fur Elektrochemische Industrie), A., i, 1115.
catalytic hydrogenation of (Grunstein), A., i, 112.
Crotonic acid, transformations of, in ultra-violet light (Stoermer and Robert), A., i, 519.
vanillylamide of (Ott and Zimmermann), A., i, 187.
Crotonic acid, β-amino-, ethyl ester, compound of methyl azodicarboxylate and (Diels), A., i, 774.
Crucibles, silica, use of, in estimation of potassium (Jones and Reeder), A., ii, 85.
Cryoscopy, use of cinnamic acid in (Falciola), A., ii, 421.
Cryptal from eucalyptus oil (Penfold), T., 266.
Crystals, structure of (Bragg), T., 2766.
Crystals, structure of, and constitution of atoms (Niggli), A., ii, 36.
by means of Röntgen rays (Hull and Davey; Hull), A., ii, 624.
of complex haloids, by means of Röntgen rays (Scherrer and Stoll), A., ii, 514.
electronic (Huggins), A., ii, 744.
absorption of Röntgen rays in (Aurén), A., ii, 810.
reflexion of Röntgen rays from (Darwin), A., ii, 416; (Dardord), A., ii, 673.
scattering of Röntgen rays by (Bragg, James, and Bosanquet), A., ii, 184.
Röntgenographic determination of the arrangement of (Polányi), A., ii, 623.
Röntgen ray investigation of the lattice of (Gerlach), A., ii, 36, 265.
use of Röntgen rays in analysis of (Clark and Duane), A., ii, 483; (Quarder), A., ii, 677.
luminous path of α-rays in (Geiger and Werner), A., ii, 183.
photography of (François and Lormand), A., ii, 127.
rotatory power of (Longchambon), A., ii, 603.
ionic properties of (Grimm), A., ii, 127.
size of atoms in (Pease), A., ii, 428.
radius of hydrogen atoms in (Aminoff), A., ii, 496.
loosening of the lattice in (v. Hevesy), A., ii, 623.
hardness of (Reis and Zimmermann), A., ii, 745.
adsorption of colouring matters by (Paneth and Vorwerk), A., ii, 619.
absorption of gases by (Seeliger and Lapkamp), A., ii, 30.
velocity of decomposition of (Sieverts), A., ii, 700.
diamond type, size of atoms in (Pease), A., ii, 634.
liquid, existence of (Lehmann), A., ii, 692.
formation of, and the symmetry of molecules (Vorländer), A., ii, 554.
structure of drops of (Lehmann), A., ii, 201.
mixed, resistance limits in (Masing), A., ii, 37.
binary mixed, chemical behaviour of (Tammann), A., ii, 63.
organic, structure of (Bragg; Becker and Jancke), A., ii, 128.

Crystalline condition, distinction between the amorphous and the (HABER), A., ii, 553.
  substances, space formulæ for (RINNE), A., ii, 368.
Crystallisation, process of (SCHAUM), A., ii, 264.
  produced by annealing (GAUBERT), A., ii, 35.
  starting of, by friction of a glass rod against the wall of the vessel (DEDE; FRICKE), A., ii, 744.
  prevention of, by addition of proteins (CAVAZZANI), A., ii, 745.
  spontaneous, influence of pressure on (HASSELBLATT), A., ii, 35.
   of supercooled liquids (HINSHELWOOD and HARTLEY), A., ii, 200.
Crystalloids, transition from, to colloids (WITZEMANN), A., ii, 428.
Crystal-violet-leucosulphonic acid (WIELAND and SCHEUING), A., i, 58.
Cubebin (MAMELI), A., i, 347.
Cubebinic acid, *di*bromohydroxy-, and hydroxy-, amides of (MAMELI), A., i, 348.
Cubebinolide, derivatives of (MAMELI), A., i, 347.
Culture solutions, estimation of alkalinity of (MICHAELIS), A., i, 405.
iso-ψ-**Cumenol** (3:5:6-*trimethylphenol*) (v. AUWERS and SAURWEIN), A., i, 1033.
α-ψ-**Cumidine**, *di*-ω-chloro-. See 2:3:5-Trimethylbenzene, 1-*di*chloroamino-
Cuminaldehyde from eucalyptus oil (PENFOLD), T., 266.
Cumylcumoquinonedi-imide, chloro- (GOLDSCHMIDT and STROHMENGER), A., i, 1005.
Cuprates. See under Copper.
Cuprene, constitution of (KAUFMANN and SCHNEIDER), A., i, 245.
Cupretenine methyl ether, hydrochloride of (HEIDELBERGER and JACOBS), A., i, 673.
Curcanolic acid (GRIMME), A., i, 98.
Curcine (GRIMME), A., i, 98.
Curite (SCHOEP), A., ii, 77.
Currant. See *Ribes rubrum*.
Cuttlefish, action of inky secretion of, on pyrrole (RONDONI), A., i, 64.
Cyanamide, preparation of carbamide from (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 993.
  physiological action of (HESSE), A., i, 1093.
Cyanamides, condensation of hydrochlorides of, with phenols (SHORT and SMITH), T., 1803.
Cyanamidoethyl alcohol, and its derivatives (FROMM and HONOLD), A., i, 529.
Cyanates, thio-. See Thiocyanates.
Cyanic acid and **Cyanides**. See under Cyanogen.
Cyanines, thio-, tautomerism of (MILLS and BRAUNHOLTZ), T., 1489.
*iso***Cyanines**, brominated (MOUDGILL), T., 1509.
  thio- (BRAUNHOLTZ and MILLS), T., 2004.
Cyanine colouring matters (MILLS), T., 455; (MILLS and BRAUNHOLTZ), T., 1489; (BRAUNHOLTZ and MILLS), T., 2004.
  antiseptic properties of (BROWNING, COHEN, and GULBRANSEN), A., ii, 1097.
Cyanogen, spectrum of (KRATZER), A., ii, 4.
  band spectrum of (OKUBO), A., ii, 601.
Cyanogen bromide, action of, on tertiary arsines (STEINKOPF, DONAT, and JAEGER), A., i, 994.
  haloids, action of, on phenylhydrazine (PELLIZZARI), A., i, 585.
  Hydrocyanic acid, formation of, from nitrogen and hydrocarbons (KOENIG and HUBBUCH), A., i, 642
   preparation of, in the laboratory (FRITZMANN), A., i, 1128.
   production of, by *Bacillus pyocyaneus* (PATTY), A., i, 407.
   synthesis of, by oxidation of various organic compounds (FOSSE; FOSSE and HIEULLE), A., i, 117.
   tautomerism of (USHERWOOD), T., 1604.
   polymeride of, and its derivatives (GRISCHKEVITSCH-TROCHIMOVSKI), A., i, 723.
   oxidation of formaldehyde to (FOSSE and HIEULLE), A., i, 523.
   in plants (ROSENTHALER), A., i, 412, 614; (SIEGFRIED), A., i, 614.
   calcium salt, preparation of, pure (PINCASS), A., i, 532.
   magnesium salt, and its complex silver compounds (FICHTER and SUTER), A., i, 532.
   mercuric salt, compounds of, ammonia with (BRINKLEY), A., i, 724.
   potassium salt, crystal structure of (BOZORTH), A., i, 441; (COOPER), A., i, 1128.
   potassium cadmium, potassium mercury, and potassium zinc salts, crystal structure of (DICKINSON), A., i, 532.
   detection of (SUNDBERG), A., ii, 404.
  Cyanides, estimation of, electrometrically, in presence of haloids (MÜLLER and LAUTERBACH), A., ii, 403.

Cyanogen:—

Cyanic acid in blood (Nidoux and Welter), A., i, 789.

*iso***Cyanic acid**, condensation of, with aromatic o-aminosulphonic acids (Scott and Cohen), T., 2034.

Cyanogen, estimation of (Yanagisawa), A., ii, 667.

Cyanohydrins, synthesis of, by means of emulsion (Nordefeldt), A., i, 66.

Cyanuric dihydrazidomonoazide, monohydrazidodiazide and triazide (Ott), A., i, 1128.

*apo***Cyclene** (Komppa and Roschier), A., i, 1167.

Cyclic compounds, formation of, from halogenated open-chain derivatives (Chandrasena and Ingold), T., 1306; (Ingold), T., 2676.

formation of, from hydroaromatic dicarboxylic acids (Windaus and Hückel), A., i, 658.

space configuration of (Derx), A., i, 651.

tautomerism of, with open-chain isomerides (Kon, Stevenson, and Thorpe), T., 650.

halogen derivatives, absorption spectra of (Graham and Macbeth), T., 2601.

Cymbopogon cæsius (inchi grass), essential oil from (Moudgill and Iyer), A., i, 945.

p-**Cymene**, bromo-2-amino-, and its derivatives (Wheeler and Smithey), A., i, 832.

γ-**2-Cymylbutyric acid** (Ruzicka and Mingazzini), A., i, 1001.

β-**2-Cymylethyl alcohol**, and its bromide (Ruzicka and Seidel), A., i, 562

β-**2-Cymylethylmalonic acid**, ethyl ester (Ruzicka and Mingazzini), A., i, 1001.

methyl ester (Ruzicka and Seidel), A., i, 562.

β-**2-Cymyl-α-methylbutyric acid**, and its chloride (Ruzicka and Seidel), A., i, 562.

Cyprine, from New York (Lewis and Bauer), A., ii, 714.

Cyprinus carpio (carp), constituents of the ovaries of (Fauré-Fremiet and Garrault), A., i, 700.

Cystine (Merrill), A., i, 326.

preparation of (Schmidt), A., i, 992.

acid hydrolysis of (Hoffman and Gortner), A., i, 429.

oxidation of, in the animal organism (Lewis and Root), A., i, 487.

excretion of, as cysteine (Lewis, McGinty, and Root), A., i, 1088.

estimation of, in proteins (Folin and Looney), A., ii, 539.

Cysts, ovarial-dermoid, unsaturated alcohols from (Muck), A., i, 1092.

Cytopectans (Clayson, Norris, and Schryver), A., i, 206.

Cytopectic acid (Clayson, Norris, and Schryver), A., i, 206.

D.

Dakin's hypochlorite solution, action of, on organic compounds (Engfeldt), A., i, 812.

Deaminoproteins (Herzig and Lieb), A., i, 386.

Decahydronaphthalene (*decalin*), physical properties of (Herz and Schuftan), A., i, 647.

Decahydronaphthalenes, isomerism of (Mohr), A., i, 248.

Decalactone (Grün and Wirth), A., i, 805.

Decalin. See Decahydronaphthalene.

Decanedial, and its derivatives (Rosenmund, Zetzsche, and Enderlin), A., i, 431.

Decarboxylation in biochemistry (Spiro), A., i, 1213.

Δ^{θ}-**Decenoic acid**, synthesis of (Grün and Wirth), A., i, 804.

from butter, and *di*bromo-, and their methyl esters (Grün and Wirth), A., i, 806.

Deco*iso***butylamide** (Asahina and Asano), A., i, 506.

Decoic acid, ι-chloro-, methyl ester (Grün and Wirth), A., i, 805.

ι-hydroxy-, and its methyl ester (Grün and Wirth), A., i, 805.

n-**Decyl** fluoride (Swarts), A., i, 101.

Dehydrocholic acid, trisemicarbazone of (Borsche and Hallwass), A., i, 1159.

Dehydrolithocholic acid, methyl ester, and its oxime (Borsche and Hallwass), A., i, 1159.

Dehydroxidation (Müller), A., i, 110.

Delphinidæ, oil from the heads of (Nakatogawa and Kobayashi), A., i, 701.

Demethoxy-yanogonine (Murayama and Mayeda), A., i, 265.

Demethylscopolinone, and its salts and derivatives (Hess and Wahl), A., i, 857.

Denitrification with formates (Groenewege), A., i, 971.

Density (*specific gravity*), determination of, of liquids (Wiedbrauk), A., ii, 740.

contraction of flasks, used in the determination of, of gases (Moles and Miravalles), A., ii, 617.

Deoxybenzoin acetal and anil, and their derivatives (KNOEVENAGEL and GOOS), A., i, 752.
a- and *β*-**Deoxybenzoinpinacones** (GARCÍA BANÚS and PASCUAL VILA), A., i, 734.
Deoxybilianic acid, semicarbazone of (BORSCHE and HALLWASS), A., i, 1160.
*iso***Deoxybilianic acid,** formula of, and its derivatives (WIELAND and ADICKES), A., i, 838.
2-Deoxyglucose, and its derivatives (BERGMANN, SCHOTTE, and LECHINSKY), A., i, 227.
Deoxyindigotin, and its sulphonic acid and sodium salt (BORSCHE and MEYER), A., i, 55.
Deoxymatrine, and its salts and derivatives (KONDÔ, KISHI, and ARAKI), A., i, 269.
Deoxyscopolamine, and its salts (HESS and WAHL), A., i, 856.
Deoxytropyl bromide (HESS and WAHL), A., i, 855.
a- and *β*-**Deoxytropylscopolein,** and their salts (HESS and WAHL), A., i, 855.
Detectors, new, for wireless telegraphy (HEIKE), A., ii, 19.
Detonators, *a*-particles as (HENDERSON), A., ii, 606.
Dewindtite, a radioactive mineral (SCHOEP), A., ii, 305.
Dextrin, adsorption in solutions of, and their emulsifying action (CLARK and MANN), A., ii, 550.
Dextrose (d-*glucose*; *grape-sugar*), mutarotation of (MURSCHAUSER), A., i, 322, 432; ii, 92.
  solubility of, in water (JACKSON and SILSBEE), A., i, 986.
  decomposition of, in alkaline solution (WATERMAN and VAN TUSSENBROEK), A., i, 433.
  decomposition of, by pyocyanic bacilli (AUBEL), A., i, 201.
  lactic acid fermentation of, by peptone (SCHLATTER), A., i, 1096; (BAUR and HERZFELD), A., i, 1097.
  function of phosphates in oxidation of, by hydrogen peroxide (HARDEN and HENLEY), A., i, 433.
  oxidation of, in the body (HIRSCH), A., i, 87.
  catalytic reduction of (CAKE), A., i, 523.
  electrolytic reduction of (FINDLAY and WILLIAMS), A., i, 523.
  acetone derivatives of (IRVINE and PATTERSON), T., 2146.
  action of ammonia on (LING and NANJI), A., i, 631.
  action of ozone on solutions of (SCHONEBAUM), A., i, 223.
Dextrose, distribution of, in arterial and venous blood (HENRIQUES and EGE), A., i, 191.
  permeability of blood-corpuscles for (VAN CREVELD and BRINKMAN), A., i, 192.
  action of injections of, on diuresis (CORI), A., i, 1091.
  sulphate (NEUBERG and LIEBERMANN), A., i, 222.
  and its tetra-acetyl derivative, sulphate compounds of, and their salts (OHLE), A., i, 986.
  detection of, biochemically (ARNOLD), A., i, 311.
  detection of, in urine by means of *o*-nitrophenylpropiolic acid (RODILLON), A., ii, 166.
  estimation of (GREINER), A., ii, 400; (LEMKES and LANDSBERG), A., ii, 724; (KRULL; VAN DER HAAR), A., ii, 790; (FLEURY and BOUTOT), A., ii, 879.
  separation of sucrose from, by dialysis (CONGDON and INGERSOLL), A., i, 322.
Diabetes (*glycosuria*), chemistry of (IONESCU), A., i, 198.
  acetone substances in blood in (FITZ), A., i, 192.
  acetonuria in (HUBBARD and NICHOLSON), A., i, 969.
  aldehyde in urine in (STEPP and FEULGEN), A., i, 300.
  aldol and acetaldehyde in urine in (FRICKE), A., i, 300.
  carbohydrate metabolism in (ALLEN and WISHART), A., i, 893; (WAGNER and PARNAS), A., i, 965.
  utilisation of fat in (BLATHERWICK), A., i, 89.
  administration of lævulose in (DESGREZ, BIERRY, and RATHERY), A., i, 1215.
  adrenaline (ELIAS and SAMMARTINO), A., i, 86.
  phloridzin, sugar in the kidneys in (NASH), A., i, 497.
    action of desiccated thyroid in (ASHER and HORRISBERGER), A., i, 293.
Di-5-acenaphthylcarbamide (FLEISCHER and SCHRANZ), A., i, 1143.
Diacetonedeoxyglucose (FREUDENBERG and BRAUNS), A., i, 1117.
Diacetoneglucoenose (FREUDENBERG and BRAUNS), A., i, 1117.
Diacetoneglucose, transformations of (FREUDENBERG and BRAUNS), A., i, 1117.
  sulphuric ester of (LEVENE, MEYER, and WEBER), A., i, 987.

Diacetonexylose (FREUDENBERG and SVANBERG), A., i, 1116.

pp'-**Diacetoxybenzene** (FICHTER and JAECK), A., i, 62.

7:12-Diacetoxydibenzothianthren, 5:14-*di*hydroxy- (BRASS and KÖHLER), A., i, 1051.

5:14-Diacetoxydibenzothianthrenquinone (BRASS and KÖHLER), A., i, 1051.

Diacetoxydiethyl sulphide (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 420.

3:5-Diacetoxydimercuri-4-hydroxybenzaldehyde (HENRY and SHARP), T., 1058.

3:5-Diacetoxydimercurisalicylaldehyde (HENRY and SHARP), T., 1056.

Diacetoxy-7:7-dimethyl-α-dinaphthaxanthens (SEN-GUPTA and TUCKER), T., 560, 562.

Diacetoxymercurinitroanilines (KHARASCH, LOMMEN, and JACOBSOHN), A., i, 604.

Diacetoxymercuri-5-nitrosalicylic acid (RAIZISS and PROSKOURIAKOFF), A., i, 604.

Diacetoxy-7-methyl-7-ethyl-α-dinaphthaxanthens (SEN-GUPTA and TUCKER), T., 563.

1:5-Diacetoxynaphthalene, and *di*nitro- (HEMMELMAYR), A, i, 836.

6:11-Diacetoxy-ββ-naphthaphenthiazine, 3-amino-, acetyl derivative (FRIES and KERKOW), A, i, 578.

2:3-Diacetoxyphenyl-*n*-octaldehyde (MAJIMA and TAHARA), A., i, 263.

3:4-Diacetoxystyrene, ω-nitro- (ROSENMUND and PFANNKUCH), A., i, 1030.

Diacetylacetone, preparation of, and its salts and derivatives (COLLIE and REILLY), T., 1984.

1:1'-Diacetyldihydro-4:4'-dipyridyl (DIMROTH and FRISTER), A., i, 678.

Diacetylpurpurin 2-methyl ether (DIMROTH, SCHULTZE, and HEINZE), A., i, 157.

Diacetylquinizarin, *mono*- and *di*-bromo- (DIMROTH, SCHULTZE, and HEINZE), A., i, 157.

Diacetylsuccinic acid, ethyl ester,
  tautomerism of (KAUFMANN), A., i, 985.
  isomerism of, and its estimation and iron salts (KNORR and KAUFMANN), A., i, 220.

Diacetylsuccinic acid, *di*bromo-, ethyl ester, preparation of (HIRST and MACBETH), T., 2175.

1:1'-Diacetyltetrahydro-4:4'-dipyridyl (DIMROTH and HEENE), A., i, 48.

1:1'-Diacetyltetrahydrodiquinolyl (DIMROTH and HEENE), A., i, 50.

αα'-**Diacetyl-*αα'ββ'*-tetraphenyltetrazan** (GOLDSCHMIDT and EULER), A., i, 475.

αα'-**Diacetyl-*αα'ββ'*-tetra-*p*-tolyltetrazan** (GOLDSCHMIDT and EULER), A., i, 476.

Dialkyl sulphides, chloro- (POPE and SMITH), T., 1166.

7:-9-Dialkyldeoxyuric acids (BILTZ), A., i, 380; (BILTZ and BÜLOW), A., i, 381, 382, 383, 384; (BILTZ and HEIDRICH), A., i, 382, 383.

Diallylanthranilic acid (FÖLDI), A., i, 732.

Diallylbenzidine, 3:3':5:5'-*tetra*nitro- (VAN ROMBURGH), A., i, 276.

NN'-**Di(*p*-allyloxyphenyl)acetamidine** (SCHULER), A., i, 179.

Dialyser, rapid (GUTBIER, HUBER, and SCHIEBER), A., ii, 551.
  simple (GUTBIER and MAYER), A., ii, 353.

Diamminodinitro-oxalatocobaltiates, crystallography and optical properties of (KNAGGS), T., 2069.

Diamond, energy of atomic linkings in (FAJANS), A., ii, 818.
  forces between atoms in, and in aliphatic hydrocarbons (FAJANS), A., ii, 194.
  action of, on carbon monoxide (FOIX), A., ii, 641.

Diamyl selenide, *ββ'*-*di*chloro-, and its dichloride (BOORD and COPE), A., i, 421.

Diamylose, constitution of (KARRER and SMIRNOV), A., i, 435.

Di*iso*amyloxydiphenylmethane (MACKENZIE), T., 1696.

2:7-Dianilinonaphthaflavinduline (DUTT), T., 1953.

2:7-Dianilinophenanthranaphthazine, and its nitro- derivatives (SIRCAR and DUTT), T., 1948.

3:5-Dianilino-1:2:4-triazole, and its dibenzoyl derivative (FROMM, KAYSER, BRIEGLEB, and FOHRENBACH), A., i, 378.

Dianilinovinyl ketone, and its derivatives (BORSCHE and BONACKER), A., i, 50.

o-**Dianisidine** hydroferrocyanide (CUMMING), T., 1296.

Di-*p'*-anisyl-*p*-benzoquinone (PUMMERER and PRELL), A., i, 1165.

Di-*p*-anisyl-(ββ-diphenylvinyl)methyl perchlorate (ZIEGLER, OCHS, BREMER, and THIEL), A., i, 1049.

NN'-**Di-*p*-anisylhydrazine,** and its derivatives (WIELAND, WECKER, and ALBERT), A., i, 780.

2:5-Di-*p*-anisylquinol (PUMMERER and PRELL), A., i, 1165.

Di-*p*-anisylstyryl carbinol, and its derivatives (ZIEGLER and OCHS), A., i, 151, 1048.

Dianthraquinone, 2:2′-*di*hydroxy- (BRADSHAW and PERKIN), T., 921.

Dianthraquinonylcarbamides, isomeric (BATTEGAY and BERNHARDT), A., i, 1041.

Dianthrone, 3:3′-*di*hydroxy-, and its derivatives (PERKIN and WHATTAM), T., 294.

Dianthryl, 2:2′-*di*hydroxy-, and its derivatives (PERKIN and WHATTAM), T., 292.

Diantipyryl selenide, *di-p* nitro- (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 1066.

Diaquotetramminecobaltiselenate. See under Cobalt.

Diaquotetrapyridinemagnesium bromide (SPACU), A., i, 859.

Diarylstyrylcarbinols, halochromy of (ZIEGLER), A., i, 151.

Diastase, inactivation of, by metals (LUGER), A., i, 65.
  regeneration of (BIEDERMANN), A., i, 698.
  action of pepsin and trypsin on (BIEDERMANN), A., i, 480.
  malt, thermostability of (ERNSTROM), A., i, 599.

2-Diazoamino-3-bromo-*p*-cymene (WHEELER and SMITHEY), A., i, 333.

Diazobenzene(4-arsinic acid)-4′-aminoacetanilide, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-aminoacetophenone, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid) 4′-amino-6′-acetophenoxyacetic acid, and its sodium salt and methyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-3′-aminoanisic acid, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)aminobenzoic acids, and their sodium salts (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-aminocinnamic acid, and its salts and ethyl ester (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-amino-2′:5′-dimethylphenoxyacetic acid, sodium salt and methyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene-4-arsinic acid-3′-amino-6′-methoxybenzoic acid, methyl ester, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-amino-2′-methylphenoxyacetic acid, and its methyl ester and sodium salts (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)aminomethyl*iso*propylphenoxyacetic acids, sodium salts and methyl esters (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-4′-aminophenol, and its sodium salt and benzoic ester (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-aminophenoxyacetic acid, and its salts and derivatives (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-4′-aminophenylarsinic acid, and its salts (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-6′-aminopiperonylic acid, methyl ester, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)aniline, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)anisidines, and their sodium salts (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)benzylglycine (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-6-bromo-4-amino-2-methylphenoxyacetic acid, and its sodium salt and methyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-2′-bromo-4′-aminophenoxyacetic acid, and its sodium salt and methyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-4′-chloroaniline, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)diethylamine, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)dimethylamine, and its sodium salt (JACOBS and HEIDELBERGER), A., i, 73.

Diazobenzene(4-arsinic acid)-4′-ethoxyphenylglycine, and its sodium salts and ethyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-4′-methoxyphenylglycine, and its sodium salts and ethyl ester (JACOBS and HEIDELBERGER), A., i, 74.

Diazobenzene(4-arsinic acid)-3′-methyl-4′-aminophenoxyacetic acid, and its methyl ester and sodium salts (Jacobs and Heidelberger), A., i, 74.

Diazobenzene(4-arsinic acid)-4′-methylaminophenoxyacetic acid (Jacobs and Heidelberger), A., i, 74.

Diazobenzene(4-arsinic acid)methylaniline, and its sodium salt (Jacobs and Heidelberger), A., i, 73.

*bis***Diazobenzene(4-arsinic acid)pentamethylenetetramine**, and its sodium salt (Jacobs and Heidelberger), A., i, 73.

Diazobenzene(4-arsinic acid)phenylglycine, and its sodium salt (Jacobs and Heidelberger), A., i, 74.

Diazobenzene(4-arsinic acid)piperidine, and its sodium salt (Jacobs and Heidelberger), A., i, 73.

Diazobenzene(4-arsinic acid)-*p*-toluidine, and its sodium salt (Jacobs and Heidelberger), A., i, 73.

Diazobenzene(4-arsinic acid)-*p*-tolylglycine, and its sodium salt (Jacobs and Heidelberger), A., i, 74.

Diazo-2-bromobenzene(4-arsinic acid)-*p*-aminophenoxyacetic acid, and its methyl ester and sodium salts (Jacobs and Heidelberger), A., i, 74.

Diazo-compounds (Angeli), A., i, 774; (Pieroni), A., i, 1071.
  aliphatic (Staudinger and Lüscher), A., i, 237; (Staudinger), A., i, 238, 240.
    asymmetry of (Levene and Mikeska), A., i, 818.
    mechanism of reaction of (Oliveri-Mandalà), A., i, 994.
  optically active (Chiles and Noyes), A., i, 924.

α-**Diazoglutaric acid**, esters (Chiles and Noyes), A., i, 924.

Diazo-groups, replacement of nitro-groups by (Veselý and Dvořak), A., i, 690.

α-**Diazo-*n*-hexoic acid**, *d*- and *l*-ethyl esters (Chiles and Noyes), A., i, 925.

Diazomalonic acid ethyl and methyl esters, interaction of triphenylphosphine with (Staudinger and Lüscher), A., i, 238.

Diazomethane, action of, on uracil (Johnson, Hill, and Case), A., i, 471.
  action of, on ureides and uric acid (Herzig), A., i, 373.

Diazonium salts, interaction of phenols and (Chattaway and Hill), T., 2756.

Diazo-reaction in the carbazole series (Morgan and Read), T., 2709.

Diazotisation, velocity of reaction of (Schoutissen), A., i, 181.

6-Diazo-*o*-toluene(3-arsinic acid)-*p*-aminophenoxyacetic acid, and its sodium salt and methyl ester (Jacobs and Heidelberger), A., i, 74.

5-Dibenzenesulphonylaminoacenaphthene (Fleischer and Schranz), A., i, 1144.

Dibenzhydrazide chloride, action of sodium azide with (Stollé and Netz), A., i, 690.

Dibenzofulvene (*diphenylene-ethylene*), and its derivatives (Wieland, Reindel, and Ferrer), A., i, 1137.
  and its picrate and polymeride, and 2:7-*di*bromo- (Sieglitz and Jassoy), A., i, 820.

Dibenzothianthren, 5:7:12:14-*tetra*hydroxy (Brass and Kohler), A., i, 1051.

Dibenzothianthrendiquinone, preparation of, and its sulphoxide and 1:14-*di*hydroxy- (Brass and Köhler), A., i, 1051.

Dibenzothiazolylmethane, and its ethiodide and methiodide (Mills), T., 464.

Dibenzoylalizarin, preparation of (Barnett and Cook), T., 1389.

αδ-**Dibenzoylamino-β-ketobutane**, and its semicarbazone (Windaus, Dorries, and Jensen), A., i, 60.

αδ-**Dibenzoylamino-γ-ketovaleric acid**, methyl ester, and its phenylhydrazone (Windaus, Dörries, and Jensen), A., i, 61.

Dibenzoylcystine, properties of (Wolf and Rideal), A., i, 1114.
  colloidal gels of (Gortner and Hoffman), A., ii, 130.

Dibenzoyl-β-hydroxyethylguanidine (Fromm and Honold), A., i, 530.

Dibenzoylmethane of Wislicenus, true nature of (Dufraisse and Gérald), A., i, 89.
  selenium compounds of, and chloro- (Morgan, Drew, and Barker), T., 2463

Dibenzoylmethylethylglyoxime (Ponzio), A., i, 18.

Dibenzoylmethylglyoxime (Ponzio), A., i, 17.

1:4- and **1:5-Dibenzoylnaphthalenes** (Scholl and Neumann), A., i, 261.

5:14-Dibenzoyloxydibenzothianthrenquinone (Brass and Kohler), A., i, 1051.

5,9-Dibenzoyloxy-7:7-dimethyl-α-dinaphthaxanthen (Sen-Gupta and Tucker), T., 562.

5:9-Dibenzoyloxy-7-methyl 7-ethyl-α-dinaphthaxanthen (Sen-Gupta and Tucker), T., 564.

1:12 Dibenzoyloxyperylene (Zincke and Dengg), A., i, 1013.

Dibenzoylphenylmethane (Meisenheimer and Weibezahn), A., i, 178.

Dibenzoylpyrazoleanthrone-yellow (Mayer and Heil), A., i, 878.

αα'-Dibenzoyl-αα'ββ'-tetraphenyltetrazan, and its derivatives (Goldschmidt and Euler), A., i, 475.

αα'-Dibenzoyl-αα'ββ' tetra-*p*-tolyltetrazan, and its compound with triphenyl methyl (Goldschmidt and Euler), A., i, 476.

Dibenzpyrene-5:8 quinone (Scholl and Neumann), A., i, 261.

Dibenzyl. See *s.*-Diphenylethane.

Dibenzyl ether (Farbenfabriken vorm. F. Bayer & Co.), A., i, 934.

*di*sulphide, *di-o*-hydroxy- (Zemplén and Hoffmann), A., i, 564.

Dibenzylacethydroxamic acid, and its salts and derivatives (Jones and Scott), A., i, 454.

Dibenzylacetyl chloride (Jones and Scott), A., i, 454.

Dibenzylamine, acetyl derivative (Short and Smith), T., 1806.

Dibenzylbenzoamidine, and its salts (Curtius and Ehrhart), A., i, 775.

Dibenzylcyanamide dihydrochloride (Short and Smith), T., 1806.

2:3-Dibenzyl-5:6-dihydropyrazine, αα'-*di*cyano- (Dutt and Sen), T., 2664.

Dibenzyl diketone, αα'-*di*cyano-, colouring matters from (Dutt and Sen), T., 2663.

9:12-Dibenzyldiphensuccindane (Brand and Müller), A., i, 445.

1:1'-Dibenzyl-4:4'-dipyridinium (Weitz and Ludwig), A., i, 366.

hydrogen carbonate (Weitz and König), A., i, 1186.

Dibenzylideneacetone. See Distyryl ketone.

Dibenzylidene*cyclo*butanone (Demjanov and Dojarenko), A., i, 1161.

9:12-Dibenzylidenediphensuccindane (Brand and Müller), A., i, 445.

9:12-Dibenzylidene-Δ^{10}-diphensuccindene (Brand and Müller), A., i, 445.

Dibenzylmalonic acid, *di-o*-nitro-, methyl ester (Leuchs, v. Katinsky, and Conrad), A., i, 472.

Dibenzylmethylglucoside (Gomberg and Buchler), A., i, 112.

2:3-Dibenzyl-8-methylquinoxaline, αα'-*di*cyano- (Dutt and Sen), T., 2665.

2:3-Dibenzyl-1:4-naphthaquinoxaline, αα'-*di*cyano- (Dutt and Sen), T., 2665.

2:3-Dibenzyl-1:4-naphthaquinoxaline-7-sulphonic acid, αα'-*di*cyano- (Dutt and Sen), T., 2665.

2:3-Dibenzyl-1:4-naphthaquinoxaline-8-sulphonic acid, αα'-*di*cyano-10-hydroxy- (Dutt and Sen), T., 2666.

2:3-Dibenzylquinoxaline, αα'-*di*cyano-, and αα'-*di*cyano-7-amino- (Dutt and Sen), T., 2664.

Dibenzylsulphine-*p*-toluenesulphonylimine (Mann and Pope), T., 1053.

1:1'-Dibenzyltetrahydro-4:4'-dipyridyl, preparation and reactions of (Emmert and Varenkamp), A., i, 1065.

dissociation of (Weitz), A., i, 470.

3:5-Dibenzylthiol-1:2:4-triazole, and its hydrochloride (Fromm, Kayser, Briegleb, and Fohrenbach), A., i, 379.

Dibutyl selenide, ββ'-dichloro-, and its dichloride (Boord and Cope), A., i, 421.

Dibutylarsinic acid, and its copper salt (Quick and Adams), A., i, 600.

Di*iso*butylbenzidine, 3:3':5:5'-*tetra*nitro- (van Romburgh), A., i, 276.

Di*iso*butylcyanoarsine (Steinkopf, Donat, and Jaeger), A., i, 995.

Di*iso*butyl ketone semicarbazone (Leroide), A., i, 217.

αα-Dibutyrylethane, and its copper derivative (Leroide), A., i, 217.

Dibutyrylmethane, and its copper derivative (Leroide), A., i, 217.

ββ-Dibutyrylpropane, and its disemicarbazone (Leroide), A., i, 217.

Dicamphomethylchloroamine (Rupe and Schmid), A., i, 1042.

Dicamphomethylhydroxylamine, and its salts (Rupe and Schmid), A., i, 1041.

αα'-Dicarbamyl-αα'-dimethyl*cyclo*hexane-1:1-diacetic acid, ω-imide of (Kon and Thorpe), T., 1803.

α-*NN'*-Dicarbethoxyhydrazinoacetoacetic acid, ethyl ester (Diels and Fuldner), A., i, 1196.

β-Dicarbethoxyhydrazinoacetylacetone (Diels and Fuldner), A., i, 1196.

γ-*NN'*-Dicarbethoxyhydrazinoacetylacetone (Diels), A., i, 774.

10-αβ-Dicarbethoxyhydrazinoanthracene, 9-amino-, and its derivatives (Diels and Möhl), A., i, 1194.

2- and 4-αβ-Dicarbethoxyhydrazinonaphthalenes, 1-amino- (Diels and Sörensen), A., i, 1194.

2-αβ-Dicarbethoxyhydrazinonaphthalene-4-sulphonic acid, sodium salt (Diels and Sörensen), A., i, 1194.

6-αβ-Dicarbethoxyhydrazino-*p*-xylene, 3-amino-, and its derivatives (Diels and Eckelmann), A., i, 1195.

α-*NN′*-Dicarbomethoxyhydrazinoacetoacetic acid, ethyl ester (Diels and Fuldner), A., i, 1196.
β-Dicarbomethoxyhydrazinoacetylacetone (Diels and Fuldner), A., i, 1196.
α-*NN′*-Dicarbomethoxyhydrazinocrotonic acid, β-amino-, ethyl ester (Diels and Fuldner), A., i, 1196.
1-αβ-Dicarbomethoxyhydrazinonapthalene, 2-amino-, and its derivatives (Diels and Wackermann), A., i, 1195.
4-αβ-Dicarbomethoxyhydrazinonaphthalene, 1-amino- (Diels and Kleinfeller), A., i, 1195.
2:4-Dicarboxy*cyclo*butane-1:3-diacetic acids, and the α-anhydride (Ingold, Perren, and Thorpe), T., 1789.
cis- **and** *trans*- **2:4-Dicarboxy*cyclo*butane 1:3-di-α-propionic acids**, and 2:4-*di*-cyano-, ethyl ester (Ingold, Perren, and Thorpe), T., 1787.
4-αβ-Dicarboxyethylamidohydrazinonaphthalene, 1-amino- (Diels and Sörensen), A., i, 1195.
αγ-Dicarboxyglutaconic acid, γ-bromo-, ethyl ester, transformations of (Faltis, and de Roxas), A., i, 624.
αγ-Dicarboxyglutaconolactone, γ-hydroxy-, triethyl ester (Faltis and de Roxas), A., i, 625.
ω′ω″-Dicarboxymethanetriacetic acid, ω-cyano-, ethyl ester (Ingold and Perren), T., 1418.
αβ-Dicarboxymethylamidohydrazinonaphthalenes, amino- (Diels and Sörensen), A., i, 1195.
Dichromates. See under Chromium.
Dicumylamine, chloroamino- (Goldschmidt and Strohmenger), A., i, 1005.
Dicyanamide, and its salts (Madelung and Kern), A., i, 438.
Dicyanimide (Franklin), A., i, 440.
Dicyanodiamide, action of aqueous ammonia on (Davis), A., i, 118.
  formation of guanidine from (Blair and Braham), A., i, 1123.
  action of, with methyl- and dimethylammonium chlorides (Werner and Bell), T., 1790.
Di-*p*-dimethylaminostyryl ketone, α-chloro- (Bauer and Werner), A., i, 1035.
Didymium, absorption spectrum of (Weigert), A., ii, 413.
Dieckmann reaction (Kon), T., 513.
Dieckmann-Komppa reaction (Dickens, Kon, and Thorpe), T., 1496.
Dielectric constants, measurement of (King and Patrick), A., ii, 109.
  of colloidal solutions (Errera), A., ii, 694.
Diet, effect of, on fixation of nitrogen (Dienes), A., i, 293.
  replacement of protein by urea in (Morgen, Schöler, Windheuser, and Ohlmer), A., i, 293.
γ-Diethoxyacetoacetic acid, ethyl ester, use of, in the synthesis of glyoxaline derivatives (Pucher and Johnson), A., i, 549.
2:9-Diethoxyacridine (Farbwerke vorm. Meister, Lucius, & Brüning). A., i, 469.
4:4′-Diethoxybenzil, 3-3′ *di*nitro- (Schönberg and Kraemer), A., i, 664.
Diethoxy-1:1′-diethylcarbocyanine iodides (Braunholtz), T., 171.
4:4′-Diethoxy-1:1′-dinaphthyl (Scholl and Seer), A., i, 336.
4:4′-Diethoxy-1:1′-di-*ar*-tetrahydronaphthyl (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 124.
αε-Diethoxy-β-methylpentan-β-ol-δ-one (Daudel), A., i, 432.
Di-*p*-ethoxyphenylformazyl methyl ketone (Jacobsen), A., i, 596.
2:3-Di-*p*-ethoxyphenyl-αβ-naphthaquinoxaline, and 2:3-*di*-*m*-nitro- (Schönberg and Kraemer) A., i, 664.
Diethyl ether. See Ethyl ether.
  sulphide, ββ′-*di*chloro-, preparation and reactions of (Mann and Pope), T., 594.
    hydrolysis of, and preparation of a non-vesicant isomeride (Bales and Nickelson), T., 2137.
    reaction of, with sodium silicate, and the treatment of burns produced by it (Kramer), A., i, 914.
   *di*hydroxy-, preparation of esters of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 420.
  sulphoxides, αββ′-*tri*- and αβββ′-*tetra*-chloro- (Mann and Pope), T., 603.
Diethylacetal, β′β″-*di*chloro- (Grignard and Purdy), A., i, 803.
Diethylacetylallophanic acid, bromo-, ethyl ester (Callsen), A., i, 1128.
Diethylallylamine, and its oxide, and their picrates (Meisenheimer and Willmersdorf), A., i, 334.
5-Diethylaminoacenaphthene, and its derivatives (Fleischer and Schranz), A., i, 1143.
***p*-Diethylaminobenzylideneanthranilic acid** (Ekeley, Rogers, and Swisher), A., i, 935.
β-Diethylaminobutan-γ-ol (Fourneau and Puyal), A., i, 639.

Diethylaminobutylacetoacetic acid, ethyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
9-Diethylamino-2-ethoxyacridine (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 469.
α-Diethylaminoethylacetoacetic acid, ethyl and methyl esters (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
Diethylaminoethylacetonedicarboxylic acid, ethyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRUNING), A., i, 529.
Diethylaminoethylacetylacetone (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
α-Diethylaminoethylbutyric acid, β-hydroxy-, ethyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 640.
Diethylaminoethylcamphorcarboxylic acid, methyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
Diethylaminoethylcyanoacetic acid, ethyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
Diethylaminoethylmalonic acid, ethyl ester (FARBWERKE VORM. MEISTER, LUCIUS, & BRUNING), A., i, 529.
α-Diethylaminopropan-β-ol (FOURNEAU and PUYAL), A., i, 639.
ε-Diethylamino-βδδ-trimethylheptan-α-one (BILLON), A., i, 717.
Diethylammonium ruthenipentabromide (GUTBIER and KRAUSS), A., i, 16.
Diethylaniline, compound of 3:5-dinitrobenzoic acid and (LEY and GRAU), A., i, 536.
1:1′-Diethylazurine iodide, bromo-derivatives (MOUDGILL), T., 1510.
Diethylbarbituric acid, action of diazomethane on (HERZIG), A., i, 373.
  calcium and magnesium salts (WÜLFING), A., i, 1066.
  compound of 4-dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone and (CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING), A., i, 582.
Diethylbenzidine, 3:3′:5:5′-*tetra*nitro- (VAN ROMBURGH), A., i, 275.
Diethylbromoethylamine (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
1:1-Diethyl*cyclo*butane-3-one-2-carboxylic acid, methyl ester, semicarbazone (DICKENS, KON, and THORPE), T., 1504.
Diethylcarbodi-imide (STAUDINGER and HAUSER), A., i, 70.
2:2′-Diethylcarbothiocyanine iodide (MILLS and BRAUNHOLTZ), T., 1493.
  crystallography of (MILLS), T., 462.
Diethylchlorobutylamine (FARBWERKE VORM. MEISTER, LUCIUS, & BRUNING), A., i, 529.
Diethylchloroethylamine (FARBWERKE VORM. MEISTER, LUCIUS, & BRÜNING), A., i, 529.
7:9-Diethyldeoxyuric acid, and its salts (BILTZ and BULOW), A., i, 384.
d-N.O-**Diethyldihydrocupreicinol** (HEIDELBERGER and JACOBS), A., i, 674.
7:7-Diethyl-α-dinaphthaxanthen, oxidation of, and 5:9-*di*hydroxy- (SEN-GUPTA and TUCKER), T., 565.
Diethylene *di*sulphide tetraiodide, as an antiseptic (BACHEM), A., i, 611.
Diethylenediaminecobaltic bromides, conductivities of (DUFF), T., 450.
as-**Diethylethylenediamine** (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 255.
ββ-Diethylglutaric acid, methyl ester (DICKENS, KON, and THORPE), T., 1504.
ββ-Diethylglutaric acid, αα′-*di*bromo-, and its ethyl ester (DESHAPANDE and THORPE), T., 1436.
gem-**Diethyl groups,** effect of, on the carbon tetrahedral angle (DESHAPANDE and THORPE), T., 1430.
5:5-Diethylhydantoin (INGOLD, SAKO, and THORPE), T., 1192.
Diethyliminovioluric acid, and its salts (LIFSCHITZ and HEPNER), A., i, 768.
2:2-Diethylindan-1-one (HALLER and BAUER), A., i, 259.
Diethylmalonbromoamide (INGOLD, SAKO, and THORPE), T., 1192.
Diethylmalonic acid, and its ethyl hydrogen ester, esterification of (DUMESNIL), A., i, 622.
  ethyl esters, hydrolysis of (DUMESNIL), A., i, 520.
    derivatives of (DUMESNIL), A., i, 807.
Diethylmalonodi-5-acenaphthylamide (FLEISCHER and SCHRANZ), A., i, 1143.
Diethylnitrosoamine (SCHMIDT and FISCHER), A., i, 822.
γζ-Diethyloctane-γζ-diol, and its oxide (CARRIÈRE), A., i, 320.
Diethyl*cyclo*pentamethylenearsonium iodide (STEINKOPF, DONAT, and JAEGER), A., i, 996.
1:1-Diethyl*cyclo*pentane-3:4-dione, and its disemicarbazone (DICKENS, KON, and THORPE), T., 1506.

7:8-Diethylphenalene (Mayer and Sieglitz), A., i, 741.

Diethylpiperazine dichloroethylate (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 529.

Dihydrofencholamine, and its salts and derivatives (Maxwell), A., i, 753.

Dihydro*iso*indole, preparation of (v. Braun and Nelken), A., i, 863.

Dihydromethystic acids (Goebel) A., i, 657.

Dihydromethysticin (Goebel), A., i, 657.

Dihydromethysticoles, and their semicarbazones (Goebel), A., i, 657.

Dihydromorphine *N*-oxide (Speyer and Becker), A., i, 676.

Dihydromorphinesulphonic acids (Speyer and Becker), A., i, 676.

Δ^{α}-Dihydromuconic acid, δ-bromo-γ-hydroxy-, and γ-chloro-δ-bromo-, methyl ester (Chandrasena and Ingold), T. 1318.

Dihydronaphthalenealkamine. See Tetrahydro-β-naphthylamine, β-hydroxy-.

Dihydronaphthalene-2-imino-oxazolidine, and its salts (Takeda and Kuroda), A., i, 275.

Dihydronaphthalene series (Rowe and Davies), T., 1000.

5:8-Dihydro-α-naphthylamine, oxidation and bromination of (Rowe and Davies), T., 1000.

Dihydronaphthylethanol, and its phenylurethane (de Pommereau), A., i, 828.

7:8-Dihydrophenalone-9, and its oxime (Mayer and Sieglitz), A., i, 741.

9:16-Dihydrophenanthranaphthazine, 2:7-*di*amino-, and 2:7-*di*hydroxy- (Sircar and Dutt), T., 1950.

d- and *l*-**Dihydroquinicinol,** and their salts (Heidelberger and Jacobs), A., i, 674.

Dihydroquinine ethyl bromide (Heidelberger and Jacobs), A., i, 673.

Dihydroquinine, 5:8-*di*amino-, 8-amino-5-hydroxy-, and 5:8-*di*hydroxy-, and their salts (Jacobs and Heidelberger), A., i, 671.

Dihydroquinine oxide, preparation of, and its dinitrate (Speyer and Becker), A., i, 675.

Dihydrorubicene, and its picrate (Dziewoński and Suszko), A., i, 730.

4:5-Dihydrothiazole, 2-thiol-, compound of chloropicrin and (Rây and Das), T., 325.

1:4-Di(5′-hydroxy-7′-sulpho-2′-naphthylamino)benzene (Kalle & Co.), A., i, 824.

Di-isatinazine, and its acetyl derivative (Borsche and Meyer), A., i, 54.

5:5′-Di-isatylmethane (Borsche and Meyer), A., i, 53.

3:5-Diketo-1-benzyl-1:4-hexahydrodiazine (Dubsky and Dingemanse), A., i, 57.

Diketocholenic acid, and its ethyl ester, and its dioxime (BORSCHE and HALLWASS), A., i, 1158.

2:5-Diketo-1:4-dibenzoylmethylpiperazine (CHERBULIEZ and FEER), A., i, 1065.

2:5-Diketo-1:4-dibenzoylpiperazine, preparation of (SASAKI and HASHIMOTO), A., i, 56.

2:5-Diketo-3:6-dibenzylidene-1-methylpiperazine. See Xanthorocellin.

2:6-Diketo-3:5-dibenzylidene-2:3:5:6-tetrahydro-*m*-α-benzbispyrrole (DAVIES and HICKOX,) T., 2653.

2:5-Diketo-1:4-dibenzylpiperazine, preparation of (SASAKI and HASHIMOTO), A., i, 56.

2:5-Diketo-1:4-dichloromethylpiperazine (CHERBULIEZ and FEER), A., i, 1065.

2:2′-Diketo-$\Delta^{1:1'}$dicoumaran (*oxindigo*), synthesis of (FRIES and HASENJÄGER), A., i, 46.

2:5-Diketo-1:4-diethoxymethylpiperazine (CHERBULIEZ and FEER), A., i, 1066.

5.6-Diketo-7:7-diethyl-5:6-dihydro-α-dinaphthaxanthen, and its derivatives (SEN-GUPTA and TUCKER), T., 565.

2:5-Diketo-1:4-dihydroxymethylpiperazine (CHERBULIEZ and FEER), A., i, 1065.

2:5-Diketo-1:4-dimethoxymethyl-2:5-piperazine (CHERBULIEZ and FEER), A., i, 1065.

5:6-Diketo-7:7-dimethyl-5:6-dihydro-α-dinaphthaxanthen, and its derivatives (SEN-GUPTA and TUCKER), T., 559.

2:5-Diketo-1:4-dinaphthylmethylpiperazine (CHERBULIEZ and FEER), A., i, 1066.

2:5-Diketo-1:4-dipiperidinomethylpiperazine (CHERBULIEZ and FEER), A., i, 1065.

2:2′-Diketo-6-methyl-$\Delta^{1:1'}$-dicoumaran (FRIES and HASENJÄGER), A., i, 46.

5:6-Diketo-7-methyl-7-ethyl-5:6-dihydro-α-dinaphthaxanthen, and its derivatives (SEN-GUPTA and TUCKER), T., 563.

5:6-Diketo-7-methyl-7-*n*-propyl-5:6-dihydro-α-dinaphthaxanthen (SEN-GUPTA and TUCKER), T., 566.

1:4-Diketo-2-methyltetrahydronaphthalene, 2:3-*di*bromo-, and 2:3-*di*chloro- (FRIES and LOHMANN), A., i, 30.

Diketone, $C_{22}H_{16}O_5$ from the methyl ether of the substance $C_{22}H_{12}O_4$ (FRIES and LEUE), A., i, 462.
  $C_{26}H_{42}O_2$ and its dioxime, from the oxidation product of cholestan-4:7-dione (WINDAUS and GRIMMER), A., i, 541.

1:2-Diketones (SCHÖNBERG), A., i, 27; (SCHÖNBERG and KRAEMER), A., i, 663.

β-Diketones, action of carbon disulphide on thallous compounds of (MORGAN and LEDBURY), T., 2892.
  interaction of selenium tetrachloride and (MORGAN, DREW, and BARKER), T., 2438.

αε-Diketo-αβγδε-pentaphenyl-Δ^{β}-pentene (DILTHEY and KAFFER), A., i, 669.

2:4-Diketo-5-phenyl-5-ethyltetrahydro-oxazole, preparation of (ALTWEGG and EBIN), A., i, 53.

2:4-Diketo-5-phenyl-5-methyltetrahydro-oxazole (ALTWEGG and EBIN), A., i, 53.

Diketopiperazine, molecular compounds of phenols and (POVARNIN and TICHOMIROV), A., i, 1185.

2:5-Diketopiperazine, formaldehyde derivatives of (CHERBULIEZ and FEER), A., i, 1065.

Diketopiperazines (DUBSKY and DINGEMANSE), A., i, 56; (DUBSKY and HOHER; DUBSKY, HOHER, and DINGEMANSE), A., i, 57.

2:5-Diketopiperazine-1:4-diacetodi-α-naphthalide (DUBSKY, HOHER, and DINGEMANSE), A., i, 57.

θι **Diketostearic acid**, fusion of, with potassium hydroxide, and its ethyl and methyl esters (NICOLET and JURIST), A., i, 622.

Dimatridine, and its salts and derivatives (KONDÔ, KISHI, and ARAKI), A., i, 269.

Dimercuri*di*aminoazobenzene diacetate (VECCHIOTTI), A., i, 478.

Dimercuri-4-hydroxybenzaldehyde, 3:5-*di*chloro-, and 3:5-*di*hydroxy- (HENRY and SHARP), T., 1058.

Dimercurisalicylaldehyde, 3:5-*di*chloro- and 3:5-*di*hydroxy- (HENRY and SHARP), T., 1057.

1:3-Dimethindiazidine, synthesis and division of derivatives of (INGOLD and PIGGOTT), T., 2793.

2:4-Dimethoxyacetophenone, 3-hydroxy-, and its derivatives (BRAND and COLLISCHONN), A., i, 452.

4:4′-Dimethoxyarsenobenzene, 3:3′-*di*amino-, dihydrochloride (CHRISTIANSEN), A., i, 1203.

3:4-Dimethoxybenzaldehyde, 5-hydroxy- (SPÄTH and RÖDER), A., i, 853.

2:2′-Dimethoxybenzhydrol (ZIEGLER and OCHS), A., i, 1049.

2:2′-Dimethoxybenzil, and its derivatives (SCHÖNBERG and KRAEMER), A., i, 664.

3:4-Dimethoxybenzylideneanthranilic acid (Ekeley, Rogers, and Swisher), A., i, 935.
9:3′:4′-Dimethoxybenzylidenefluorene-2′-carboxylic acid, 2:7-*di*bromo-, and its derivatives (Sieglitz and Jassoy), A., i, 821.
Dimethoxycarboxybenzeneazobenzene-4′-arsinic acids, amino-, and their salts (Jacobs and Heidelberger), A., i, 75.
2:2′-Dimethoxy-5:5′-dimethylbenzil, and its osazone (Schönberg and Kraemer), A., i, 663.
5.9-Dimethoxy-7:7-dimethyl-α-dinaphthaxanthen (Sen-Gupta and Tucker), T., 562.
6:7-Dimethoxy-2:3-dimethylquinoline, and its salts (Rilliet), A., i, 840.
4:4′-Dimethoxy-1:1′-dinaphthyl (Scholl and Seer), A., i, 336.
4:4′-Dimethoxydi-*m*-tolyl *di*sulphide (Stewart), T., 2558.
3′:4′-Dimethoxy-2-hydroxydistyryl ketone (Buck and Heilbron), T., 1099.
Dimethoxy-*p*-menthane, *di*bromo- (Schmidt, Bartholomé, and Lubke), A., i, 827.
5:9-Dimethoxy-7-methyl-7-ethyl-α-dinaphthaxanthen (Sen-Gupta and Tucker), T., 564.
6:7-Dimethoxy-2-methylquinazoline, and its picrate (Rilliet), A., i, 840.
4:6-Dimethoxyphenylarsinic acid, 3-nitro- (Christiansen), A., i, 1203.
2:4-Dimethoxyphenyl bromomethyl ketone (Sonn and Falkenheim), A., i, 1163.
3:4-Dimethoxyphenyl α-chloro-4′-dimethylanimostyryl ketone (Bauer and Werner), A., i, 1035.
3:4-Dimethoxyphenyl α-chlorostyryl ketone (Bauer and Werner), A., i, 1035.
3 4-Dimethoxyphenylethylamine, β-5-hydroxy- (Spath and Röder), A., i, 853.
3:5-Dimethoxyphenyl ethyl ketone (Mauthner), A., i, 457.
α-3:4-Dimethoxyphenyl-β-hydroxypropylamine. See Methyl*iso*eugenolalkamine.
α-3:4-Dimethoxyphenyl-β-hydroxypropyldimethylamine. See Trimethyl*iso*eugenolalkamine.
α-3:4-Dimethoxyphenylmethyl-β-hydroxypropylamine. See Dimethyl*iso*eugenolalkamine.
2:3-Di-*p*-methoxyphenyl-αβ-naphthaquinoxaline (Schönberg and Kraemer), A., i, 665.
3:5-Dimethoxyphenylpropionamide, β-4-hydroxy- (Späth and Röder), A., i, 852.
6:7-Dimethoxy-2-phenylquinazoline, and its salts (Rilliet) A., i, 840.
6:7-Dimethoxy-2-phenylquinoline, and its salts (Rilliet), A., i, 840.
2:4-Dimethoxyphenyl styryl ketone, 3-hydroxy-, and its dibromide (Brand and Collischonn), A., i, 452.
3:4-Dimethoxyphenyl styryl ketone dichloride (Bauer and Werner), A., i, 1035.
3:4-Dimethoxyphenyl β-veratrylethyl ketone, 2-hydroxy- (Crabtree and Robinson), T., 1038.
3:5-Dimethoxy-1-*n*-propylbenzene (Mauthner), A., i, 457.
6:7-Dimethoxyquinaldine, and its salts (Rilliet), A., i, 839.
4:4′-Dimethoxystilbene, α-nitro- (Meisenheimer and Weibezahn), A., i, 177.
3′:4′-Dimethoxy-2-styrylbenzopyrylium chloride (Buck and Heilbron), T., 1210.
5-3′:4′-Dimethoxy-2′-styrylbenzylideneaminoacenaphthene (Fleischer and Schranz), A., i, 1143.
6:8-Dimethoxy-1:2:3:4-tetrahydro*iso*quinoline, 7-hydroxy- (Spath and Roder), A., i, 852.
6:7-Dimethoxy-1-3′:4′:5′-trimethoxybenzyl-1:2:3:4-tetrahydro*iso*quinoline, and its derivatives (Spath and Bohm), A., i, 1175.
Dimethoxyvinyldihydrophenanthrene (Faltis and Krausz), A., i, 677.
Dimethyl ether, *s.-di*chloro-, reaction of ethyl malonate with (Dox and Yoder), A., i, 429.
  sulphide, *s.-di*chloro- (Bloch and Hohn), A., i, 218.
  telluride dihaloids, physiological action of (Cow and Dixon), A., i, 402.
Dimethylacethydroxamic acid. See *iso*-Butyrhydroxamic acid.
αα-Dimethylaconitic acid (Farmer, Ingold, and Thorpe), T., 149.
***N*-Dimethylalanine,** ethyl ester (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 814.
2:4-Dimethyl-5-aldehydopyrrole (Fischer and Zerweck), A., i, 758.
Dimethyl-5-aldehydopyrrole-3-carboxylic acids, derivatives of (Fischer and Zerweck), A., i, 758.
Dimethylallyl bromide. See γ-Methyl-Δβ-butene, α-bromo-.
Dimethylallylaceticacid. See δ-Methyl-Δγ-hexenoic acid.

Dimethylallylamine oxide, picrate (Meisenheimer and Willmersdorf), A., i, 334.

3:7 Dimethyl-allylxanthine (Hoffmann-La Roche & Co.), A., i, 585.

Dimethylamine chlorite (Levi), A., i, 528.
compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.

5-Dimethylaminoacenaphthene and its derivatives (Fleischer and Schranz), A., i, 1143.

5-Dimethylaminoacetyl-2:4 dimethylpyrrole-3-carboxylic acid, ethyl ester (Fischer, Schneller, and Zerweck), A., i, 1056.

p-**Dimethylaminoanilino-6-methyl-2:2′-dicoumaranones**, isomeric (Fries and Hasenjäger), A., i, 45.

p-**Dimethylaminobenzaldehyde**, action of, on urine (Hári), A., i, 88

4-Dimethylaminobenzonitrile, 3-nitro- (Mattaar), A., i, 251.

p-**Dimethylaminobenzophenoneanil** hydrochloride (Reddelien and Danilof), A., i, 148.

2-*p* Dimethylaminobenzylidene-5-methylpyrrole-4 carboxylic acid, 3-hydroxy-, ethyl ester (Fischer and Hermann), A., i, 1054.

β-Dimethylaminobutan-γ-ol (Fourneau and Puyal), A., i, 639.

trans-p-**Dimethylaminocinnamic acid**, and α-bromo-, esters of, and their derivatives (Pfeiffer and Haefelin), A., i, 738.

2-Dimethylamino-1-αβ-dicarbethoxyhydrazinonaphthalene, and its perchlorate (Diels and Kleinfeller), A., i, 1195.

1-Dimethylamino-4-αβ-dicarbomethoxyhydrazinonaphthalene, and its hydrochloride (Diels and Kleinfeller), A., i, 1195.

5:6-Dimethylamino-1:3-dimethyluracil, and its hydrochloride (Biltz and Heidrich), A., i, 384.

4-Dimethylaminodiphenyl, and 3-amino-, and 3-*mono*- and 3:5:2′:4′-*tetra*-nitro- (García Banús and Ferrer Tomás), A., i, 333.

4′-Dimethylaminodiphenylamine, 5-chloro-2-nitro- (Jacobsen), A., i, 594.

4′-Dimethylamino-4-ethoxyazobenzene (Jacobsen), A., i, 593.

4′-Dimethylamino-5-ethoxydiphenylamine, 2-amino-, and 2-nitro- (Jacobsen), A., i, 593.

4′-Dimethylamino-4-ethoxyhydrazobenzene, isomerisation of (Jacobsen), A., i, 593.

α-Dimethylaminoethylacetoacetic acid, ethyl ester (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 529.

4′-Dimethylamino-*tri*hydroxy-9-phenylfluorones (Mukerji), T., 550.

7-Dimethylamino-3-hydroxy-4-thiolphenazine (Watson and Dutt), T., 1942.

α-Dimethylamino-β-methylbutan-β-ol (Fourneau and Puyal), A., i, 639.

2-Dimethylamino-6-methylphenazine, methiodide, and 7-amino-, methochloride (Browning, Cohen, Gaunt, and Gulbransen), A., i, 612.

m-**Dimethylaminophenolcamphorein** hydrochloride (Sircar and Dutt), T., 1284.

4-Dimethylaminophenyl 2′-nitrophenyl *di*sulphide (Lecher and Simon), A., i, 1013.

6-Dimethylamino-2-phenylbenzthiazole (Bogert and Abrahamson), A., i, 576.

p-**Dimethylaminophenyl-bis(3-acetyl-2:4-dimethylpyrryl)methane**, and its ferrichloride (Fischer and Luckmann), A., i, 276.

Dimethylaminophenyl-bis(-3-carbethoxydimethylpyrryl)methanes, and their ferrichlorides (Fischer and Luckmann), A., i, 276.

4-Dimethylamino-1-phenyl-2:3-dimethyl-5-pyrazolone, compound of diethylbarbituric acid with (Chemische Fabrik auf Aktien vorm. E. Schering), A., i, 582.

1-*p*-Dimethylaminophenyl-6-ethoxybenziminazole, and its derivatives (Jacobsen), A., i, 593.

4′-Dimethylamino-9-phenylfluorone, 2:4:5:7-tetra-amino-, trichloride (Mukerji), T., 550.

α-Dimethylaminopropan-β-ol (Fourneau and Puyal), A., i, 639.

α-Dimethylaminopropionic acid. See *N*-Dimethylalanine.

ω-Dimethylaminopropiophenone, and its hydrochloride and oxime (Mannich and Heilner), A., i, 351.

α-Dimethylaminopyridine methiodide (Browning, Cohen, Gaunt, and Gulbransen), A., i, 612.

α-*p*-Dimethylaminostyryl methylenedioxystyryl ketone, α-chloro- (Bauer and Werner), A., i, 1085.

4-Dimethylaminostyryl methyl ketone, α-chloro-, and its derivatives (Bauer and Werner), A., i, 1085.

2-*p*-Dimethylaminostyrylpyridine methiodide (Mills and Pope), T., 946.

1-*p*-Dimethylaminostyryl*iso*quinoline methiodide (Mills and Smith), T., 2733.

Dimethylaminosulphonic acid, copper and nickel salts (Delépine and Demars), A., i, 923.

ε-Dimethylamino-ββδδ-tetramethylheptan-α-one (Billon), A., i, 717.

η-Dimethylamino-γγεε-tetramethyloctan-δ-one (Billon), A., i, 717.

***p*-Dimethylaminothiobenzophenone** (Reddelien and Danilof), A., i, 148.

7-Dimethylamino-4-thiolphenazine, 3-amino- (Watson and Dutt), T., 1941.

9-Dimethylamino-2-thiol-3-phenoxazone (Watson and Dutt), T., 1942.

ε-Dimethylamino-βδδ-trimethylheptan-α-one (Billon), A., i, 717.

5:6-Dimethyl*di*aminouracil, and its derivatives (Biltz and Bülow), A., i, 382.

α-Dimethylamino*iso*valeric acid, ethyl ester (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 814.

Dimethylammonium chloride, action of dicyanodiamide with (Werner and Bell), T., 1790.
  ruthenipentabromide (Gutbier and Krauss), A., i, 16.

Dimethylanhalamine methiodide (Spath), A., i, 165.

Dimethylaniline, electrochemical oxidation of (Fichter and Rothenberger), A., i, 447.
  action of 1-chloro-2-aminoanthraquinone with, in presence of copper (Kopetschni and Wiesler), A., i, 844.
  and *p*-bromo- and *p*-nitroso-, hydroferrocyanides (Cumming), T., 1297.

Dimethylaniline, *o*-chloro-*p*-iododichloride hydrochloride and *o*-chloro-*p*-iodo- (Sachs and Leopold), A., i, 822.
  m-nitro-, nitro-derivatives of (Forster and Coulson), T., 1988.

5:8-Dimethylanthraquinone, 1-chloro- (Mayer and Heil), A., i, 878.

2:-6-Dimethylapophyllenic acid, and its ethyl and methyl esters (Mumm and Gottschaldt), A., i, 263.

5:5′-Dimethylarsenobenzene, 3:3′-*di*-amino-4:4′-*di*hydroxy-, dihydrochloride (Christiansen), A., i, 1203.

Dimethylarsinecarboxylic acid (Job and Guinot), A., i, 75.

2:4-Dimethylatropic acid, β-chloro- (v. Auwers and Ziegler), A., i, 140.

2′:3-Dimethylazobenzene, 4-amino-, derivatives of (Jacobsen), A., i, 594.

3:3′-Dimethylazobenzene, 4:4′(?)-*di*-chloro- (Goldschmidt and Strohmenger), A., i, 1005.

3:5-Dimethylazobenzene (Jacobsen), A., i, 595.

4:6-Dimethylbenzaldehyde, 2-hydroxy-, and its derivatives (v. Auwers and Saurwein), A., i, 1032.

Dimethylbenzbisthiazoles, and their salts (Edge), T., 774.

1:4-Dimethylbenzenesulphonephthalein, 5-hydroxy-. See Xylenol-blue.

4:6 Dimethylbenzonitrile, 2-hydroxy- (v. Auwers and Saurwein), A., i, 1032.

***o*-2′:5′-Dimethylbenzoylbenzoic acid,** 6-chloro- (Mayer and Heil), A., i, 878.

2:4-Dimethylbenzoylbenzoic acids, and their silver salts and methyl esters (Smith), A., i, 141.

1:5-Dimethylbenzthiazole ethiodide (Mills), T., 463.

βγ-Dimethyl-$\Delta^{\alpha\gamma}$-butadiene (*diisopropenyl*), combination of hydrogen bromide with (Bergmann), A., i, 1106.

ββ-Dimethylbutane, synthesis of (van Risseghem), A., i, 313.

βγ-Dimethylbutane, αγ-*di*bromo- (Bergmann), A., i, 1106.
  β-chloro γ-hydroxy- (Detœuf), A., i, 327.

βγ-Dimethyl-Δ^{α}-butene, γ-bromo- (Bergmann), A., i, 1106.

β-Dimethylchlorohaemin (Küster and Gerlach), A., i, 597.

α-1:3-Dimethyl-1-*di*chloromethyl-$\Delta^{2\,5}$-*cyclo*hexadien-Δ^4-acetic acid, and its ethyl ester (v. Auwers and Ziegler), A., i, 140.

1:4-Dimethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ol, 5-*mono*-, and 3:5-*di*-bromo (v. Auwers and Ziegler), A., i, 145.

1:4-Dimethyl-1-*tri*chloromethyl-$\Delta^{2\,5}$-*cyclo*hexadien-4-ol, 3:5-*di*bromo- (v. Auwers and Jülicher), A., i, 843.

1:3-Dimethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-one, 5-bromo- (v. Auwers and Ziegler), A., i, 145.

1:2-Dimethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ones, 5-*mono*- and 3:5 *di*-chloro- (v. Auwers and Ziegler), A., i, 144.

1:2-Dimethyl-1-*di*chloromethyl-Δ^2-*cyclo*hexen-4-one, 5:6-*di*chloro- (v. Auwers and Ziegler), A., i, 144.

2:6-Dimethylcinchomeronic acid, esters of, and their methiodides (Mumm and Gottschaldt), A., i, 861.

1:1′-Dimethyl*iso*cyanine, 6-bromo-, iodide (Moudgill), T., 1510.

7:9-Dimethyldeoxyuric acid, and its salts and derivatives (BILTZ and BÜLOW), A., i, 382.

αα' **Dimethyldi*iso*butenyl** *di*sulphide (POPE and SMITH), T., 1167.

αα'-**Dimethyldi*iso*butyl** *di*sulphide, ββ'-*di*chloro- (POPE and SMITH), T., 1167.

5:5'-Dimethyl-2:2'-diethylcarbothiocyanine iodide (MILLS), T., 464.

Dimethyldihydro*apo*morphimethine, and its methiodide (FALTIS and KRAUSZ), A., i, 676.

1:6-Dimethyl-$\Delta^{6,7}$-5:8-dihydronaphthalene, and its dibromide (MAYER and SCHULTE), A., i, 820.

2:6-Dimethyl-$\Delta^{2\ 3}$-dihydronaphthalene (MAYER and ALKEN), A., i, 999.

Dimethyldihydroresorcinol, chloro-, action of phosphorus chlorides on (HINKEL and WILLIAMS), T., 2498.

7:7-Dimethyl-α-dinaphthaxanthen, oxidation of (SEN-GUPTA and TUCKER), T., 559.

7:7-Dimethyl-α-dinaphthaxanthen, 5:9-*di*hydroxy- (SEN-GUPTA and TUCKER), T., 561.

3:3'-Dimethyldinaphthyl sulphate, 4:4'-*di*amino-, and its derivatives (FRIES and LOHMANN), A., i, 30.

2:4-Dimethyldiphenyl (2 4-*ditolyl*), and *tetra*nitro- (JACOBSEN), A., i, 595.

2:6-Dimethyldiphenyl (2:6-*ditolyl*), and 4:4'-*di*amino-, and its benzylidene derivative, and *tri-* and *tetra*-nitro- (JACOBSEN), A., i, 595.

3':4-Dimethyldiphenyl (3':4-*ditolyl*), 2:4':5-*tri*amino-, acetyl derivatives, and their derivatives (JACOBSEN), A., i, 595.

4-4'-Dimethyldiphenyl(4:4'-*ditolyl*),2 2'-*di*chloro-6:6'-*di*nitro- (BURTON and KENNER), T., 495.

2:4'-Dimethyldiphenylamine, 4-amino-, and its salicylaldehyde derivative (JACOBSEN), A., i, 593.

3:3'-Dimethyldiphenylamine, 4:4'-*di*amino-, 4'-acetyl derivative, and its salicylidene derivative (JACOBSEN), A., i, 595.

3':5-Dimethyldiphenylamine, 2-amino-4'-hydroxy- (JACOBSEN), A., i, 593.

αα-**Dimethyl-δδ-dipropylvalerolactone**, and its barium salt (LEROIDE), A., i, 218.

3:5-Dimethyldisulphon-1-phenyl-1:2:4-triazole (FROMM, KAYSER, BRIEGLEB, and FÖHRENBACH), A., i, 378.

Dimethyldithiolethylene, reactions of metallic salts with (MORGAN and LEDBURY), T., 2882.

αα-Diphenylethyl-β-urethane (SIEGLITZ and SPITZER), A., i, 829.

Diphenylformylacetic acid, ethyl ester, acetal (STAUDINGER and RATHSAM), A., i, 1015.

***N*-Diphenylglycine-*o*-carboxylic acid,** and *p*-chloro-, and their esters (FRIEDLANDER and KUNZ), A., i, 765.

***s*.-Diphenylguanidine,** use of, in acidimetry and alkalimetry (CARLTON), A., ii, 654.

1:4-Diphenylhexahydro-1:2:4:5-tetrazine, and its derivatives (THIELEPAPE and SPRECKELSEN), A., i, 1192.

Diphenylhydroxystibine, *di-p*-amino-, acetyl derivative (SCHMIDT), A., i, 1204.

Diphenyl*di*hydroxy-*m*- and -*p*-tolylmethanes (MACKENZIE), T., 1698.

4:6-Diphenyl-2-(6-hydroxy-*m*-tolyl)-pyridine, and its picrate (DILTHEY, NÜSSLEIN, MEYER, and KAFFER), A., i, 949.

Diphenylimidoacetic acid, ethyl ester, and its hydrochloride (STAUDINGER and RATHSAM), A., i, 1015.

1:2-Diphenylindene, formation of (ORÉKHOFF and TIFFENEAU), A., i, 458.

1:1′-Diphenylindigotin, and 1:1′-*di-p*-chloro- (FRIEDLANDER and KUNZ), A., i, 766.

Diphenyliodobismuthine, *di-p*-chloro- (CHALLENGER and RIDGWAY), T., 110.

Diphenyl*tetra*iodophthalide (LAWRANCE and ODDY), A., i, 455.

Diphenylketenmethylimine (STAUDINGER and HAUSER), A., i, 29.

Diphenylketimine, 2:4:6:2′-*tetra*hydroxy-, and its hydrochloride (NISHIKAWA and ROBINSON), T., 840.

Diphenylmethane, action of aluminium chloride with (SCHOLL, SEER, and (NEUMANN), A., i, 336.

Diphenylmethane, 2:2′:4:4′-*tetra*amino-5:5′-*di*thiol- (WATSON and DUTT), T., 1943.

4:6-Diphenyl-2-(4-methoxy-3 methylphenyl)pyridine, and its hydrochloride (DILTHEY, NÜSSLEIN, MEYER, and KAFFER), A., i, 949.

Diphenylmethylamine ferrocyanide (FÖLDI), A., i, 732.

Diphenylmethylarsine, salts of (STEINKOPF and SCHWEN), A., i, 72.

ββ-Diphenyl-γ-methylbutane, γ-chloro- (RAMART), A., i, 35.

ββ-Diphenyl-γ-methylbutan-γ-ol (RAMART), A., i, 35.

Diphenylmethylcarbamyl chloride (JONES and HURD), A., i, 249.

Diphenylmethylcarbimide (JONES and HURD), A., i, 249.

4:4-Diphenyl-2-methyl-4:5-dihydro-5-glyoxalone, and its derivatives (BILTZ, SEYDEL, and HAMBURGER-GLAZER), A., i, 871.

Diphenylmethylphosphinic acid, α-hydroxy- (CONANT, MACDONALD, and KINNEY), A., i, 186.

γγ-Diphenyl-β-methylpropane (RAMART and ALBESCO), A., i, 663.

4:6-Diphenyl-2-methylpyridine (GASTALDI), A., i, 573.

2:6-Diphenyl-4-methylpyrylium salts (SCHNEIDER and ROSS), A., i, 1172.

5:5-Diphenylmethyltetrahydro-4-glyoxalones, and their derivatives (BILTZ, SEYDEL, and HAMBURGER-GLAZER), A., i, 871.

Diphenyl-α-methylthiolnaphthylacetic acid, and its derivatives (BISTRZYCKI and KUBA), A., i, 34.

Diphenyl-α-methylthiolnaphthylmethane (Bistrzycki and Kuba), A., i, 34.

Diphenylmethylurethane (Jones and Hurd), A., i, 249.

Diphenyl-α-naphthylbismuthine *di*chloride (Challenger and Wilkinson), T., 102.

Diphenyl-β-naphthylmethane (McMullen), A., i, 1026.

Diphenyl-β-naphthylmethyl, and its derivatives (Gomberg and Sullivan), A., i, 929.

αα-Diphenyl-β-*tri*nitrophenylhydrazine (Goldschmidt and Renn), A., i, 477.

αα-Diphenyl-β-*tri*nitrophenylhydrazyl, and β-hydroxy-, and their derivatives (Goldschmidt and Renn), A , i, 477.

1:4-Diphenyl-3-*m*-nitrophenyl-2-*p*-hydroxyphenyl-1:3-dimethindiazidine (Ingold and Piggott), T., 2798.

1:4 Diphenyl-3 *o*-nitrophenyl-2-*p*-nitrophenyl-1:3-dimethindiazidine (Ingold and Piggott), T., 2799.

Diphenylnitrosoamine (Schmidt and Fischer), A., i, 822.

3:5-Diphenyl*iso*oxazole-4-carboxylic acids, derivatives of (Betti and Berlingozzi), A., i, 52.

ββ-Diphenylpentane, γ-chloro- (Ramart), A., i, 35.

ββ-Diphenylpentan-γ-ol (Ramart), A., i, 35.

Diphenylphenylethinylcarbinol, preparation and reactions of (Hess and Weltzien), A , i, 35.

Diphenylphenylethinylcarbinol, *di*-*p*-chloro- (Meyer and Schuster), A., i, 556.

Diphenylphosphoric acid. See Diphenyl hydrogen phosphate.

ββ-Diphenylpropionic acid, ethyl ester, azide and hydrazide of (Sieglitz and Spitzer), A., i, 828.

Diphenylpropylcarbinol (Skraup and Freundlich), A., i, 540.

αγ-Diphenylpropylphosphinic acid, α-hydroxy- (Conant, MacDonald, and Kinney), A., i, 186.

2:4-Diphenylpyridine, and its derivatives (Gastaldi), A., i, 574, 679.

2:4-Diphenylpyridine, 6-hydroxy-, and its 5-carboxylic acid, ethyl ester (Kohler), A., i, 461.

2:4-Diphenylpyridine-6-carboxylic acid, and its sodium salt (Gastaldi), A., i, 574.

2:4-Diphenyl-6-pyrone (Kohler), A., i, 461.

2:4-Diphenyl-6-pyrone-5-carboxylic acid, and its sodium salt and esters (Kohler), A., i, 461.

Diphenylpyrrylcarbinol, and its derivatives (Fischer and Kaan), A., i, 869.

2:5-Diphenylquinol, *pp′*-*di*hydroxy-, and its tetra-acetate (Pummerer and Prell), A., i, 1165.

2:3-Diphenylquinoline-4-carboxylic acid (Farbwerke vorm. Meister, Lucius, & Bruning), A , i, 867.

Diphenylstibinic acid, *di*-*p*-amino-, acetyl derivative (Schmidt), A., i, 1204.

Diphenylstyrylcarbinol (Meyer and Schuster), A., i, 540.

S-Diphenylsuccinic acid, preparation of (Lapworth and McRae), T., 1709.

S-Diphenylsuccinimide (Lapworth and McRae), T., 1712.

Diphenylsulphone, *di*bromo-, *di*chloro-, and *di*iodo-derivatives (Grandmougin), A., i, 251.

3:3′-*di*iodo- and 2:2′ *di*nitro- (Grandmougin), A., i, 331.

2:5-Diphenyltetrahydro-1:4:2:5-dioxadiarsine (Palmer and Adams), A., i, 786.

Diphenylthiocyanobismuthine (Challenger and Wilkinson), T., 98.

Diphenylthiolbenzene, derivatives of (Smiles and Graham), T., 2506.

1:3-Diphenylthiophthalan (Bistrzycki and Brenken), A., i, 269.

2:4-Diphenyl-6-*p*-tolylpyridine (Gastaldi), A., i, 368.

2:4-Diphenyl-6-*p*-tolylpyrylium nitrate (Gastaldi), A., i, 368.

9-ββ-Diphenylvinylidenexanthene (Ziegler, Ochs, Bremer, and Thiel), A , i, 1049.

ββ-Diphenylvinylxanthyl, and its derivatives (Ziegler, Ochs, Bremer, and Thiel), A., i, 1049.

2:4-Diphthaliminophenol (Mukerji), T., 549.

4:6-Diphthaliminoresorcinol (Mukerji), T., 549.

Diphthalyl-lactonic acid, preparation of (Ruggli and Meyer), A., i, 343.

Diphtheria toxin (Walbum), A., i, 902.

Dipicrylamine, cobaltammines of (Morgan and King), T., 1726.

Dipiperidino-4-phenylmethane, *di*-4-hydroxy- (Borsche and Bonacker), A., i, 51.

2:5-Dipiperonyloxazole (Greene and Robinson), T., 2188.

2:3-Dipiperonylquinoxaline (Greene and Robinson), T., 2194.

Di*iso*propenyl. See βγ-Dimethyl-$\Delta^{\alpha\gamma}$ butadiene.

Dipropionylpentamethylenediamine, *di*-α-bromo- (Bergell), A , i, 720.

Dipropyl ethers, $\gamma\gamma'$-*di*bromo-, and $\gamma\gamma'$-*di*chloro- (KAMM and NEWCOMB), A., i, 105.

  selenide, $\beta\beta'$-*di*chloro-, and its dichloride (BOORD and COPE), A., i, 421.

$\beta\beta'$-Dipropyl sulphides, $\gamma\gamma'$-*tetra*chloro- (POPE and SMITH), T., 1168.

$\beta\beta$-Dipropylacraldehyde, and its semicarbazone (LOCQUIN and WOUSENG), A., i, 711.

$\gamma\gamma$-Dipropylallyl alcohol, and its allophanate (LOCQUIN and WOUSENG), A., i, 711.

Dipropylammonium ruthenibromides (GUTBIER and KRAUSS), A., i, 16.

Dipropylbarbituric acid, action of diazomethane on (HERZIG), A., i, 574.

Di-*n*- and *iso*-propylbenzidines, 3:3':5:5'-*tetra*nitro- (VAN ROMBURGH), A., i, 275.

Dipropylcampholactone, and its copper salt (LEROIDE), A., i, 218.

Di-*n*-propylcyanoarsine (STEINKOPF, DONAT, and JAEGER), A., i, 995.

$\delta\eta$-Dipropyl-Δ^{ϵ}-decinene-$\delta\eta$-diol (LOCQUIN and WOUSENG), A., i, 617.

Dipropylethinylcarbinol, and its allophanate (LOCQUIN and WOUSENG), A., i, 617.

Dipropylethylcarbinol, and its allophanate (LOCQUIN and WOUSENG), A , i, 617.

s-**Di*iso*propylhydrazine**, and its derivatives (LOCHTE, BAILEY, and NOYES), A., i, 329.

$\delta\epsilon$-Dipropyloctane (PICCARD and BREWSTER), A., i, 313.

Di*iso*propylphenylthiosemicarbazide (LOCHTE, BAILEY, and NOYES), A., i, 329.

Dipropyl*iso*propylcarbinol phenylurethane (LEROIDE), A., i, 217

Dipropylvinylcarbinol, and its allophanate (LOCQUIN and WOUSENG), A., i, 710.

Dipyridineiridic acid, *tetra*chloro-, potassium salt (DELÉPINE), A., i, 859.

Dipyridineiridium, *tetra*chloro-, and its derivatives (DELÉPINE), A., i, 859.

Dipyridinium μ-dichloro-hexachloropyridinediferrate and μ-dichloro-tetrachlorodinitratodipyridinediferrate (WEINLAND and KISSLING), A., i, 364.

4:4'-Dipyridyl di*iso*amyl hydroxide and its salts (EMMERT and PARR), A., i, 179.

  di*iso*butyl iodide and platinichloride (EMMERT and PARR), A., i, 180.

Dipyrryl, *hepta*iodo- (PIERONI), A., i, 763.

Dipyrrylphenylmethane colouring matters, iron salts of (FISCHER and LUCKMANN), A., i, 276.

6-Diquinaldylmethane, and its picrate (BORSCHE and MEYER), A., i, 53.

Di-2-quinolyl ketone, and its derivatives (SCHEIBE and SCHMIDT), A., i, 1190.

Diquinolylmethane (BORSCHE and MEYER), A , i, 53.

Disaccharides, constitution of (HAWORTH and LEITCH), T., 1921.

  containing selenium and sulphur, synthesis of (WREDE), A., i, 226.

Disalicin *di*sulphide, and its octa-acetate (ZEMPLÉN and HOFFMANN), A., i, 563.

Disalicinamine (ZEMPLÉN and KUNZ), A., i, 564.

Disalicylaldehyde, constitution of (ADAMS, FOGLER, and KREGER), A., i, 660.

Disalicylic acid (*anhydrosalicylic acid*), and its salts and derivatives (ANSCHUTZ and CLAASEN), A., i, 456.

Disinfection, theory of (TRAUBE and SOMOGYI ; TRAUBE), A., i, 204 ; (VERMAST), A., i, 406.

Dispersion of colloidal solutions (TADOKORO), A., ii, 204.

  rotatory (LOWRY and AUSTIN), A., ii, 414.

    calculation of (RUPE), A., ii, 602.

    anomalous (RUPE and SCHMID), A., ii, 603.

    of organic compounds (LOWRY and CUTTER), T., 532.

Dispersity (OSTWALD), A., ii, 131.

Dispersoid analysis. See Analysis.

Diss, ergot of. See Ergot.

Dissociation constants of dibasic acids (DUBOUX), A., ii, 346.

Distillation (GAY), A., ii, 120.

  of foaming liquids (KLANHARDT), A., ii, 472.

  separation of miscible liquids by (DUFTON), T., 306.

Distillation apparatus, receiver for fractionation (WILLIAMS), A., ii, 26 ; (WHEELER and BLAIR), A., ii, 258.

  stillhead for prevention of spray (HAHN), A., ii, 368.

Distyryl sulphide (POPE and SMITH), T., 1168.

Distyryl ketone (*dibenzylideneacetone*), halochromism of (HANTZSCH), A., i, 556.

Distyryl ketone, unsaturated halogen derivatives of, and their conductivity (STRAUS and DÜTZMANN), A., i, 148.

  3':2-*di*hydroxy-, and its dibenzoyl derivative (BUCK and HEILBRON), T., 1097.

Distyryl ketones, benzopyrylium salts of (Buck and Heilbron), T., 1198.

Di-9-styrylxanthyl ether (Ziegler and Ochs), A., i, 1048.

Disulphides (Fromm, Kayser, Briegleb, and Fohrenbach), A., i, 377.

  aromatic, action of sulphuric acid on (Smiles and McClelland), T., 86.

p-**Disulphidobenzoic acid** (Smiles and Harrison), T., 2022.

5-Disulphidobis-2:4-dimethylpyrrole-3-carboxylic acid, ethyl ester (Fischer and Herrmann), A., i, 1055.

Disulphidodiphenylbisazo-α-naphthol-2-sulphonic acid (Watson and Dutt), T., 2418.

Disulphosalicylaldehyde, and its salts and derivatives (Weil and Brimmer), A., i, 349.

Di-*ar*-tetrahydronaphthyls, *di*amino-, and their salts (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.

Dithienoylhydroxamic acid, and its salts (Jones and Hurd), A., i, 250.

2-Dithiobenzoyl (Smiles and McClelland), T., 89.

Dithiocarbamic acid, derivatives of, as accelerators of vulcanisation (Twiss, Brazier, and Thomas), A., i, 460.

Dithionates. See under Sulphur.

3:5-Dithion-1:2:4-tribenzoyl-1:2:4-triazole (Fromm, Kayser, Briegleb, and Föhrenbach). A., i, 379.

Di(toluene-*p*-sulpho)diphenylethylenediamine (Clemo and Perkin), T., 648.

5-Ditoluene-*p*-sulphonylaminoacenaphthene (Fleischer and Schranz), A., i, 1144.

Di-*p*-toluenesulphonylethylene (Fromm and Siebert), A., i, 543.

Ditolyl. See Dimethyldiphenyl.

Ditolyl dimethyl ether (Farbenfabriken vorm. F. Bayer & Co.), A., i, 934.

Ditolylamine, amino- (Goldschmidt and Strohmenger), A., i, 1005.

Di-*p*-tolylantipyryl selenide (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 1066.

NN'-**Di-*p*-tolylbenzidine** (Wieland, Wecker, and Albert), A., i, 780.

2:5-Di-*p'*-tolyl-*p*-benzoquinone (Pummerer and Prell), A., i, 1165.

Ditolyl*tetra*bromophthalide (Lawrance and Oddy), A., i, 455.

βγ-Di-*m*-tolylbutane (v. Auwers and Kolligs), A., ii, 176.

s.-**Di-*p*-tolylcarbamide-2:2'-disulphonic acid**, potassium salt (Scott and Cohen), T., 2041.

Di-*p*-tolylchlorobismuthine (Challenger and Ridgway), T., 113.

Di-*p*-tolylhydrazine dinitrosoamine (Wieland, Wecker, and Albert), A., i, 780.

Ditolyl*tetra*iodophthalide (Lawrance and Oddy), A., i, 455.

2:3-Di-*p*-tolyl-αβ-naphthaquinoxaline (Schonberg and Kraemer), A., i, 665.

2:5-Di-*p*-tolylquinol, and its derivatives (Pummerer and Prell), A., i, 1165.

3:4'-Ditolylsulphone, 4-chloro- (Steinkopf and Buchheim), A., i, 122.

s.-**Ditolylthiocarbamide**, compound of chloropicrin and (Rây and Das), T., 327.

Di-*p*-tolylthiolacetylene, and its dibromide (Fromm and Siebert), A., i, 542.

Di-*p*-tolylthiolethylene, and its derivatives (Fromm and Siebert), A., i, 542.

Di-trimethylene glycol ether, and its derivatives (Rojahn), A., i, 103.

Diuresis, action of injections of dextrose and gum arabic on (Cori), A., i, 1091.

  phosphate excretion in (Bock and Iversen), A., i, 1090.

Diuretics, distribution coefficients of (Aiello), A., i, 301.

Divaleraldehyde, *di*-γ-hydroxy-. See Bis-5-methyltetrahydro-2-furyl ether.

αβ-Di*iso*valerylaminopropane, and its dipicrate (Windaus, Dorries, and Jensen), A., i, 60.

Divinyl sulphide, synthesis of (Bales and Nickelson), T., 2137.

Divinylarsinic acid, ββ'-*di*chloro- and its salts (Mann and Pope), T., 1756.

1:1'-Dixanthonoyl, 4:4'-*di*chloro- (Eckert and Endler), A., i, 941.

4:5-Dixanthylpyrocatechol (Fabre), A., i, 1148.

2:3-Dixanthylquinol (Fabre), A., i, 1148.

2:4-Dixanthylresorcinol, and its diacetyl derivative (Fabre), A., i, 1148.

Di-*o*-xylyleneimine, *p*-nitrobenzoyl derivative (v. Braun and Nelken), A., i, 864.

Dodecamethyltetralævoglucosan (Pringsheim and Schmalz), A., i, 1118.

Doebner's reaction (Ciusa), A., i, 1062.

Doebner's-violet-leucosulphonic acid (Wieland and Scheuing), A., i, 58.

Dogs, effect of injection of sugars on respiration of (Bürger), A., i, 286.
Dopplerite (Tideswell and Wheeler), T., 2345.
Doryphora sassafras, oil from the leaves of (Penfold), A., i, 847.
Drosophila, vitamins required by (Bacot and Harden), A., i, 493.
Drugs, distribution of, between immiscible solvents (Emery and Wright), A., ii, 205.
  distribution of, in blood (Schaeppi), A., i, 290.
  influence of the reaction of the solution on the action of, on bacteria or tadpoles (Labes), A., i, 901.
Drying, change of properties of substances on (Baker), T., 568.
  influence of, on internal change (Smits), A., ii, 358.
Dugaldin (Marsh, Clawson, Couch, and Marsh), A., i, 413.
Dulcin. See *p*-Phenetylcarbamide.
Duodenal fluid, analysis of (Damade), A., ii, 887.
Duralumin, analysis of (Costa-Vet), A., ii, 528.
Dyeing, use of mordants in (Bancroft), A., ii, 551, 822; (Paddon), A., ii, 822.
  of cotton, effect of salts on (Auerbach), A., ii, 353.
  of hides and leather (Rakuzin), A., i, 702.
  of deaminated wool (Paddon), A., i, 608.
Dypnonanil (Knoevenagel and Goos), A., i, 751.

E.

Earths, rare (Yntema and Hopkins), A., ii, 462; (Hopkins and Driggs), A., ii, 770.
  preparation of, pure, and their spectra (Kiess, Hopkins and Kremers), A., ii, 244.
  preparation of pure compounds of (Manske), A., ii, 646.
  place of, in the periodic system (Norrish), A., ii, 211; (Renz), A., ii, 758.
  minerals containing (Shibata and Kimura), A., ii, 220; (Henrich and Hiller), A., ii, 860.
  absorption spectra of (Herzfeld; Meyer and Greulich), A., ii, 6.
  structure of the ions of the (Grimm), A., ii, 635.
  rates of hydrolysis of carbonates of (Brinton and James), A., ii, 39.
Earths, rare, density and molecular volume of oxides of the (Prandtl), A., ii, 379.
  magnesium sulphide phosphors of (Tiede and Schleede), A., ii, 769.
  detection of, spectroscopically (Meyer and Greulich), A., ii, 6.
  concentration and separation of (Brinton and James), A., ii, 62.
  separation of (Prandt and Rauchenberger), A., ii, 298, 769; (Prandtl and Lösch), A., ii, 770.
Earthworm, Japanese, constituents of (Murayama and Aoyama), A., i, 898.
Ebullioscopy of binary mixtures (Beckmann and Liesche), A., ii, 117.
Ecgonine (Gadamer and John), A., i, 167.
Edestin, colloidal properties of (Hitchcock), A., i, 693.
Eggs, hens', sugar contents of (Hepburn and St. John), A., i, 294.
Egg-albumin. See Albumin.
Egg-shells, utilisation of calcium salts in formation of (Buckner, Martin, Pierce and Peter), A., i, 488.
Egg-yolk, absorption spectrum of (Lewin and Stenger), A., ii, 414.
Einstein's law in relation to photochemical action and fluorescence (Weigert), A., ii, 681.
α-Elæostearic acid, methyl ester, conversion of, into methyl β-elæostearate (Morrell), A., i, 982.
Elaidanilide *di*bromide (Nicolet), A., i, 106.
Elaidoacetylhydroxamic acid (Nicolet and Pelc), A., i, 644.
Elaidodiacetylhydroxamic acid (Nicolet and Pelc), A., i, 644.
Elaidohydroxamic acid (Nicolet and Pelc), A., i, 644.
Electric discharge, absorption of gases in the (Newman), A., ii, 546.
    disappearance of gases in the (General Electric Co.), A., ii, 417.
    chemical reactions induced by the (Miyamoto), A., i, 418.
    corona, chemical reactions induced by the (Montemartini), A., ii, 734.
    action of, on fatty acids and their glycerides (Eichwald), A., i, 982.
  furnace, ionisation experiments with the (King), A., ii, 810.
    tungsten (Compton), A., ii, 822.
Electrical conductivity of mixtures of acids with acids, esters and ketones (Kendall and Gross), A., ii, 33.

Electrical conductivity of electrolytes, measurement of (Abribat), A., ii, 344; (Rolla and Mazza), A., ii, 544.
of electrolytes in solution (Kraus), A., ii, 256.
of ternary electrolytes in propyl alcohol (Kraus and Bishop), A., ii, 19.
of solid electrolytes (Vaillant), A., ii, 418.
of formates in formic acid and of sulphates in sulphuric acid (Kendall, Adler and Davidson), A., ii, 126.
of photographic emulsions and films (Rabinovich), A., ii, 605.
of molten salts and their mixtures (Benrath and Drekopf), A., ii, 109.

Electrical endosmosis (Strickler and Mathews), A., ii, 688.

Electro-adsorption (Kolthoff), A., ii, 197; (Ostwald), A., ii, 427.

Electrochemistry of non-aqueous solutions (Müller; Müller and Duschek), A., ii, 612.

Electrodes, overvoltage of (Isgarischev and Berkmann), A., ii, 253, 254.
reproducible, for acidimetry and alkalimetry (Sharp and MacDougall), A., ii, 579.
hydrogen, quick acting (Moloney), A., ii, 253.
  use of phthalate solutions for measuring (Oakes and Salisbury; Clark), A., ii, 468; (Wood and Murdick), A., ii, 735.
  electro-volumetric analysis with, in alcoholic solution (Bishop, Kittredge and Hildebrand), A., ii, 308.
Clark hydrogen (Healy and Karraker), A., ii, 519; (Cullen), A., ii, 611.
iodine, potential of (McKeown), A., ii, 417.
  potentiometric estimations with (Kolthoff), A., ii, 388.
mercury drop (Heyrovsky), A., ii, 816.
non-attackable (Klemenc), A., ii, 253.
platinum film, construction and use of (Eilert), A., ii, 610.
quinhydrone (S. P. L. and M. Sörensen and Linderström-Lang); (Biilmann and Lund), A., ii, 111.
sodium amalgam (Neuhausen), A., ii, 610.
zinc, effect of hydrogen-ion concentration on the potential of (Richards and Dunham), A., ii, 418.

Electrolysis, rapid, without rotating electrodes (Edgar and Purdum), A., ii, 547.
with mercury drops as electrode (Heyrovsky), A., ii, 816.

Electrolytes, recent conception of (Schreiner), A., ii, 736.
constitution and function of (Madelung), A., ii, 344.
structure of molecules of (Wasastjerna), A., ii, 2.
measurement of the conductivity of (Kraus), A., ii, 258; (Abribat), A., ii, 344; (Rolla and Mazza), A., ii, 544.
activity coefficients and colligative properties of (Harned), A., ii, 255.
theory of solutions of (Ghosh), A., ii, 125.
effect of, on the solubility of non-electrolytes (McKeown), A., ii, 552.
diffusion of, into gels (Stiles and Adair; Stiles), A., ii, 125.
adsorption and precipitation of, by colloids (Weiser), A., ii, 262; (Weiser and Nicholas), A., ii, 266.
coagulation of colloids by (Murray), A., ii, 37; (Freundlich and Scholz), A., ii, 828.
equilibrium law for (Jabłczyński and Wiśniewski), A., ii, 190.
hydration of (Aschkenasi), A., ii, 482.
condition of, in blood (Neuhausen and Marshall), A., i, 1085.
amphoteric, viscosity of solutions of (Hedestrand), A., ii, 821.
  precipitation conditions for (Prins), A., ii, 77.
binary, physical properties of non-aqueous solutions of (Walden), A., ii, 345.
binary mixed, equilibrium in (Kraus), A., ii, 269.
solid, changes in the conductivity of (Vaillant), A., ii, 418.
strong, theory of (Kallmann), A., ii, 125; (Arrhenius), A., ii, 345.
  ionic equilibria of (Stearn), A., ii, 420.
  molecular conductivity of (Lorenz), A., ii, 19.
  anomalous behaviour of (Ebert), A., ii, 113; (Kendall), A., ii, 419.
  application of the gas laws to (Bronsted), A., ii, 113.
ternary, conductivity of, in propyl alcohol (Kraus and Bishop), A., ii, 19.

Electrolytes, weak, ionisation of (Schoorl), A., ii, 31.
Electrolytic detector, new (Reichinstein and Rothschild), A., ii, 736.
  dissociation, relation between adsorption and (Rakuzin), A., ii, 619.
    of salts (Rabinowitsch), A., ii, 186, 187, 188.
  ions, theory of (Lorenz), A., ii, 19.
  oxidation of organic compounds (Müller), A., ii, 469.
  reduction of organic compounds (Conant, Kahn, Fieser, and Kurtz), A., ii, 547.
Electromotive force of electrolytic cells (Gerke), A., ii, 682; (Wasastjerna), A., ii, 815.
  from the movement of an electrode in an electrolyte (Procopiu), A., ii, 112.
  at the junction of two liquids (Freundlich), A., ii, 19.
  metallic conductivity (Tammann), A., ii, 255.
  of metallic compounds with electron conductivity (Trumpler), A., ii, 110.
Electrons and atoms (Pease), A., ii, 757.
  binding of, by atoms (Nicholson), A., ii, 544.
  motion of, in gases (Townsend and Bailey), A., ii, 43, 836; (Skinker), A., ii, 887.
  vibration of, without radiation resistance (Fokker), A., ii, 106.
  free, behaviour of, towards gas molecules (Wahlin), A., ii, 608.
  positive (Lodge), A., ii, 836.
Electron gas, entropy of (Tolman), A., ii, 18.
Electron theory and photosynthesis (Dixon and Ball), A., ii, 248.
  application of, to the structure of solids (Thomson), A., ii, 355.
Electro-osmosis (Aten; Prausnitz), A., ii, 114.
  potential difference in (Freundlich), A., ii, 189.
Elements, genesis of (Neuburger), A., ii, 365.
  structure of (Allen), A., ii, 758; (Wachter), A., ii, 837.
  electronic structure of (Coster), A., ii, 677; (Dauvillier), A., ii, 678.
  periodic classification of (Balareff), A., ii, 365.
  periodic system of the ions of (Grimm), A., ii, 635.
  physical and chemical properties of (Bohr), A., ii, 363.
Elements, properties of, and their compounds, in relation to the dimensions of the component atoms and ions (Clark), A., ii, 634.
  Rontgen spectra of (Hjalmar; Coster), A., ii, 180; (Smekal), A., ii, 181.
  ionisation of the vapours of, at high temperatures (Noyes and Wilson), A., ii, 811.
  disintegration of (Wächter), A., ii, 838.
  artificial disintegration of (Rutherford), T., 400.
  disintegration of, by α-particles (Rutherford and Chadwick), A., ii, 682.
  entropy of, in relation to the periodic system (Herz), A., ii, 548.
  linear relationships in the periodic system of (Biltz), A., ii, 494.
  relative volumes of (Collins), A., ii, 28.
  light, ultra-violet spectra of (Millikan), A., ii, 100.
  radioactive. See Radioactive elements.
Ellagic acid in raspberry juice (Kunz-Krause), A., i, 210.
Elsholtzic acid, constitution of (Asahina and Kuwada), A., i, 1047.
Emilium (Loisel), A., ii, 15.
Emulsin (Willstatter and Oppenheimer), A., i, 959.
  preparation and activity of (Helferich; Willstatter and Csányi), A., i, 390.
  decomposition of amygdalin by (Giaja), A., i, 185.
  synthesis of cyanohydrins by means of (Nordefeldt), A., i, 66, 1077.
δ- and σ-**Emulsins** (Rosenthaler), A., i, 600.
Emulsions, inhibition period in the separation of (Nugent), A., ii, 625.
  aniline-water, coagulation of (Bhatnagar), A., ii, 268.
  chromatic (Holmes and Cameron), A., ii, 269.
  oil-water, reversal of phases in (Bhatnagar), A., ii, 204.
Enantiomorphism of matter (Condelli), A., i, 410.
Energy of gaseous molecules (Partington), A., ii, 614; (Planck), A., ii, 689.
Enols, azo-ester reaction with (Diels), A., i, 774, 1194.
Entropy, calculation of (Planck), A., ii, 191.
  relation of probability to (Linhart), A., ii, 257, 738.

Entropy of elements (Lewis and Latimer), A., ii, 471.
    in relation to the periodic system (Herz), A., ii, 548.
  of metals (Latimer), A., ii, 814.
Enzymes (Biedermann and Rueha), A., i, 65.
  chemistry of (v. Euler and Myrbäck), A., i, 1201.
  periodicity of (Sluiter), A., i, 887.
  combined action of (Vandevelde), A., i, 958.
  adsorption of (Jacoby and Shimizu), A., i, 481; (Rakuzin), A., i, 1199.
  effect of acids, bases and salts on (Bokorny), A., i, 93.
  action of poisons on (Santesson), A., i, 1077.
  effect of yeast extracts on the action of (Abderhalden and Wertheimer), A., i, 796.
  of blood (Compton), A., i, 392, 1087; (Bach and Zubkowa), A., i, 392; (Pincussen), A., i, 393.
  autolytic (Bradley), A., i, 896.
  digestive, during fœtal life (Porcher and Tapernoux), A., i, 1088.
  hydrolytic, action of (van Laer), A., i, 64.
  oxidising (Marinesco), A., i, 790, 1211.
  oxidising and reducing, mechanism of the action of (Battelli and Stern), A., i, 1077.
  proteolytic, of malt (Lundin), A., i, 959.
    in albuminous urine (Hedin), A., i, 609.
    estimation of (Pincussen), A., ii, 884.
  of plants, velocity of reaction of (Maestrini), A., i, 507, 508.

Ethylazide (Staudinger and Hauser), A., i, 69.
2-Ethyl-4:5-benzoindane (Mayer and Sieglitz), A., i, 743.
2-Ethyl-4:5-benzoindan-1-one (Mayer and Sieglitz), A., i, 743.
2-Ethylbenzothiazolenylbenzothiazolylmethane (Mills), T., 464.
2-Ethylbenzoxazole (Skraup and Moser), A., i, 575.
O-**Ethyl*iso*biuret** (Madelung and Kern), A., i, 439.
5-Ethyl-5-*n*-butylbarbituric acid (Dox and Yoder), A., i, 808.
hypnotic power of (Carnot and Tiffeneau), A., i, 900.
α-**Ethylbutylcarbamide,** bromo- (Farbenfabriken vorm. F. Bayer & Co.), A., i, 993.
α-**Ethylbutylphosphinic acid,** α-hydroxy-, lead salt (Conant, MacDonald, and Kinney), A., i, 186.
α-**Ethyl-β-butyrolactone** (Johansson and Hagman), A., i, 426.
N-**Ethylcarbazole-3-azoacetoacetic acid,** ethyl ester (Morgan and Read), T., 2716.
N-**Ethylcarbazole-3-diazonium** salts (Morgan and Read), T., 2715.
Ethylcarbonatoacetonitrile, and its derivatives (Sonn and Falkenheim), A., i, 1164.
5-Ethylcarbonato-3:4-dimethoxybenzaldehyde (Spath and Röder), A., i, 853.
5-Ethylcarbonato-3:4-dimethoxybenzoic acid (Spath and Roder), A., i, 853.
4-Ethylcarbonato-3:5-dimethoxybenzylmalonic acid (Späth and Roder), A., i, 852.
4-Ethylcarbonato-3:5-dimethoxyphenylacetaldoxime (Spath and Röder), A., i, 852.
β-**4-Ethylcarbonato-3-5-dimethoxyphenylethylamine,** and its salts (Spath and Röder), A., i, 852.
β-**4-Ethylcarbonato-3:5-dimethoxyphenylpropionic acid,** and its derivatives (Spath and Röder), A., i, 852.
4- and **5-Ethylcarbonatodimethoxystyrenes,** ω-nitro- (Späth and Röder), A., i, 852.

7-Ethylcarbonato-6:8 dimethoxy-1:2:3:4-tetrahydro*iso*quinoline and its hydrochloride (SPÄTH and RÖDER), A., i, 852.
2-Ethylcarbonato-1:3-dimethyl*cyclo*buten-4-one-3-carboxylic acid, methyl ester (DIECKMANN and WITTMANN), A., i, 1156.
Ethylcarbonatophenylalanine (CURTIUS and SIEBER), A., i, 722.
ω-Ethylcarbonatoresacetophenone (SONN and FALKENHEIM), A., i, 1164.
1-[Ethylcarbonato*iso*vanillyl]-6:7-dimethoxy-3:4-dihydro*iso*quinoline, and its hydrochloride (SPATH and LANGE), A., i, 569.
Ethyl-cellulose, de-polymerisation of (HESS and WITTELSBACH), A., i, 116.
Ethylconiine, hydroxy-, and its derivatives (v. BRAUN, BRAUNSDORF, and RATH), A., i, 760.
O-**Ethylcyano*iso*carbamide**, and its sodium salt (MADELUNG and KERN), A., i, 439.
Ethyldi*iso*butylarsine, and its salts (STEINKOPF, DONAT, and JAEGER) A., i, 995.
Ethyldihydrocupreicine (*optotoxin*) sulphate (HEIDELBERGER and JACOBS), A., i, 673.
d-*O*-**Ethyldihydrocupreicinol**, and its hydrochlorides (HEIDELBERGER and JACOBS), A., i, 674.
Ethyldihydrocupreine ethyl bromide (HEIDELBERGER and JACOBS), A., i, 673.
oxide, and its dinitrate (SPEYER and BECKER), A., i, 675.
N-**Ethyldihydro*iso*indole**, β-hydroxy-, and its picrate (v. BRAUN, BRAUNSDORF, and RÄTH), A., i, 760.
Ethyldihydronaphthalene (DE POMMEREAU), A., i, 828.
8-Ethyl-7:8 dihydrophenalene (MAYER and SIEGLITZ), A., i, 741.
8-Ethyl-7:8-dihydrophenalone-9 (MAYER and SIEGLITZ), A., i, 741.
N-**Ethyldihydroquinicine** hydrochloride (HEIDELBERGER and JACOBS), A., i, 673.
d- and *l*-*N*-**Ethyldihydroquinicinol**, and their derivatives (HEIDELBERGER and JACOBS), A., i, 674.
α-Ethyl-ββ-dimethylglutaric acid, and its derivatives (KON and THORPE), T., 1800.
4-Ethyldiphenyl (v. AUWERS and JÜLICHER), A., i, 842.
Ethyldi-*n*-propylarsine, and its salts (STEINKOPF, DONAT, and JAEGER), A., i, 995.
Ethylene, preparation of, by reduction of acetylene (CHEVALIER and BOURCET), A., i, 801.
compressibility of (BATUECAS), A., ii, 618.
absorption of, by sulphuric acid (DAMIENS), A., i, 1105.
catalytic hydrogenation of, with nickel (RIDEAL), T., 309.
formation of butadiene from (ZANETTI, SUYDAM, and OFFNER), A., i, 977.
reaction of nitrogen and, under the electric discharge (MIYAMOTO), A., i, 418.
cyanohydrin. See Propionitrile, β-hydroxy-.
dicarbamidophenyl ether (SPECKAN), A., i, 580.
halohydrins, esters of (ALTWEGG and LANDRIVON), A., i, 315.
chloro-derivatives, antiseptic action of (JOACHIMOGLU), A., i, 304.
di-, *tri*-, and *tetra*-chloro-, iodine numbers of (MARGOSCHES and BARU), A., ii, 235.
*di*iodo-derivatives (KAUFMANN), A., i, 214; (LATIERS), A., i, 314.
Ethylenediamine, compounds of, with metallic salts (PETERS), A., i, 48.
Ethylenediphenyldiarsinous acid (QUICK and ADAMS), A., i, 601.
Ethylene glycol, *mono*thio-, and its metallic derivatives (BENNETT), T., 2139.
derivatives of (ROSEN and REID), A., i, 420.
*di*thio-, potassium salt, compound of chloropicrin and (RÂY and DAS), T., 326.
Ethylene mercaptan, compound of mercuric nitrite and (RÂY), T., 1282.
Ethylene oxide, physical properties of (MAASS and BOOMER), A., i, 912.
hydrate of (MAZZUCCHELLI and ARMENANTE), A., i, 620.
9-Ethylfluorene, 2:7-*di*bromo-9-hydroxy-, and 9-chloro-2:7-*di*bromo- (SIEGLITZ and JASSOY), A., i, 821.
γ-Ethylglutaconic acid, α-cyano-, ethyl ester (INGOLD, PERREN, and THORPE), T., 1782.
4-Ethylglyoxaline, β-amino- (*histamine*), physiological action of (SCHENCK), A., i, 498.
in the intestines (MEAKINS and HARINGTON), A., i, 396; (GERARD), A., i, 790.
1-Ethylhexahydropyridine-3-carboxylic acid, ethyl ester (WOLFFENSTEIN), A., i, 950.

α-Ethyl*cyclo*hexane-1:1-diacetic acid, and *αα′-di*cyano-, ω-imides of (Kon and Thorpe), T., 1800.
γ-Ethylhexane-γζ-diol, and its derivatives (Carrière), A., i, 320.
Ethylhydrocupreidine, salts of tropic acid with (King and Palmer), T., 2583.
Ethylhydrocupreine, and its oxide sulphate, and chloro- (Vereinigte Chininfabriken Zimmer & Co.), A., i, 948.
  salt of tropic acid with (King and Palmer), T., 2583.
Ethylhydrocupreine, nitro-, and its sulphonic acid (Boehringer and Söhne), A., i, 46.
Ethylidenemalonic acid, ethyl ester, preparation of γ-alkylidene derivatives of (Higginbotham and Lapworth), T., 2823.
2-Ethylindole-3-carboxylic acid, 2-β-amino-, and its picrate (Asahina and Fujita), A., i, 47.
Ethylmalonazidic acid (Curtius and Sieber), A., i, 723.
Ethylmenthol (Ogata and Miyashita), A., i, 844.
Ethylmethylaniline, β-chloro- (Clemo and Perkin), T., 648.
α-Ethyl-β-naphthacinchoninylpropionic acid, and its derivatives (Carrière), A., i, 320.
4-Ethylnitroaminobenzonitrile, 3:5-*di*nitro- (Mattaar), A., i, 251.
γ-Ethyl-γζ-octandiol, and its derivatives (Carrière), A., i, 319.
Ethyl*cyclo*pentamethylenearsine, and its salts (Steinkopf, Donat, and Jaeger), A., i, 996.
γ-Ethylpentane-αβ-dicarboxylic acid, *αβ-di*cyano-γ-hydroxy-, and γ-hydroxy-, lactone (Birch and Thorpe), T., 1826.
γ-Ethylpentane-ααβ-tricarboxylic acid, γ-hydroxy-, lactone (Birch and Thorpe), T., 1826.
γ-Ethylpentan-α-ol, γ-chloro- (Moureu and Barrett), A., i, 5.
Ethyl pentyl ketone, α-chloro-, and its semicarbazone (Detœuf), A., i, 327.
Ethylphenetidine, β-hydroxy-, and its hydrogen oxalic ester (Bergmann, Ulpts, and Camacho), A., i, 1182.
Ethylphthalimide, hydroxy- (Dersin), A., i, 142.
***N*-Ethylpiperidine**, β-hydroxy-, and their derivatives (v. Braun, Braunsdorf, and Räth), A., i, 760.
***O*-Ethylpivalylacetone** (Morgan and Drew), T., 938.
Ethyl-*n*-propylcyanoarsine (Steinkopf, Donat, and Jaeger), A., i, 995.
***N*-Ethylpyrrolidine**, β-hydroxy-, and its derivatives (v. Braun, Braunsdorf, and Räth), A., i, 760.
***N*-Ethylquinicine** hydrochloride (Heidelberger and Jacobs), A., i, 673.
6′-Ethyl*iso*quinoline-red (Harris and Pope), T., 1032.
Ethylsuccinic acid, derivatives of (Carrière), A., i, 319.
β-Ethylsulphonylpropionic acid, β-bromo-, and its salts (Fitger), A., i, 108.
Ethylsulphonylsuccinic acid, and α-bromo-, and its salts (Fitger), A., i, 108.
Ethylsulphoxysuccinic acid, and its salts (Fitger), A., i, 108.
***N*-Ethyltetrahydro*iso*quinoline**, β-hydroxy-, and its salts (v. Braun, Braunsdorf, and Räth), A., i, 761.
2-Ethyl-5-thienyl methyl ketone semicarbazone (Steinkopf and Herold), A., i, 851.
β-Ethylthiolacrylic acid (Fitger), A., i, 108.
β-Ethylthiolmaleic acid, α-bromo-, and its barium salt and anhydride (Fitger), A., i, 108.
2-Ethylthiol-3-phenyl-5-anilinomethylene-4-glyoxalone (Dains, Thompson, and Asendorf), A., i, 1186.
Ethylthiolsuccinic acids, stereoisomeric, and their salts (Fitger), A., i, 107.
3-Ethylthiophen mercurichlorides (Steinkopf and Herold), A., i, 850.
Ethyltrigonelline hydrochloride (Merck), A., i, 949.
Eucalyptus oil, aromatic aldehydes in (Penfold), T., 266.
  thymol, menthone and menthol from (Smith and Penfold), A., i, 31.
Eudalene, and its salts (Ruzicka, Meyer, and Mingazzini), A., i, 560.
***iso*Eugenol**, derivatives of (Rastelli), A., i, 1010.
n- and *iso*-**Eugenols**, ultra-violet absorption spectra of (Durrans), A., ii, 6.
***iso*Eugenyl** methyl ether, β-nitro- (Schmidt, Schumacher, Bäjen, and Wagner), A., i, 733.
Euphylline, coagulation of blood by (Meissner), A., i, 193.
Europium oxide, density and molecular volume of (Prandtl), A., ii, 379.
Euxanthogen. See Mangiferin.
Explosion of mixed gases (Campbell), T., 2483.
Explosions, thermodynamical theory of (Henderson and Hassé), A., ii, 207.
  of organic dust (Beyersdorfer), A. ii, 749.

- **Explosives**, sensitiveness of (Eggert), A., ii, 133.
  - high, velocity of decomposition of, in a vacuum (Farmer), T., 174.
- **Extraction** of colloids by Winkelblech's method (Charitschkov), A., ii, 826.
- **Extraction apparatus**, chloroform (Schaap), A., ii, 797.
  - funnel (Wolffram), A., ii, 221.
  - micro-chemical (Laquer), A., ii, 325.
  - perforation, for extraction of non-miscible liquids (Fayolle and Lormand), A., ii, 759.

F.

- **Fæces**, human, hydrogen-ion concentration of (Robinson), A., i, 899.
- **Fasting**, effect of, on intestines (Dombrowski and Kozlowski), A., i, 606.
- **Fat**, Illipé. See Illipé fat.
- **Fats**, production of, from proteins (Atkinson, Rapport, Lusk, Soderstrom, and Evenden), A., i, 966.
  - enzymic synthesis of (Spiegel), A., i, 694.
  - chemistry of (André), A., i, 713.
  - effect of radiations on the hydrolysis of (Pincussen and Anagnostu), A., i, 485.
  - catalysis in the hydrolysis of (Briner and Trampler), A., ii, 208.
  - saponification of (Norris and McBain), T., 1362; (Langton), A., i, 982.
  - nutritive value of (Takahashi), A., i, 699.
  - relations between carbohydrates and (Muller), A., i, 486.
  - degradation of, in the body (Baer), A., i, 490.
  - excretion of (Hill and Bloor), A., i, 968.
  - analytical constants of, from beef bone and neat's foot oil (Eckart), A., i, 967.
  - partly hydrolysed, analysis of (Fahrion), A., ii, 401.
  - animal, detection of vegetable oils in (Muttelet), A., ii, 168.
  - estimation of the acetyl value of (Leys), A., ii, 167.
  - estimation of the iodine-bromine number of, without using potassium iodide (Winkler), A., ii, 534.
- **Feeding stuffs**, estimation of amino-acids in (Hamilton, Nevens and Grindley), A., ii, 92.
- **Fehling's solution**, behaviour of, in light (Benrath and Oberbach), A., i, 108.
- **Felspar**, constitution of (Denaeyer), A., ii, 451.
  - potash, melting of (Morey and Bowen), A., ii, 577.
- **β-Fenchocamphorol**, and its acetate (Komppa and Roschier), A., i, 1167.
- **Fenchone**, derivatives of (Maxwell), A., i, 753.
- **Fermentation**, activators of (v. Euler and Karlsson), A., i, 972; (Lindberg), A., i, 1219.
  - acetic, effect of radioactive substances on (Laborde, Jaloustre, and Leulier), A., i, 1219.
  - acetone and butyl alcohol, of carbohydrates (Robinson), A., i, 971.
  - alcoholic, nature of (Warden), A., i, 307.
    - rôle of acetaldehyde in (Fernbach and Schoen), A., i, 203.
    - acceleration of, by animal and plant extracts (Fränkel and Hager; Fränkel and Scharf), A., i, 409.
    - in presence of calcium carbonate (Kerb and Zeckendorf), A., i, 305.
    - co-enzyme of, and its separation from vitamin-*B* (Tholin), A., i, 305.
    - stimulants for (Neuberg, Reinfurth, and Sandberg), A., i, 306; (Neuberg and Sandberg), A., i, 408.
    - influence of thyroxin on (Tomita), A., i, 972.
    - in presence of urea (Sandberg), A., i, 502.
    - by means of yeast-cells (Abderhalden), A., i, 92.
  - butyric acid, nature of (Neuberg and Arinstein), A., i, 91.
  - lactic acid, effect of lactic acid on (Holwerda), A., i, 611.
  - by micro-organisms, formation of acetaldehyde in (Neuberg and Cohen), A., i, 304.
  - yeast. See Yeast.
  - without yeast (Baur and Herzfeld), A., i, 93; (Bau), A., i, 307.
- **Ferric salts**. See under Iron.
- **Ferrioxalic acid**, salts, preparation of (Burrows and Turner), A., i, 916.
  - potassium salt, crystallography and optical properties of (Knaggs), T., 2070.
- **Ferrochromium**, estimation of chromium in (Kelley and Wiley), A., ii, 164.
- **Ferrocyanides**, titration of metals with (Treadwell and Chervet), A., ii, 786.

Ferrocyanides, estimation of electro-volumetrically (Muller and Lauterbach), A., ii, 795.
  estimation of, volumetrically, with permanganate (Kolthoff), A., ii, 587.
Ferrosilicon, toxic properties of (Kurnakov and Urasov), A., ii, 845.
Ferro-tungsten, analysis of (Losana and Carozzi), A., ii, 661.
Ferrous salts. See under Iron.
Ferrovanadium, estimation of chromium and vanadium in (Kelley, Wiley, Bohn, and Wright), A., ii, 89.
Fertilisers, estimation of nitrogen in (Mach and Sindlinger), A., ii, 783.
*iso***Ferulic acid**. See 4-Methoxycinnamic acid, 3-hydroxy-.
Fibres, textile, behaviour and structure of (Nodder), A., ii, 791.
Fibrin, swelling of, by acids (Somogyi), A., i, 182.
  estimation of, in blood (Gram), A., ii, 240.
Fibrinogen, estimation of, in blood (Gram), A., i, 288; (Leendertz and Gromelski), A., ii, 798.
Fibrinolysis (Rosenmann), A., i, 596.
Ficus fulva, stearic acid from the latex of (Ultée), A., i, 1100.
Films, thin, properties and molecular structure of (Adam), A., ii, 687.
Filters, membrane, use of, in analysis (Jander), A., ii, 457.
Filter paper, apparatus for testing the permeability of (Griffin and Parish), A., ii, 309.
Fisetole. See Resacetophenone, ω-hydroxy-.
Fish, physiology of the respiration of (Powers), A., i, 286.
  fresh water, respiratory exchange in (Gardner, King, and Powers), A., i, 1084.
  sperm, phosphatides of (Sano), A., i, 699.
Flagstaffite, identity of, with terpin hydrate (Guild), A., ii, 76.
Flame, propagation of, in mixtures of air with gases (Payman and Wheeler), T., 363; (White), T., 1244, 1688, 2561.
  luminescence of ions of, in the air spark (Greinacher), A., ii, 250.
  inverted air, gaseous products from (Hofmann and Will), A., i, 1107.
Flash-point, apparatus for determination of (Wright), T., 2247.
Flavanol, and its derivatives (Freudenberg and Orthner), A., i, 758.
Flavanone, reduction of (Freudenberg and Orthner), A., i, 757.
Flavonols, 2- and 4-chloro-, and their acetyl derivatives (Minton and Stephen), T., 1602.
Flax, distinction between hemp and (Nodder), A., ii, 791.
Flocculation by electrolytes (Freundlich and Scholz), A., ii, 828.
Flour, relation between the catalytic activity of, and its grade of extraction (Fernández and Pizarroso), A., ii, 94.
  catalase of (Merl and Daimer), A., i, 184.
Flowers, manganese in (Wester), A., i, 309.
Fluoran, 2:4:5:7-*tetra*-amino-1:8-*di*hydroxy-, diphthalyl derivative of (Mukerji), T., 549.
Fluorene, pyrogenic transformation of (Dziewoński and Suszko), A., i, 730.
  catalytic oxidation of (Weiss and Downs), A., i, 27.
Fluorene, 2:7-*di*bromo-9-hydroxy- (Sieglitz and Jassoy), A., i, 821.
Fluorene series (Sieglitz and Jassoy), A., i, 820.
Fluorene-9-acethydrazide, 2:7-*di*bromo-, and its hydrazones (Sieglitz and Jassoy), A., i, 821.
9-Fluorene-9-acetic acid, 2:7-*di*bromo-9-hydroxy-, and its ethyl ester (Sieglitz and Jassoy), A., i, 820.
Fluorenoneanil-*p′*-carboxylic acid (Reddelien), A., i, 146.
  methyl ester (Reddelien and Danilof), A., i, 148.
Fluorenonebenzoylhydrazone (Reddelien), A., i, 146.
Fluorenonebenzoylimide (Reddelien and Danilof), A., i, 148.
Fluorenonemethylimide (Reddelien), A., i, 146.
Fluorenylidene-*p*-aminodiphenyl (Reddelien), A., i, 146.
Fluorenyl-9-methylurethane, 2:7-*di*bromo- (Sieglitz and Jassoy), A., i, 821.
Fluorescein, preparation and derivatives of (Fischer and Bollmann), A., i, 936.
Fluorescein, *di*thiol- (Watson and Dutt), T., 1942.
Fluorescence and photochemistry (Wood), A., ii, 334; (Weigert), A., ii, 681.
  disturbance of the power of, by light (Pringsheim), A., ii, 602.
  by flame excitation (Nichols and Wilber), A., ii, 806.
  estimation of (Lewis), A., ii, 334.

Fluorescent substances, action of, on cells (Jodlbauer and Haffner), A., i, 94.
Fluorides. See under Fluorine.
Fluorine, spectrum of (Smythe), A., ii, 99.
  detection and estimation of (Smitt), A., ii, 716.
  Hydrofluosilicic acid, estimation of, by conductometric titration (Kanô), A., ii, 719.
Fluorine organic compounds:—
  Fluorides, organic (Krause and Pohland), A., i, 644.
    aliphatic (Swarts), A., i, 101.
Fluorine detection:—
  detection of (Fetkenheuer), A., ii, 655.
  detection of, in Spanish grapes (Pondal), A., i, 1100.
Fluorites, colour of (Sakao and Hirose), A., ii, 779.
Foods, phytin in (Arbenz), A., i, 1102.
  tryptophan content of (Ide), A., i, 414.
  microchemical analysis of (Lührig), A., ii, 534.
  detection of β-naphthol in (Kinugasa and Tatsuno), A., ii, 400.
  detection of sulphites in (Chapman), A., ii, 520.
  detection of vitamins in (Drummond and Watson), A. ii, 596.
  estimation of the alkalinity of the ash of (Pfyl), A., ii, 586.
  See also Feeding stuffs
Formaldehyde, preparation of (Traun's Forschungslaboratorium), A., i, 522, 528; (Blair and Wheeler), A., i, 917.
  and its polymerides (Lush), A., i, 625.
  production of, by the action of ozone on hydrocarbons (Wheeler and Blair), A., i, 1105.
  water-soluble form of (Cohn), A., i, 918.
  alcoholic fermentation of (Müller), A., i, 110, 809.
  dehydroxidation of (Müller), A., i, 109.
  formation of hydrocyanic acid by (Fosse and Hieulle), A., i, 523.
  action of phosphorus trihydride on (Hoffman), A., i, 8.
  as an intermediate product of assimilation (Jacoby), A., i, 502.
  effect of, on bacteria and on spores (Hailer), A., i, 408.
  in urine (Voit), A., i, 1218.
Formaldehyde hyposulphite, preparation of, and its zinc compound (Malvezin, Rivalland and Grandchamp), A., i, 8.
  detection of, with phenols (Pfyl, Reif, and Hanner), A., ii, 94.
  detection of, in urine (Stepp), A., ii, 793.
Formaldehydesulphoxylic acid, sodium salt, as an antianaphylactic (Brodin and Huchet), A., i, 90.
Formamide, synthesis of (Meyer and Orthner), A., i, 529.
Formamidines, reactions of (Dains, Thompson, and Asendorf), A., i, 1185.
Formic acid, anhydrous, preparation of (Boswell and Corman), A., i, 712.
  formation of, during the decomposition of dextrose (Waterman and van Tussenbroek), A., i, 433.
  and its salts, electrical conductivity of mixtures of (Kendall, Adler, and Davidson), A , ii, 126.
  partition of, between water and organic solvents (Gordon and Reid), A., ii, 824.
  catalytic decomposition of, on platinum and silver (Tingey and Hinshelwood), T., 1668.
  catalytic dehydroxidation of (Müller and Sponsel), A., ii, 558.
  thermal decomposition of (Hinshelwood, Hartley, and Topley), A., ii, 274.
  action of, on hexamethylenetetramine salts (Sommelet and Guioth), A., ii, 333.
  velocity of reaction between manganates and (Holluta), A., ii, 700.
  mechanism of the reduction of permanganate by (Holluta), A., ii, 448; (Holluta and Weiser), A., ii, 628.
  compounds of molybdic acid and (Jakób), A., i, 712.
  condensation of, with 3-oxythionaphthen and with phloroglucinol (Schwenk), A., i, 153.
  salts, denitrification with (Groenewege), A., i, 971.
  alkali salts, solubility of, in water (Sidgwick and Gentle), T., 1837.
  metallic salts, freezing point curves of, in formic acid solution (Adler), A., i, 5.
  lithium salt, preparation of, and its use in the production of alcohols and ketones (Badische Anilin- & Soda-Fabrik), A., i, 218.

Formic acid, mercurous salt, preparation of, and its reactions with aliphatic halogen compounds (Kunz-Krause and Manicke), A., i, 6.
  sodium salt, transformation of, to sodium oxalate (Matignon and Marchal), A., i, 913.
  esters, dielectric constants of (Jackson), A., ii, 252.
  detection of, in urine (Fresenius and Grünhut), A., ii, 234.
Formoxyhaemin (Kuster and Gerlach), A., i, 596.
Formylacetone, sodium derivative, action of aniline hydrochloride with (Thielepape), A., i, 271.
3-Formyl-1-acetyl-2-hydroxy-5:5-diphenyl-2-methyltetrahydro-4-glyoxalone (Biltz, Seydel, and Hamburger-Glazer), A., i, 872.
Formylethylsuccinic acid, ethyl ester, derivatives of (Carrière), A., i, 319.
Formylsuccinic acid, ethyl ester, *p*-nitrophenylhydrazone, oxime, and semicarbazone of (Carrière), A., i, 318.
Friction, internal, of organic liquids (Herz), A., ii, 30.
Friedel and Crafts' reaction (McMullen), A., i, 140, 1025; (Smith), A., i, 140; (Stephens), A., i, 141; (Lawrance), A., i, 340; (Lawrance and Oddy), A., i, 455; (Wieland and Bettag), A., i, 1033.
  use of iron pyrites in (Smythe), T., 1270.
Frog. See *Rana temporaria.*
d-**Fructose.** See Lævulose.
Fructosediphosphates, enzymic synthesis of (v. Euler and Nordlund), A., i, 306.
Fruit, stored, changes in the pectin in (Carré), A., i, 1222.
Fucaceæ, chemical constituents of (Lapicque and Emberique), A., i, 413.
Fuel, natural, origin of (Calcagni), A., ii, 385.
  estimation of water in (Marinot), A., ii, 228.
Fuller's earth, adsorption and catalysis in (Rideal and Thomas), T., 2119.
Fulminic acid, mercury salt, velocity of decomposition of (Farmer), T., 174.
    decomposition of (Langhans), A., i, 328.
    detection and estimation of impurities in (Rathsburg), A., i, 116.
Fumaric acid, action of muscle enzymes on (Dakin), A., i, 792.
  calcium salt, crystallography and optical properties of (Wherry and Hann), A., i, 716.
  methyl ester, alkaline hydrolysis of (Skrabal and Raith), A., ii, 434.
Fungi, higher chemistry of (Hasenöhrl and Zellner), A., i, 904.
  mould, formation of ammonia by (Butkewitsch), A., i, 973.
  urea and urease in (Goris and Costy), A., i, 1220.
Furan, *tetra*iodo- (Ciusa), A., i, 1057.
Furan-2:3-dicarboxylic acid, methyl ester and anilide (Asahina and Kuwada), A., i, 1047.
Furfuraldehyde, solubility of, in water (Mains), A., i, 566.
  condensation of *p*-nitrobenzyl chloride with (Kleucker), A., i, 734.
  detection of, with orcinol (Justin-Mueller), A., ii, 95.
  estimation of, colorimetrically (Fleury and Poirot), A., ii, 595, 666.
1-Furfurylidene*cyclo*hexan-2-one (Wolff), A., i, 668.
3-Furfurylidene-1-methyl*cyclo*hexan-2-one (Wolff), A., i, 668.
3-Furfuryl-1-methyl*cyclo*hexan-2-one (Wolff), A., i, 668.
Furnaces, blast, carbon oxides in (v. Jüptner), A., ii, 374.
  tungsten. See Electric furnace.
2-Furylalanine (Gränacher), A., i, 850.
α-Furylcinchonic acid (Ciusa), A., i, 1062.
5-α-Furylideneaminoacenaphthene (Fleischer and Schranz), A., i, 1143.
β-2-Furylpyruvic acid, α-oximino- (Gränacher), A., i, 850.
Fusarium lini, nutrition of (Tochinai), A., i, 207.

G.

Galactosan (Pictet and Vernet), A., i, 811.
Galactose, preparation of, pure (Mougne), A., i, 630.
d-**Galactose**, fermentation of (Tomita) A., i, 307.
α-Galactosyl chloride (Pictet and Vernet), A., i. 811.
β-Galaheptanepentol-di-acid (Kiliani and Wingler), A., i, 322.
α-Galaoctanehexol-di-acid, and its metallic salts and lactones (Kiliani and Wingler), A., i, 321.

Gallaldehyde, preparation of, and its derivatives (Rosenmund), A., i, 1030.

Gallium, arc spectrum of (Uhler and Tanch), A., ii, 677.

Gallotannin, constitution of (Nierenstein), A., i, 266.

Galloyllævoglucosan (Karrer and Salomon), A., i, 267.

Gallylamine hydrochloride (Rosenmund and Pfannkuch), A., i, 1031.

Gambier-catechin-carboxylic acids (Nierenstein), T., 26.

Gas, detonating, ignition of (Mitscherlich), A., ii, 358.
  illuminating, estimation of sulphur in, with perhydrol (Klemmer), A., ii, 224.

Gases, properties of (Wächter), A., ii, 476.
  ultra-red spectra of (Schaefer), A., ii, 727.
  motion of electrons in (Townsend and Bailey), A., ii, 43.
  behaviour of free electrons towards the molecules of (Wahlin), A., ii, 608.
  resonance and ionisation potentials of (Boucher), A., ii, 608.
  disappearance of, in the electric discharge (General Electric Co.), A., ii, 417; (Newman), A., ii, 546.
  specific heat of (Ingold and Usherwood), T., 2286; (Mewes), A., ii, 737.
  determination of high temperatures by effusion of (Yamaguchi), A., ii, 470.
  thermo-compression of (Deleuer), A., ii, 684.
  compressibility of, at low temperature (Guye and Batuecas), A., ii, 617; (Batuecas), A., ii, 618.
  contraction of flasks in the determination of density of (Moles and Miravalles), A., ii, 617.
  solubility of, in liquids (Neuhausen and Patrick), A., ii, 264; (Neuhausen), A., ii, 621.
  adsorption of, calculation of (Berényi), A., ii, 426.
  kinetic theory of adsorption of (Henry), A., ii, 740.
  adsorption of, by charcoal (Gustaver), A., ii, 479.
  adsorption of, by charcoal and lignite (McLean), A., ii, 352.
  adsorption of, by crystals (Seeliger and Lapkamp), A., ii, 30.
  application of the quantum theory to (Schaposchnikov), A., ii, 839.
  relation between the internal friction and chemical constitution of (Schmidt), A., ii, 278.

Gases, energy of the molecules of (Partington), A., ii, 614.
  containing hydrogen, molecular structure of (Rankine), A., ii, 685.
  ignition of (Mason and Wheeler), T., 2079.
  of blood, analysis of (Meier and Kronig), A., i, 191.
  diatomic, chemical constants of (Partington), A., ii, 889.
  mixed, explosion of (Campbell), T., 2483.
    ignition of (Payman and Wheeler), T., 363; (White), T., 1244, 1688, 2561; (Mason and Wheeler), T., 2079.
  monatomic, calculation of the chemical constants of (Brody), A., ii, 191.
  natural, collection and examination of (Henrich and Prell), A., ii, 858.
  volcanic, analyses of (Allen), A., ii, 219.
  estimation of, in metals (Simons), A., ii, 719.
  separation of volatile substances from (Berl and Schwebel), A., i, 932.

Gas analysis, absorption by pyrogallol in (Hoffmann), A., ii, 582.
  receiver for (Guthrie), A., ii, 158.

Gas analysis apparatus (van Slyke), A., ii, 158; (Moser and Brukl), A., ii, 393; (Blair and Wheeler; Moser), A., ii, 519; (Schaller and Berndt), A., ii, 862.

Gas constants, numerical values of (Henning), A., ii, 191.

Gas generator with washing apparatus (Müller), A., ii, 706.
  carbon oxides in (v. Jüptner), A., ii, 374.

Gas reactions, homogeneous, catalysis in (Herzfeld), A., ii, 136.

Gas washing apparatus (Ernst), A., ii, 839.

Gastric juice (Takata), A., i, 698.
  relation of saliva to (Nakagawa), A., i, 789.
  detection of bile pigments in (Utz), A., ii, 799.
  estimation of chlorine in (Malgoyre), A., ii, 780.

Gelatin, preparation of, pure (Loeb), A., i, 387.
  isoelectric condition of (Rawling and Clark), T., 2830.
  solubility of (Fairbrother and Swan), T., 1237.
  physical properties of solutions of (Davis and Oakes), A., i, 597.
  effect of electrolytes on the solution and precipitation of (J. and R. F. Loeb), A., i, 182.

- **Gelatin** gels, thermal expansion of (Taffel), T., 1971.
  - elasticity of, as a function of the hydrogen-ion concentration (Sheppard, Sweet, and Benedict), A., ii, 747.
- **Gelatin** as a protective colloid (Gutbier, Huber, and Zweigle), A. ii, 485; (Gutbier and Emslander), A., ii, 625.
  - dialysed, properties of (Lloyd), A., i, 1075.
  - swelling of (MacDougall), A., i, 205.
  - drying and swelling of (Sheppard and Elliot), A., i, 387; (Bogue), A., i, 388.
  - swelling of, in organic acids (Kuhn), A., i, 183.
  - swelling and hydrolysis of, by acids (Moeller), A., ii, 689.
  - action of sulphosalicylic acid on the swelling of (Ostwald and Kuhn), A., i, 598.
  - products of hydrolysis of (van Slyke and Hiller), A., i, 63.
  - viscosity of solutions of (Davis, Oakes, and Browne), A., i, 63.
  - viscosity and plasticity of solutions of (Bogue), A., i, 782; ii, 122.
  - combination of acids and alkalis with (Lloyd and Mayes), A., i, 280.
  - combination of hydrochloric acid with (Wintgen and Vogel), A., i, 280; (Hitchcock), A., i, 882.
  - mixtures of, with arabic acid (Tiebackx), A., i, 638.
  - coagulation of mixtures of, with gum-arabic (Tiebackx), A., ii, 698.
  - nitrogenous value of, in the diet of man (Robison), A., i, 488.
- **Gels**, action of ultra-violet light on (Holmes and Patrick), A., ii, 338.
  - diffusion of electrolytes into (Stiles and Adair; Stiles), A., ii, 125.
  - elastic, structure of (Bogue), A., i, 782.
- **Generator gas**, equilibrium of (Jellinek and Diethelm), A., ii, 833.
- **Germanium**, occurrence and extraction of (Dennis and Papish), A., ii, 150.
  - occurrence of, in cassiterite (Hadding), A., ii, 855.
  - crystal structure of (Kolkmeijer), A., ii, 713.
- **Germanium** *tetra*bromide and *tetra*chloride (Dennis and Hance), A., ii, 302.
  - hydride (Müller and Smith), A., ii, 775; (Paneth and Schmidt-Hebbel), A., ii, 776; (Schenck and Imker), A., ii, 855.
- **Germanium** *di*oxide, effect of, on blood (Hammett, Nowrey, and Müller), A., i, 1086.
- **Germanium detection and separation**:—
  - detection of, by the arc spectrum (Papish), A., ii, 163.
  - separation of arsenic and (Müller), A., ii, 320.
- **German silver**, equilibrium of the formation of (Voigt), A., ii, 295.
- **Germination**, action of nitrogenous compounds on (Bokorny), A., i, 93.
- **Glands**, physiology of (Asher and Koda; Asher and Doubler), A., i, 286; (Asher and Matsuno), A., i, 298; (Asher and Bernet), A., i, 491.
- **Glass**, molecular structure of (Raman), A., ii, 201.
  - determination of the durability of (Turner), A., ii, 719.
  - effect of lime and magnesia on the durability of (Dimbleby, Muirhead, and Turner), A., ii, 709.
  - preparation of suspensions of (Fricke), A., ii, 692.
  - diffusion of hydrogen and helium through (Williams and Ferguson), A., ii, 841.
  - migration of sodium ions through (Pirani and Lax), A., ii, 817.
  - colourless, use of selenium compounds in production of (Cousen and Turner), A., ii, 708.
  - natural, properties and composition of (Tilley), A., ii, 220.
  - containing didymium, absorption spectra of (Weigert), A., ii, 413.
- **Glassware**, chemical, action of analytical reagents on (Turner and Wilson), A., ii, 501.
- **Glauconite** from Sussex (Hallimond and Radley), A., ii, 861.
- **Gliadin**, wheat, rate of hydrolysis of (Vickery), A., ii, 754.
- **Globulin**, carbohydrate as a constituent of (Langstein), A., i, 479.
  - serum, colloidal behaviour of (Hitchcock), A., i, 1074.
- **Globulins**, estimation of, in blood-serum (Henley), A., ii, 671.
  - separation of, from serum (Vila), A., i, 1209.
- **Glucamine**, production of (Ling and Nanji), T., 1686.
- **Glucimidazole**, and 2-thiol- (Pauly and Ludwig), A., i, 953.
- **Glucimidazolone** (Pauly and Ludwig), A., i, 953.
- **Glucinum** (*beryllium*), atomic weight of (Honigschmid and Birckenbach), A., ii, 214.

Glucinum (*beryllium*), spectrum of, and its relation to the spectrum of aluminium (GLASER), A., ii, 675.
anode rays of (THOMSON), A., ii, 106.
crystal structure of, and its oxide (MCKEEHAN), A., ii, 766.
Glucinum fluoride, spectrum of (DATTA), A., ii, 411.
sulphate, dissociation of (MARCHAL), A., ii, 620.
equilibrium of ammonium sulphate, water and (BRITTON), T., 2612.
Glucinum separation:—
separation of aluminium and (BRITTON), A., ii, 228.
Glucodesose. See 2-Deoxyglucose.
α-Glucoheptol, synthesis of (PICTET and BARBIER), A., i, 4.
Gluconeogeny (MÜLLER; JUNG and MÜLLER), A., i, 486.
Gluconic acid, preparation of (LING and NANJI), A., i, 221.
Glucosamine, and its derivatives, mutarotation of (IRVINE and EARL), T., 2370.
formation of, heterocyclic compounds from (PAULY and LUDWIG), A., i, 953.
*iso***Glucosamine** (LING and NANJI), T., 1682.
d-**Glucosamine**, salicylidene derivatives of (IRVINE and EARL), T., 2376.
Glucose, thio-, and its silver salt and tetra-acetyl derivative (WREDE), A., i, 525.
d-**Glucose.** See Dextrose.
Glucoses, substituted, phosphoric and sulphuric esters of (LEVENE, MEYER, and WEBER), A., i, 987.
Glucose-ammonia (LING and NANJI), T., 1682; A., i, 631.
Glucose-α-galactoside (PICTET and VERNET), A., i, 811.
α-Glucosidase, non-identity of maltase and (WILLSTÄTTER and STEIBELT), A., i, 282.
Glucosides (KARRER, NÄGELI, and SMIRNOV), A., i, 253.
studies on (MACBETH and PRYDE), T., 1660.
new, synthesis of (DE FAZI), A., i, 755.
coumarin, in orchids (HÉRISSEY and DELAUNEY), A., i, 210.
detection and extraction of, from plants (VERGELOT), A., i, 207.
Glucosides. See also:—
Amygdalin.
Anthochlor.
Aucubin.
Glucosides. See also:—
Capsularin.
Castelin.
Digitonin.
Dugaldin.
Hyssopin.
Indican.
Pelargonenin.
Pelargonin.
Glue, animal, action of alum on (GUTBIER, SAUER, and SCHELLING), A., i, 783.
Glutaconic acid (VERKADE), A., i, 520.
action of muscle enzymes on (DAKIN), A., i, 792.
derivatives of, addition of hydrogen cyanide to (HOPE and SHELDON), T., 2223.
Glutaconic acid, β-chloro-, preparation of, and its ethyl ester (INGOLD and NICKOLLS), T., 1643.
Glutaconic acids, isomerism of (FEIST), A., i, 521.
esters, self-condensation of (INGOLD, PERREN, and THORPE), T., 1783.
d-**Glutamic acid**, esters of, and their hydrochlorides (CHILES and NOYES), A., i, 924.
Glutamine, constitution of (THIERFELDER), A., i, 326.
synthesis of, in the human organism (SHIPLE and SHERWIN), A., i, 492.
Glutaric acid, ethyl ester, oxalyl derivative, and its semicarbazone (DICKENS, KON, and THORPE), T., 1501.
αββ-trialkylated derivatives, preparation of (KON and THORPE), T., 1795.
Glutaric acid, α-hydroxy-, *iso*propyl ester (CHILES and NOYES), A., i, 925.
Glutaric acid series, esters of the, Dieckmann reaction with (KON), T., 513.
Glutaronitrile, action of magnesium organic compounds on (BRUYLANTS), A., i, 531.
Glycæmia, respiratory metabolism in (BORNSTEIN and MÜLLER), A., i, 392; (BORNSTEIN and HOLM), A., i, 890.
d-**Glyceraldehyde**, conversion of, into active glyceric acid (WOHL and SCHELLENBERG), A., i, 626.
Glycerides, synthesis of (AMBERGER and BROMIG), A., i, 804.
constitution of (GRÜN), A., i, 420, 517, 621.
thin films of binary mixtures of (COLLET), A., ii, 477.
Glycerol, preparation of, from sugar (VEREINIGTE CHEMISCHE WERKE), A., i, 980.
synthesis of (PICTET and BARBIER), A., i, 4.

- **Glycerol**, partition of compounds between acetone and (Smith), A., ii, 270.
  - equilibrium in the system, water and (Pushin and Glagoleva), T., 2818.
  - fermentation of, in presence of sulphur (H. and L. Müller), A., i, 904.
  - action of copper ethylenediamine hydroxide with (Traube) A., i, 718.
  - velocity of saponification of the acetins of (Smith), A., i, 915.
  - crude, distillation of (Lewis), A., i, 419; (Rayner), A., i, 711.
  - action of *Aspergillus glaucus* on (Traetta-Mosca and Preti), A., i, 91.
  - decomposition of, by *Bacillus lactis aerogenes* (Kumagawa), A., i, 972.
  - estimation of (Kellner), A., ii, 399.
  - estimation of, by the dichromate method (Kellner), A., ii, 723.
  - estimation of, in presence of sugars (Hoyt and Pemberton), A., ii, 321.
  - estimation of trimethylene glycol in (Cocks and Salway), A., ii, 232.
- **Glycerophosphoric acid**, ionisation constants of, and their use as buffers (Mellons, Acree, Avery, and Slagle), A., i, 405.
- **Glyceryl** chloro- and bromo-hydrins, preparation of, from allyl alcohol (Read and Hurst), T., 989.
- **Glycine** (*aminoacetic acid*), synthesis of, from formaldehyde (Ling and Nanji), A., i, 1124.
  - synthesis of, in the human organism (Shiple and Sherwin), A., i, 492.
  - modifications of, and their action with diazomethane (Biltz and Paetzold), A., i, 528.
- **Glycocholic acid**, sodium salt, hæmolytic action of (Ponder), A., i, 292.
- **Glycogen** (Karrer), A., i, 11.
  - effect of sugar concentration on the synthesis of (Éderer), A., i, 895.
  - change of, when exposed to light (Bayer), A., i, 323.
  - content of white blood-corpuscles (de Haan), A., i, 484.
  - formation in the embryo liver (Aron), A., i, 702.
  - action of pilocarpine on the content of, in organs (Hornemann), A., i, 296.
  - acetate (Pringsheim and Lassmann), A., i, 634.
- **Glycols**, amino-, and nitro- (Schmidt and Wilkendorf), A., i, 314.
- **Glycollanilide** sulphite (Blaise and Montagne), A., i, 520.
- **Glycollic acid**, action of thionyl chloride on (Blaise and Montagne), A., i, 520.
- **Glycolysis**, influence of the dextrose concentration on (Mauriac and Servantie), A., i, 1211.
- **Glycosuria.** See Diabetes.
- **Glycylglycine**, hydrolysis of, by hydrochloric acid (Jaitschnikov), A., i, 1124.
- **Glyoxaline** derivatives, synthesis of (Pucher and Johnson), A., i, 549.
- **Glyoxaline**, bromo-, and bromonitro-derivatives, and their salts (Balaban and Pyman), T., 947.
- **Glyoxaline-4-carboxylic acid**, and 2:5-*di*bromo-, and its ethyl ester (Balaban and Pyman), T., 954.
- **Glyoxalinedicarboxylic acid**, salts of, with organic bases (Pauly and Ludwig), A., i, 953.
- **Glyoxaline-5-sulphonic acid**, 4-bromo-, and its barium salt (Balaban and Pyman), T., 954.
- **Glyoxalones**, thiol- (Dains, Thompson, and Asendorf), A., i, 1185.
- **Glyoximes**, structure of (Bigiavi), A., i, 352.
  - bisulphite compounds of (Gastaldi and Braunizer), A., i, 626.
- **Gold**, L-series spectrum of (Dauvillier), A., ii, 101; (Duane and Patterson), A., ii, 463.
  - Rontgen ray spectrum of (de Broglie), A., ii, 330.
  - preparation of colloidal solutions of (Gettler and Jackson), A., ii, 240.
  - colloidal, effect of temperature on the coagulation of (Lachs and Goldberg), A., ii, 697.
  - re-crystallisation of pure unworked (Fraenkel), A., ii, 778.
  - anodic oxidation of, in sulphuric acid (Jirsa and Buryánek), A., ii, 713.
  - action of selenium on (Pélabon), A., ii, 303.
- **Gold alloys** with copper, electrochemistry of (Lorenz, Fraenkel, and Wormser), A., ii, 21.
  - reaction limit of (Tammann), A., ii, 75.
- **Gold silver bromides** (Suschnig), A., ii 514.
  - chlorides, complex (Wells), A., ii, 449.
  - **Auric cæsium chloride** (Wells), A., ii, 514.
- **Gold** haloids, compounds of benzyl sulphide with (Smith), A., i, 933.
  - sulphides (Gutbier and Dürrwachter), A., ii, 513.

Gold estimation :—
  estimation of, colorimetrically (Muller and Foix), A., ii, 662.
Gouft oil, constituents of (Roure-Bertrand Fils), A., i, 845.
Grapes, Spanish, fluorine in (Pondal), A., i, 1100.
Grape juice, methyl anthranilate in (Power and Chesnut), A., i, 97.
Grape seed oil, solid fatty acids from (André), A., i, 908.
Graphite, linkings of carbon atoms in (Wibaut), A., ii, 259.
"**Graphites**" from pyrrole and from thiophen (Ciusa), A., i, 1057.
Grass, inchi. See *Cymbopogon cæsius*.
Grignard reaction (Östling), A., i, 843.
Grignard reagents, constitution of (v. Braun), A., i, 22.
  use of, in organic syntheses (Hepworth), A., i, 118.
  action of, on thiocyanates (Adams), A., i, 531.
Guaiacol, 5-iodo-, behaviour of, in the organism (Simon), A., i, 970.
Guaiacoldimercuri-compounds (Mameli), A., i, 1082.
Guaiacyl-γ-methyl-Δ^{β}-butenyl ether (Staudinger, Kreis, and Schilt), A., i, 978.
Guanidine, preparation and derivatives of (Marckwald and Struwe), A., i, 328.
  mechanism of formation of, from dicyanodiamide (Blair and Braham), A., i, 1123.
  nitrate, preparation of (Davis), A., i, 117.
  estimation of (Dodd), A., ii, 536.
Guanidine, nitro-, action of sulphuric acid on (Davis), A., i, 530.
Guanidinophenylthiourea, amino-, and its benzylidene derivative (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 378.
Guanidoethyl alcohol, and its derivatives (Fromm and Honold), A., i, 530.
Guanidonium salts (Marckwald and Struwe), A., i, 328.
l-**Guleonic acid**. See δ-*epi*-*l*-Rhamnonic acid.
Gum arabic, adsorption in solutions of (Clark and Mann), A., ii, 550.
  effect of injections of, on diuresis (Cori), A., i, 1091.
  coagulation of mixtures of, with gelatin (Tiebackx), A., ii, 698.
Gypsum, crystalline, preparation of (Bourgeois), A., ii, 292.
  dispersoid chemistry of (Neugebauer), A., ii, 643.
Gypsum, transformation of, into ammonium sulphate (Matignon and Fréjacques), A., ii, 570.
  burnt, setting and velocity of solution of (Budnikov and Syrkin), A., ii, 849.

H.

*iso***Hæmatein**, and its ferrichloride tetramethyl ether (Crabtree and Robinson), T., 1039.
Hæmatoporphyrinuria, experimental (Binda), A., i, 89.
Hæmaturia, effect of hexamethylenetetramine in the production of (Bloedorn and Houghton), A., i, 1091.
Hæmochrome, nature of (Partos), A., i, 597.
Hæmocyanin (Dhéré and Schneider), A., i, 884.
Hæmoglobin, electric charge of (Michaelis and Airila), A., i, 63.
  effect of acids and alkalis on the chemical and physical properties of (Quagliariello), A., i, 1074.
  heat of reaction of oxygen with (Adolph and Henderson), A., ii, 350.
  crystallisation of (Amantea and Krzyszkowsky), A., i, 387.
  darkening of solutions of (Gram), A., ii, 886.
  physical chemistry of, in blood (Brown and Hill), A., i, 1199.
  combinations of, with carbon monoxide and oxygen, in blood (Hill), A., i, 193, 696.
  estimation of (Meulengracht), A., ii, 798; (Terrill), A., ii, 799.
Hæmolysis, effect of temperature on (Jarisch), A., i, 394.
  effect of metallic salts on (Purdy and Walbum), A., i, 1087.
  by morphine and its derivatives (Rhode), A., i, 1088.
  by quinine (Luger), A., i, 81.
Hæmotoxins from parasitic worms (Schwartz), A., i, 493.
Halochromism (Skraup and Freundlich), A., i, 539; (Hantzsch), A., i, 556.
Halogens, physical properties and molecular structure of (Henglein), A., ii, 44.
  velocity of the action of, on metals (Tammann and Köster), A., ii, 831.
  velocity of reaction of liberation of (Freundlich and Bartels), A., ii, 489.

Halogens, elimination of, in the reduction of halogenated nitro-compounds (BURTON and KENNER), T., 675.

estimation of, by means of mercuric nitrate (KOLTHOFF and BAK), A., ii, 159.

estimation of, microchemically (HOLTZ), A., ii, 521.

Halogen atoms, lability of, in organic compounds (HENDERSON and MACBETH), T., 892; (HIRST and MACBETH), T., 904, 2169; (GRAHAM and MACBETH), T., 1109, 2601; (MACBETH), T., 1116; (BLACK, HIRST, and MACBETH), T., 2527.

hydrides, formation and dissociation of, in aqueous solution (RÂY and SARKAR), T., 1449.

ionisation tension of (KNIPPING), A., ii, 186.

viscosity of (HARLE), A., ii, 140.

Halogenation (DATTA and CHATTERJEE), A., i, 815.

Halogen organic compounds, action of ammonia and of titanous chloride on (BLACK, HIRST, and MACBETH), T., 2527.

containing nitrogen, action of hydrazine on (HIRST and MACBETH), T., 904.

Haloids, constitution of (BILTZ), A., ii, 370.

relative toxicity of ions of (CAMERON and HOLLENBERG), A., i, 499.

inorganic, interaction of organo-metallic compounds with (CHALLENGER and RIDGWAY), T., 107.

Hardness of solids (REIS and ZIMMERMANN), A., ii, 745.

Harmaline (KERMACK, PERKIN, and ROBINSON), T., 1872.

Harmine (KERMACK, PERKIN, and ROBINSON), T., 1872.

Harrison Memorial, T., 2894.

trust-deed establishing, T., 2917.

Hasel nut oil (PRITZKER and JUNGKUNG), A., i, 208.

Heart, action of metallic ions on the (CATE; ZONDEK), A., i 296.

muscle, creatine in (CONSTABEL), A., i, 296.

action of drugs and alkaline earth salts on (BRAUN), A., i, 1218.

frog's, effect of various ions on the (SPIRO), A., i, 489.

Heat, mechanical equivalent of (SWIENTOSLAWSKI), A., ii, 194.

animal. See Animal heat.

specific (PADOA), A., ii, 348.

determination of (COHEN and MOESVELD), A., ii, 347.

Heat, specific, determination of, at low temperatures (SIMON), A., ii, 684.

of gases (INGOLD and USHERWOOD), T., 2286; (MEWES), A., ii, 737.

of metals (LATIMER), A., ii, 814.

of solids (KRASE), A., ii, 421.

of sulphides used in metallurgy (BORNEMANN and HENGSTENBERG), A., ii, 613.

Heat of combustion (HÜCKEL), A., ii, 195, 818.

in relation to constitution (BINDER), A., ii, 27.

Heat of dissociation (HÜCKEL), A., ii, 818.

Heat of evaporation (HERZ), A., ii, 818.

Heat of formation, relation of, to atomic weight and volume change (COLLINS), A., ii, 685.

in relation to ionic properties (GRIMM), A., ii, 690.

Heat of fusion, latent (STRATTON and PARTINGTON), A., ii, 258; (MORTIMER), A., ii, 622.

Heat of solution of organic substances, and its relation to the heat of fusion (GEHLHOFF), A., ii, 121.

Heat of vaporisation of non-associated liquids (MORTIMER), A., ii, 615.

Hederagenin, and its derivatives (VAN DER HAAR and TAMBURELLO), A., i, 160.

α-Hederin, and its salts and derivatives (VAN DER HAAR), A., i, 160.

Helenium hoopesii (sneezeweed), constituents of (MARSH, CLAWSON, COUCH, and MARSH), A., i, 413.

Helianthus annuus, oxidation of proteins by the green pigment in seeds of (OPARIN), A., i, 308.

Heliotherapy (VALLOT), A., i, 87.

Helium, thermodynamics of the formation of, from hydrogen (TOLMAN), A., ii, 738.

spectrum of (LYMAN; SILBERSTEIN), A., ii, 674; (HICKS), A., ii, 675.

band-spectrum of (CURTIS), A., ii, 330.

series spectrum of (SEELIGER), A., ii, 17.

ultra-violet spark spectrum of McLENNAN and PETRIE), A., ii, 330.

neutral, spectrum of (RAMAN), A., ii, 803.

Kehle model of the atoms of (VAN VLECK), A., ii, 838.

ionisation and resonance potentials of (FRANCK), A., ii, 811.

isotherms of (HOLBORN and OTTO), A., ii, 737.

Helium, solubility of, in water (Cady, Elsey, and Berger), A., ii, 642.
  diffusion of, through glass (Williams and Ferguson), A., ii, 841.
*iso***Helium**, atomic weight of (Neuburger), A., ii, 365.
Hemicellulose, digestion of (Shimizu), A., i, 82.
Hemimellitenol (3:4:5-*trimethylphenol*), 2:6-*di*bromo-, and its derivatives (v. Auwers and Saurwein), A., i, 1032.
Hemimellitylquinitrol, *di*bromo-, and *di*nitro- (v. Auwers and Saurwein), A., i, 1032.
Hemimellityl-ψ-quinol, *di*nitro- (v. Auwers and Saurwein), A., i, 1033.
Hemp, distinction between flax and (Nodder), A., ii, 791.
cis and *trans*-**Heptadecenylurethanes** (Nicolet and Pelc), A., i, 644.
Heptadecylenylcarbamide, *di*hydroxy- (Nicolet and Pelc), A., i, 644.
Heptaldehydesemioxamazone (Lapworth and McRae), T., 2753.
Heptamethylamygdalinic acid, methyl ester (Haworth and Leitch), T., 1924.
n-**Heptane**, action of nitrosyl chloride on (Lynn and Hilton), A., i, 417.
*cyclo***Heptane**, models for (Mohr), A., i, 441.
*cyclo***Heptane-1:2-diols**, space configuration of (Derx), A., i, 651.
n-**Heptenecarboxylic acid**, ethyl ester (Carmichael), T., 2549.
n-**Heptyl** fluoride (Swarts), A., i, 101.
*cyclo***Heptyl***cyclo***heptanol**, and its allophanic ester (Godchot and Brun), A., i, 350.
*cyclo***Heptylidene***cyclo***heptanone** (Godchot and Brun), A., i, 350.
Herring roe, fatty constituents of (Takahashi), A., i, 700.
Hesperidine, chemistry, properties, and detection of (Nilsson), A., i, 211.
Heterocyclic compounds, effect of substitution on the formation and stability of (Ingold, Sako, and Thorpe), T., 1177.
  formation of, from glucosamine (Pauly and Ludwig), A., i, 953.
Heteropoly-acids (Rosenheim and Leyser), A., ii, 50.
  of elements of the sulphur group (Meyer and Stateczny), A., ii, 773.
1:2:4:5:7:8-Hexa-acetoxyfluoran (Mukerji), T., 548.
Hexa-amylose dodeca-acetate (Pringsheim and Persch), A., i, 632.
Hexadecanesulphonic acid, preparation and properties of (Norris), T., 2162.
Hexadecyl fluoride (Swarts), A., i, 101.
Hexahydrocinchonine dihydrobromide (Jacobs and Heidelberger), A., i, 672.
α- and β-**Hexahydrodeoxycinchonines**, and their derivatives (Jacobs and Heidelberger), A., i, 672.
Hexahydrodioxydiboron. See under Boron.
Hexahydro-α-hydrindone, and its derivatives (Windaus and Hückel), A., i, 658.
Hexahydroquinine, and nitroso-, and their derivatives (Jacobs and Heidelberger), A., i, 673.
Hexahydrosalicylaldehyde, and its hydrochloride (Weil, Traun, and Marcel), A., i, 1023.
n-**Hexaldehyde**, δ-hydroxy-, and its *p*-bromophenylhydrazone (Helferich and Malkomes), A., i, 431.
Hexamethylenes, stereoisomeric (Skita), A., i, 534.
Hexamethylenedicarbimide (Schmidt), A., i, 761.
Hexamethyleneimine, and its salts and acetyl derivatives (Schmidt), A., i, 761.
Hexamethylenetetramine, preparation of (Traun's Forschungslaboratorium), A., i, 528; (Riedel), A., i, 991.
  catalytic synthesis of (Rombaut and Nieuwland), A., i, 990.
  action of alkyl haloids with (Delépine and Jaffeux), A., i, 234.
  action of sodammonium on (Picon), A., i, 1123.
  preparation of compounds of esters of fatty acids with (Riedel), A., i, 991.
  rôle of, in production of hæmaturia (Bloedorn and Houghton), A., i, 1091.
  salts of, action of formic acid with (Sommelet and Guioth), A., i, 333.
Hexamminechromiselenate. See under Chromium.
Hexamminecobaltic salts. See under Cobalt.
Hexamminecobaltic 2:4-dinitro-α-naphthoxide, and its 7-sulphonic acid (Morgan and King), T., 1727.
Hexamminecobaltic dipicrylamine (Morgan and King), T., 1727.
Hexane, β-chloro-γ-hydroxy- (Detœuf), A., i, 327.
*cyclo***Hexane**, 1-chloro-2-hydroxy- (Detœuf), A., i, 327.
*cyclo***Hexanes**, substituted, action of hydrazine on halogen derivatives of (Hirst and Macbeth), T 2169.

- ***cyclo*****Hexane*****spirocyclo*****butan-3-one**, and its derivatives (Kon), T., 520.
- ***cyclo*****Hexane-1:1-diacetic acid**, methyl ester (Dickens, Kon, and Thorpe), T., 1505.
- ***cyclo*****Hexane-1:2-diols**, space configuration of (Derx), A., i, 651.
- ***cyclo*****Hexane*****spirocyclo*****pentane-3:4-dione**, and its derivatives (Kon), T., 522.
- ***cyclo*****Hexanetriols**, catalytic preparation of (Senderens and Aboulenc), A., i, 337.
- ***cyclo*****Hexanol**, preparation of (Brochet), A., i, 1144.
- **Hexaphenylethane**, mechanism of the dissociation of (Cole), A., ii, 438.
- **Hexapyridine μ-dichlorodiferridi(tetrachloroferrate)** (Weinland and Kissling), A., i, 364.
- **Hexapyridinemagnesium salts** (Spacu), A., i, 859.
- **Hexen-βε-diol**, αζ-*di*chloro-γδ-*di*bromo- (Lespieau), A., i, 103.
- ***cyclo*****Hexene**, compounds of, with nitrogen tetroxide and zinc (Schaarschmidt, Veidt, and Schlosser), A., i, 646.
- Δ^{β}-**Hexenoic acid**, vanillylamide of (Ott and Zimmermann), A., i, 137.
- Δ^{δ}-**Hexenoyl** chloride (Helferich and Malkomes), A., i, 431.
- **Hexinene-αβεζ-tetrol**, dioxide from (Lespieau), A., i, 103.
- *n*-**Hexoic acid**, αγ-*di*hydroxy-, barium salt (Helferich and Speidel), A., i, 7.
- γ *iso***Hexolactone**, αβ-*di*hydroxy- (Franke and Groeger), A., i, 808.
- **Hexolactones**, bromo- and α-hydroxy- (Helferich and Speidel), A., i, 7.
- **2-Hexosamic acids**, synthesis of (Levene), A., i, 327.
- **2-Hexosamines**, synthesis of (Levene), A., i, 327.
- **Hexosediphosphoric acid**, strychnine salt (Neuberg and Dalmer), A., i, 920.
- **Hexosephosphatase** (Tomita), A., i, 960.
- **Hexosephosphoric acid**, brucine, cinchonidine, and strychnine salts (Neuberg and Dalmer), A., i, 920.
- ***cyclo*****Hexyl** allyl, ethyl and methyl esters, bromo- (Schmidt, Bartholomé, and Lübke), A., i, 827.
- **5-*****cyclo*****Hexylbarbituric acid** (Dox and Yoder), A., i, 817.
- ***cyclo*****Hexylcarbinyl alcohol**, and its urethane (de Pommereau), A., i, 339.
- ***cyclo*****Hexylmalonamide** (Dox and Yoder), A., i, 817.
- ***cyclo*****Hexylmalonic acid**, methyl ester (Dox and Yoder), A., i, 816.
- ***cyclo*****Hexyl methyl ketone**, 2-chloro-, and its semicarbazone (Wieland and Bettag), A., i, 1084.
- ***cyclo*****Hexyl phenyl ketone**, 2-chloro-, and its semicarbazone (Wieland and Bettag), A., i, 1084.
- **Hexylsuccinamic acid** (Higginbotham and Lapworth), T., 52.
- *n*-**Hexylsuccinimide** (Lapworth and McRae), T., 2750.
- **5-*****cyclo*****Hexyl-2-thiobarbituric acid** (Dox and Yoder), A., i, 817.
- **Hibernium**, a possible new radioactive element (Joly), A., ii, 651.
- **Hides**, dyeing and tanning of (Rakuzin), A., i, 702.
- **Hippuric acid**, synthesis of, in the liver (Delprat and Whipple), A., i, 86.
  - action of Dakin's hypochlorite solution on (Engfeldt), A., i, 818.
  - estimation of, in urine (Snapper and Laqueur), A., ii, 92.
- *Hirudo medicinalis* (leech), physiology and pharmacology of (Teschendorf), A., i, 970.
- **Histamine.** See 4-Ethylglyoxaline, β-amino-.
- **Histidine**, preparation of, from blood (Demjanovski), A., i, 1052.
  - production of urocanic acid from (Kotake and Konishi), A., i, 1217.
  - detection of (Hunter), A., ii, 885.
- **Histidine anhydride** dihydrochloride (Frankel and Jellinek), A., i, 965.
- **Histone** sulphate, digestion of, by pepsin (Felix), A., i, 693.
- **Histopeptone** (Felix), A., i, 479.
- **Homocamphoric acid**, phenyl ethyl ester of (Palfray), A., i, 548.
- **Homocamphoric glycol**, and its derivatives (Palfray), A., i, 548.
- **Homogeneity** (Ostwald), A., ii, 131.
- **Homogentisic acid** (Mörner), A., i, 341.
  - estimation of, in urine (Briggs), A., ii, 534.
- **Homologous series**, variation of physical properties in (Pauly), A., i, 1; (Starch), A., i, 2.
- **Homophthalic acid**, ethyl ester, preparation of (Davies and Perkin), T., 2208.
- **Homopiperonyl** methyl ester, and 6-nitro- (Greene and Robinson), T., 2194.
- *p*-**Homosalicylideneanthranilic acid** (Ekeley, Rogers, and Swisher), A., i, 935.
- **Homoterpenylic acid** (Simonsen), T., 2298.
- **Honey**, formation and ripening of (Sarin), A., i, 197.

Hormones, distribution of, in blood (Schaeppi), A., i, 290.
Horse, sedimentation of blood corpuscles of the (Runnström), A., i, 289.
"**Hsiung Ch'uang**," a Chinese drug, constituents of (Murayama), A., i, 310.
Humic acids (Eller; Jonas), A., i, 326.
  structure and formation of (Marcusson), A., i, 437.
Humoceric acid (Aschan), A., i, 714.
Humus, spontaneous oxidation of (Schrader), A., i, 637.
  estimation of, by oxidation with chromic acid (Gehring), A., ii, 592.
Hydantoins (Read), A., i, 954.
  effect of substitution on the formation and stability of (Ingold, Sako, and Thorpe), T., 1177.
Hydrargyrum oxycyanatum. See Mercury oxycyanide.
Hydration, static method of study of (Guichard), A., ii, 555.
Hydratropic acid, fate of, in the body (Kay and Raper), A., i, 1093.
Hydrazide, $C_3H_7ON_3S_2$, from methyl chlorothioformate and thiosemicarbazide (Arndt, Milde, and Tschenscher), A., i, 376.
  $C_7H_{10}N_4S_2$, from thiosemicarbazide and phenylthiocarbimide (Arndt, Milde, and Tschenscher), A., i, 377.
  $C_8H_{10}ON_4S$, from phenylthiocarbimide and semicarbazide hydrochloride (Arndt, Milde, and Tschenscher), A., i, 376.
Hydrazine stannichloride (Druce), A., i, 639.
  estimation of, volumetrically (Kurtenacker and Wagner), A., ii, 312.
Hydrazines (Wieland and Wecker), A., i, 779.
  optically active, preparation of (Glattfield and Wertheim), A., i, 385.
Hydrazinedicarbonamides containing sulphur, ring closure with (Fromm), A., i, 62; (Arndt, Milde, and Tschenscher), A., i, 375.
9-Hydrazinoacridine (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 469.
Hydrazino-9:9-bisacridine (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 469.
Hydrazinodiacetoneglucose (Freudenberg and Brauns), A., i, 1117.
1-Hydrazino-4-methylanthraquinone (Mayer and Heil), A., i, 878.
o-**Hydrazinophenylacetic acid** (Neber), A., i, 546.
Hydrazinopyrine picrate (Thielepape and Spreckelsen), A., i, 1191.
2-Hydrazinoquinoline-4-carboxylic acid, and its hydrazide (Thielepape), A., i, 271.
Hydrazobenzene, 5-bromo-2:4-*di*nitro- (Giua), A., i, 691.
Hydrazo-compounds (Charrier), A., i, 769.
  isomeric changes of (Jacobsen), A., i, 589, 596.
Hydrazoic acid. See Azoimide.
Hydrazones (Brady and McHugh), T., 1648.
  basic properties of (Ciusa and Vecchiotti), A., i, 474.
1:1-Hydrazo-*ar*-tetrahydronaphthalene (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.
Hydrindene derivatives, dehydrogenation of (v. Braun, Hahn, and Seemann), A., i, 728.
Hydrindene, bromohydroxy- (Read and Hurst), T., 2554.
1-Hydrindone, 5-hydroxy-, derivatives (v. Auwers, Hilliger, and Wulf), A., i, 1194.
Hydrindones (v. Konek and Szamák), A., i, 458.
2-Hydrindone-1-carboxylic acid, ethyl ester, and its phenylhydrazones (Perkin and Titley), T., 1566.
2-Hydrindone-3-carboxylic acid, ethyl ester (Dieckmann), A., i, 1022.
Hydriodic acid. See under Iodine.
Hydrobenzoins, 2:4-*di*nitro- (Bishop and Brady), T., 2367.
Hydrobromic acid. See under Bromine.
Hydrobromocupreine dihydrobromide (Heidelberger and Jacobs), A., i, 673.
Hydrobufotoxin (Wieland and Alles), A., i, 784.
Hydrocarbon, $C_{10}H_{18}$, from dehydration of dihydrofencholenyl alcohol (Maxwell), A., i, 753.
  $C_{16}H_{22}$, from reduction of 1:2:2:3-tetramethyl*cyclo*pentyl phenyl ketone (Rupe and Jäggi), A., i, 840.
  $C_{28}H_{28}$, from condensation of *p*-tolyl methyl ketone (Gastaldi), A., i, 367.
Hydrocarbons, formation of, from carbon dioxide and from formates (Levi), A., i, 801.
  preparation of (Plauson and v. Tischenko), A., i, 818.
  relation between molecular weights and iodine values of (Woog), A., i, 101.

Hydrocarbons, viscosity of (Chavanne and van Risseghem), A., ii, 352.
  nitration of (Battegay and Brandt), A., i, 1001.
  oxidation of (Blair and Wheeler), A., i, 917.
  action of ozone on (Wheeler and Blair), A., i, 1105.
  action of sodammonium on (Lebeau and Picon). A., i, 801.
  aliphatic, forces between carbon atoms in, and in diamond (Fajans), A., ii, 194, 818.
    oxidation of, with nitrogen peroxide (Granacher and Schaufelberger), A., i, 513.
  aromatic, molecular refraction of (v. Auwers), A., ii, 98; (v. Auwers and Kolligs), A., ii, 174.
    action of, with azo-compounds and aluminium chloride (Pummerer and Binapfl), A., i, 24.
    reaction of azobenzene hydrochloride with (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1196.
    estimation of, in mineral oils (Waterman and Perquin), A., ii, 399.
  cyclic, stereoisomerism of (Skita and Schenck), A., i, 240.
  ethylenic, action of chlorocarbamide on (Detœuf), A., i, 236, 327.
  liquid, preparation of, from ethylene and sulphuric acid (Damiens), A., i, 1105.
  paraffin, catalytic oxidation of (Salway and Williams), T., 1343.
  saturated and unsaturated, energy of atomic linkings in (Wibaut), A., i, 909.
  semibenzene (v. Auwers and Ziegler), A., i, 119.
  unsaturated, hydrogenation of (Chemische Fabrik Griesheim-Elektron), A., i, 977.
    aliphatic, replacement of halogens in (Kaufmann), A., i, 213.
Hydrocarbons, chloro-derivatives, elimination of hydrogen chloride from (Faragher and Garner), A., i, 3.
Hydrocarbostyrildihydrocoumarin-3:3-spiran (Leuchs, v. Katinsky, and Conrad), A., i, 473.
Hydrocellulose, action of heat on (Justin-Mueller), A., i, 11.
Hydrochloric acid. See under Chlorine.
Hydrocinchonidine, salts of tropic acid with (King and Palmer), T., 2585.
Hydrocinchonine, salts of tropic acid with (King and Palmer), T., 2584.
Hydrocinchonine, nitro-, and its sulphonic acid (Boehringer & Söhne), A., i, 46.
Hydrocupreine oxide (Vereinigte Chininfabriken Zimmer & Co.), A., i, 948.
Hydrodiphthal-lactonic acid, and bromo-, and their derivatives (Ruggli and Meyer), A., i, 344.
Hydroecgonidine hydrochloride and aurichlorides (Gadamer and John), A., i, 168.
Hydroferricyanic acid, zirconium salt (Venable and Moehlmann), A., ii, 712.
Hydroferricyanides of organic bases (Cumming), T., 1287.
Hydroferrocyanic acid, potassium salt,
    solubility of, in water (Fabris), A., i, 329.
    decomposition of (Baudisch and Bass), A., i, 993.
  zirconium salt (Venable and Moehlmann), A., ii, 712.
Hydroferrocyanides of organic bases (Cumming), T., 1287.
Hydrofluosilicic acid. See under Fluorine.
Hydrogen, model of the molecule of (Crehore), A., ii, 494.
  model of the ionised molecule of (Pauli), A., ii. 703.
  spectrum of (Wood), A., ii, 273; (Merton and Barratt), A., ii, 461.
  continuous spectrum of (Lewis), A., ii, 802.
  line spectrum of (Oldenburg), A., ii, 725; (Gehrcke and Lau), A., ii, 726; (Kimura and Fukuda; Hulbert), A., ii, 801.
  series spectrum of (Seeliger), A., ii, 17; (Oldenberg), A., ii, 410.
  stability of the luminous discharge in (Gibson and Noyes), A., ii, 812.
  atomic, incandescence of substances in (Wood), A., ii, 759.
  atoms, radius of, in crystals (Aminoff), A., ii, 496.
  triatomic (Wendt and Landauer), A., ii, 369.
  nuclei, collision of α-particles with (Chadwick and Bieler; McAulay), A., ii, 12.
  structure and magnetic susceptibility of molecules of (Honda), A., ii, 838.
  movement of electrons in (Townsend and Bailey), A., ii, 836.
  rectilinear diameter of (Mathias, Crommelin, and Onnes), A., ii, 440, 561.

Hydrogen, effect of a glow discharge in, between tin electrodes (Paneth), A., ii, 363.
absorption of, in the electric discharge (Newman), A., ii, 279, 546, 639; (Wendt), A., ii, 639.
specific heat of (Ingold and Usherwood), T., 2286.
heat of vaporisation and specific heat of (Mathias, Crommelin, and Onnes), A., ii, 472.
occlusion of, by palladium (Oxley), A., ii, 469.
properties of, when desorbed from platinum and palladium (Anderson), T., 1153.
compressibility of (Guye and Batuecas), A., ii, 618.
vapour pressure of (Martinez and Onnes), A., ii, 472; (Onnes and Martinez), A., ii, 759.
velocity of sound in (Grüneisen and Merkel), A., ii, 190.
thermodynamics of the formation of helium from (Tolman), A., ii, 738.
diffusion of, through glass (Williams and Ferguson), A., ii, 841.
  through iron and platinum (Schmidt and Lücke), A., ii, 198.
dissociation of, in a tungsten furnace (Duffenback), A., ii, 620.
  by excited mercury atoms (Cario and Franck), A., ii, 809.
formation and dissociation of polyhalogen compounds of, in aqueous solution (Rây and Sarkar), T., 1449.
equation of state for (Schames), A., ii, 24.
equilibrium of the reduction of nickel chloride by (Berger and Crut), A., ii, 38.
combination of, with acetylene derivatives (Zalkind), A., ii, 835.
photochemical reactions between chlorine and (Göhring), A., ii, 9; (Weigert and Kellermann), A., ii, 808.
action of oxygen with, on platinum (Langmuir), A., ii, 629.
combination of oxygen and, in presence of colloidal palladium (Sandonnini and Quaglia), A., ii, 556.
catalytic formation of water from oxygen and (Pease and Taylor), A., ii, 701.
ignition of mixtures of oxygen and (Mitscherlich), A., ii, 358.
flame, luminescence excited by the (Howes), A., ii, 335.
simple generator for (Cathcart), A., ii, 440.

Hydrogen compounds, gaseous, molecular structure of (Rankine), A., ii, 635.
Hydrogen bromide. See Hydrobromic acid under Bromine.
chloride. See Hydrochloric acid under Chlorine.
cyanide. See Hydrocyanic acid under Cyanogen.
haloids. See Halogen hydrides.
iodide. See Hydriodic acid under Iodine.
*per*oxide, constitution of (Oddo and Binaghi), A., i, 314.
  production of, by bacteria (McLeod and Gordon), A., i, 1095.
  catalytic formation and decomposition of, by platinum (Hofmann), A., ii, 490.
  effect of radium rays on the rate of formation and decomposition of (Kailan), A., ii, 106, 466, 756.
  catalytic decomposition of, by finely-divided platinum (Maxted), T., 1760.
  effect of Rontgen rays on the catalytic decomposition of (Schwarz, Friedrich, and Wunnerlich), A., ii, 436.
  oxidation of butyric acid by (Witzemann), A., i, 6.
  influence of ferrous oxide on the action of, on iodides (Pamfilov and Petin), A., ii, 835.
  velocity of the action of, on metals (Tammann and Koster), A., ii, 831.
  velocity of reaction of potassium permanganate with (Zawidzki), A., ii, 207.
  action of, on solutions of sugars (Schonebaum), A., i, 920.
  bactericidal action of (Müller), A., i, 903.
  estimation of, colorimetrically (Isaacs), A., ii, 715.
phosphide, estimation of (Moser and Brukl), A., ii, 393.
selenide, preparation of (Moser and Doctor), A., ii, 46.
sulphide, effect of, on respiration (Haggard and Henderson), A., i, 1206.
  hindrance of precipitation with (Dede and Bonin), A., ii, 766.
di- and *tri*-sulphides, preparation and properties of (Walton and Parsons), A., ii, 281.
telluride, preparation of (Moser and Ertl), A., ii, 48.

- **Hydrogen estimation and separation:**—
  - estimation of, in organic compounds (Wrede), A., ii, 316; (Lindner), A., ii, 657; (Simon and Guillaumin), A., ii, 867; (Simon), A., ii, 868.
  - estimation of traces of oxygen in (Larson and White), A., ii, 311.
  - estimation of, and its separation from gaseous paraffins (Muller and Foix), A., ii, 655.
- **Hydrogen-calomel cell.** See under Cells, electrochemical.
- **Hydrogen electrode.** See Electrode.
- **Hydrogen ions**, determination of concentration of (Michaelis and Krüger; Acree, Mellon, Avery, and Slagle; Gillespie), A., ii, 157.
    - colorimetrically (Kolthoff), A., ii, 222
    - colorimetrically, and electrometrically (Cullen and Hastings), A., ii, 657.
    - in blood (Lindhard), A., ii, 240.
    - apparatus for (Kling, Lassieur, and Lassieur; Healy and Karraker), A., ii, 519; (Kling and Lassieur), A., ii, 234, 715.
  - measurement of, and their hydration (Schreiner), A., ii, 466.
  - effect of sucrose on the activity of (Corran and Lewis), A., ii, 691.
- **Hydrogenation apparatus** (Klimont), A., ii, 369.
- **Hydrolaccol** dimethyl ether, and 5-*mono*- and 5:6-*di*-nitro (Majima and Chiba), A., i, 264.

    - of weak acids and weak bases (Griffith), A., ii, 420.
- **Hydronitric acid.** See Azoimide.
- **Hydrophthalyl-lactonic acid**, chloro-, esters of (Ruggli and Meyer), A., i, 344.
- **Hydroquinidine**, salt of tropic acid with (King and Palmer), T., 2582.
- **Hydroquinine**, salts of tropic acid with (King and Palmer), T., 2582.
- **Hydroquinine**, amino-, and its sulphonic acid (Boehringer & Söhne), A., i, 46.
  - nitro-, and its sulphonic acid (Boehringer & Söhne), A., i, 46.
- **Hydrosols**, freezing of (Lottermoser), A., ii, 266.
  - coloured, of nephelometry (Bechhold and Hebler), A., ii, 652.
- **Hydrothitsiol**, and its dimethyl ether and 6-nitro-, dimethyl ether (Majima and Chiba), A., i, 264.
- **Hydroxamic acids** (Jones and Scott), A., i, 453; (Oliveri-Mandalà), A., i, 544.
  - preparation and rearrangement of (Jones and Hurd), A., i, 248.
- **Hydroxy-acids**, action of potassium iodide and iodate on (Krishna and Pope), T., 798.
  - degradation of, in the animal organism (Woringer), A., i, 90.
  - esters, oxidation of, by oxygen or air (Simon), A., i, 984.
  - aromatic, in urine (de Sanctis and Fiori), A., i, 609.
- **α-Hydroxy-acids**, configuration of (Freudenberg and Brauns), A., i, 623.
  - action of thionyl chloride on (Blaise and Montagne), A., i, 520, 715.
- **Hydroxyaldehydes**, synthesis of substances like disaccharides from (Helferich and Weidenhagen), A., i, 1115.
  - aromatic, manufacture of (Société Chimique des Usines du Rhône), A., i, 257.
- **γ-Hydroxyaldehydes** (Helferich and Gehrke), A., i, 9.
- **Hydroxy-amines**, aldehyde derivatives of (Bergmann, Ulpts, and Camacho), A., i, 1180.
- **Hydroxycarbonyl compounds** (Karrer), A., i, 40.
- **Hydroxy-compounds**, aromatic, action of sulphites on (Bucherer and Wahl), A., i, 464; (Bucherer and Zimmermann), A., i, 465.
- **Hydroxy-ketones**, migration of acyl residues in acyl derivatives of the phenylhydrazones of (v. Auwers, Hilliger, and Wulf), A., i, 1192.
- **Hydroxyl groups**, auxiliary valency of (Reihlen), A., i, 1146; (Reihlen and Sapper), A., i, 1147.
- **α-Hydroxy-lactones** (Helferich and Speidel), A., i, 6.
- **Hydroxylactonic acid**, $C_9H_{14}O_5$, **and its** ethyl ester, from hydrolysis of ethyl *αα′*-dibromo-*ββ*-diethylglutarate (Deshapande and Thorpe), T., 1438.
- **Hydroxylamine**, preparation of (Lecher and Hofmann), A., ii, 442.
  - reactions of (Kjellin), A., ii, 640.
  - action of, and its derivatives on sodium arsenite (Gutmann), A., ii, 844.
  - stannichloride (Druce), A., i, 1206.
  - estimation of, volumetrically (Kurtenacker and Wagner), A., ii, 312.
- **Hydroxymethyleneacetophenone.** See Phenyl *β*-hydroxyvinyl ketone.

α-Hydroxymethylene-α-benzylacetone. See β-Phenyl-α-hydroxymethylene-ethyl methyl ketone.
Hydroxymethylenedeoxybenzoin, action of phenylhydroxylamine with (Rupe and Wittwer), A., i, 448.
Hygroscopy of soluble substances (Edgar and Swan), A., ii, 349.
Hyoscyamine, preparation and racemisation of and its sulphate (Goris and Costy), A., i, 1174.
Hyperglycæmia, adrenaline (Achard, Ribot, and Binet), A., i, 963; (Brösamlen), A., i, 1092.
Hypochlorous acid. See under Chlorine.
Hypoiodous acid. See under Iodine.
Hypophosphorous acid. See under Phosphorus.
Hyposulphurous acid. See under Sulphur.
Hypoxanthine, oxidation of, by tissues and by milk (Morgan, Stewart, and Hopkins), A., i, 1078.
Hyssopin (Oesterle), A., i, 849.
Hyssopinglycone, and its acetate (Oesterle), A., i, 849.
Hystazarindipyridinium *di*bromide, and its phenobetaine (Barnett and Cook), T., 1388.

I.

Ice, crystal structure of (Bragg), A., ii, 440.
Ichthyol, standardisation of commercial preparations of (Pépin and Reaubourg), A., ii, 784.
Ignition of gases (Payman and Wheeler), T., 363; (White), T., 1244, 2561; (Mason and Wheeler), T., 2079.
  of mixtures of ammonia with air and oxygen (White), T., 1688.
Illipé fat, constituents of (Kobayashi), A., i, 1113.
Illipene, and its hydrochloride (Kobayashi), A., i, 1113.
Ilsemannite, occurrence of (Cook), A., ii, 576.
Imidazolones, thio-. See Glyoxalones, thiol-.
Imidoacetyldi-*N*:*N*-rhodanine-α-acenaphthenequinone (Granacher, Reis, and Pool), A., i, 577.
"**Iminazole*iso*piperidin.**" See 1:3:5-Benztriazole.
Iminoaceticpropionic acid, ethyl ester (Ruzicka and Seidel), A., i, 1058.
Iminoanilourazole, and its derivatives (Cassella & Co.), A., i, 277.
Imino-aryl ethers (Chapman), T., 1676.
Iminodi-*N*:*N*-rhodanine-α-acenaphthenequinone (Granacher, Reis, and Pool), A., i, 577.
Imino-ethers, spontaneous decomposition of (Johnson and Bass), A., i, 736.
Incandescence of substances in hydrogen gas (Wood), A., ii, 759.
Indazole, 5-amino-, and 5-iodo-, and its acetyl derivative (v. Auwers and Lange), A., i, 687.
  bromo- and chloro-, and their derivatives (v. Auwers and Lange), A., i, 686.
Indazoles, stereoisomerism of, and of their halogen derivatives (v. Auwers and Lange), A., i, 684.
Indazole-3-carboxylic acid, and 5-bromo-, ethyl esters and derivatives (v. Auwers and Lange), A., i, 687.
Indene, catalytic hydrogenation of (v. Braun and Kirschbaum), A., i, 727.
  action of bromine water on (Read and Hurst), T., 2550.
2:3-Indeno(2:1)-indole (Armit and Robinson), T , 838.
2:3-Indeno(2:1)-indolecarboxylic acid ethyl ester (Perkin and Titley), T., 1568.
Indian yellow, precursor of (Gorter), A., i, 932.
Indican, constitution of (Macbeth and Pryde), T., 1660.
  estimation of, in blood serum (Snapper and van Vloten), A., ii, 793.
Indicators, sensitiveness of (Kolthoff), A., ii, 156.
  use of, without buffer solutions (Michaelis and Kruger), A., ii, 157.
  coloured, salt error of (Kolthoff), A., ii, 222.
  modified methyl-orange (Hickman and Linstead), T., 2502.
  mixed, use of (Cohen), A., ii, 780.
  radioactive (Paneth), A., ii, 785.
Indigotin, synthesis of (Bailey and Potter), A., i, 370.
  acylation and alkylation of leuco-derivatives of (Grandmougin), A., i, 470.
Indigotin, *octa*bromo- (Grandmougin), A., i, 55.
Indigotins, halogenated (Grandmougin), A., i, 180.
Indigotinsulphonic acid, estimation of, by reduction (Treadwell, Dreifuss, and Bossi), A., ii, 789.
Indildi-indoyls (Oddo and Sanna), A., i, 371.

Indium, arc spectrum of (Uhler and Tanch), A., ii, 677.
Indole, formation of, by bacteria, and its reactions (Frieber), A., i, 901.
  effect of sugar on the production of (Appelmans), A., i, 794.
  mechanism of the Fischer synthesis of (Hollins), A., i, 863.
  detection of, by the cotton wool plug test (Gore), A., ii, 535.
Indole group, syntheses in the (Oddo and Sanna), A., i, 371.
Indole-2-carboxydimethylacetalylamide (Kermack, Perkin, and Robinson), T., 1892.
Indole-2-carboxydimethylacetalylmethylamide (Kermack, Perkin, and Robinson), T., 1886.
2-Indole-1′-indaneindigo. See 2-Indoxyl-1-indan-2-one.
Indolinone, derivatives of (Tomiček), A., i, 679.
Indophenol and its oxide, monomethyl ethers of (Kehrmann, Decker, and Schmajewski), A., i, 32.
Indophenols, preparation of (Schoutissen), A., i, 135.
2-Indoxyl-1-indan-2-one, and *di*bromo- (Friedländer, Herzog, and v. Voss), A., i, 764.
Inflammation (Wolf), A., i, 401.
Inorganic compounds, heat of formation, lattice energy and work of ionisation of (Grimm), A., ii, 690.
  regularities in the molecular volumes of (Henglein), A., ii, 260.
Inositol, decomposition of, by *Bacillus lactis ærogenes* (Kumagawa), A., i, 972.
***i*-Inositol**, fermentation of (Hewitt and Steabben), A., i, 406.
Interferometer, water, use of, in analysis of non-aqueous solutions (Cohen and Bruins), A., ii, 77.
    use of, as a pressure gauge (van Doren, Parker, and Lotz), A., ii, 263.
Intertraction and diffusion (Schoneboom), A., ii, 690.
Intestines, sterilisation of, during fasting (Dombrowski and Kozlowski), A., i, 606
  intoxication in (Gerard), A., i, 790.
  effect of choline on movements of (Le Heux), A., i, 85.
  histamine in (Meakins and Harington), A., i, 396.
  saccharase in (v. Euler and Svanberg), A., i, 296; (Knaffl-Lenz), A., i, 485.
  permeability of, to sucrose (Woringer), A., i, 1214.
Inulin (Pringsheim and Lassmann), A., i, 634; (Pringsheim and Aronowsky), A., i, 635.
  preparation of, from artichoke tubers (Willaman), A., i, 434.
  constitution of, and its methylation (Irvine, Steele, and Shannon), T., 1060.
  digestion of (Shimizu), A., i, 82.
  compounds of potassium and sodium hydroxides with (Karrer, Staub, and Wälti), A., i, 229.
  detection of (Castellani and Taylor), A., ii, 379.
Invertase (Willstatter and Racke), A., i, 598; (Willstätter, Graser, and Kuhn), A., i, 1200.
  action of (Vosburgh), A., i, 64; (Nelson and Hitchcock), A., i, 388.
  activity of, when adsorbed (Nelson and Hitchcock), A., i, 184.
  action of nitrophenols on (Rona and Bach), A., i, 65.
  action of quinine and narcotics on (Rona and Bloch), A., i, 65; (Rona, Airila, and Lasnitzki), A., i, 959.
  activity of, in yeast (Miller), A., i, 202.
  estimation of the activity of (Harding), A., ii, 800.
Iodates. See under Iodine.
Iodimetry, potassium dichromate as a standard in (Vosburgh), A., ii, 863.
Iodine in species of *Laminaria* (Freundler, Menager, and Laurent), A., i, 98.
  absorption spectrum of (Lindsay), A., ii, 599.
  absorption and fluorescence spectra of (Pringsheim), A., ii, 178.
  emission spectrum of the vapour of (Landau-Ziemecki), A., ii, 674.
  resonance spectrum of (Mecke), A., ii, 177; (Pringsheim), A., ii, 178.
  electrodeless discharge in the vapour of (Robertson), A., ii, 610.
  fractional diffusion of the vapour of (Kohlweiler), A., ii, 497.
  absorption of active hydrogen and nitrogen by (Wendt; Newman), A., ii, 639.
  adsorption of, by silver iodide (Germann and Traxler), A., ii, 371.
  colour of solutions of, at low temperatures (Piccard and Herrmann), A., ii, 655.
  kinetics of alkaline solutions of (Liévin), A., ii, 359.
  equilibrium between sulphur and, in solution (Amadori), A., ii, 561.

Iodine, comparative purity of various specimens of (Foulk and Morris), A., ii, 810.
  action of potassium azide with, in presence of carbon disulphide (Browne and Hoel), A., ii, 847.
  compounds of starch with (v. Euler and Myrbäck), A., i, 527, 1120; (v. Euler and Bergman; v. Euler and Landergren), A., i, 921.
  action of sulphurous acid with (Macaulay), T., 552.
  introduction of, into the human system, and its elimination (Bourguignon and Conduché), A., i, 704.
Iodine *pent*oxide indicator for estimation of carbon monoxide (Katz and Bloomfield), A., ii, 585.
  Hydriodic acid, heats of neutralisation of (Richards and Rowe), A., ii, 425.
    photochemical oxidation of (Winther), A., ii, 808.
  Iodides, photochemistry of the reaction between ferric salts and (Sasaki), A., ii, 772.
    influence of ferrous oxide on the action of hydrogen peroxide on (Pamfilov and Petin), A., ii, 835.
    action of nitrous acid on, in presence of oxygen (Lombard), A., ii, 313.
    estimation of, in presence of bromides and chlorides (Kolthoff), A., ii, 581.
    estimation of, by the formation of cyanogen iodide (Lang), A., ii, 782.
  Iodic acid, reaction between sulphurous acid and (Skrabal), A., ii, 488.
    use of, in detection of organic bases (Rosenthaler), A., ii, 327.
    estimation of (Kikuchi), A., ii, 519.
  Iodates, reflection spectra of (Schaefer and Schubert), A., ii, 180.
    detection of, in potassium iodide (Lachartre), A., ii, 716.
  Hypoiodous acid, dissociation constant of (Furth), A., ii, 281.
Iodine estimation:—
  estimation of, in animal tissues (Damiens), A., ii, 79.
Iodine electrode. See Electrode.
Iodoform, action of light on (Butler), A., ii, 604.
  action of, on magnesium alkyl haloids (Binaghi), A., i, 1002.
  action of, on magnesium alkyl and aryl bromides (Oddo and Binaghi), A., i, 313.
Iodoform, compounds of, with salts of organic bases (Steinkopf and Schwen), A., i, 118.
Ions, structure of, and isomorphism (Grimm), A., ii, 483.
  properties of, and chemical facts (Grimm), A., ii, 690.
  existence of homogeneous groups of large (Nolan), A., ii, 251.
  adsorption of (Kolthoff), A., ii, 197; (Mukherjee), A., ii, 689.
  hydration of (Aschkenasi), A., ii, 258.
  antagonism of (Brenner), A, i, 907.
  specific interaction of (Brönsted), A., ii, 481.
  relative toxicity of (Cameron and Hollenberg), A., i, 499.
  electrolytic. See Electrolytic ions.
Ionisation, theories of (Fredenhagen), A., ii, 112.
  by α-rays (Wilkins), A., ii, 607.
  and lattice energy, in relation to ionic properties (Grimm), A., ii, 690.
  influence of the solvent on (Neale), A., ii, 420.
  in electric furnace experiments (King), A., ii, 810.
  experiments on, with a tungsten furnace (Compton), A., ii, 822.
  amphoteric (Noyes and Wilson), A., ii, 692.
  thermal, of metallic vapours (Tolman), A., ii, 18.
  of aliphatic acids (Windisch and Osswald), A., ii, 123.
  of gaseous elements at high temperatures (Noyes and Wilson), A., ii, 810.
  of weak electrolytes (Schoorl), A., ii, 31.
Ionisation potentials, measurement of, in thermionic valves (Palmer), A., ii, 108.
  of gases (Boucher), A., ii, 608.
Ionium in radium residues (Rona), A., ii, 250.
Ionogen linking, nature of the (Kauffmann), A., ii, 366.
Ipurolic acid, constitution of (Asahina and Shimidzu), A., i, 506.
Iridium:—
  Chloroiridiates of cobalt- and chromium-ammines (Benrath, Bücher, and Eckstein), A., ii, 515.
Iridium organic compounds with pyridine (Delépine), A., i, 859.
Iron, structure of (Mügge), A., ii, 381.
  spectrum of (Müller), A., ii, 725.
  mass spectrum of (Aston), A., ii, 710.
  Röntgen-ray spectrum of (Duane and Fricke), A, ii, 804.

Iron, emissivity of (Lubowsky), A., ii, 108.
as a photochemical catalyst (Baudisch and Bass), A., i, 993.
diffusion of carbon in mixed crystals of (Tammann and Schönert), A., ii, 772.
diffusion of hydrogen through (Schmidt and Lücke), A., ii, 198.
crystalline structure of (Westgren and Lindh), A., ii, 152; (Westgren and Phragmén), A., ii, 711.
rate of solution of, in ferric alum (Collenberg and Bodforss), A., ii, 431.
rate of solution of, in dilute sulphuric acid (Friend and Dennett), T., 41.
and its oxides, equilibrium of, with carbon and its oxides (Reinders and van Groningen), A., ii, 153; (Eastman), A., ii, 506.
meteoric. See Meteoric iron.
"saccharated," colloidal nature of (Mannich and Rojahn), A., i, 718.
Iron alloys with carbon (Honda), A., ii, 711.
with carbon and boron (Vogel and Tammann), A., ii, 852.
with carbon and chromium (Daeves), A., ii, 70.
with carbon and tungsten (Daeves), A., ii, 70.
with manganese, electrochemistry of (Tammann and Vaders), A., ii, 380.
with uranium (Polushkin), A., ii, 152.
Iron salts, excretion of, in urine (Kisch), A., i, 898; (Ehrenberg and Karsten), A., i, 967.
Iron *penta*carbonyl (Mond and Wallis), T., 30.
hydroxide, adsorption of, by precipitated manganese dioxide (Geloso), A., ii, 589.
hydroxides, naturally-occurring (Willmann), A., ii, 76.
nitrosocarbonyl (Mond and Wallis), T., 35.
oxide, separation of, from calcium oxide (Charriou), A., ii, 319.
Ferric salts, photochemistry of the reaction between iodides and (Sasaki), A., ii, 772.
reduction of, by mercury (McCay and Anderson), A., ii, 217.
chloride, photochemical dissociation of (Puxeddu and Vodret), A., ii, 415.
chloride, reduction of (Pickles), A., ii, 299.
Iron:—
Ferric hydroxide, colloidal, preparation of (Bradfield), A., ii, 507.
adsorption of sodium alizarin by (Bull and Adams), A., i, 355.
adsorption of radium-*B* and -*C* by (Cranston and Hutton), T., 2843.
oxide, heat of coagulation of, by electrolytes (Browne and Mathews), A., ii, 196.
equilibrium of sulphur trioxide, water and (Posnjak and Merwin), A., ii, 772.
colour of (Hedvall), A., ii, 381.
precipitation of calcium oxide with (Charriou), A., ii, 163.
separation of aluminium oxide and, from magnesium oxide (Charriou), A., ii, 873.
sulphates, equilibrium of formation of (Applebey and Wilkes), T., 337.
Ferrous chloride, equilibrium in the system ammonium chloride, water, and (Clendinnen), T., 801.
hydroxide, reducing action of (Miyamoto), A., ii, 647.
oxide, mechanism of the catalytic action of (Pamfilov and Petin), A., ii, 835.
sulphate, compound of chlorine and (Röhm), A., ii, 648.
Iron organic compounds with phosphoric acids (Farbenfabriken vorm. F. Bayer & Co.), A., i, 631.
Ferric salts of 1:2:3:4-benzodiquinone-1:3-dioxime (Morgan and Moss), T., 2857.
with pyridine or quinoline (Weinland and Kissling), A., i, 863.
Ferrous ethyl iodide (Job and Reich), A., i, 645.
Iron, cast, estimation of carbon in (Batta and Thyssen), A., ii, 395.
estimation of sulphur in (Marinot), A., ii, 224.
Steel, crystalline structure of (Westgren and Lindh), A., ii, 152; (Westgren and Phragmén), A., ii, 711.
tempering of (Poucholle), A., ii, 299; (Charpy and Grenet), A., ii, 507.
A^1 transformation and quenching of (Chikashige), A., ii, 852.
solubility limits of carbon in (Daeves), A., ii, 70.
solid sodium hydroxide as solvent for carbon dioxide in analysis of (Kelley and Evers), A., ii, 160.

- **Iron, cast** :—
  - **Steel**, detection and estimation of vanadium in (Misson), A., ii, 459.
    - estimation of carbon in (Batta and Thyssen), A., ii, 395.
    - estimation of chromium in (Losana and Carozzi), A., ii, 589.
    - estimation of chromium and nickel in (Simion), A., ii, 529.
    - estimation of cobalt in (Eder), A., ii, 458.
    - estimation of manganese in colorimetrically (Heslinga), A., ii, 660.
    - estimation of nickel in (Rubricius), A., ii, 163.
    - estimation of sulphur in (Marinot), A., ii, 224.
    - estimation of vanadium in (Cain and Hostetter) A., ii, 320; (Kropf), A., ii, 590.
- **Iron estimation and separation** :—
  - estimation of (Kikuchi; Kanô), A., ii, 721.
  - estimation of, after reduction with hydrogen sulphide (Lundell and Knowles), A., ii, 88.
  - estimation of, in presence of copper (Wark), T., 358; (Thornton), A., ii, 528.
  - estimation of, in blood (Brown), A., ii, 319.
  - estimation of phosphorus in (Murmann), A., ii, 226.
  - separation of aluminium and (Chalupny and Breisch), A., ii, 588.
  - separation of manganese from (Carus), A., ii, 88.
- **Iron pyrites**. See Pyrites.
- **Isatin**, and its derivatives (Borsche and Meyer), A., i, 53.
- **Isatins**, silver salts and ethers of (Hantzsch and Meyer), A., i, 1178.
- **Isatins**, bromo- and chloro-, and their derivatives (Grandmougin), A., i, 368.
  - 5:7-*di*bromo-, 5:7-*di*chloro-, and 4-chloro-5-bromo-, and their silver compounds and derivatives (Heller, Benade, and Hochmuth), A., i, 1059.
- **Isatin series**, isomerism in the (Heller), A., i, 1058; (Hantzsch), A., i, 1177.
- **Isatin-α-benzyloxime**, and its alkali salts (Hantzsch and Meyer), A., i, 1179.
- **Isatinhydrazone** (Borsche and Meyer), A., i, 54.
- **Isatin-5-sulphonic acid**, and its potassium and sodium salts, hydrazones of (Martinet), A., i, 279.
- **Isatin-6-sulphonic acid**, sodium salt, hydrazones of (Martinet), A., i, 278.
- **Isatin-yellow series**, colouring matters of the (Martinet), A., i, 278.
- **Isatogenic acid**, ethyl ester, oxime (Heller and Boessneck), A., i, 370.
- **Isatogens** (Heller and Boessneck), A., i, 369.
- **Isatoic acid**, 5:7-*di*bromo-, and 5:7-*di*chloro-, and 4-chloro-5-bromo-, and their salts and derivatives (Heller, Benade, and Hochmuth), A., i, 1059.
- **Isatoids** (Heller and Benade), A., i, 582.
- **Isatole**, 5:7-*di*chloro- (Heller, Benade, and Hochmuth), A., i, 1060.
- **Ishikawaite** (Shibata and Kimura), A., ii, 861.
- **Isomerism**, geometric, in relation to the formation of films (Adam), A., ii, 424.
- **ψ-Isomerism**, Hantzsch's theory of (Madelung), A., ii, 344.
- **Isomorphism**, ionic structure and (Grimm), A., ii, 483.
- **Isoprene** in relation to caoutchouc (Staudinger and Fritschi), A., i, 1043.
  - bromination of (Bergmann), A., i, 1106.
  - addition of hydrogen haloids to (Staudinger, Kreis, and Schilt), A., i, 978.
  - *di*bromide and *di*bromo- (Staudinger, Muntwyler, and Kupfer), A., i, 979.
- **Isotopes**, structure of (Neuburger), A., ii, 107.
  - band spectra of (Grebe and Konen), A., ii, 4.
  - difference between series spectra of (Ehrenfest; Bohr), A., ii, 598; (Nicholson), A., ii, 599.
  - and the transformation of atoms (Meitner), A., ii, 15.
  - separation of (Mulliken and Harkins), A., ii, 295; (Mulliken), A., ii, 492; (Harkins), A., ii, 702.

J.

- *Jatropha curcas*, oil from seeds of (Grimme), A., i, 98.
- **Jaundice**, bile pigments in (Rosenthal and Meier), A., i, 198.
- **Jejunum**, human, sucrose-splitting enzyme in the (v. Euler and Myrbäck), A., i, 295.
- **Juglone**. See 1:4-Naphthaquinone, 5-hydroxy-.
- *Juncus effusus*, constituents of (Zellner), A., i, 1098.
- **Juniper oil** from Cyrenaica (Massera), A., i, 945.

Juniperus oxycedrus, constituents of the wood of (Huerre), A., i, 505.
Jute. See *Corchorus capsularis.*

K.

Kagurazame oil, constituents of (Tsujimoto and Toyama), A., i, 297.
Kaolinite (*kaolin*), decomposition of, by micro-organisms (Vernadsky), A., i, 1096.
Kasolite, composition and radioactivity of (Schoep), A., ii, 154.
Kataphoresis of metallic compounds of proteins (Benedicenti and Rebello-Alves), A., ii, 683.
of water in organic liquids (Gyemant), A., ii, 684.
Kawaic acid (Murayama and Mayeda), A., i, 265.
β-Kawaic acid (Murayama and Mayeda), A., i, 265.
Kawa-kawa resin (Murayama and Mayeda), A., i, 265.
"**Kazunoko.**" See Herring roe.
Keeleyite from Bolivia (Gordon), A., ii, 859.
Keratin (Heiduschka and Komm), A., i, 967.
Ketens (Staudinger and Hauser), A., i, 28; (Staudinger), A., i, 238, 240; (Staudinger and Rathsam), A., i, 1014; (Staudinger and Meyer), A., i, 1015.
dimeric (Dieckmann and Wittmann), A., i, 1156.
Ketenacetals (Scheibler and Ziegner), A., i, 426; (Staudinger and Rathsam), A., i, 1014; (Staudinger and Meyer), A., i, 1015.
Ketenethylimine (Staudinger and Hauser), A., i, 29.
Ketenimine derivatives (Staudinger and Hauser), A., i, 28.
Ketenium compounds (Wedekind and Weinand), A., i, 234.
Ketenphenylimine (Staudinger and Hauser), A., i, 29.
Ketentriethylium, bromo-, and *mono*- and *di*-chloro- (Wedekind and Weinand), A., i, 235.
Keto-acids, degradation of, in the animal organism (Woringer), A., i, 90.
1-Keto 2 aldehydoacenaphthene, 5(or 6)-bromo-, and its derivatives (Mayer and Schönfelder), A., i, 1167.
1-Keto-5-aminotetrahydronaphthalene, 5-acetyl derivative (Schroeter and Tetralin G. m. b. H.), A., i, 1036.
Keto-anils (Reddelien), A., i, 145; (Knoevenagel and Bähr), A., i, 750; (Knoevenagel and Goos), A., i, 751; (Knoevenagel), A., i, 1060.
β-Keto-bases, synthesis of (Mannich and Heilner), A., i, 351.
δ-Ketocamphane-*epi*-carboxylic acid. See *p*-Camphocarboxylic acid.
α-Keto-α-campholenic acid, and its semicarbazone (Chandrasena and Ingold), T., 1554.
δ-Keto-β-carboxy-γγ-dimethylhexoic acid (Chandrasena, Ingold, and Thorpe), T., 1549.
1-Keto-2-cinnamylidenetetrahydronaphthalene (Herzog and Kreidl), A., i, 1168.
α-Keto-ββ-diethylglutaric acid, and its calcium salt and semicarbazone (Deshapande and Thorpe), T., 1439.
5-Keto-4:7-dimethyl-4:5-dihydroindolediazine(1:4) (Kermack, Perkin, and Robinson), T., 1888.
5-Keto-1:6-dimethyl-4-*iso*propyltetrahydronaphthalene (Ruzicka and Seidel), A., i, 562.
Ketodinitrones, formation and properties of (Alessandri), A., i, 558.
Keto-enolic mixtures, spectrochemical and volumetric analysis of (v. Auwers and Jacobsen), A., ii, 168.
3-Keto-2-ethoxydihydroindole-2-carboxylic acid, 1-hydroxy-, ethyl and methyl esters (Heller and Boessneck), A., i, 370.
Ketogenic balance, calculation of, from respiratory quotients (Shaffer), A., i, 83.
Ketogenesis (Wilder and Winter), A., i, 893.
5-Keto-*d*-gluconic acid semicarbazonesemicarbazide (Kiliani), A., i, 1112.
α-Ketoglutaric acid, condensation of, with *o*-phenylenediamine (Kon, Stevenson, and Thorpe), T., 664.
***ac*-1-Keto-2-hydroxy-3-methyltetrahydronaphthalene-3-acetic acid,** lactone, and its silver salt and derivatives (Kon, Stevenson, and Thorpe), T., 660.
1-Keto-5- and -8-hydroxytetrahydronaphthalenes, and their derivatives (Schroeter and Tetralin G. m. b. H), A., i, 1036.
3-Keto-2-methoxydihydroindole-2-carboxylic acid, 1-hydroxy-, ethyl and methyl esters (Heller and Boessneck), A., i, 369.
1-Keto-2-methyl-2:3:4:4-*tetra*chlorotetrahydronaphthalene (Fries and Lohmann), A., i, 29.

3-Keto-4-methyl-3:4-dihydro-4-carboline (Kermack, Perkin, and Robinson), T., 1887.
5-Keto-1-methyl-4-*iso*propyltetrahydronaphthalene, and its semicarbazone (Ruzicka and Mingazzini), A., i, 1001.
2-Keto-1-methyltetrahydronaphthalene, 1:3:4:4-*tetra*chloro- (Fries), A., i, 43.
1-Keto*peri*naphthindane, 3:3-*di*chloro- (Fleischer and Retze), A., i, 1138.
2-Keto-1:3:4-naphth*iso*triazine-4-carboxylic acid, ethyl ester (Diels and Sörensen), A., i, 1194.
2-Keto-1:3:4-naphth*iso*triazine-6-sulphonic acid (Diels and Sörensen), A., i, 1194.
Ketones, preparation of (Badische Anilin- & Soda Fabrik), A., i, 218; (Hunt), A., i, 810.
  preparation of, from mineral and tar oils (Harries), A., i, 514.
  conductivity of mixtures of acids with (Kendall and Gross), A., ii, 33.
  halochromism of (Hantzsch), A., i, 556.
  action of phosphorus trichloride on (Conant, MacDonald, and Kinney), A., i, 186.
  interaction of thiocarbamides and (Taylor), T., 2267.
  sodium derivatives, action of acetylene on (Locquin and Wouseng), A., i, 617.
  aliphatic, decomposition of (Mailhe), A., i, 985.
    action of trimethylene chlorobromide on (Billon), A., i, 717.
  aliphatic-aromatic, melting points of (Majima, Nagaoka, and Tamada), A., i, 257.
  aromatic, synthesis of, by means of zinc organic compounds (Mauthner), A., i, 457.
  cyclic, of the quinoline series, preparation of (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 867.
  unsaturated, reactivity of (Buck and Heilbron), T., 1095.
    formation of, from tertiary ethinylcarbinols (Meyer and Schuster), A., i, 556.
  detection of (Bougault and Gros), A., ii, 666.
  estimation of, with hydroxylamine (Bennett and Donovan), A., ii, 535.
Ketones, *a*-halogenated, action of amines with (Mayer and Freund), A., i, 865.
Ketones, *a*-halogenated, condensation of aldehydes with (Bauer and Werner), A., i, 1034.
  oximino-, bisulphite compounds of (Gastaldi and Braunizer), A., i, 626.
  *di*thio-, formation and properties of (Naik and Avasare), T., 2592.
Ketone-alcohol, $C_9H_9O_2Cl$, and its derivatives, from *o*-chlorobenzaldehyde and acetaldehyde (Neuberg and Liebermann), A., i, 305.
Ketonic compounds, rôle of, in the formation of sugars (Geelmuyden), A., i, 607.
δ-Ketonic esters, action of bromine on (Kohler), A., i, 552.
3-Keto-2-*o*-nitrophenyl-3:4-dihydroquinoline (Neber), A., i, 545.
4-Keto-*s*-octahydroanthracene, and its semicarbazone (Schroeter and Tetralin G. m. b. H.), A., i, 1136.
4-Keto-*s*-octahydrophenanthrene, and its semicarbazones (Schroeter and Tetralin G. m. b. H.), A., i, 1137.
2-Keto-4-phenyl-1-methyl-1:2-dihydropyrimidine, and its 5:6-dibromide, and 6(or 5)-bromo- (Mannich and Heilner), A., i, 372.
2-Keto-4-phenyl-1-methylhexahydropyrimidine (Mannich and Heilner), A., i, 372.
2-Keto-4-phenyl-1-methyl-1:2:5:6-tetrahydropyrimidine, and its bromo-derivative (Mannich and Heilner), A., i, 372.
Ketopinic anhydride (Wedekind and Weinand), A., i, 549.
Ketopinyl chloride, and its action with triethylamine (Wedekind and Weinand), A., i, 548.
4-Ketopiperidinepropionic acid, ethyl ester (Ruzicka and Seidel), A., i, 1057.
Ketorhamnonic acid, constitution of (Kiliani), A., i, 1112.
α-Ketorhamnonic acid, lactone of, and its *p*-nitrophenylhydrazone (Kiliani), A., i, 224.
2-Keto-6-sulpho-1:3:4-naphth*iso*triazine-4-carboxylic acid, ethyl ester (Diels and Sörensen), A., i, 1194.
α-Ketotetrahydronaphthalene (Schroeter and Tetralin G. m. b. H.), A., i, 1036.
***ac*-1-Ketotetrahydronaphthalene-3-acetic acid**, and its semicarbazone (Stevenson and Thorpe), T., 1721.
1-Ketotetrahydronaphthalene-3-sulphonic acid, 5-hydroxy-, and its phenylhydrazone with its metallic salts (Fuchs and Stix), A, i, 451.

- **Ketotricarboxylic acids**, $C_{23}H_{34}O_7$, from pyrocholoidanic acid and alkali hydroxide (Wieland and Schulenburg), A., i, 346.
- *a*-**Keto-*ββγ*-trimethylsuccinic acid**, and its condensation products with phenylenediamines (Kon, Stevenson, and Thorpe), T., 663.
- **Ketoximes**, thermochemistry of (Dorabialska), A., ii, 548.
- **Kidneys**, permeability of the glomerulus membrane of, for sugars (Hamburger), A., i, 490, 491, 790, 919.
  - proteolytic enzymes of (Hedin), A., i, 1212.
- **Kinetics** of unimolecular reactions (Garner), A., ii, 358.
- **Kojic acid**, and bromo-, and hydroxy-, and their salts and derivatives (Yabuta), A., i, 939.
- **Krypton**, estimation of (Moureu and Lepape), A., ii, 394.
- **Kynurenic acid**, constitution and derivatives of (Späth), A., i, 173.

L.

- **Lac**, Japanese, constituents of (Majima), A., i, 262, 263.
- **Laccól** dimethyl ether ozonide (Majima and Kudo), A., i, 264.
- *a*-**Lactanilide**, *β*-*tri*chloro- (Passerini), A., i, 731.
- **Lactase** in yeast (Willstätter and Oppenheimer), A., i, 203.
- **Lactic acid**, formation of, from dextrose by peptone (Schlatter), A., i, 1096.
  - synthesis of inactive (Pirak), A., i, 810.
  - heat of combustion of (Meyerhof), A., ii, 475.
  - action of thionyl chloride on (Blaise and Montagne), A., i, 715.
  - in plants (Franzen and Keyssner), A., i, 310; (Franzen and Stern), A., i, 311.
  - destruction of, by yeast (Lieben), A., i, 796; (v. Furth and Lieben), A., i, 1219.
    - by yeast and by blood-cells (v. Fürth and Lieben), A., i, 502.
  - in blood (Hastings), A., i, 81.
  - formation of, in muscle (Meyerhof), A., i, 86.
  - function of, in muscle (Foster and Moyle), A., i, 398.
  - effect of sugar injections on the excretion of (Moraczewski and Lindner), A., i, 402.
  - detection of, in organic liquids (D'Arbela), A., ii, 460.
  - detection of, in tissues (Laquer), A., ii, 325.
  - estimation of (Clausen), A., ii, 593.
- **Lactone**, $C_6H_{10}O_2$ from *cyclo*hexanone oxime (Helferich and Malkomes), A., i, 431.
- **Lactones**, velocity of formation and hydrolysis of (Kailan and Neumann), A., ii, 433.
- *β*-**Lactones** (Johansson and Hagman), A., i, 425.
- **Lactose** (*milk-sugar*), action of ozone on (Schonebaum), A., i, 717.
  - detection of, in urine (Herzberg), A., ii, 167.
  - micro-estimation of, in milk (Fontès and Thivolle), A., ii, 323.
- **Lævidulinase** (Mayeda), A., i, 694.
- **Lævoglucosan**, formation of, by distillation of carbohydrates (Karrer and Rosenberg), A., i, 812.
  - polymerides of (Pictet and Ross), A., i, 525.
- **Lævulic acid** *a*-alkyl derivatives of (Gault and Salomon), A., i, 427.
- **Lævulose** (d-*fructose; fruit sugar*), preparation of (Harding), A., i, 919.
  - action of ammonia on (Ling and Nanji), A., i, 631.
  - action of ozone on solutions of (Schonebaum), A., i, 223.
  - acetone derivatives of (Irvine and Patterson), T., 2146.
  - constitution and rotation of compounds of, with boric acid and sodium hydroxide (Gilmour), T., 1333.
  - decomposition of, by pyocyanic bacilli (Aubel), A., i, 201.
  - effect of, in diabetes (Desgrez, Bierry, and Rathery), A., i, 1215.
  - detection of, in presence of aldoses (Kolthoff), A., ii, 166.
  - estimation of, in straw (Collins), A., ii, 323.
- **Lævulosecarboxylic acid**, *l*-phenylhydrazide of (Kiliani), A., i, 1112.
- **Lævulosephosphoric acids**, iron salts (Farbenfabriken vorm. F. Bayer & Co.), A., i, 631.
- **Lævulosuria** (Barrenscheen), A., i, 496.
- *Laminaria*, iodine in species of (Freundler, Menager, and Laurent), A., i, 98.
- **Laminarin**, action of ferments on (Gruzewska), A., i, 11.
- **Lamp**, sodium, for polarimetry (Fales and Morrell), A., ii, 43.
- **Landolt's reaction** (Skrabal), A., ii, 488.
- *Lantana camara*, oil from the leaves of (Moudgill and Vridhachalam), A., i, 754.
- **Lanthanum**, atomic weight of (Baxter), A., ii, 298; (Hopkins and Driggs), A., ii, 770.
  - spectrum of (Ôkubo), A., ii, 676.

- **Lanthanum**, arc spectra of (Kiess, Hopkins, and Kremers), A., ii, 244.
- **Lanthanum** oxide, density and molecular volume of (Prandtl), A., ii, 379.
- **Laudanine**, synthesis of (Spath and Lang), A., i, 568.
- **Laudanum**, detection of saffron in (Guerbet), A., ii, 793.
- **Lauric acid**, potassium salt, ultra-filtration of solutions of (McBain and Jenkins), T., 2325.
  - sodium salt, equilibrium of sodium chloride, water and (McBain and Burnett), T., 1320.
  - cellulose ester (Grun and Wittka), A., i, 114.
- **Lavender oil**, constituents of (Roure-Bertrand Fils), A., i, 847.
- **Lead** from uranium minerals of Madagascar (Muguet), A., ii, 216.
  - arc spectrum of (Hemsalech and de Gramont), A., ii, 176.
  - band spectra of, and of uranium-lead (Grebe and Konen), A., ii, 4.
  - electro-deposition of (Hughes), A., ii, 446.
    - and of its dioxide (Mellon and Reinhard), A., ii, 817.
  - separation of the isotopes of (Dillon, Clarke, and Hinchy), A., ii, 710.
  - vapour pressure curve of (Ingold), T., 2419.
  - liquid, density and surface tension of (Hogness), A., ii, 29.
  - solubility of bismuth in (Di Capua), A., ii, 576.
  - solubility of cadmium in (Di Capua), A., ii, 576.
  - test-papers, preparation of (Olivier), A., ii, 396.
  - reductions with, in volumetric analysis (Treadwell), A., ii, 780.
  - poisoning. See Poisoning.
- **Lead alloys** with mercury, estimation of lead in (Mellon and Reinhard), A., ii, 787; (Mellon), A., ii, 870.
  - with strontium, constitution of (Piwowarsky), A., ii, 644.
  - with tellurium (Dreifuss), A., ii, 503.
- **Lead salts**, basic, constitution of (Weinland and Stroh), A., ii, 767.
  - soluble, action of, on plant growth (Bonnet), A., i, 412.
- **Lead** azide, abnormal crystallisation of (Lowndes), A., ii, 216.
  - chromate, solvolysis of (Hicks and Craig), A., ii, 622.
  - chromates, basic (Hicks), A., ii, 147.
    - equilibria of (Jaeger and Germs), A., ii, 65.
- **Lead** haloids, compounds of ammonia with (Biltz and Fischer), A., ii, 851.
  - molybdates, equilibria of (Jaeger and Germs), A., ii, 65.
  - nitrate, crystal structure of (Vegard), A., ii, 503.
    - electrometric titrations with (Kolthoff), A., ii, 781.
  - thallous nitrite (Cuttica and Paciello), A., ii, 378.
  - oxides, physical chemistry of (Glasstone), T., 58, 1456, 1469, 2091.
  - *mon*oxide, isomerism of (Applebey and Reid), T., 2129.
    - hydrates of (Glasstone), T., 58.
    - density of (Brown, Cook, and Warner), A., ii, 571.
    - fusion diagram of mixtures of bismuth oxide and (Belladen), A., ii, 777.
  - *sesqui*oxide (Glasstone), T., 1456.
  - *di*oxide, electromotive properties of (Glasstone), T., 1469.
  - *per*oxide, estimation of, in minium (Bonis), A., ii, 587.
  - **Triplumbic** *tetr*oxide (Glasstone), T., 1456.
- **Lead** sulphates, equilibria of (Jaeger and Germs), A., ii, 65.
  - sulphide, solubility of (Trumpler), A., ii, 111.
  - tungstates, equilibria of (Jaeger and Germs), A., ii, 65.
  - **Plumbates**, preparation and electrochemistry of (Grube), A., ii, 570.
- **Lead organic compounds**, action of thallic chloride on (D. and A. E. Goddard), T., 260.
  - diphenyl, salts of, with organic acids (Goddard, Ashley, and Evans), T., 981.
  - di-*p*-tolyl, triphenyl, tritolyls, and tri-*p*-xylyl, and their haloids (Krause and Reissaus), A., i, 602.
  - tetraphenyl, use of, in preparation of organo-metallic compounds (Goddard, Ashley, and Evans), T., 978.
  - trialkyl and triaryl fluorides (Krause and Pohland), A., i, 644.
- **Lead detection, estimation and separation**:—
  - detection of small quantities of, in urine (Schumm), A., ii, 317.
  - estimation of (Fairhall), A., ii, 659.
  - estimation of, electro-volumetrically (MacInnes and Townsend), A., ii, 456.
  - estimation of, volumetrically (Jellinek and Ens), A., ii, 864.

Lead detection, estimation, and separation:—
  estimation of, volumetrically, with ferrocyanides (Treadwell and Chervet), A., ii, 786.
  estimation of, in lead amalgams (Mellon and Reinhard), A., ii, 787; (Mellon), A., ii, 870.
  estimation of, in water (Avery, Hemingway, Anderson, and Read), A., ii, 161.
  estimation of, and its separation from antimony, copper and tin (Kling and Lassieur), A., ii, 86.
Lead anode. See Anode.
Lead tree, formation and disglomeration of (Thiel), A., ii, 63.
Leather, dyeing, tanning and preservation of (Rakuzin), A., i, 702.
Leaves, distribution of carbohydrates in (Schroeder and Horn), A., i, 906.
  disappearance of starch from (Molisch), A., i, 309.
  dead, carbohydrates in (Combes and Kohler), A., i, 1222.
  old and young, manganese content of (Jadin and Astruc), A., i, 1098.
  young, oxalic acid in (Bau), A., i, 309.
Lecithin, precipitation of hydrosols of, by electrolytes (Kakiuchi), A., i, 711.
  from eggs, unsaturated fatty acids from (Levene and Rolf), A., i, 621.
  from liver, unsaturated fatty acids of (Levene and Simms), A., i, 424.
  estimation of, as ether-soluble phosphorus (Le Breton), A., ii, 168.
  estimation of, in blood (Randles and Knudson), A., ii, 719.
Lectures, delivered before the Chemical Society (Rutherford), T., 400; (Gregory), T., 750; (Bragg), T., 2766.
Lecture experiments with atomic models (King), A., ii, 705.
  showing a time reaction (Meyer), A., ii, 636.
  on protective colloids (Friend), A., ii, 267.
  to show the detection and estimation of traces of copper (Hahn and Leimbach), A., ii, 870.
  with hydrazoic acid and azides (Browne and Hoel), A., ii, 840.
  to show the antiseptic action of mercury ions (Joachimoglu), A., ii, 211.
Leech. See *Hirudo medicinalis.*
Leguminosæ, assimilation of carbon dioxide by (Kostytschev), A., i, 618.
Lemon juice, growth-promoting factor of (Leichtentritt and Zielaskowski), A., i, 1094.
Lens, crystalline, lipoids of the (Goldschmidt), A., i, 489.
    cleavage products from proteins of the (Hijikata), A., i, 489; (Jess), A., i, 1199.
Leptospermum, essential oils from species of (Penfold), A., i, 44.
Letsche's acid. See Biloidanic acid.
l-Leucine, degradation of, by bacteria (Arai), A., i, 303.
l-Leucinecholine, salts of (Karrer, Gisler, Horlacher, Locher, Mäder, and Thomann), A., i, 815.
Leucocyanoselenopyronin (Battegay and Hugel), A., i, 669.
Leucocytes, effect of chemicals on the chemotaxis of (Wolf), A., i, 401.
  glycolytic action of (Fukushima), A., i, 697.
Leuconic acid, constitution of (Homolka), A., i, 630.
Leucosin, isoelectric point of (Lüers and Landauer), A., i, 881.
Lichenin, digestion of (Shimizu), A., i, 82.
Liesegang's rings, formation of (McGuigan), A., ii, 38; (Fischer and McLaughlin), A., ii, 206.
Light, emission of, by atoms (Försterling), A., ii, 729; (Seeliger), A., ii, 804.
  scattering of, by dust-free liquids (Martin and Lehrman), A., ii, 335.
  molecular scattering of, in n-pentane (Venkateswaran), T., 2655.
  absorption of, by colouring matters (Lasarev), A., ii, 103, 332.
    by solutions (Lunelund), A., ii, 8; (v. Halban and Siedentopf), A., ii, 332.
  blue, from the Röntgen tube, polarisation of (Seeman), A., ii, 8.
  ultra-violet, measurement of absorption of (Winther, Baggesgaard-Rasmussen, and Schreiner), A., ii, 729.
    action of, on gels (Holmes and Patrick), A., ii, 338.
    action of, on aqueous solutions of organic acids and their salts (Jaeger and Berger), A., i, 316.
    action of, on colloidal platinum (Spear, Jones, Neave, and Shlager), A., ii, 11.

Lignin (Melander), A., i, 325.
  from straw (Paschke), A., i, 325.
  from winter rye straw (Beckmann, Liesche, and Lehmann), A., i, 233.
  methylation of (Heuser, Schmitt, and Gunkel), A., i, 325.
  oxidation of (Heuser and Samuelsen), A., i, 812.
  spontaneous oxidation of (Schrader), A., i, 637.
  reduction of, with hydriodic acid and phosphorus (Willstätter and Kalb), A., i, 989.
  pine (Klason), A., i, 324, 413.
  detection of, in cells (van Zijp), A., ii, 94.
α-Lignin, constitution of (Klason), A., i, 324.
Ligninsulphonic acids (McKee and Barsky), A., i, 1121.
Lignite, constituents of (Ciusa and Croce), A., ii, 385.
  heat developed in adsorption of gases by (McLean), A., ii, 352.
  producer tar from (Ruhemann), A., i, 22; (Fischer), A., i, 330.
Lignoceric acid, and its derivatives (Brigl and Fuchs), A., i, 712.
Lignocerin (Brigl and Fuchs), A., i, 713.
Lignoceryl cyanide (Levene and Taylor), A., i, 715.
Lignoceryl alcohol, and its acetate (Brigl and Fuchs), A., i, 713.
Lignocyanin (Paschke), A., i, 326.
Lignosulphonic acid (Klason), A., i, 14.
  oxidation of (Heuser and Samuelsen), A., i, 812.
α-Lignosulphonic acid, and its salts (Klason), A., i, 324.
Lilium candidum and *martagon*. See Lily.
Lily, formation of anthocyanin in the bulb scales of (Mirande), A., i, 1100, 1224.
Lime-water, equilibrium between cement and (Lorenz and Haegermann), A., ii, 59.
Linolohydroxamic acid (Nicolet and Pelc), A., i, 644.
Linseed oil, drying of (Slansky), A., i, 1113.
  oxidation of (Coffey), T., 18.
Linusic acid, methyl ester (Bauer and Hardegg), A., i, 984.
Lipæmia (Bloor), A., i, 89.
Lipase from castor beans, preparation and properties of (Haley and Lyman), A., i, 390.
  action of antiseptics on the activity of (Palmer), A., i, 886.
Lipase, action of quinine on (Rona and Reinicke), A., i, 67.
  liver, action of quinine and atoxyl on (Rona and Pavlović), A., i, 887.
  stomach, activity of (Sluiter), A., i, 887.
Lipoids (Fränkel and Gilbert; Fränkel and Kasz), A., i, 294.
  physical chemistry of (Loewe), A., ii, 354.
  ultramicroscopy of (Hattori), A., i, 192.
  action of, on metabolism in plant cells (Boas), A., i, 94, 613.
  nutritive value of (Takahashi), A., i, 699.
  estimation of, in blood (Lemeland), A., i, 666.
Liquids, physical properties of, in equilibrium with their vapour (Swientoslawski), A., ii, 192.
  electromotive force and concentration at the junction of (Freundlich), A., ii, 19; (Freundlich and Gyemant), A., ii, 342.
  density of (Wiedbrauk), A., ii, 740.
  equation of compression of (Carl), A., ii, 477.
  with intersecting vapour pressure curves (v. Rechenberg), A., ii, 120.
  solubility of, at high pressures (Timmermans), A., ii, 482.
  solubility of gases in (Neuhausen), A., ii, 621.
  solubility of liquids in (Gordon and Reid), A., ii, 824.
  partial miscibility of (Dubrisay), A., ii, 428.
  surface pressure of thin layers of (Marcelin), A., ii, 686.
  viscosity of (Herz), A., ii, 821.
  calculation of viscosity and surface tension of (Creighton), A, ii, 426.
  laws of internal friction of (Herz), A., ii, 352.
  adsorption of, by charcoal (Driver and Firth), T., 2409; (Harkins and Ewing), A., ii, 123.
  change of properties of, on drying (Baker), T., 568.
  molecular ælotropy in (Raman), A., ii, 603.
  extraction of, with the Soxhlet apparatus (Handorf), A., ii, 496.
  anisotropic, structure of (Friedel and Royer), A., ii, 129.
    scattering of Röntgen rays by (Hückel), A., ii, 14.
    inversion of rotation in (Royer), A., ii, 415.
  dust-free, scattering of light by (Martin and Lehrman), A., ii, 335.

Liquids, foaming, distillation of (Klänhardt), A., ii, 472.
slightly miscible, determination of reciprocal solubility of (Chéneveau), A., ii, 355, 427.
mixed, separation of, by centrifuging (Mulliken), A., ii, 686.
separation of, by distillation (Dufton), T., 306.
binary mixed, theory of (Schmidt), A., ii, 472.
vapour pressure of (Schmidt), A., ii, 119; (Faust), A., ii, 423; (Cassel; Schulze), A., ii, 424.
non-associated, vapour pressure and heat of vaporisation of (Mortimer), A., ii, 615.
non-miscible, apparatus for extraction of (Fayolle and Lormand), A., ii, 759.
organic, properties of (Herz), A., ii, 23.
refractive index of (Himstedt and Wertheimer), A., ii, 725.
freezing points of (Timmermans, van der Horst, and Onnes), A., ii, 258.
partition coefficients between water and (Smith), A., ii, 430, 431.
internal friction of (Herz), A., ii, 30.
kataphoresis of water in (Gyemant), A., ii, 684.
velocity of hydrogenation of, in presence of nickel (Armstrong and Hilditch), A., ii, 41.
binary organic, classification of (Timmermans), A., ii, 25.
supercooled, spontaneous crystallisation of (Hinshelwood and Hartley), A., ii, 200.
superheated, pressure volume relation of (Wismer), A., ii, 425.
undercooled, melting interval of (Ferguson), A., ii, 614.
Lithium, isotopes of (Dempster), A., ii, 417.
arc spectra of isotopes of (McLennan and Ainslie), A., ii, 541.
line spectrum of (Merton), A., ii, 803.
crystal structure of (Bijvoet and Karssen), A., ii, 499.
attempt at transmutation of (Wyckoff), A., ii, 642.
ions, hydration of (Baborovsky and Velisek), A., ii, 816.
vapour, electrodeless discharge in (Robertson), A., ii, 609.
Lithium salts of weak inorganic acids (Rosenheim and Reglin), A., ii, 289.
Lithium antimoniodobromide (Vournazos), A., ii, 651.
Lithium chloride, solubility of, in quinoline (Walton and Wise), A., i, 370.
cupric chloride, absorption of light by (Getman), A., ii, 412.
chlorite (Levi), A., ii, 567.
hydride (Ephraim and Michel), A., ii, 58.
structure of (Bijvoet and Karssen), A., ii, 569.
hydroxide, heats of neutralisation of (Richards and Rowe), A., ii, 425.
neutralisation of phenylstibinic acids by (Schmidt), A., i, 482.
nitrate, solubility of, in ammonia (Davis, Olmstead, and Lundstrum), A., ii, 56.
n- and *iso*-**Lithobilianic acids,** and their derivatives (Borsche and Hallwass), A., i, 1160.
Lithocholic acid, methyl ester (Borsche and Hallwass), A., i, 1159.
Lithospermum erythrorhizon, colouring matter from the roots of (Majima and Kuroda), A., i, 946.
Liver, function of the (Delprat and Whipple), A., i, 86; (Pelkan and Whipple), A., i, 490.
fat exchange in the (Lombroso), A., i, 702.
spacial separation of glycogen and diastase in the cells of (Lesser), A., i, 195.
basal metabolism and utilisation of protein in diseases of (Aub and Means), A., i, 193.
yellow atrophy of (Kahn and Barsky), A., i, 969.
embryonic, glycogen formation in (Aron), A., i, 702.
Liver oil, detection of, with sulphuric acid (Drummond and Watson), A., ii, 665.
Loellingite, crystal structure of (Huggins), A., ii, 651.
Loranthaceæ, constituents of some (Wester), A., i, 208.
Lubricating oils. See under Oils.
Lubrication, boundary, in relation to chemical constitution (Doubleday), T., 2875.
Lucerne (*alfalfa*), proteins of (Osborne, Wakeman, and Leavenworth), A., i, 99.
water-soluble constituents of (Osborne, Wakeman, and Leavenworth), A., i, 1104.
hay, nitrogen compounds in (Miller), A., i, 414.
Luciferase, specificity of (Harvey), A., i, 299.

- **Luciferin**, specificity of (Harvey), A., i, 299.
- **Lumbang oil** (West and Montes), A., i, 95.
- **Luminescence** by flame excitation (Howes), A., ii, 335; (Nichols and Wilber), A., ii, 806.
  - inorganic (Tiede and Richter), A., ii, 215.
  - of metallic oxides (Nichols and Wilber), A. ii, 105.
  - of incandescent solids (Nichols and Howes), A., ii, 597.
- **Lungs**, chemistry of the (Sammartino), A., i, 296, 1089.
- **Lung stones** (Scherer), A., i, 966.
- **Lupeol**, identity of xanthosterol with (Ultée), A., i, 826.
- **Lupines**, effect of nitrogenous fertilisers on the alkaloids in (Vogel and Weber), A., i, 798.
- *Lupinus albus*, effect of cocaine on the growth of (Macht and Livingston), A., i, 798.
- **Lutecium**, atomic number of (Urbain), A., ii, 505.
  - *L*-series spectrum of (Dauvillier), A., ii, 463.
- **Luteocobaltic** chloride. See Hexamminocobaltic chloride under Cobalt.
- *Lythium salicaria*, constituents of (Zellner), A., i, 799.

M.

- **Magnesium**, arc spectrum of (Foote, Meggers, and Mohler), A., ii, 4; (Hemsalech and de Gramont), A., ii, 411.
  - effect of electric fields on the spectrum of (de Gramont and Hemsalech), A., ii, 243.
  - electromotive properties of (Beck), A., ii, 545.
  - isotopes of (Dempster), A., ii, 417.
- **Magnesium alloys**, heat of formation of (Biltz and Hohorst), A., ii, 350.
  - with cadmium (Guillet), A., ii, 570.
  - with mercury, thermal analysis of (Beck), A., ii, 545.
    - equilibrium of ammonia with (Loomis), A., ii, 294.
- **Magnesium salts**, distribution of, in blood (Kramer and Tisdall), A., i, 1087.
- **Magnesium** dihydrogen orthantimonate (Obajdin), A., ii, 501.
  - carbonate, formation of, from the oxide (Hedvall and Heuberger), A., ii, 766.
- **Magnesium** *per*chlorate, preparation an properties of, and its use as a drying agent (Willard and Smith), A., ii, 850.
  - haloids, compounds of ammonia with (Biltz and Hüttig), A., ii, 59.
  - nitrate, equilibrium of, with sodium nitrate and water, and magnesium sulphate and water (Jackman and Browne), T., 694.
  - silicide, preparation of, and its decomposition (Schwarz and Konrad), A., ii, 846.
  - sulphate, equilibrium of ammonium and potassium sulphates, water and (Weston), T., 1223.
    - equilibrium of magnesium nitrate, water and (Jackman and Browne), T., 694.
    - pharmacology of (Ferrara), A., i, 500.
  - sulphide, preparation of, pure, and its phosphorescence (Tiede and Richter), A., ii, 215, 247.
    - rare earth phosphors of (Tiede and Schleede), A., ii, 769.
- **Magnesium organic compounds**, use of, in syntheses (Hepworth), A, i, 118.
  - electrolysis of (Kondyrev), A., i, 1128.
  - action of cupric chloride with (Turner), A., i, 23.
  - action of, on glutaronitrile (Bruylants), A., i, 531.
  - action of, on nitriles (Baerts), A., i, 817.
  - with olefines (Krestinski), A., i, 1128.
  - with pyridine (Spacu), A., i, 859.
  - reactions of (García Banús and Pascual Vila), A., i, 734.
  - alkyl haloids, action of halogen derivatives of ethane and methane on (Binaghi), A., i, 1002.
  - alkyl and aryl haloids, action of iodoform on (Oddo and Binaghi), A., i, 313.
  - allyl bromide, action of dichloroethyl ether on (Lespieau), A., i, 619.
  - cyanide, and its complex silver salts (Fichter and Suter), A., i, 532.
  - ethyl bromide, action of, with ethyl chloropropionates (Moureu and Barrett), A., i, 4.
  - methyl bromide, action of, with phenylacetonitrile (Rondou), A., i, 934.
  - phenyl bromide, action of thallous bromide on (D. and A. E. Goddard), T., 259.

Magnesium detection, estimation, and separation:—
detection of, with 8-hydroxyquinone (Mörner), A., ii, 659.
detection of, in presence of manganese and phosphoric acid (Purgotti), A., ii, 85.
estimation of, colorimetrically (Hammett and Adams), A., ii, 587; (Briggs; Denis), A., ii, 659.
estimation of, in nickel (Chalupny and Breisch), A., ii, 227.
estimation of, volumetrically, in potassium salts (Vürtheim), A., ii, 870.
estimation of, and separation from alkalis (Borgström), A., ii, 659.
Magnetic field, effect of a, on catalysis by ions (Garner and Jackman), T., 1298.
Magnetism and constitution of atoms (Weiss), A., ii, 23.
relation between atomic structure and (Cabrera; Oxley), A., ii, 469.
Maize, constituents of the pollen of (Anderson and Kulp), A., i, 508.
effect of aluminium and iron salts on growth of (Arndt), A., i, 1103.
absorption of calcium chloride by the roots of (Redfern), A., i, 614.
proteins in (Showalter and Carr), A., i, 1103.
Maize oil, chemical composition of (Baughman and Jamieson), A., i, 414.
Malachite-green-leucosulphonic acid, pararosaniline salt (Wieland and Scheuing), A., i, 58.
Maleic acid, preparation of (Downs), A., i, 984.
action of muscle enzymes on (Dakin), A., i, 792.
calcium salt, crystallography and optical properties of (Wherry and Hann), A., i, 716.
methyl ester, alkaline hydrolysis of (Skrabal and Raith), A., ii, 434.
Malic acid, formation of (Weiss and Downs), A., i, 622.
impure form of, in Crassulaceæ (Franzen and Ostertag), A., i, 1223.
excretion of (Tomita), A., i, 301.
d-**Malic acid** (Freudenberg and Brauns), A., i, 623.
l-**Malic acid**, activation of racemic acid by (McKenzie and Walker), T., 349.
Malic acid, hydroxy-. See Succinic acid, aminohydroxy-.
nitro-, and its salts (Lachman), A., i, 107.
Malonamide, *iso*nitroso-, derivatives of (Rendall and Whiteley), T., 2110.
Malonanilide, amino- (Rendall and Whiteley), T., 2119.
*iso*nitroso-, ethers of (Rendall and Whiteley), T., 2115.
Malon-*p*-bromoanilide, *mono*-, and *di*-chloro-, and chlorobromo- (West), T., 2201.
Malondibenzylamide, *iso*nitroso-, ethers of (Rendall and Whiteley), T., 2118.
Malondiethylamide, chlorobromo- (West), T., 2201.
Malondimethylamide, *di*chloro-, and chlorobromo- (West), T., 2202.
*iso*nitroso-, ethers of (Rendall and Whiteley), T., 2116.
Malonhydrazidic acid, potassium ethyl ester and benzylidene derivative (Curtius and Sieber), A., i, 723.
Malonic acid, diethyl ester, reaction of *s*.-dichlorodimethyl ether with (Dox and Yoder), A., i, 429.
and its substituted derivatives, decomposition velocity of (Bernoulli and Jakubowicz), A., ii, 40; (Jakubowicz), A., ii, 361.
sodium derivative, condensation of, with ethyl muconate (Farmer), T., 2015.
alkyl derivatives, conversion of, into α-amino-acids (Curtius and Sieber), A., i, 721.
esters, condensation of, with aromatic amidines (Dox and Yoder), A., i, 374.
Malonic acid, halogen derivatives, quantitative reduction of, by hydriodic acid (West), T., 2196.
bromo-derivatives, absorption spectra of derivatives of (Graham and Macbeth), T., 1109.
esters, action of hydrazine on (Hirst and Macbeth), T., 904.
mono-, and *di*-chloro-, methyl esters (Hirst and Macbeth), T., 2177.
ethyl esters, preparation of (Macbeth), T., 1120.
Malonmethylanilide, bromo-, and chloro- (West), T., 2199.
Malonmethylbromoanilide, bromo- (West), T., 2199.
Malonodi-5-acenaphthylamide (Fleischer and Schranz), A., i, 1143.
Malononitrile, *di*bromo-, *di*chloro-, and *di*iodo- (Ott and Löpmann), A., i, 643.
Malontetrabenzylamide, bromo-, and *mono*- and *di*-chloro- (West), T., 2200.
Malontetrabromophenylamide, bromo- (West), T., 2200.

Malontetraphenylamide, bromo-, and chloro- (West), T., 2199.
Malt, diastatic action of, and its preparations (Lecoq), A., i, 312; (Duchaček), A., i, 974.
proteolytic enzymes of (Lundin), A., i, 959.
Maltase (Willstätter and Steibelt), A., i, 306.
removal of, from adsorbed substances (Willstätter and Kuhn), A., i, 283.
action of arsenic compounds on (Rona, Airila, and Lasnitzki), A., i, 959.
non-identity of α-glucosidase and (Willstätter and Steibelt), A., i, 282.
genesis of, in plants (Palladin and Popov), A., i, 614.
in blood (Compton), A., i, 392.
of dog's serum (Compton), A., i, 1087.
Maltose, action of ozone on pure solutions of (Schonebaum), A., i, 921.
l-**Mandelamide,** preparation and racemisation of (McKenzie and Smith), T., 1353.
Mandelic acid, tetra-acetyl glucose esters (Karrer, Nägeli, and Smirnov), A., i, 253.
Manganates. See under Manganese.
Manganese, preparation of (Fujidayashi), A., ii, 647.
spectra of (Catalán), A., ii, 726.
Röntgen-ray spectrum of (Duane and Fricke), A., ii, 804.
Manganese alloys, electrochemistry of (Tammann and Vaders), A., ii, 380.
Manganese compounds in flowers (Wester), A., i, 309.
in the leaves of plants (Bertrand and Rosenblatt), A., i, 411.
in young and old leaves (Jadin and Astruc), A., i, 1098.
rôle of, in plants (McHargue), A., i, 906.
in higher plants (Bertrand and Rosenblatt), A., i, 95.
in seeds (Wester), A., i, 93.
Manganese *di*oxide, coagulation of sols of (Ganguly and Dhar), A., ii, 829.
adsorption of iron hydroxide by precipitates of (Geloso), A., ii, 589.
use of, in the catalytic oxidation of ammonia (Piggot), A., ii, 142.
alkali selenates (Tutton), A., ii, 505.
tungstate (Smith), A., ii, 774.
Manganous sulphide, green, preparation of (Hahn), A., ii, 380.
Manganese:—
Manganates, velocity of reaction between formic acid and (Holluta), A., ii, 700.
Permanganates, mechanism of the reduction of (Holluta), A., ii, 700, 771.
Manganites, preparation and properties of (Sarkar and Dhar), A., ii, 398.
Manganese organic compounds:—
Mangani-acetic and **-benzoic acids,** complex salts of (Weinland and Fischer), A., i, 421.
Manganese detection, estimation, and separation:—
detection of (Ditz), A., ii, 229.
detection of, by oxidation to permanganate (Heslinga), A., ii, 589.
estimation of (Huber; Sarkar and Dhar; Nicolardot, Geloso, and Réglade), A., ii, 398; (Winkler), A., ii, 589; (Minovici and Kollo), A., ii, 787.
estimation of, colorimetrically, in steel and alloys (Heslinga), A., ii, 660.
separation of, from iron (Carus), A., ii, 88.
Manganites. See under Manganese.
Mangiferin (*euxanthogen*), and its derivatives (Gorter), A., i, 933.
Mannanase (Mayeda), A., i, 694.
Mannitol, action of boric acid on (Dubrisay), A., i, 1110.
constitution and rotation of compounds of, with boric acid and sodium hydroxide (Gilmour), T., 1333.
Mannitolphosphoric acid, iron salt (Farbenfabriken vorm. F. Bayer & Co.), A., i, 631.
l-**Mannoheptúronic acid,** and its lactone, derivatives of (Kiliani and Wingler), A., i, 321.
Mannose, preparation of (Clark), A., i, 433.
Manurial experiments, with aluminium and iron salts (Arndt), A., i, 1103.
with silicic acid (Lemmermann and Wiessmann), A., i, 1108.
Maple, Korean. See *Acer ginnala.*
Marble, corrosion of, by plant roots (Chemin), A., i, 94.
Marcasite, crystalline structure of (Huggins), A., ii, 651.
Martensite, heat of transformation of, into pearlite (Yamada), A., ii, 475.
Matrine, constitution of (Kondô, Kishi, and Araki), A., i, 269.
Matter, enantiomorphism of (Condelli), A., i, 410.

Mechanics, statistical, relation between, and thermodynamics (Tolman), A., ii, 257.
Meconic acid, estimation of, in opium (Annett and Bose), A., ii, 791.
Medicago falcata, yellow pigment from flowers of, and its transformation by oxydases (Jonesco), A., i, 1224.
Melamine, *tri*cyano-, and its salts (Madelung and Kern), A., i, 440.
Melampyrum arvense, aucubin and melampyritol from (Bridel and Braecke), A., i, 799.
aucubin and sucrose in the seeds of (Bridel and Braecke), A., i, 209.
Melanin from pyrrole (Rondoni), A., i, 64.
Melanin acids, formation of, from organic compounds (Adler and Wiechowski), A., i, 1170.
physiological action of (Adler and Wiechowski), A., i, 498.
Melanovanadite (Lindgren), A., ii, 155; (Lindgren, Hamilton and Palache), A., ii, 305.
Meleagris gallipavo (turkey), enzymes of the fat of (Hepburn), A., i, 196.
Melilites, natural and synthetic (Buddington), A., ii, 155.
Mellitic acid (Philippi; Philippi and Rie; Philippi and Thelen; Philippi, Seka, and Froeschl; Philippi, Seka, and Robinson), A., i, 837.
Melting point, relation of boiling point to (Lorenz and Herz), A., ii, 739.
relation between boiling point, critical temperature, and (Prud'homme), A., ii, 349.
of aliphatic-aromatic ketones (Majima, Nagaoka, and Tamada), A., i, 257
Melting point determinations (Heike), A., ii, 25.
apparatus for (Uytenbogaart), A., ii, 471.
Melting point tubes, use of, as reaction vessels (Fuchs), A., ii, 759.
Membranes, collodion, anomalous osmosis through (Loeb), A., ii, 742.
de Haen's, for electro-osmosis (Prausnitz), A., ii, 114.
Mentha aquatica, oil from (Kremers), A., i, 848.
Menthane, cyano- (Lück), A., i, 44.
Menthanealdehyde (Lück), A., i, 44.
Menthanecarboxylic acid, and its potassium salt (Lück), A., i, 44.
Menthene glycol, chlorohydrin of (Detœuf), A., i, 327.
Menthol, preparation of (Smith and Penfold), A., i, 31.
l-**Menthol**, derivatives of (Lück), A., i, 44.
Menthone, preparation of (Smith and Penfold), A., i, 31.
oxidation of, by ferric chloride (Asahina and Mituhori), A., i, 667.
Menthylsemicarbazide (Neighbors, Foster, Clark, Miller, and Bailey), A., i, 881.
Mercaptans, action of chloropicrin with (Rây and Das), T., 323.
2-Mercapto-1-*p*-iodophenyl-6-methylbenziminazole, and its derivatives (Jacobsen), A., i, 591.
2-Mercapto-5-methylthiazole, and its metallic salts and their use in vulcanisation (Bruni and Romani), A., i, 755.
3-Mercapto-1:4-naphthaquinone, 2-amino-, acetyl derivative, and its *S*-methyl ether (Fries and Kerkow), A., i, 578.
Mercapturic acid, formation of, during the ingestion of proteins (Kapfhammer), A., i, 293.
Mercerisation, heat developed in (Barratt and Lewis), A., i, 526.
Mercuriale vivace. See *Mercurialis perennis*.
Mercurialis perennis, content and distribution of sugars in (Gillot), A., i, 1101.
Mercury, atomic weight of (Brönsted and v. Hevesy), A., ii, 645.
absorption and spectrum of the vapour of (McLennan, Ainslie, and Cale; Franck and Grotrian), A., ii, 728.
arc spectrum of (Procopiŭ), A., ii, 600.
continuous spectrum of the vapour of (Child), A., ii, 676.
fluorescence spectrum of (van der Lingen and Wood), A., ii, 245; (van der Lingen), A., ii, 543.
series spectrum of (Seeliger), A., ii, 17.
stability of the luminous discharge in (Gibson and Noyes), A., ii, 812.
vapour, electrodeless discharge in (Robertson), A., ii, 609.
separation of isotopes of (Brönsted, and v. Hevesy), A., ii, 149; (Mulliken and Harkins), A., ii, 295.
critical constants of (Weber), A., ii, 645, 769.
density and surface tension of (Hogness), A., ii, 29.
velocity of vaporisation of (Volmer and Estermann), A., ii, 193.
decomposition of hydrogen molecules by (Cario and Franck), A., ii, 809.

- **Mercury**, solution of metals in (Skaupy), A., ii, 297; (Tammann and Jander), A., ii, 825.
  - reduction of ferric salts by (McCay and Anderson), A., ii, 217.
  - reduction of vanadic acid by (McCay and Anderson), A., ii, 530.
- **Mercury alloys** (*amalgams*), use of in volumetric analysis (Kikuchi), A., ii, 519, 721; (Kanô), A., ii, 529, 721.
  - with alkali metals, relative densities of (Bain and Withrow), A., ii, 145.
  - with aluminium, electromotive properties of (Müller and Hölzl), A., ii, 341.
  - with cadmium, use of, in analysis (Kanô), A., ii, 529.
  - with calcium, electrolytic preparation of (Neuhausen), A., ii, 643.
  - with copper (Paal and Steyer), A., ii, 446.
  - with lead, estimation of lead in (Mellon and Reinhard), A., ii, 787; (Mellon), A., ii, 870.
  - with magnesium, thermal analysis of (Beck), A., ii, 545.
    - equilibrium of ammonia with (Loomis), A., ii, 294.
  - with silver, preparation of (Muller and Hönig), A., ii, 500.
  - with sodium, electrochemistry of (Richards and Conant), A., ii, 340.
  - with thallium (Richards and Smyth), A., ii, 341.
- **Mercury compounds**, lecture experiment to show the antiseptic action of (Joachimoglu), A., ii, 211.
- **Mercury salts**, physiological action of (Salant and Kleitman), A., i, 794.
- **Mercury** *per*chlorate, electrometric titrations with (Kolthoff), A., ii, 655.
  - chlorides, action of sulphur dioxide on (Stewart and Wardlaw), T., 1481.
  - oxychlorides (Toda), A., ii, 769.
  - **Mercuric** chloride, compound of pyridinebetaine and (Cassella & Co.), A., i, 860.
    - poisoning. See Poisoning.
    - oxide, catalytic influence of oxides on the decomposition of (Kendall and Fuchs), A., ii, 147.
    - sulphide, complex compound of mercuric acetate and (Miolati), A., i, 982.
- **Mercury organic compounds** (Rossi), A., i, 605; (Mameli), A., i, 695, 1082; (Mameli and Mameli-Mannessier), A., i, 1080; (Mameli and Cocconi), A., i, 1083.
- **Mercury organic compounds** with dihydrobenzofurans (Adams, Roman, and Sperry), A., i, 946.
  - with hydroxybenzaldehydes (Henry and Sharp), T., 1055.
  - with nitroanilines (Kharasch, Lommen, and Jacobsohn), A., i, 603.
  - dialkyls, preparation of (Marvel and Gould), A., i, 329.
  - 3:3'-diethyldithienyl (Steinkopf and Herold), A., i, 850.
  - mercaptide nitrites, and their derivatives (Rây), T., 1281.
  - 2:4:2':4'-*tetra*nitrodibenzyl (Kharasch), A., i, 190.
  - *oo'*-*di*nitrodiphenyl (Wibaut and Jürgens), A., i, 694.
  - 2:4:6:2':4':6'-*hexa*nitrodiphenyl (Kharasch), A., i, 190.
  - oxycyanide, explosion of (Merck), A., i, 640.
  - *o*:*o'*-**Mercury-bis-*p*-nitroaniline** (Kharasch, Lommen, and Jacobsohn), A., i, 603.
  - **Mercuric** cyanide, equilibrium of ammonia with (Brinkley), A., i, 724.
  - **Mercuri-compounds** (Kharasch), A., i, 188, 189; (Kharasch and Jacobsohn), A., i, 189.
  - **Mercuriacetic acids**, phenol derivatives (Mameli), A., i, 695.
  - **Mercuri*di*aminoazobenzene** acetate (Vecchiotti), A., i, 478.
  - **Mercuribenzoic acid**, *o*-chloro-, *n*-butyl ester (Whitmore and Middleton), A., i, 889.
  - *o*-**Mercuribis-*p*-nitrobenzoic acid**, esters of (Whitmore and Middleton), A., i, 889.
  - **Mercuridicarboxylic acids**, esters, preparation and hydrolysis of (Schoeller and Schrauth), A., i, 605.
  - **Mercuridimethylaniline**, *o* nitro-*p*-chloro- (Kharasch and Jacobsohn), A., i, 189.
  - **1:1-Mercuridimethylenebis-1:2-dihydrobenzofuran** (Adams, Roman, and Sperry), A , i, 947.
  - **Mercuriethylaniline**, *p*-nitro-*o*-chloro- (Kharasch and Jacobsohn), A., i, 189.
  - **Mercuri-iodides** of alkaloids (François and Blanc), A., i, 851.
  - **Mercurimethylaniline**, nitrochloro-derivatives (Kharasch and Jacobsohn), A., i, 189.
  - **Mercurimethyl-1:2-dihydrobenzofuran**, 1-bromo-, 1-chloro-, and 1-iodo- (Adams, Roman, and Sperry), A., i, 947.

Mercury organic compounds:—
Mecurinitroanilines, chloro- (Kharasch, Lommen, and Jacobsohn), A., i, 603.
Mercuri-*p*-nitrobenzoic acid, *o*-chloro- and *o*-hydroxy-, derivatives of (Whitmore and Middleton), A., i, 888.
Mercurinitrophenols, chloro- (Raiziss and Proskouriakoff), A., i, 604.
Mercuri-*o*-nitrophenoxide, hydroxy-, sodium (Raiziss and Proskouriakoff), A., i, 604.
Mercuri-2-nitroresorcinol, 4-chloro- (Raiziss and Proskouriakoff), A., i, 604.
Mercuri-5-nitrosalicylic acid, 3-chloro- (Raiziss and Proskouriakoff), A., i, 604.
Mercuriphenoxide, 2-nitro-4-hydroxy-, sodium (Schamberg, Raiziss, and Kolmer), A., i, 391.
Mercury estimation and separation:—
estimation of, in ores (Heinzelmann), A., ii, 162.
estimation of, in pills (François), A., ii, 87.
separation of, from silver salts (Kolthoff), A., ii, 160.
Mercury cathode. See Cathode.
Mercury electrode. See Electrodes.
Mesityl oxide, chlorohydrin. See *iso*-Butyl methyl ketone, *α*-chloro-*β*-hydroxy-.
Mesitylene, additive compound of tetrachlorophthalic anhydride and (Pfeiffer and Flater), A., i, 341.
Mesochætopterus Taylori, constituents of the tube of (Berkeley), A., i, 400, 493.
Mesohydry (Oddo), A., ii, 367.
Mesothorium, chemical properties of (Yovanovitch), A., ii, 712.
Mesoxalic acid, sodium salt and hydrazones of (Chattaway and Harris), T., 2706.
Mesoxamide, oxime of. See Malonamide, *iso*nitroso-.
Metabolism, effect of radiothorium on (Miyadera), A., i, 966.
effect of putrefaction products on (Hijikata), A., i, 495.
effect of injection of sulphur on (Meyer-Bisch and Basch), A., i, 83.
in alcaptonuria (Gibson and Howard), A., i, 401.
basal, in underweight children (Blunt, Nelson, and Oleson), A., i, 83.
in menstruation (Wiltshire), A., i, 395.
calcium (Rosemann), A., i, 1210.
Metabolism of calcium and phosphoric acid (Bluhdorn), A., i, 83.
carbohydrate (Elias and Sammartino), A., i, 86; (Hewitt and de Souza), A., i, 395; (Elias and Weiss; Neuwirth), A., i, 485.
effect of light on (Pincussen), A., i, 1088.
in diabetes (Allen and Wishart), A., i, 893); (Wagner and Parnas), A., i, 965.
effect of simultaneous injection of adrenaline and pilocarpine on (Vogel and Bornstein), A., i, 395.
chloride, during the menstrual period (Eisenhardt and Schaefer), A., i, 83.
chlorine, in tuberculosis (Boenheim), A., i, 1092.
creatinine, effect of the thyroid on (Schenk), A., i, 1212.
endogenous, in tissues (Mitchell, Nevens, and Kendall), A., i, 897.
nitrogen, of higher plants (Chibnall), A., i, 1225.
nucleic acid, effect of Rontgen rays on (Pincussen and Momferratos-Floros), A., i, 395.
nuclein (Rother), A., i, 292.
of phosphorus in tetany (Elias and Spiegel), A., i, 401.
of pigments (Fromholdt and Nersessov), A., i, 387, 404.
purine (Kikuchi), A., i, 698.
influence of food ingestion on (Rose), A., i, 194.
respiratory (Burger; Pedotti; Asher and Koda; Asher and Doubler), A., i, 286.
in glycæmia (Bornstein and Muller), A., i, 392; (Bornstein and Holm), A., i, 890.
of inorganic salts (Gross and Underhill), A., i, 1210.
of sugars, intermediary (Staub), A., i, 83.
sulphur (Lewis and Root), A., i, 487; (Lewis, McGinty, and Root), A., i, 1088.
Metacholesterol, preparation and properties of (Lifschutz), A., i, 541.
Metallic alloys. See Alloys.
carbonyls (Mond and Wallis), T., 29.
action of nitric oxide on (Mond and Wallis), T., 32.
chlorides, dissociation of, in aqueous solutions (Günther-Schulze), A., ii, 765.
compounds, possible existence of, as vapour (Eucken and Neumann), A., ii, 567.

- **Metallic** conductivity in relation to electromotive force (Tammann), A., ii, 255.
  - haloids, complex, determination of crystal structure of, by means of Röntgen rays (Scherrer and Stoll), A., ii, 514.
  - hydrides (Ephraim and Michel), A., ii, 58.
    - gaseous, preparation of (Paneth, Johannsen, and Matthies; Paneth, Matthies, and Schmidt-Hebbel), A., ii, 383.
  - hydroxides, constitution of (Tiemann), A., ii, 53.
    - peptisation of (Chatterji and Dhar), A., ii, 205, 627.
  - oxides, formation of, from hydroxides (H. and U. v. Euler), A., ii, 831.
    - Röntgen-ray spectra of (Hedval), A., ii, 800.
    - luminescence of, sublimed in the electric arc (Nichols and Wilber), A., ii, 105.
    - isomerism of (Applebey and Reid), T., 2129
    - hydrated (Weiser), A., ii, 575, 853.
    - catalytic decomposition of (Taylor and Hulett; Kendall and Fuchs), A., ii, 646.
  - salts, refractive index of (Limann), A., ii, 173.
    - molten, molecular refraction of (Meyer and Heck), A., ii, 329.
    - absorption of light by (George), A., ii, 806.
    - crystalline particles in solutions of, visible in the Tyndall cone (Traube and Klein), A., ii, 201.
    - electrolytic dissociation of, in solution and in fused and solid states (Rabinowitsch), A., ii, 186, 187, 188.
    - mixed, electrolysis of (Creutzfeldt), A., ii, 347.
    - and their mixtures, electrical conductivity of, in molten condition (Benrath and Drekopf), A., ii, 109.
    - temperature of the vapour from boiling solutions of (Harker), A., ii, 26.
    - vapour pressure of (v. Wartenberg and Schulz), A., ii, 146; (v. Wartenberg and Bosse), A., ii, 739.
    - vapour pressure of saturated solutions of (Edgar and Swan), A., ii, 349.
    - vapour pressure curves of ammonia with solutions of (Davis, Olmstead, and Lundstrum), A., ii, 49.
- **Metallic** salts, solubility of, in aqueous ethyl alcohol and water (Treadwell), A., ii, 31.
    - fused (Herz), A., ii, 116, 739.
    - thermal expansion of solutions of (Meyer), A., ii, 737.
    - adsorption of, by metal surfaces (v. Euler and Zimmerlund), A., ii, 822.
    - preparation of gels of (Charitschkov), A., ii, 827.
    - complex coloured, grouping of atoms in (Wells), A., ii, 464.
    - sparingly soluble solid, reaction affinity in systems of (Brönsted), A., ii, 132.
    - double decomposition of, and its geometrical representation (Jänecke), A., ii, 427.
    - reactions of, with dimethyldithiolethylene (Morgan and Ledbury), T., 2882.
    - additive compounds of organic bases with (Peters), A., i, 48.
    - action of solutions of, on the heart (Cate; Zondek), A., i, 296.
  - selenides, preparation of (Moser and Doctor), A., ii, 46.
  - sulphides, solubility of (Weigel), A., ii, 644.
    - used in metallurgy, specific heat of (Bornemann and Hengstenberg), A., ii, 613.
  - tellurides, preparation of (Moser and Ertl), A., ii, 48.
  - vapours, thermal ionisation of (Tolman), A., ii, 18.
- **Metallo-albumins**, toxicity of (Ariola), A., i, 500.
- **Metals**, constitution of (Kraus), A., ii, 566.
  - vacuum spark spectra of (Carter), A., ii, 599.
  - electromotive behaviour of (Dhar), A., ii, 20.
  - allotropy and electromotive behaviour of (Smits), A., ii, 110.
  - electrolytic deposition of (Kling and Lassieur), A., ii, 587.
  - cathodic deposition of, on aluminium and chromium (Kyropoulos), A., ii, 22.
  - thermo-electric force, entropy, and specific heat of, at high temperatures (Latimer), A., ii, 814.
  - crystal structure of (Hull), A., ii, 624; (Haughton and Ford), A., ii, 825.
  - impurities between the crystallites of (Tammann), A., ii, 502.
  - mechanical properties of (Guillet and Cournot), A., ii, 261.

Metals, increase in the size of grain of, formed from powdered material (Sauerwald), A., ii, 746.
solubility of, in acids (Prins), A., ii, 488.
diffusion in, in the solid state (Sirovich and Cartoceti), A., ii, 571.
diffusion and cementation of (Sirovich and Cartoceti), A., ii, 68.
ionic equilibria on the surfaces of (v. Euler, Hedelius, and Zimmerlund), A., ii, 251.
adsorption of metallic salts on the surface of (v. Euler and Zimmerlund), A., ii, 822.
reactions on the surfaces of (Ruff), A., ii, 363.
corrosion of, influence of protective colloids on (Friend and Vallance), T., 466.
passivity of (Evans; Gillis), A., ii, 814.
behaviour of, as catalysts (Sandonnini), A., ii, 557.
catalytic oxidation by means of (Karczag), A., ii, 42.
velocity of the action of oxygen, hydrogen sulphide, and the halogens on (Tammann and Köster), A., ii, 831.
action of nitric acid on (Banerji and Dhar), A., ii, 756.
compounds of proteins with (Benedicenti and Rebello-Alves), A., ii, 683.
action of, on toxins (Erdstein and Fürth), A., i, 90.
deflagrated, positive ray analysis of the gases given off by (Thomson), A., ii, 565.
dissolved in mercury, molecular condition of (Skaupy), A., ii, 297.
affinity of, for each other (Tammann and Jander), A., ii, 825.
powdered, toxicity of (Ariola), A., i, 500.
bearing, estimation of tin in (Nágel), A., ii, 721.
precipitation of, by hydrogen sulphide (Smith), A., ii, 626.
estimation of gases in (Simons), A., ii, 719.

Metal wires, hard drawn, structure of (Ettisch, Polányi, and Weissenberg), A., ii, 201.

Meteoric iron from Texas and California (Merrill), A., ii, 451, 452.

Meteorite, the Annaheim (Johnston and Ellsworth), A., ii, 306.
the Pitts (McCallie), A., ii, 306.
the Strathmore, composition of (McLintock and Ennos), A., ii, 861.

Methæmoglobin, absorption spectra of, and its transformation into oxyhæmoglobin (Quagliariello), A., i, 883.

Methanalsulphurous acid. See Sulphiformin.

Methane, preparation of (Ohmann), A., i, 2.
action of ozone on (Wheeler and Blair), A., i, 1105.
ignition of mixtures of atmospheric air and (Mason and Wheeler), T., 2079.
synthesis of the polyacetic acids of (Ingold and Perren), T., 1414; (Ingold and Nickolls), T., 1638.
estimation of, in small quantities (Murmann), A., ii, 591.

Methane, bromo*tri*nitro- (Schmidt, Bartholomé, and Lubke), A., i, 826.
chloro-derivatives, antiseptic action of (Joachimoglu), A., i, 304.
halogen derivatives, action of, on magnesium alkyl compounds (Binaghi), A., i, 1002.
*tetra*nitro- (Schmidt, Schumacher, Bájen, and Wagner), A., i, 733.
action of triphenylhydrazine on (Goldschmidt and Renn), A., i, 478.

Methanedisulphonic acid, amino-, copper and nickel salts (Delépine and Demars), A., i, 923.

Methanetetra-acetic acid, and its salts and derivatives, and ω-cyano-, ethyl ester (Ingold and Nickolls), T., 1645.

Methanetriacetic acid, preparation of, and its esters (Ingold and Perren), T., 1414.

Methenylbis-2:4-dimethylpyrrole-3-carboxylic acid, ethyl ester (Kuster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.
hydrochloride (Fischer and Zerweck), A., i, 758.

Methoxide, sodium, action of, on benzophenone chloride and benzylidene chloride (Mackenzie), T., 1695.

4-Methoxyacetophenone, 3-hydroxy-. See *iso*Acetovanillone.

2-Methoxy-5-aldehydobenzoic acid, and its derivatives (Wayne and Cohen), T., 1022.

2-Methoxyanthraquinone-1-carboxylic acid (Bradshaw and Perkin), T., 917.

2-Methoxyanthraquinone-1-glyoxylic acid, methyl ester (Bradshaw and Perkin), T., 917.

2-*o*-Methoxybenzeneazoglyoxaline (PUMMERER, BINAPFL, BITTNER, and SCHUEGRAF), A., i, 1198.

2-*o*′-Methoxybenzeneazo-1:8-naphthasultam-4-sulphonic acid, and its potassium salt (KONIG and KEIL), A., i, 823.

2′-Methoxybenzil, 2-hydroxy- (SCHONBERG and KRAEMER), A., i, 664.

Methoxybenzoic acids, amino-, and nitro- (FROELICHER and COHEN), T., 1652.

4-Methoxybenzonitrile, 3-nitro- (MATTAAR), A., i, 251.

4-Methoxybenzophenone-4′-arsinic acid (LEWIS and CHEETHAM), A., i, 187.

o-**4′-Methoxybenzoylbenzoic acid,** preparation of, and its salts (ORNDORFF and KELLEY), A., i, 834.

4′-Methoxybenzoylbenzoin (GREENE and ROBINSON), T., 2189.

γ-**4-Methoxybenzoyl-β-phenylethylmethylmalonic acid,** and γ-bromo-, methyl esters (KOHLER), A., i, 552.

Methoxybenzyl bromides, isomeric, preparation and properties of (LAPWORTH and SHOESMITH), T., 1391.

p-**Methoxybenzylcinnamic acids,** and their anilides (INGOLD and PERREN), T., 2386.

5-*p*-Methoxybenzylideneaminoacenaphthene (FLEISCHER and SCHRANZ), A., i, 1143.

o-**Methoxybenzylideneanthranilic acid** (EKELEY, ROGERS, and SWISHER), A., i, 935.

p-**Methoxybenzyl methyl ketone,** derivatives of (LE BRAZIDEC), A., i, 456.

5-Methoxy-2-benzyl-2-methyltetrahydrofuran (HELFERICH and GEHRKE), A., i, 10.

o- and *p*-**Methoxy-β-bromo-α-allylpropylbenzene** (SCHMIDT, BARTHOLOMÉ, and LÜBKE), A., i, 827

p-**Methoxy-β-bromo-α-ethoxypropylbenzene** (SCHMIDT, BARTHOLOMÉ, and LUBKE), A., i, 827.

β-**Methoxy-α-bromomercuri-β-*p*-methoxyphenylpropionic acid,** ethyl ester (SCHRAUTH and GELLER), A., i, 1126.

β-**Methoxy-α-bromomercuri-β-phenylpropionic acid** (SCHRAUTH and GELLER), A., i, 1125.

β-**Methoxy-α-bromomercuri*iso*valeric acid,** ethyl ester (SCHRAUTH and GELLER), A., i, 1125.

o- and *p*-**Methoxy-β-bromo-α-methoxypropylbenzene** (SCHMIDT, BARTHOLOMÉ, and LÜBKE), A., i, 827.

α-*p*-**Methoxybromophenyl-β-hydroxypropylamine.** See Anetholealkamine, bromo-.

β-**Methoxybutyronitrile** (BRUYLANTS), A., i, 924.

6-Methoxy-2γγγ-*tri*chloro-Δ^{α}-propenylquinoline-4-carboxylic acid (HALBERKANN), A., i, 175.

4-Methoxycinnamic acid, 3-amino-, and 3-hydroxy- (MAUTHNER), A., i, 936.
  α-amino-3-hydroxy-, α-benzoyl derivatives (SPÄTH and LANG), A., i, 568.

p-**Methoxycinnamyl alcohol** (KARRER and HORLACHER), A., i, 825.

p-**Methoxycinnamylidenemalonic acid** (HIGGINBOTHAM and LAPWORTH), T., 2828.

5-Methoxydihydrindone, 6-hydroxy-, and its phenylhydrazone (v. KONEK and SZAMÁR), A., i, 459.

α-**Methoxydihydro-*o*-anethole,** β-nitro- (SCHMIDT, SCHUMACHER, BAJEN, and WAGNER), A., i, 733.

7-Methoxy-7:12-dihydro-γ-benzophenarsazine (LEWIS and HAMILTON), A., i, 188.

α-**Methoxydihydro*iso*safrole,** β-nitro- (SCHMIDT, SCHUMACHER, BÄJEN, and WAGNER), A., i, 733.

2′-Methoxy-5:5′-dimethylbenzil, 2-hydroxy- (SCHONBERG and KRAEMER), A., i, 663.

2-Methoxy-4:6-dimethylbenzoic acid (v. AUWERS and SAURWEIN), A., i, 1032.

5-Methoxydioxindole, and its diacetyl derivative (HALBERKANN), A., i, 172.

4′-Methoxydiphenylamine, 2:4-*di*nitro- (BLOM), A., i, 28.

6-Methoxy-2:3-diphenylquinoline-4-carboxylic acid (HALBERKANN), A., i, 175.

6-Methoxy-2-(2′)-furylquinoline-4-carboxylic acid (HALBERKANN), A., i, 175.

Methoxy-2-hydroxydistyryl ketones, and their derivatives (BUCK and HEILBRON), T., 1097.

3′-Methoxy-4′-hydroxy-2-styrylbenzopyrylium chloride (BUCK and HEILBRON), T., 1208.

6-Methoxyindole, and its picrate (KERMACK, PERKIN, and ROBINSON), T., 1879.

6-Methoxyindole-3-aldehyde (KERMACK, PERKIN, and ROBINSON), T., 1882.

6-Methoxyindole-2-carboxydimethylacetalylmethylamide (KERMACK, PERKIN, and ROBINSON), T., 1889.

10-Methoxyindophenazine (HALBERKANN), A., i, 173.

β-**Methoxy-α-iodomercuri-β-*p*-methoxyphenylpropionic acid,** ethyl ester (SCHRAUTH and GELLER), A., i, 1126.

5-Methoxyisatin, and its derivatives (Halberkann), A., i, 172.

5-Methoxy-2-ketodihydroindole-3-carboxylic acid, 3-hydroxy-, ethyl ester, and its diacetyl derivative (Halberkann), A., i, 172.

6-Methoxy-2-keto-1:2-dihydroquinoline-4-carboxylic acid (Halberkann), A., i, 175.

11-Methoxy-3-keto-4-methyl-3:4-dihydro-4-carboline (Kermack, Perkin, and Robinson), T., 1889.

11-Methoxy-5-keto-4-methyl-4:5-dihydroindolediazine(1:4) (Kermack, Perkin, and Robinson), T., 1890.

5-Methoxy-1-ketotetrahydronaphthalene-3-sulphonic acid, sodium salt (Fuchs and Stix), A., i, 451.

Methoxyl groups, apparatus for estimation of (Cumming), A., ii, 232.

5-Methoxymandelic acid, 2-amino- (Halberkann), A., i, 172.

Methoxy-*p*-menthan-8-ol, bromo- (Schmidt, Bartholomé, and Lübke), A., i, 827.

β-Methoxy-β-*p*-methoxybromophenylpropionic acid, α-amino- (Schrauth and Geller), A., 1126.

β-Methoxy-β-*p*-methoxyphenylpropionic acid, α-amino-, and α-iodo-, and ethyl ester of the latter (Schrauth and Geller), A., i, 1126.

4-Methoxy-3-methylbenzylideneanthranilic acid (Ekeley, Rogers, and Swisher), A., i, 935.

6-Methoxy-4-methyl-2.3-diketocoumaran (Schonberg and Kraemer), A., i, 664.

5-Methoxy 9-methyl-7-ethyl-4:5-dihydrouric acid, 4-hydroxy- (Biltz and Heidrich), A., i, 383.

7-Methoxy-4-methyl-1-hydrindone, hydrazones of (v. Auwers, Hilliger, and Wulf), A., i, 1193.

(6?)-**Methoxy-1-methylindole-2-carboxylic acid** (Kermack, Perkin, and Robinson), T., 1881.

4-Methoxy-5-methylphenylarsinic acid, and 3-nitro- (Christiansen), A., i, 1203.

1-Methoxy-3-methyl*cyclo*propane-1:2-dicarboxylic acid (Ingold), T., 2694.

5-Methoxy-2-methyl-2-propyltetrahydrofuran (Helferich and Gehrke), A., i, 9.

6-Methoxy-2-methylquinoline-4-carboxylic acid (Halberkann), A., i, 175.

5-Methoxy-3-methylsulphone-1-phenyl-1:2:4-triazole (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 378.

6-Methoxy-2-methyltetrahydropyran (Helferich and Malkomes), A., i, 431.

2-Methoxynaphthalene, bromo- and chloro-derivatives (Franzen and Stäuble), A., i, 450.

Methoxynaphthaleneazobenzene-4′-arsinic acids, 1-amino- (Jacobs and Heidelberger), A., i, 74.

5-Methoxy-1:4-naphthaquinone, 2:3-*di*bromo-8-hydroxy- (Wheeler and Andrews), A., i, 354.

Methoxynaphthoic acids, and amino-, and nitro- (Froelicher and Cohen), T., 1656.

9-Methoxy-10-phenanthryl peroxide (Goldschmidt and Schmidt), A., i, 1150.

2-Methoxy-*p*-phenetidine, 3:5-*di*nitro- (Reverdin and Roethlisberger), A., i, 538.

4-Methoxyphenylacetic acid, 3-hydroxy- (Spath and Lange), A., i, 569.

4-Methoxyphenylarsinic acid, 3-amino-, acetyl derivative, and 3-nitro- (Christiansen), A., i, 1203.

6-Methoxy-3-[phenyl-(4′-arsinic acid)-azo]-phenoxyacetic acid, 4-amino-, and its salts (Jacobs and Heidelberger), A., i, 75.

4-*m*-Methoxyphenylglyoxaline, 2:4-*di*amino-, and its salts (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1198.

2-Methoxyphenyl iodomethyl ketone, 4-hydroxy- (Sonn and Falkenheim), A., i, 1164.

m-**Methoxyphenylmethylhydrazine**, preparation of (Kermack, Perkin, and Robinson), T., 1880.

5-Methoxy-2-phenyl-2-methyltetrahydrofuran (Helferich and Gehrke), A., i, 9.

3-Methoxyphenyloctoic acid, 2-hydroxy- (Majima and Takayama), A., i, 263.

Methoxyphenylpropanone. See *p*-Methoxybenzyl methyl ketone.

β-Methoxy-β-phenylpropionic acid, α-amino-, and α-bromo-, and their derivatives (Schrauth and Geller), A., i, 1125.
  β-2-hydroxy-, and its derivatives (Langley and Adams), A., i, 1154.

4-Methoxyphenylpyruvic acid, 3-hydroxy- (Spath and Lang), A., i, 568.

6-Methoxy-2-phenylquinoline-4-carboxylic acid, 5-amino-, and 5-nitro- (Halberkann), A., i, 174.

8-Methoxy-2-phenyltetrahydroquinoline-4-carboxylic acid (Zuckmayer), A., i, 574.

6-Methoxyquinoline, 5:8-*di*amino-, 8-amino-5-hydroxy-, and 5:8-*di*hydroxy- (Jacobs and Heidelberger), A., i, 671.
7-Methoxyquinoline, 3-chloro- (Kermack, Perkin, and Robinson), T., 1883.
6-Methoxyquinoline-2:4-dicarboxylic acid, and its salts (Halberkann), A., i, 174.
6-Methoxyquinoline-2:3:4-tricarboxylic acid (Halberkann), A., i, 174.
6′-Methoxy-9-rubanone, and its salts (Rabe, Kindler, and Wagner), A., i, 362.
6′-Methoxy-9-rubatoxanone, and its salts (Rabe, Kindler, and Wagner), A., i, 361.
Methoxystearic acid, bromo-, methyl ester (Schmidt, Bartholomé, and Lubke), A., i, 827.
3′- and **4′-Methoxy-2-styrylbenzopyrylium chlorides** (Buck and Heilbron), T., 1206.
Methoxytetrahydronaphthalenes, bromo- (Schmidt, Bartholomé, and Lubke), A., i, 827.
2-Methoxy-*ar*-tetrahydronaphthalenes, amino-, bromoamino-, nitro-, and nitroamino-, and their derivatives (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 128.
2-Methoxy-*ar*-tetrahydronaphthalene-3-sulphonic acid (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 127.
Methoxytetrapyridineferritetrachloroferrate, hydroxy- (Weinland and Kissling), A., i, 364.
Methoxytetrapyridineferritetrathiocyanatoferrate, hydroxy- (Weinland and Kissling), A., i, 365.
2- and **4-Methoxytoluoyl** chlorides (Mauthner), A, i, 457.
2- and **4-Methoxytolyl ethyl ketones** (Mauthner), A., i, 457.
α-(*o*-Methoxy-*m*-tolyl)-naphthylamine, β-hydroxy- (Wahl and Lantz), A., i, 823.
β-Methoxy*iso*valeric acid, α-amino-, and α-bromo-, and ethyl ester of the latter (Schrauth and Geller), A., i, 1125.
1-Methoxyxanthone, 4-chloro- (Eckert and Endler), A., i, 941.
Methyl alcohol, preparation of (Traun's Forschungslaboratorium), A., i, 522.
  purification of, with sodium hypochlorite (Menzies), T., 2787.
  equilibrium of carbon disulphide with (McKelvy and Simpson), A., ii, 271.
Methyl alcohol, equilibrium in the system, water and (Pushin and Glagoleva), T., 2813.
  reaction of water and, with heated copper (Christiansen), A., i, 3.
  poisoning. See Poisoning.
  toxicity of (v. Euler), A., i, 90.
  fate of, in the animal organism (Pohl), A., i, 498.
  detection of (Hamálainen), A., ii, 723.

1-Methylisatinhydrazone, and its salts and acetyl derivative (Borsche and Meyer), A., i, 55.

Methylisatoid, *tetra*chloro- (Heller, Benade, and Hochmuth), A., i, 1060.

Methylitamalic acid, and its barium salt (Ingold), T., 2689.

α-Methyllignosulphonic acid, β-naphthylamine salt (Klason), A., i, 324.

α-Methyl-*d*-mannoside, biochemical synthesis of (Hérissey), A., i, 112.

Methylmenthol (Ogata and Miyashita), A., i, 844.

β-Methylmethanetriacetic acid, preparation of, and its ethyl ester (Ingold), T., 1148.

Methyl*cyclo*methylenehydrazineimide-1:3-dicarboxylic acid, 4-chloro-, ethyl ester and its derivatives (Datta and Chatterjee), A., i, 816.

2-Methylnaphthalene, 3-bromo-1:4-*di*hydroxy-, 3-chloro-1:4-*di*hydroxy-, and 1:4-*di*hydroxy- (Fries and Lohmann), A., i, 30.

Methylnaphthalenes, ring closure in derivatives of (Mayer and Sieglitz), A., i, 999.

1-Methylnaphthalene-4-carboxylic acid, and its derivatives (Mayer and Sieglitz), A., i, 740.

2-Methylnaphthalene-1-carboxylic acid, and its derivatives (Mayer and Sieglitz), A., i, 742.

6-Methylnaphthalene-2-carboxylic acid, 1-amino-, and 1-nitro- (Mayer and Alken), A., i, 1000.

12-Methyl-ββ-naphthaphenthiazine-6:11-quinone (Fries and Kerkow), A., i, 578.

2-Methyl-1:4-naphthaquinone, and 2-bromo-, and 3-chloro- (Fries and Lohmann), A., i, 30.

2-Methyl-α-naphthiminazole, 1-chloro- (Fischer and Kracker), A., i, 957.

Methyl-1-α-naphthiminazolonecarbamide (Diels and Sörensen), A., i, 1195.

7-Methyl-α-naphthindole (Mayer and Alken), A., i, 1000.

7-Methyl-α-naphthindole-2-carboxylic acid, and its barium salt (Mayer and Alken), A., i, 1000.

7-Methyl-α-naphthisatin, and its phenylhydrazone (Mayer and Alken), A., i, 1000.

1-Methyl-β-naphthol, 4-chloro-, and 4-chloro-6-bromo- (Fries), A., i, 42.

2-Methyl-α-naphthol, 4-chloro-, and its acetate (Fries and Lohmann), A., i, 29.

7-Methyl-α-naphthoxindole (Mayer and Alken), A., i, 1000.

6-Methylnaphthyl-2-acetaldehyde, 1-nitro-, and its phenylhydrazone (Mayer and Alken), A., i, 1000.

6-Methylnaphthyl-2-acetic acid, 1-nitro-, and its derivatives (Mayer and Alken), A., i, 1000.

6-Methylnaphthyl-2-pyruvic acid, 1-nitro-, and its derivatives (Mayer and Alken), A., i, 1000.

***p*-Methylnitrosoaminobenzonitrile** (Schmidt, Schumacher, Bajen, and Wagner), A., i, 734.

γ-Methylnonane-αβ-dicarboxylic acid, αβ-*di*cyano-γ-hydroxy-, and γ-hydroxy-, lactone (Birch and Thorpe), T., 1830.

γ-Methylnonane-ααβ-tricarboxylic acid, γ-hydroxy-, lactone (Birch and Thorpe), T., 1829.

Methylnonylcarbinol, and its allophanate (Locquin and Wouseng), A., i, 617.

8-Methyloctahydro-ψ-phenanthroline, and its dihydrochloride (Lindner), A., i, 688.

Methyloglycogen (Karrer), A., i, 11.

Methyl-orange, improved modification of, as an indicator (Hickman and Linstead), T., 2502.

1-Methyloxindole, 3-*di*chloro- (Stollé), A., i, 762.

δ-Methyl-$\Delta^{\alpha\gamma}$-pentadiene (Krestinski), A., i, 1129.

δ-Methyl-$\Delta^{\alpha\delta}$-pentadiene-αα-dicarboxylic acid, ethyl ester (Staudinger, Muntwyler, and Kupfer), A., i, 979.

γ-Methylpentane-βδ-dicarboxylic acid, βγ-*di*cyano-, ethyl ester (Hope and Sheldon), T., 2234.

γ-Methyl-Δγ-pentenes, isomeric (van Risseghem), A., i, 909.

δ-Methyl-Δ^{δ}-pentenecarboxylic acid, γ-hydroxy-, lactone derivatives of (Staudinger, Muntwyler, and Kupfer), A., i, 979.

δ-Methyl-Δγ-pentenyl-2:5:8-*tri*hydroxy-1:4-naphthaquinone. See Shikonin.

3-Methyl-ψ-phenanthroline, preparation and constitution of (Lindner), A., i, 688.

6-Methylphenylacetoacetic acid, 5-chloro-2:4-*di*nitro-, ethyl ester (Davies and Hickox), T., 2647.

5-Methylphenylarsinic acid, 3-nitro-4-hydroxy- (Christiansen), A., i, 1203.

1-α-*N*-Methylpiperidylethan-α-ols (Hess and Corleis), A., i, 170.

1-α-*N*-Methylpiperidylethan-α-one, and its salts and derivatives (Hess and Corleis), A., i, 170.

β-Methylpropane, α-amino-β-hydroxy-, and β-chloro-α-amino-, and their salts (Dersin), A., i, 142.

1-Methyl*cyclo*propane-1-carboxylic acid, methyl ester (Kohn and Mendelewitsch), A., i, 518.

3-Methyl*cyclo*propane-1:2-dicarboxylic acids, and 1-bromo-, and their salts (Ingold), T., 2687.

3-Methyl*cyclo*propan-1-ol-1:2-dicarboxylic acid, and its silver salt (Ingold), T., 2693.

Methyl*iso*propenylaniline, and its derivatives (Knoevenagel and Bahr), A., i, 750.

Methyl *iso*propenyl ketone (Scheibler and Fischer), A., i, 1110.

α-Methylpropionic acid, α-amino-β-hydroxy-, and its copper salt (Zelinsky and Dengin), A., i, 1129.

Methyl*cyclo*propylcarbinyl iodide (Demjanov and Dojarenko), A., i, 1014.

3-Methyl-6-*iso*propylcoumaran-1:2-dione (Mameli), A., i, 671.

3-Methyl-6-*iso*propylcoumaran-8-one, and its derivatives (Mameli), A., i, 669.

Methyl*iso*propylcoumarophenazine (Mameli), A., i, 671.

7-Methyl-7-*n*-propyl-α-dinaphthaxanthen, oxidation of, and 5:9-*di*hydroxy- (Sen-Gupta and Tucker), T., 563.

5-Methyl-2-*iso*propyl-1-ethylidene*cyclo*hexane (Ogata and Miyashita), A., i, 844.

Methyl-*n*- and -*iso*-propylglyoximes, and their salts and dibenzoyl derivatives (Ponzio), A., i, 18.

***Py*-*N*-Methyl-*Ind*-*N*-propylharmine** chloride (Kermack, Perkin, and Robinson), T., 1893.

cis-**1-Methyl-4-*iso*propyl*cyclo*hexane** (Skita and Schenck), A., i, 241.

5-Methyl-2-*iso*propylidenepyrrolenine-4-carboxylic acid, 3-hydroxy-, ethyl ester (Kuster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

5-Methyl-2-*iso*propyl-1-methylene*cyclo*hexane (Ogata and Miyashita), A., i, 844.

Methyl*iso*propylnaphthalenes and their salts (Ruzicka and Mingazzini), A., i, 1001.

6-Methyl-4-*iso*propyl-1-naphthoic acid, (Ruzicka, Meyer, and Mingazzini), A., i, 561.

δ-Methyl-δ-propyloctan-ε-ol, and its phenylurethane (Leroide) A., i, 216.

α-Methylpropylphosphinic acid, α-hydroxy-, lead salt (Conant, MacDonald, and Kinney), A., i, 186.

5-Methyl-1-propyl-2-*iso*propyl*cyclo*hexanol. See Propylmenthol.

1-Methyl-4-*iso*propyl-3-propylidene*cyclo*hexane (Ogata and Miyashita), A., i, 844.

2-Methyl-2-propyltetrahydrofuran, 5-hydroxy- (Helferich and Gehrke), A., i, 9.

1-Methyl-4-*iso*propyl-5:6:7:8-tetrahydronaphthalene (Ruzicka and Mingazzini), A., i, 1001.

α-Methyl-α-propylvaleric acid, and its ethyl ester and amide (Leroide), A., i, 216.

3-Methylpyrazole, 5-chloro-, sodium salt (Rojahn), A., i, 1183.

Methylpyrazoleanthrones (Mayer and Heil), A., i, 878.

3-Methyl-6-pyridazinone (Gault and Salomon), A., i, 873.

3-Methyl-6-pyridazinone-5-carboxylic acid, ethyl ester and hydrazide (Gault and Salomon), A., i, 873.

1-Methylpyridine-3-carboxylic acid, methyl ester, chloride (Merck), A., i, 950.
    methosulphate (Wolffenstein), A., i, 861.

1-Methyl-2-pyridone-2-benzoylimide, and its picrate (Tschitschibabin and Bylinkin), A., i, 573.

2-Methylpyrimidine, 6-chloro-5-bromo-, and 6-hydroxy- (Cherbuliez and Stavritch), A., i, 581.

2-Methylpyrimidine-4-carboxylic acid, 5-bromo-6-hydroxy-, and 6-hydroxy-, and their copper salts (Cherbuliez and Stavritch), A., i, 581.

5-Methylpyrrole-4-carboxylic acid, 5-amino-2-hydroxy-, ethyl ester (Fischer and Herrmann), A., i, 1054.

5-Methylpyrrole-4-carboxylic acid, 2- and 3-hydroxy-, ethyl esters, derivatives of (Fischer and Herrmann), A., i, 1054.

Methylpyrrolidine, 1-hydroxy- (Putochin), A., i, 1176.

3-Methylquindoline, and its acetyl derivative (Grandmougin), A., i, 585.

***N*-Methylquinicine** dihydrochloride (Heidelberger and Jacobs), A., i, 673.

2-Methylquinoline, 6-amino-, stanni- and stanno-chlorides (Druce), A., i, 1206.
    bromo-, and their salts (Moudgill), A., i, 173.

Methyl*iso*quinolines, and their methiodides (Mills and Smith), T., 2732.

2-Methylquinoline-3-carboxylic acid, 4-hydroxy-, oxide and its ethyl ester and derivatives (McCluskey), A., i, 864.

2-Methylquinoline-4-carboxylic acid, 6-hydroxy- (Halberkann), A., i, 175.

6′-Methyl*iso*quinoline-red (Harris and Pope), T., 1032.

1-Methyl-2-quinolone-4-carboxylic acid, ethyl ester (Thielepape), A., i, 271.

Methylquinoxalino*cyclo*pentane-2:3-dione-1-carboxylic acid, ethyl ester (Dieckmann), A., i, 1022.

Methylretene, formation of, from abietic acid (Ruzicka and Meyer), A., i, 829.

Methylretenequinone, and its quinoxaline derivative (Ruzicka and Meyer), A., i, 830.

***N*-Methyl*iso*safrolealkamine**, and its salts and derivatives (Takeda and Kuroda), A., i, 274.

Methyl*iso*safrole-2-imino-oxazolidine (Takeda and Kuroda), A., i, 274.

α-Methylserine. See α-Methylpropionic acid, α amino-β-hydroxy-.

Methylstannonic acid, constitution and derivatives of (Lambourne), T., 2533

β Methylsticinic acid (Murayama and Mayeda), A., i, 265.

α-Methylstyryl methyl ketone, amino- and nitro-derivatives (Heller, Lauth, and Buchwaldt), A., i, 349.

3-Methylsulphone-1-nitrophenyl-1:2:4-triazole, 5-hydroxy- (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 378.

3-Methylsulphone-1-phenyl-1:2:4-triazole, 5-hydroxy- (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 378.

p-**Methylsulphonetriphenylacetic acid** (BISTRZYCKI and KUBA), A., i, 33.

Nalita (Saha and Choudhury), T., 1044.

1:5-Naphthabisdioxindole (Martinet and Vacher), A., i, 689.

ββ-Naphthabisdioxindole-3:8-dicarboxylic acid, ethyl ester, and its acetyl derivatives (Martinet and Vacher), A., i, 689.

Naphthacinchoninylpropionic acid, ethyl ester (Carrière), A., i, 319.

β-Naphthacoumarin, nitro- (Morgan and Reeves), T , 7.

αβ-Naphthadihydro*iso*oxazine (Clemo and Perkin), T., 647.

1:5-Naphthadi-isatin, and its derivatives (Martinet and Vacher), A., i, 689.

Naphthaflavindulines, amino-, bromo-, hydroxy-, and nitro- (Dutt), T., 1951.

α-Naphthaldehyde, 2- and 4-hydroxy-, azomethine derivatives of (Morgan and Reeves), T., 1.
nitro-2-hydroxy- (Morgan and Reeves), T., 6.

β-Naphthaldehyde, phenylhydrazone of (Weil and Ostermeier), A., i, 139.

α- and **β-Naphthaldehydes**, bromo- (Mayer and Sieglitz), A., i, 742, 744.

Naphthalene, structure of, and its derivatives (Voroshcov), A., i, 1135.
absorption of ultra-violet rays by (Henry and Steiner), A., i, 928.
heat of combustion of (Verkade, Coops, and Hartman), A., ii, 475 ; (Swientoslawski and Starczewska), A , ii, 616.
vapour pressure of (Nelson and Senseman), A., i, 245.
ethylation of (Milligan and Reid), A., i, 330.
nitration of (Davis), A., i, 818.
catalytic oxidation of (Downs), A., i, 27 ; (Conover and Gibbs), A., i, 454.
and its derivatives, electrolytic oxidation of (Ono), A., i, 1008.
hydrogenated derivatives (Schroeter), A., i, 122, 123, 126 ; (Schroeter and Tetralin G. m. b. H.), A., i, 1036.

Naphthalene, 5-(or 8-)bromo-2-amino-, -2-hydroxy-, and -2-nitro-, and their derivatives (v. Braun, Hahn, and Seemann), A., i, 730.
bromonitro-1:5-*di*hydroxy- (Hemmelmayr), A., i, 836.
1:8-*di*bromo-2:7-*di*hydroxy-, and 5-iodo-1-nitro-, and their derivatives (Scholl, Seer, and Weitzenböck), A., ii, 650.
2:3-*di*bromo-1:4:5:8-*tetra*hydroxy-, 2:3:8-*tri*bromo-1:4 5-*tri*hydroxy-, and 1:4:5:8-*tetra*hydroxy- (Wheeler and Andrews), A., i, 354.
chloro-, chloroamino-, chlorohydroxy-, and chloronitro-derivatives (Kalle & Co.), A., i, 819.
*di*chloronitro- and *tri*chloro-derivatives (Friedlander, Karamessinis, and Schenk), A., i, 244.
1:4-*di*cyano- (Scholl and Neumann), A., i, 261.
1:5-*di*hydroxy-, effect of heating, with potassium hydrogen carbonate (Hemmelmayr), A., i, 836.
1:5- and 2:7-*di*hydroxy-, tautomerism of (Fuchs and Stix), A., i, 451.

Naphthalenes, *di*hydroxy-, equilibria of amines with (Kremann, Hemmelmayr, and Riemer), A., i, 1010.

Naphthalene-2-aldehyde, 4-bromo-1-hydroxy-, 4-chloro-1-hydroxy-, and their derivatives (Weil and Heerdt), A., i, 256.

Naphthalene-1-azo-*p*-benzylcamphor, β-hydroxy- (Haller and Boudin), A., i, 357.

Naphthalene-1-azo-*p*-benzylidenecamphor, β-hydroxy- (Haller and Boudin), A , i, 356.

5-Naphthaleneazo-6-methoxy-2-phenylquinoline-4-carboxylic acid, 5-hydroxy- (Halberkann), A., i, 175.

Naphthaleneazo-4-nitro-α-naphthol, 4-nitro- (Mukerji), T., 2881.

Naphthalene-1-carboxylic acid, 4-bromo-, and its methyl ester (Mayer and Sieglitz), A., i, 740.

Naphthalene-2-carboxylic acid, 4-chloro-1-hydroxy- (Weil and Heerdt), A., i, 257.

Naphthalene-1:4-dicarboxyl chloride (Scholl and Neumann), A., i, 261.

Naphthalene-1:4-dicarboxylic acid, and its methyl ester (Mayer and Sieglitz), A., i, 741.

Naphthalene-2:6-dicarboxylic acid, 1:5-dihydroxy-, and its barium salts and dinitro-derivative (Hemmelmayr), A., i, 836.

Naphthalene-1:5:disulphonic acid, salts of (FRIEDLÄNDER, KARAMESSINIS, and SCHENK), A., i, 244.

Naphthalene-3:6-disulphonic acid, 1:8-*di*amino-, and 1:8-*di*nitro-, salts of (LYNCH), A., ii, 881.

Naphthalenedi-*m*-thiobenzoic acid, (SMILES and GRAHAM), T., 2509.

Naphthalene-1-sulphinic acid, 5-amino-, acetyl derivative, and 5-chloro- (REISSERT), A., i, 584.
  8-amino-, and 5- and 8-nitro-, and their salts (REISSERT), A., i, 583.

Naphthalenesulphonamides, cyano- (KAUFMANN and ZOBEL), A., i, 744.

Naphthalene-1-sulphonic acid, 2:5-*di*amino- (BUCHERER and WAHL), A., i, 464.

Naphthalene-2-sulphonic acid, hexamminechromic and hexamminecobaltic salts (EPHRAIM and MOSIMANN), A., ii, 575.

Naphthalene-4-sulphonic acid, 1:8-*di*nitro-, sodium salt and sulphonyl chloride of (FRIEDLANDER, KARAMESSINIS, and SCHENK), A., i, 245.

Naphthalene-5-sulphonic acid, 1:6-*di*hydroxy-, disulphurous acid ester (BUCHERER and WAHL), A., i, 464.

Naphthalene-8-sulphonic acid, 4-chloro-1-hydroxy- (KALLE & Co.), A., i, 819.
  4-chloro-1 nitro-, and its sodium salt (FRIEDLANDER, KARAMESSINIS, and SCHENK), A., i, 244.

Naphthalenesulphonic acids, amine salts, solubilities of (WALES), A., i, 727.
  substituted, identification of (LYNCH), A., ii, 881.

Naphthalene-1-sulphonyl chloride, 2-cyano- (KAUFMANN and ZOBEL), A., i, 744.

Naphthalene-5-sulphonyl chloride, 4-nitro-1-amino-, acetyl derivative (REISSERT), A., i, 584.

3-β-Naphthalenesulphonyl-2-methylquinoline, and its platinichloride (TRÖGER and MENZEL), A., i, 270.

β-Naphthalenesulphonylpiperidine (BERGELL), A., i, 720.

ββ-Naphthaphenthiazine, and 3-amino-, 6:11-*di*hydroxy-, and 3-imino-, and their derivatives (FRIES and KERKOW), A., i, 578.

ββ-Naphthaphenthiazine-6:11-dicarboxylic acid, ethyl ester, 11:12-lactam (FRIES and KERKOW), A., i, 578.

ββ-Naphthaphenthiazine-6 11-quinone, and its derivatives, and 3-amino-, 3-bromo-, and 3-chloro- (FRIES and KERKOW), A., i, 578.

1:2-Naphthaquinols (FRIES), A., i, 42.

β-Naphthaquinoline, *di*amino-, and *di*nitro- (BROWNING, COHEN, GAUNT, and GULBRANSEN), A., i, 612.

Naphthaquinone, hydroxy-derivatives (WHEELER and ANDREWS), A., i, 354; (WHEELER and NAIMAN), A., i, 1165.

1:4-Naphthaquinone, *mono*- and *di*-bromo-5-hydroxy-, 2-bromo-2:3-*di*hydroxy-, and *mono*- and *di*-chloro-5-hydroxy- (WHEELER and NAIMAN), A., i, 1165.

Naphthaquinoneanil, hydrochloride and methyl ether of (KALLE & Co.), A., i, 824.

Naphthasaccharin I. and II. See Naphthoicsulphonimides.

4-1:8-Naphthasultamazo-1′-naphthalene-4′-sulphonic acid (KÖNIG and KÖHLER), A., i, 880.

1:8-Naphthasultam-4-sulphonic acid, and its salts and derivatives (KÖNIG and KEIL), A., i, 822.

Naphthasultone, preparation of sulphonyl chlorides of (KALLE & Co.), A., i, 819.

Naphthathiam, and nitroso- (REISSERT), A., i, 583.

Naphthathiam-blue, constitution of, and *di*amino- (REISSERT), A., i, 583.

α-Naphthatriazole-2:3-dicarboxylic acid, 3-hydroxy-, methyl ester (DIELS and WACKERMANN), A., i, 1195.

α-Naphthiminazole, 1-chloro- (FISCHER and KRACKER), A., i, 957.

αβ-Naphthiminazole-6-sulphonic acid (MORGAN and ROOKE), A., i, 134.

α-Naphthiminoazolone (DIELS and SÖRENSEN), A., i, 1195.

2:2′-ββ-Naphthindigotin (FIERZ and TOBLER), A., i, 869.

Naphthisatin, β-thio- (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 1179.

*meso***Naphthodixanthylene** (ECKERT and ENDLER), A., i, 941.

2-Naphthoic acid, 1-bromo- (MAYER and SIEGLITZ), A., i, 744.

3-Naphthoic acid, 6-amino-2-hydroxy- (FROELICHER and COHEN), T., 1659.

Naphthoic acids, reduction of (WEIL and OSTERMEIER), A., i, 139.

Naphthoicsulphonimides, and their derivatives (KAUFMANN and ZOBEL), A., i, 744.

α-Naphthol, 3-chloro- (FRANZEN and STÄUBLE), A., i, 450.
  5-iodo- (SCHOLL, SEER, and WEITZENBÖCK), A., i, 651.
  2:4-*di*nitro-, and its 7-sulphonic acid, cobaltammines of (MORGAN and KING), T., 1727.

β-Naphthol, preparation of (May), A., i, 449.
  detection of, in foods, spices, and beverages (Kinugasa and Tatsuno), A., ii, 400.
β-Naphthol, bromo- and bromonitro-derivatives (Franzen and Stäuble), A., i, 450.
  4:8-*di*chloro-, and its methyl ether (Friedlander, Karamessinis, and Schenk), A., i, 244.
Naphthols, substitution in (Franzen and Stauble), A., i, 450.
o-β-**Naphtholazophenylacetic acid**, and its sodium salt and esters (Neber), A., i, 545
β-Naphthol-3-carboxylic acid, methyl ester, condensation of methyl *n*-opianate with (Stosius), A., i, 746.
Naphtholcarboxylic acids, reduction of (Weil and Ostermeier), A., i, 139; (Weil and Heerdt), A., i, 256.
α-Naphthol-3:6-disulphonic acid, 8-amino- (H-*acid*), cobaltammine salt of (Morgan and Moss), T., 2864.
  estimation of (Lee), A., ii, 235.
α-Naphthol-2:5- and 4:5-disulphonic acids, 6-amino- (Bucherer and Wahl), A., i, 248.
α-Naphthol-2-sulphonic acid, sodium salt, use of in estimation of amino-compounds (Mathewson), A., ii, 882.
α-Naphthol-5-sulphonic acid, 6-amino-, and its derivatives (Bucherer and Wahl), A., i, 247.
  action of sulphites on (Bucherer and Wahl), A., i, 464.
Naphtholsulphonic acids, amino-, action of phenylhydrazine-bisulphite mixture on (Bucherer and Zimmermann), A., i, 465.
β Naphthoxyethylaniline (Clemo and Perkin), T., 649.
α- and **β-Naphthoxyparaffins** (Elektrochemische Werke, Bosshard, and Strauss), A., i, 913.
α- and β-Naphthoylbenzoic acids, acetyl derivatives (McMullen), A., i, 1025.
α-Naphthyl methyl ether, compound of tetrachlorophthalimide with (Pfeiffer and Flater), A., i, 342.
  5-iodo- (Scholl, Seer, and Weitzenböck), A., i, 651.
  thiocyanate (Challenger and Wilkinson), T., 100.
β-Naphthyl ethyl *di*sulphide (Lecher and Wittwer), A., i, 642.
α- and β-Naphthyl β-chloroethyl ethers, and 1-amino-, and 1-nitro- (Clemo and Perkin), T., 646.
α- and β-Naphthyl mercaptans, hydroxy- (Watson and Dutt), T., 2416.
α- and β-Naphthylacetaldoximes (Mayer and Sieglitz), A., i, 742, 743.
α- and β-Naphthylacetic acid, bromo-, and their derivatives (Mayer and Sieglitz), A., i, 742, 744.
d-**Naphthylalanine** (Sasaki and Kinose), A., i, 303.
dl-**Naphthylalanine**, action of *Bacillus proteus* on (Sasaki and Kinose), A., i, 303.
α-Naphthylamine, electrolytic oxidation of (Ono), A., i, 1008.
  substitution in (Franzen and Stäuble), A., i, 450.
α-Naphthylamine, 5-iodo-, and its salts (Scholl, Seer, and Weitzenböck), A., i, 650.
  8-thiol-, and its dibenzoyl derivative (Reissert), A., i, 584.
β-Naphthylamine, compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.
  additive compounds of, with azo-esters, and their oxidation products (Diels and Wackermann), A., i, 1068.
  analysis of (Lee and Jones), A., ii, 883.
α- and **β-Naphthylamines**, equilibria of, with dihydroxynaphthalenes (Kremann, Hemmelmayr, and Riemer), A., i, 1010.
  hydroferrocyanides of (Cumming), T., 1295.
α- and **β-Naphthylamines**, chloro-derivatives, and their derivatives (Friedlander, Karamessinis, and Schenk), A., i, 244.
α-Naphthylamine-8-sulphonic acid, 4-chloro-, sodium salt (Friedlander, Karamessinis, and Schenk), A., i, 244.
o-α-**Naphthylaminobenzoylbenzene**, *o*-2′ nitro- (Mayer and Freund), A., i, 866.
Naphthylaminodiphenyl, 4-amino-1:4′-*di*hydroxy- (Kalle & Co.), A., i, 824.
N-α-**Naphthyl-β-aminoethyl** hydrogen sulphate (Saunders), T., 2675.
p-α-**Naphthylaniline**, and its benzylidene derivative (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1197.
α-Naphthyl 1-anthraquinonyl ketone (Scholl, Seer, and Daimer), A., i, 258.
α-Naphthylarsinic acid, sulphonic acid of, and its potassium salts (Hill and Balls), A., i, 1080.

Naphthylazobenzene (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1197.
2-β-Naphthylbenzoxazole (Skraup and Moser), A., i, 575.
α-1- and -2-Naphthylbutanes (Mayer and Sieglitz), A., i, 741, 743.
α-1- and -2-Naphthylbutan-γ-ones, and their derivatives (Mayer and Sieglitz), A., i, 741.
1-α-Naphthyl-2:3-dibenzylquinoxalinium chloride, αα′-*di*cyano- (Dutt and Sen), T., 2666.
β-Naphthyldimethylamine-6-sulphonic acid, potassium salt (Morgan and Rooke), A., i, 135.
β-Naphthyl-β-dimethylaminoethyl ether, hydrochloride (Clemo and Perkin), T., 646.
1:2-Naphthylenecarbamide. See α-Naphthiminoazolone.
1:4-Naphthylenediamine-2-*p*-toluene-6(7)sulphonic acid, monoacetyl derivative, and its sodium salt (Society of Chemical Industry in Basle), A., i, 579.
α-1-Naphthylethylamine (Samuelson), A., i, 823.
α- and β-Naphthylethylamines, and their derivatives (Mayer and Sieglitz), A., i, 742, 743.
β-Naphthylethylmalonic acid (Mayer and Sieglitz), A., i, 743.
α-Naphthylglycine-8-carboxylic acid, sodium salt (Fierz and Sallmann), A., i, 870.
β-Naphthylglycine-3-carboxylic acid, and its sodium salt (Fierz and Tobler), A., i, 870.
Naphthylglycinesulphonic acids (Fierz and Sallmann), A., i, 870.
Naphthylideneanthranilic acid, β-hydroxy- (Ekeley, Rogers, and Swisher), A., i, 935.
α-Naphthylidenenitroanilines, 2- and 4-hydroxy- (Morgan and Reeves), T., 4.
5-Naphthylimino-2-thio-3-naphthyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
5-Naphthylimino-2-thio-3-phenyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
5-Naphthylimino-2-thio-3-tolyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
α-Naphthylmethyl ethyl ether, 4-bromo- (Mayer and Sieglitz), A., i, 742.
α- and β-Naphthylmethyl bromides, bromo- (Mayer and Sieglitz), A., i, 742, 743.
α- and β-1-Naphthylmethylacetoacetic acids, ethyl esters (Mayer and Sieglitz), A., i, 741, 743.
β-Naphthylmethylamine-6-sulphonic acid, and its salts and derivatives, and 1-nitroso- (Morgan and Rooke), A., i, 134.
α-1- and -2-Naphthylmethylbutyric acids, and their derivatives (Mayer and Sieglitz), A., i, 741, 743.
α- and β-Naphthylmethylethylmalonic acids, and their ethyl esters (Mayer and Sieglitz), A., i, 741, 743.
β-Naphthyl methyl ketone, and its derivatives (v. Braun, Hahn, and Seemann), A., i, 729.
α- and β-Naphthylmethylmalonic acids, and bromo-, and their derivatives (Mayer and Sieglitz), A., i, 741, 743.
β-Naphthylmethylnitrosoamine-6-sulphonic acid (Morgan and Rooke), A., i, 134.
α-1- and -2-Naphthyl-β-nitroethylenes (Mayer and Sieglitz), A., i, 742, 743.
Naphthylpropionic acids, bromo-, and their derivatives (Mayer and Sieglitz), A., i, 742.
2-β-Naphthylquinoline, methiodide of (v. Braun, Hahn, and Seemann), A., i, 729.
α-Naphthylthioselenium acetylacetone (Morgan, Drew, and Barker), T., 2453.
Narcosis, theory of (Traube and Klein), A., i, 198; (Joachimoglu), A., i, 199.
Narcotics, distribution coefficients of (Aiello), A., i, 301.
  mode of action of (Wieland), A., i, 497.
  effective strengths of (Fühner), A., i, 199.
Narcotine, estimation of, in opium (Rakshit), A., ii, 96.
Naurite (Elschner), A., ii, 714.
Neat's foot oil, analytical constants of (Eckart), A., i, 967.
Neoarsphenamine. See Neosalvarsan.
Neodymium oxide, density and molecular volume of (Prandtl), A., ii, 379.
Neon, spectrum of (Broughall), A., ii, 541.
  Rontgen spectrum and ionisation potential of (Grotrian), A., ii, 179.
  series spectrum of (Seeliger), A., ii, 17.
  excitation and ionisation potentials of (Hertz), A., ii, 733.
  frequency of electrons in the atom of (Broughall), A., ii, 213.

Neosalvarsan, toxicity of (Hart and Payne), A., i, 704.
Neotruxinic acids, and their derivatives (Stoermer and Bachér), A., i, 832.
Neoytterbium, atomic number of (Urbain), A., ii, 505.
Nepeta japonica, essential oil from (Murayama and Itagaki), A., i, 44.
Nephelectrometer (Kugelmass), A., ii, 692.
Nephelometers, theory and use of (Wells), A., ii, 308; (Weinberg), A., ii, 309; (Baudouin and Bénard), A., ii, 862.
Nephelometry of colloidal solutions (Bechhold and Hebler), A., ii, 693.
  of coloured hydrosols (Bechhold and Hebler), A., ii, 652.
Nephritis from chromic acid (Major), A., i, 610.
  nitrogen constituents of blood in (Williams), A., i, 401.
  nitrogen retention in (Weiss and Garner), A., i, 704.
  dropsical, excretion of chlorides in (Violle), A., i, 968.
Nerves, diffusion of hydrogen and hydroxyl ions in relation to the action of (Adams), A., i, 1211.
  sensory, stimulation of, by alcohols and chlorohydrins (Irwin), A., i, 899.
Nervous system, biochemistry of the (Pighini), A., i, 295.
Neutral salt action at high concentrations (Akerlöf), A., ii, 134.
Nickel, spectrum of (Müller), A., ii, 725.
  electrolytic, structure of, and its deposition and solution potential (Kohlschütter and Schödl), A., ii. 648.
  scattering of electrons by (Davisson and Kunsman), A., ii, 251.
  catalytic hydrogenation with (Rideal), T., 309.
  effect of copper on the catalytic activity of (Armstrong and Hilditch), A., ii, 757.
  occurrence and estimation of, in plants (Bertrand and Mokragnatz), A., i, 1099.
  in arable soils (Bertrand and Mokragnatz), A., i, 975.
Nickel alloys with chromium, expansion of (Chenevard), A., ii, 153.
  estimation of chromium in (Löffelbein; Hild), A., ii, 660.
  with copper and zinc (Voigt), A., ii, 295.
  with manganese, electrochemistry of (Tammann and Vaders), A., ii, 380.
Nickel salts, catalytic hydrogenation by means of (v. Braun and Kirschbaum), A., i, 727.
Nickel chloride, equilibrium in the system, ammonium chloride, water, and (Clendinnen), T., 801.
  equilibrium of the reduction of, by hydrogen (Berger and Crut), A., ii, 38.
  haloids, crystal structure of the ammoniates of (Wyckoff), A., ii, 573.
  hydroxide, preparation of colloidal solutions of (Tower and Cooke), A., ii, 853.
  nitrate, composition and crystal structure of (Wyckoff), A., ii, 573.
  nitrites, complex (Cuttica), A., ii, 448.
  oxide, reduction of, by hydrogen (Berger), A., ii, 508.
  tungstate (Smith), A., ii, 774.
Nickel organic compounds:—
  with dioximes (Bjerrum), A., i, 18, 19, 20, 21.
Nickel estimation:—
  estimation of, electrometrically (Müller and Lauterbach), A., ii, 875.
  estimation of, gravimetrically, as dioxide (Vaubel), A., ii, 875.
  estimation of, in silicate rocks (Hackl), A., ii, 458.
  estimation of, in steel (Rubricius), A., ii, 163; (Simion), A., ii, 529.
  estimation of magnesium in (Chalupny and Breisch), A., ii, 227.
Nicotine, estimation of, in tobacco (Liotta), A., ii, 404.
Nicotinic acid (*pyridine-3-carboxylic acid*), amyl and ethyl esters (Wolffenstein), A., i, 861.
  ethyl ester, *N*-ethiodide (Wolffenstein), A., i, 365.
  methyl ester, preparation of *N*-alkylhaloids of (Wolffenstein), A., i, 365.
  dipropylamide and piperidide of (Society of Chemical Industry in Basle), A., i, 1058.
Nicotinodiethylamide (Hartmann and Seiberth), A., i, 679.
Nicotinodipropylamide (Hartmann and Seiberth), A., i, 679.
Nicotinopiperidide (Hartmann and Seiberth), A., i, 679.
Night-blue, surface tension of aqueous solutions of (de Izaguirre), A., ii, 262.
  effect of anions on the colloidal state of (Akamatsu), A., ii, 830.
Niobium *pent*oxide, action of light on (Renz), A., ii, 61.

- **Nirvanol** (*4-phenyl-4-ethylhydantoin*), synthesis of (Read), A., i, 954.
- **Niton** (*radium emanation*), spectrum of (Nyswander, Lind, and Moore), A., ii, 803.
  - activity of γ-rays from (Slater), A., ii, 681.
  - effect of, on blood and urine (Hauenstein), A., i, 80.
- **Nitration** of hydrocarbons (Battegay and Brandt), A., i, 1001.
- **Nitrides**, rate of formation of (Tammann), A., ii, 852.
- **Nitrification** (Miyake and Soma), A., i, 1096.
  - in soils (Stephenson), A., i, 416.
- **Nitriles**, dynamics of the formation of, from anhydrides and amides (Kremann, Zoff, and Oswald; Kremann, Rosler, and Penkner), A., ii, 748.
  - action of hydrogen peroxide on (Oliveri-Mandalà), A., i, 544.
  - action of organomagnesium compounds on (Baerts), A., i, 817.
  - aromatic, electrochemical oxidation of (Fichter and Grisard), A., i, 37.
- *iso***Nitriles** (Passerini), A., i, 731.
- **Nitro-compounds**, reduction of, by stannous chloride (Goldschmidt, Storm, and Hassel), A., ii, 361.
  - reduction of, by titanium trichloride (Rathsburg), A., i, 242.
  - aromatic, formation of salts from (Lifschitz), A., i, 737.
    - catalytic reduction of (Brand and Steiner), A., i, 536.
    - removal of halogen atoms from (Macbeth), T., 1116.
    - action of sodium hydrogen sulphite on (Weil and Moser), A., i, 443.
  - halogenated, reduction of (Burton and Kenner), T., 675.
  - detection of (Prins), A., ii, 877.
- **Nitrogen atom**, structure of the (Moir), T., 1808.
  - active modification of (Newman), A., ii, 279, 639; (Wendt), A., ii, 639.
  - origin of the spectrum of (Duffieux), A., ii, 597.
  - ionisation and excitation tension of (Brandt), A., ii, 186.
  - heat of vaporisation and specific heat of (Mathias, Crommelin, and Onnes), A., ii, 472.
  - pure, density of (Moles), A., ii, 562.
  - atmospheric, from Madrid, density of (Payá and Moles), A., ii, 762.
  - equation of state for (Bartels and Eucken), A., ii, 117.
  - isotherms of (Holborn and Otto), A., ii, 737.
- **Nitrogen**, rectilinear diameter of (Mathias, Onnes, and Crommelin), A., ii, 562.
  - absorption of, by calcium and its alloys (Ruff and Hartmann), A., ii, 377.
  - viscosities of carbon monoxide and (Smith), A., ii, 549.
  - electrolytic reduction of (Fichter and Suter), A., ii, 372.
  - explosion of acetylene and (Garner and Matsuno), T., 1729.
  - reaction of ethylene and, under the electric discharge (Miyamoto), A., i, 418.
  - reaction between carbon, barium carbonate and (Askenasy and Grude), A., ii, 445.
  - reaction between carbon, sodium carbonate and (Ingold and Wilson), T., 2278.
  - quadrivalent, radicles containing (Wieland and Kogl), A., i, 726.
  - fixation of, in soils (Greaves, Carter, and Lund), A., i, 976.
  - effect of diet on fixation of, in the organism (Dienes), A., i, 293.
- **Nitrogen compounds**, photosynthesis of (Baly, Heilbron, and Hudson), T., 1078.
- **Nitrogen** *tri*chloride, attempted preparation of (Noyes), A., ii, 143.
  - chlorination by means of (Coleman and Noyes), A., i, 133.
  - *mono*xide (*nitrous oxide*), viscosities of carbon dioxide and (Smith), A., ii, 549.
    - solubility of, in various solvents (Kunerth), A., ii, 823.
    - narcotic action of (Wieland), A., i, 497.
  - *di*oxide (*nitric oxide*), preparation of, from boron nitride and metallic oxides (Sborgi and Nasini), A., ii, 564.
    - oxidation of (Burdick), A., ii, 272; (Briner, Niewiazski, and Wiswald), A., ii, 563.
    - action of, on metallic carbonyls (Mond and Wallis), T., 32.
    - action of, and its derivatives on sodium arsenite (Gutmann), A., ii, 844.
    - estimation of (Klemenc and Bunzl), A., ii, 783.
  - *tri*oxide (*nitrous anhydride*) (Foerster), A., ii, 284.
  - *per-* or *tetr*-oxide, liquid, analysis of (Sanfourche), A., ii, 454.
  - oxides, formation and decomposition of (Bodenstein, Boës, Lindner, and Ramstetter), A., ii, 372.

- **Nitrogen** oxides, formation of, in gas analysis (Jones and Parker), A., ii, 223.
  - reactions of alkalis with (Sanfourche), A., ii, 762.
  - compounds of, with olefines and zinc (Schaarschmidt, Veidt, and Schlosser), A., i, 645.
  - analysis of mixtures of (Burdick), A., ii, 583.
  - estimation of, in air (Allison, Parker, and Jones), A., ii, 313.
- **Nitric acid**, oxidation reactions in the synthesis of (Matignon), A., ii, 563.
  - electrolytic concentration of aqueous solutions of (Creighton), A., ii, 212.
  - heats of neutralisation of (Richards and Rowe), A., ii, 425.
  - heat developed on mixing sulphuric acid, water and (McDavid), A., ii, 617.
  - vapour pressure of aqueous solutions of (Sproesser and Taylor), A., ii, 143.
  - action of, on metals (Banerji and . Dhar), A., ii, 756.
  - estimation of nitrogen in esters of (Kesseler, Rohm, and Lutz), A., ii, 392.
- **Nitrates**, organic compounds giving precipitates with (Giral Pereira), A., ii, 523.
  - assimilation of (Baudisch), A., i, 194.
  - detection of (Foresti), A., ii, 524.
  - detection and estimation of, in serum and in urine (Nolte), A., ii, 583.
  - estimation of, in drinking water (Reuss), A., ii, 454.
- **Nitrous acid**, velocity of decomposition of (Klemenc and Pollak), A., ii, 432.
  - rate of reaction of, with aliphatic amino-acids (Dunn and Schmidt), A., i, 1024.
  - action of, on iodides, in presence of oxygen (Lombard), A., ii, 313.
  - and its salts, detection of (Falciola), A., ii, 783.
  - estimation of, in presence of arsenious acid (Klemenc), A., ii, 865.
- **Nitrites**, reaction of, with thiosulphates (Falciola), A., ii, 453.
  - assimilation of (Baudisch), A., i, 194.
  - estimation of, in presence of nitrates (Mach and Sindlinger), A., ii, 783.
- **Nitrogen**:—
  - **Pernitric acid**, properties and structure of (Trifonov), A., ii, 845.
    - as an analytical reagent (Mathewson), A., ii, 883.
- **Nitrogen estimation**:—
  - estimation of, by Dumas's method (Mohr), A., ii, 82.
  - estimation of, by the Kjeldahl method (Paul and Berry), A., ii, 82; (Parnas and Wagner), A., ii, 312; (M. and I. Sborowsky), A., ii, 783.
  - estimation of, by a modified Kjeldahl method (Mears and Hussey), A., ii, 159; (Skutil), A., ii, 582.
  - estimation of, by a micro-Kjeldahl method (Ling and Price), A., ii, 522.
  - estimation of, microchemically (Schoeller), A., ii, 159; (Acél), A., ii, 225; (Vallée and Polonovski), A., ii, 312; (Holtz), A., ii, 521.
  - estimation of, in ammonium salts (Meurice), A., ii, 225.
  - estimation of, in fertilisers (Mach and Sindlinger), A., ii, 783.
  - estimation of, in nitric esters (Kesseler, Röhm, and Lutz), A., ii, 392.
  - amino-acid, estimation of, by the ninhydrin reaction (Riffart), A., ii, 718.
  - non-protein, estimation of, in blood (Ponder), A., ii, 583; (Richter-Quittner and Hoenlinger), A., ii, 717.
    - estimation of, in serum (Cristol), A., ii, 583.
- **Nitro-groups**, replacement of diazo-groups by (Vesely and Dvořák), A., i, 690.
  - aromatic, reduction of, by tissues (Lipschitz and Gottschalk), A., i, 298.
  - estimation of, in aromatic organic compounds (Callan and Henderson), A., ii, 524.
- **β-ψ-Nitrole-γ-ketopentane**, α-oximino- (Ponzio and Ruggeri), A., i, 629.
- **β-ψ-Nitrole-γ-ketophenylbutane**, α-oximino- (Ponzio), A., i, 1038.
- **Nitrones**, catalytic reduction of (Cusmano), A., i, 143.
- **Nitrosyl** chloride, action of, on *n*-heptane (Lynn and Hilton), A., i, 417.
- **Nitrosylselenic acid** (Meyer and Wagner), A., ii, 372.
- **Nitrous acid**. See under Nitrogen.
- **Nitrous anhydride**. See Nitrogen *tri*oxide.

Nitzschia closterium, synthesis of vitamin-*A* by (Jameson, Drummond, and Coward), A., i, 1099.

Nonadecan-δ-ol, and its phenylurethane (Leroide), A., i, 217.

Δ^{α}-**Nonenoic acid,** vanillylamide and *p*-hydroxybenzylamide of (Ott and Zimmermann), A., i, 137.

Nono*iso*butylamide (Asahina and Asano), A., i, 506.

n-**Nonoic acid,** preparation of (Asahina and Ishida), A., i, 520.
  sodium salt, properties of solutions of (Flecker and Taylor), T., 1101.

Norcholoidanic acid, and its dimethyl ester (Wieland and Adickes), A., i, 838.

Norpinic acid, structure and synthesis of (Ganguly), A., i, 1153.

Norsolannellic acid (Wieland and Schulenburg), A., i, 346.

Nortropinonecarboxylic acid, ethyl ester, and its derivatives (Merck, Wolfes, and Maeder), A., i, 1173.

Novocaine, estimation of (Hanson), A., ii, 405.

Nucleic acid, compounds of proteins with (Steudel and Peiser), A., i, 1200.
  metabolism of. See Metabolism.
  animal, preparation and analysis of (Levene), A., i, 1075.
  in bacteria (Schaffer, Folkoff, and Jones), A., i, 1095.
  pancreatic (Hammarsten and Jorpes), A., i, 387.

Nucleic acids, anticoagulating action of (Doyon), A., i, 82, 1087.
  from spleen of cattle (Steudel), A., i, 297.

Nuclein metabolism. See Metabolism.

Nutmeg butter (B.), A., i, 975.

Nuts, Barbassu, constituents of (Jumelle), A., i, 207.

Nut tree oil, purging (L.), A., i, 908.

Nystagmus (Pentimalli), A., i, 302.

O.

Oak, black powder from a hollow (v. Lippmann), A., i, 311.
  tannin from the (Freudenberg and Vollbrecht), A., i, 1046.

Oats, ergot of. See Ergot.

from the Sudan (Joseph and Whitfeild), A., i, 754.
from Tonkin and Annam (Gattefossé), A., i, 1167.
effect of sunlight on the formation of, in plants (Canals), A., i, 907.
detection of, in animal fats (Muttelet), A., ii, 168.
estimation of the acetyl value of (Leys), A., ii, 167; (Cook), A., ii, 324.
estimation of the iodine-bromine number of, without using potassium iodide (Winkler), A., ii, 534.
Oil-water emulsions, reversal of phases in (Bhatnagar), A., ii, 204.
Oleanilide *di*bromide (Nicolet), A., i, 106.
Olefines, magnesium compounds of (Krestinski), A., i, 1128.
Oleic acid, measurement of the surface pressure of thin layers of (Marcelin), A., ii, 687.
catalytic decomposition of (Mailhe), A., i, 423.
relation of, to its halogen additive products (Nicolet), A., i, 106.
sodium salt, ultra-filtration of solutions of (McBain and Jenkins), T., 2325.
vanillylamide of (Ott and Zimmermann), A., i, 137.
Oleic anhydride, iodine value of (Holde, Werner, Tacke, and Wilke), A., ii, 723.
α-Olein (Amberger and Bromig), A., i, 804.
Oleoacetylhydroxamic acid (Nicolet and Pelc), A., i, 644.
Oleodiacetylhydroxamic acid (Nicolet and Pelc), A., i, 644.
α-Oleo-βγ-distearin (Amberger and Bromig), A., i, 804.
Oleum fagi sylvaticæ. See **Beechnut** oil.
Oligodynamy of silver (Doerr and Berger), A., i, 1097.
Olive oil, coloration of, with the Villavecchia reagent (Prax), A., ii, 595.
Olivine from lithosiderites (Chirvinskii), A., ii, 714.
n-**Opianic acid**, methyl ester, condensation of methyl β-naphthol-3-carboxylate with (Stosius), A., i, 746.
Opium, estimation of meconic acid in (Annett and Bose), A., ii, 791.
Indian, estimation of alkaloids in (Rakshit), A., ii, 96.
Optical anomalies, negative, effect of substitution on (Le Bas), A., ii, 9.
properties of solutions (Wasastjerna), A., ii, 2.
rotation. See Rotation.
Optically active compounds, influence of constitution on the rotatory power of (Rupe and Jaggi), A., i, 840; (Rupe), A., ii, 602.
Optotoxin. See Ethyldihydrocupreicine.
Oranges, changes in, on keeping (André), A., i, 209.
Orchids, coumarin glucosides in (Hérissey and Delauney), A., i, 210.
Orcinolsulphamphthalein (Dutt), T., 2391.
Ores, genesis of, in relation to geographical distribution (Gregory), T., 750.
Organic chemistry, problems of (Trautz and Winkler), A., i, 926.
Organic compounds, atomic and molecular refraction in (Swientoslawski), A., ii, 173; (v. Auwers and Kolligs), A., ii, 174.
rotatory dispersion of (Lowry and Cutter), T., 532.
crystalline, structure of (Bragg; Becker and Jancke), A., ii, 128.
valency of (Henrich), A., ii, 704, (Stieglitz), A., ii, 705.
polar and non-polar valency in (Garner), A., ii, 758.
linkings of carbon atoms in (Wibaut), A., ii, 259; (Beutler), A., ii, 259, 348.

Organic compounds, lability of halogen atoms in (Henderson and Macbeth), T., 892; (Hirst and Macbeth), T., 904, 2169; (Graham and Macbeth), T., 1109, 2601; (Macbeth), T., 1116; (Black, Hirst, and Macbeth), T., 2527.
numerical relationships between carbon atoms in (Decker), A., i, 417.
thermochemistry of (Swientoslawski), A., ii, 195; (Fajans), A., ii, 818; (Thiel), A., ii, 819.
relation between heats of fusion and of solution of (Gehlhoff), A., ii, 121.
wet combustion of, by means of chromic acid (Simon), A., ii, 593.
biochemical and electrochemical oxidation of (Fichter), A., ii, 23, (Nathansohn), A., ii, 421; (Muller), A., ii, 469.
electrochemistry of the reversible reduction of (Conant, Kahn, Fieser, and Kurtz), A., ii, 547.
catalytic reduction of, by platinum oxide (Voorhees and Adams), A., ii, 558.
phosphorescent mixtures of boric acid with (Tiede, Wulff, and Ragoss), A., ii, 8.
action of Dakin's hypochlorite solution on (Engfeldt), A., i, 812.
preparation of bromo-derivatives of, without production of hydrogen bromide (Gupta and Thorpe), T., 1896.
elimination of carbon dioxide from (Kunz-Krause and Manicke), A., ii, 731.
behaviour of, in plants (Ciamician and Galizzi), A., i, 503.
aromatic, estimation of nitro-groups in (Callan and Henderson), A., ii, 524.
homologous, variation of physical properties of (Pauly), A., i, 1; (Stark), A., i, 2.
giving precipitates with nitrates (Giral Pereira), A., ii, 523.
micro-analysis of (Welter), A., ii, 399.
detection of oxygen in (Piccard), A., ii, 389.
estimation of carbon and hydrogen in (Wrede), A., ii, 316; (Lindner), A., ii, 657; (Simon and Guillaumin), A., ii, 867; (Simon), A., ii, 868.
estimation of carbon and oxygen in (Klein and Steuber), A., ii, 159.
estimation of chlorine in (Klimont), A., ii, 580; (Votoček), A., ii, 863.

Organic compounds, estimation of oxygen in (Meulen), A., ii, 717.
estimation of phosphorus in (Mancini), A., ii, 83.
estimation of phosphorus in, iodometrically (Svanberg, Sjöberg, and Zimmerlund), A., ii, 867.
estimation of sulphur in (Meulen), A., ii, 311.
estimation of thallium in (A. E. and D. Goddard), T., 488.
Organic dust, explosions of (Beyersdorfer), A., ii, 749.
Organism, animal, synthesis of amino-acids in the (Shiple and Sherwin), A., i, 492.
deamination of amino-acids in the (Kotake), A., i, 1218.
oxidation in the (Mittra and Dhar), A., i, 1210.
Organo-metallic compounds (Schlubach and Goes), A., i, 1204.
preparation of (Goddard, Ashley, and Evans), T., 978.
interaction of, with inorganic haloids (Challenger and Ridgway), T., 107.
Origanum vulgare, constituents of oils from (Angelescu), A., i, 460.
Ornithine, presence of, in plants (Kiesel), A., i, 412.
Osazones, formation of (van Laer and Lombaers), A., i, 113.
Osmium, detection of, with potassium thiocyanate (Hirsch), A., ii, 459.
Osmometers, collodion (Brown), A., ii, 690.
Osmosis, anomalous (Loeb), A., ii, 124, 354, 467, 742.
See also Electrical endosmosis.
Osmotic pressure, measurement of, with the water interferometer (Lotz and Frazer), A., ii, 264.
regulation of (Palmer, Atchley, and Loeb), A., i, 692.
determination of molecular weight by means of (Foix), A., ii, 621.
of protein solutions (Loeb), A., ii, 742.
Ovalbumin. See under Albumin.
Overvoltage (Newbery), T., 7.
measurement of (Tartar and Keyes), A., ii, 343.
on electrodes (Isgarischev and Berkmann), A., ii, 253, 254.
Oxalic acid, and its potassium salt, action of radium rays on (Kailan), A., ii, 543.
action of electric arc light on the catalytic decomposition of solutions of (Kunz-Krause and Manicke), A., ii, 731.

Oxalic acid, crystallised, as a standard in oxidation processes (Hill and Smith), A., ii, 388.
formation of, in growth of *Aspergillus* and *Citromyces* (Butkewitsch), A., i, 707, 978.
in young leaves (Bau), A., i, 309.
behaviour of, in the animal organism (Pincussen), A., i, 403.
calcium salt, monohydrate, optical and crystallographic properties of (Wherry), A., ii, 450.
equilibrium of potassium carbonate with (Ramann and Sallinger), A., ii, 131.
lead diphenyl salt (Goddard, Ashley, and Evans), T., 981.
potassium salt, preparation of, from potassium acetate (Evans and Hines), A., i, 803.
sodium salt, formation of, from sodium formate (Matignon and Marchal), A., i, 915.
uranyl salt, photolysis of (Baur and Rebmann), A., ii, 337; (Baur and Hagenmacher), A., ii, 338.
methyl ester, decomposition of, by acetic acid (Turner and Wilson), A., i, 916.
detection and estimation of, and its use in standardisation (Rosenthaler), A., ii, 594.
estimation of, with permanganate without addition of acid (Witt), A., ii, 594.
estimation of, in urine (Salkowski), A., ii, 92; (Mislowitzer), A., ii, 325.

Oxalodi-5-acenaphthylamide (Fleischer and Schranz), A., i, 1143.

β-Oxalyl-*n*-butyric acid, ethyl ester (Feist and Breuer), A., i, 521.

***iso*Oxazolecarboxylic acids**, isomerism of (Betti and Berlingozzi), A., i, 52.

Oxidation, simultaneous reduction and (Kotz and Rathert), A., i, 236.
catalysis of (Karczag), A., ii, 137.
biochemical and electrochemical, of organic compounds (Fichter), A., ii, 23; (Nathansohn), A., ii, 421; (Müller), A., ii, 469.
electrolytic. See Electrolytic oxidation.
with potassium permanganate (Bigelow), A., i, 998.

Oxidation-reduction reactions, effect of substitution on the free energy of (LaMer and Baker), A., ii, 735.

***NN'*-Oxidobisdihydromorphinesulphonic acid** (Speyer and Becker), A., i, 676.

Oximes, thermochemistry of (Dorabialska), A., i, 725; ii, 548.
isomerism of (Brady and Thomas), T., 2098.

Oximinoacetoacetic acid, ethyl ester, stereoisomerism of (Dorabialska), A., i, 725.

Oximinoacetophenone, cobaltous salt (Ponzio), A., i, 662.

Oximinoacetylacetone, cupric and cobaltous salts (Ponzio), A., i, 662.

Oximinobenzoylacetone, cobaltous salt (Ponzio), A., i, 662.

***N*-Oximino-ethers** (Barrow, Griffiths, and Bloom), T., 1713.

α-Oximinoketones, cobalt compounds of (Ponzio), A., i, 661.

Oxindigo, synthesis of (Fries and Hasenjager), A., i, 45.

Oxindole, 1-amino-, and its *o*-nitrobenzylidene derivative (Neber), A., i, 546.

Oxonium salts from phenols and their ethers (Kehrmann, Decker, and Solonina), A., i, 32; (Kehrmann, Decker, and Schmajewski), A., i, 33.

Oxy*allo*betulin, and its acetate (Schulze and Pieroh), A., i, 1046.

Oxycellulose (Heuser and Stockigt), A., i, 719.
formation and reactions of (Clifford and Fargher), A., i, 1121.
action of heat on (Justin-Mueller), A., i, 11.
reactions of, with alkalis (Schwalbe and Becker), A., i, 232.
detection of (Becker), A., ii, 94.

Oxydases, chemical nature of (van der Haar), A., i, 284.

Oxydehydrocorydaline (Gadamer and v. Bruchhausen), A., i, 675.

Oxydigitogenic acid, trimethyl ester (Windaus and Weil), A., i, 849.

Oxygen, absorption spectra of liquid and gaseous (Shaver), A., ii, 331.
band spectrum of (Runge), A., ii, 329.
heat of reaction of, with hæmoglobin (Adolph and Henderson), A., ii, 350.
heat of vaporisation and specific heat of (Mathias, Crommelin, and Onnes), A., ii, 472.
rectilinear diameter of (Mathias and Onnes), A., ii, 561.
isotherms of (Holborn and Otto), A., ii, 737.
univalent (Goldschmidt), A., i, 1148; (Goldschmidt and Schmidt), A., i, 1149.
compressibility of (Guye and Batuecas), A., ii, 617.

Oxygen, density of (Moles), A., ii, 141; (Moles and González), A., ii, 497; (Moles and Crespi), A., ii, 636.
  solubility of, in organic solvents (Fischer and Pfleiderer), A., ii, 841.
  velocity of the action of, on metals (Tammann and Koster), A., ii, 831.
  equilibrium of silver oxide and (Keyes and Hara), A., ii, 353.
  ignition of mixtures of ammonia and (White), T., 1688.
  ignition of mixtures of hydrogen and (Mitscherlich), A., ii, 358.
  combination of hydrogen and, in presence of colloidal palladium (Sandonnini and Quaglia), A., ii, 556.
  catalytic formation of water from hydrogen and (Pease and Taylor), A., ii, 701.
  partial pressure of, in human blood (Barcroft and Nagahashi), A., i, 890.
  relation between carbon dioxide and, in respiration (Thunberg), A., i, 889.
  subcutaneous absorption of, at high altitudes (Bayeux), A., i, 79.
Oxygen detection and estimation:—
  detection of, in organic compounds (Piccard), A., ii, 389.
  estimation of small quantities of (Sheaff), A., ii, 582.
  estimation of, in hydrogen (Larson and White), A., ii, 311.
  estimation of, in organic compounds (Klein and Steuber), A., ii, 159; (Meulen), A., ii, 717.
Oxyhæmoglobin, crystalline, preparation of (Heidelberger), A., i, 962.
  dissociation of (Hill), A., i, 193.
Oxynitrilase. See δ-Emulsin.
Oxynitrilese. See σ-Emulsin.
10-Oxy-9-oxythionaphthenyl-6-oxyphenanthrene (Friedlander, Herzog, and v. Voss), A., i, 764.
3-Oxythionaphthen, condensation of formic acid with (Schwenk), A., i, 153.
2-Oxythionaphthenyl-2-indane-1:3-dione (Friedländer, Herzog, and v. Voss), A., i, 764.
Ozone, preparation and properties of (Riesenfeld and Schwab), A., ii, 637.
  luminescence of, when decomposing (Trautz and Seidel), A., ii, 730.
  physical constants of (Riesenfeld and Schwab), A., ii, 761.
  action of, on amines (Strecker and Baltes) A., i, 14.
Ozone, action of, on hydrocarbons (Wheeler and Blair), A., i 1105.
  action of, on lactose (Schonebaum), A., i, 717.
  action of, on sugars (Schonebaum), A., i, 223.
Ozoniser, new (Němeček), A., ii, 841.

P.

Pagoda corn oil, constituents of (Roure-Bertrand Fils), A., i, 845, 846.
Palladium, occlusion of hydrogen by (Oxley), A., ii, 469.
  properties of hydrogen desorbed from (Anderson), T., 1153.
  separation of, from platinum, by means of dimethylglyoxime (Davis), A., ii, 662.
Palmatine, conversion of berberine into (Spath and Lang), A., i, 166.
Palmitic acid, sodium salt, hydrolysis of solutions of (McBain, Taylor, and Laing), T., 621.
  cetyl ester (Brigl and Fuchs), A., i, 713.
  vanillylamide of (Ott and Zimmermann), A., i, 137.
α-Palmito-βγ-diolein (Amberger and Bromig), A., i, 804.
Palmitodistearins, isomeric (Amberger and Bromig), A., i, 804.
Pancreas, function of the (Adler), A., i, 195.
  action of amino-acid hydrochlorides on the secretion of (Arai), A., i, 297.
  amylolytic activity of, in polyneuritis (Tiger and Simonnet), A., i, 195.
  nucleic acid from (Hammarsten and Jorpes), A., i, 387.
  hydrolysis of yeast-nucleic acid by boiled extracts of (Jones), A., i, 479.
Papilionaceæ, glucosides from (Vergelot), A., i, 207.
Paracetaldehyde, preparation of (Vogt and Nieuwland), A., i, 111.
Paracetaldehyde, bromo- (Helferich and Speidel), A., i, 6.
Paraffins, oxidation of, with nitrogen peroxide (Granacher and Schaufelberger), A., i, 513.
Paraffins, *mono*- and *di*-chloro- (Elektrochemische Werke, Bosshard, and Strauss), A., i, 913.
  nitro-, absorption spectra of (Graham and Macbeth), T., 1109.
    substituted, reduction of, with titanium salts (Henderson and Macbeth), T., 892.

Paraffin wax, composition of (Francis), T., 496; (Francis, Watkins, and Wallington), T., 1529, 2804.

action of, with oxygen, sulphur, selenium or tellurium (Siebeneck), A., i, 417.

Paralysis agitans, sugar regulation in (Dresel and Lewy), A., i, 969.

Paramœcium, toxicity of alkloids for (Crane), A., i, 404.

Pararosanilineleucosulphonic acid, salts and hydrates of (Wieland and Scheuing), A., i, 58.

Paris green, estimation of copper and arsenic in (Kolthoff and Cremer), A., ii, 86.

α-**Particles**, disintegration of elements by (Rutherford and Chadwick), A., ii, 682.

excitation of γ-rays by (Slater), A., ii, 13.

collisions of, with hydrogen nuclei (Chadwick and Bieler; McAulay), A., ii, 12.

as detonators (Henderson), A., ii, 606.

Passivity (Evans; Gillis), A., ii, 814.

Patchouli oil (Roure-Bertrand Fils), A, i, 846.

Paullinia tannin (Nierenstein), T., 23.

Pea, absorption of calcium chloride by the roots of (Redfern), A., i, 614.

Peaches, odorous constituents of (Power and Chesnut), A., i, 99.

Pectin in stored fruit (Carré), A., i, 1222.

estimation of, in apples (Carré and Haynes), A., ii, 401.

Pectinase produced by *Rhizopus* (Harter and Weimer), A., i, 507.

Pelargonenin (Currey), T., 322.

Pelargonin (Currey), T., 319.

Pelargonium, scarlet, colouring matter of the (Currey), T., 319.

Pellagra, deficiency of amino-acids as a cause of (Goldberger and Tanner), A., i, 1092.

amino-acids and hippuric acid in the urine in (Murlin), A., i, 965.

Pellotine, constitution of (Späth), A., i, 163.

Penta-acetylsalicinethylamine (Zemplén and Kunz), A., i, 564.

Penta-acetylsalicinmethylamine (Zemplén and Kunz), A., i, 564.

*iso***Pentacosane** (Levene and Taylor), A., i, 715.

*iso***Pentacosoic acid, and its** ethyl ester, and α-bromo-, and α-hydroxy- (Levene and Taylor), A., i, 714.

*iso***Pentacosyl** iodide (Levene and Taylor), A. i, 715.

*iso***Pentacosyl alcohol** (Levene and Taylor), A., i, 715.

Pentamethoxy-β**-gambier-catechin carboxylic acid** (Nierenstein), T., 28.

3:4:6:3′:4′-Pentamethoxy-3-phenylchroman, and 2-chloro-, and 2-hydroxy-, and its acetyl derivative (Nierenstein), T., 613.

Pentamethyl-$\Delta^{2\,5}$*cyclo***hexadien-4-ols** (v. Auwers and Ziegler), A., i, 121.

2:2:3:3:5-Pentamethylindoline, and its salts and derivatives (Knoevenagel), A., i, 1061.

Pentamminechromiselenates. See under Chromium.

Pentamminecobaltiselenates. See under Cobalt.

n-**Pentane**, molecular scattering of light in (Venkateswaran), T., 2655.

n-**Pentane**, $\beta\gamma\delta$-*tri*oximino-. See Dimethyl triketone trioxime.

*iso***Pentane**, physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.

*cyclo***Pentane**, effect of attached groups on ring formation in (Chandrasena and Ingold), T., 1552.

*cyclo***Pentane-1:1-acetic acid**, methyl ester (Dickens, Kon, and Thorpe), T., 1502.

*cyclo***Pentane***spiro***-2:3-***di***cyano***cyclo***propane-2-carboxylic acid**, and its amide (Birch and Thorpe), T., 1834.

*cyclo***Pentane***spiro***-2:3-***di***cyano***cyclo***propane-2:3-dicarboxylic acid**, imide (Birch and Thorpe), T., 1834.

Pentane-$\beta\delta$**-diol**, β-amino-, oxalate, and γ-chloro-γ-nitro-, and γ-nitro- (Schmidt and Wilkendorf), A., i, 314.

*cyclo***Pentane-2:3-dione-1-carboxylic acid**, ethyl ester, diphenylhydrazone (Dieckmann), A., i, 1022.

$\alpha\epsilon$-**Pentanedisulphonyldihydrazide** (Clutterbuck and Cohen), T., 128.

*cyclo***Pentane***spirocyclo***pentane-3:4-dione**, and its derivatives (Kon), T., 526.

*cyclo***Pentane***spirocyclo***pentane-3:4-dione-2:5-dicarboxylic acid**, methyl ester, and its quinoxaline derivative (Dickens, Kon, and Thorpe), T., 1502.

*cyclo***Pentane***spirocyclo***propane-2:3-dicarboxylic acid**, *cis*- and *trans*-forms, and their dinitrile (Birch and Thorpe), T., 1835.

*iso***Pentane-**$\alpha\beta\delta\delta'$**-tetracarboxylic acid**, and β-cyano-, ethyl ester (Ingold and Nickolls), T., 1647.

Pentaphenylethane, chloro- (Schlenk and Mark), A., i, 1003.

Pentaphenylethyl, (SCHLENK and MARK), A., i, 1002.

Pentaphenylpyridine, salts of (DILTHEY, NUSSLEIN, MEYER, and KAFFER), A., i, 949.

Pentaphenylpyrylium salts (DILTHEY and KAFFER), A., i, 668.

Pentapyridinium μ-chlorodecachlorodiferrate (WEINLAND and KISSLING), A., i, 364.

Pentaquochromiselenates. See under Chromium.

dicyclo-**Δ^{2}-α-Penthiophen-5-carboxylic acid,** ethyl ester, and its derivatives (STEINKOPF and AUGESTAD-JENSEN), A., i, 851.

Pentosans (HEUSER), A., i, 113, 921.

Pentoses, fermentation of, by moulds (PETERSON, FRED, and SCHMIDT), A., i, 1220.

Pentosuria, *r*-arabinose in (WRZESNEVSKI), A., i, 1215.

*cyclo***Pentylethane-$\alpha\beta$-dicarboxylic acid,** $\alpha\beta$-*di*cyano-1-hydroxy-, and 1-hydroxy-, lactone (BIRCH and THORPE), T., 1836.

*cyclo***Pentylethane-$\alpha\alpha\beta$-tricarboxylic acid,** 1-hydroxy-, lactone (BIRCH and THORPE), T., 1835.

Pepper, artificial and natural, constituents of (OTT, EICHLER, LÜDEMANN, and HEIMANN), A., i, 1026.

Peppermint oil (KREMERS), A., i, 357, 848.

Pepsin, action of (HAMMARSTEN), A., i, 958.
  action of, on diastase (BIEDERMANN), A., i, 480.
  effect of chloroform on the activity of (ASTRUC and RENAUD), A., i, 281.
  diffusion of, in gels (PEKELHARING), A., i, 388.
  digestion of histone sulphate by (FELIX), A., i, 693.
  estimation of (VALTEICH and GLOVER; GLASSNER), A., ii, 406; (TAKATA), A., ii, 886.

Peptides, estimation of, by alkalimetry (WILLSTÄTTER and WALDSCHMIDT-LEITZ), A., ii, 169.

Peptisation of metallic hydroxides (CHATTERJI and DHAR), A., ii, 205, 627.

Peptone, fermentation of dextrose by (SCHLATTER), A., i, 1096; (BAUR and HERZFELD), A., i, 1097.

Peptones, toxicity of (PENTIMALLI), A., i, 302.

Perchlorates and **Perchloric acid.** See under Chlorine.

Perilla oil (BAUER and HARDEGG), A., i, 983.

Periodic system, linear relationships in the (BILTZ), A., ii, 494.
  of the ions of elements (GRIMM), A., ii, 635.

Peristalsis, production of, by choline (ARAI), A., i, 970.

Permeability of cells to acids (CROZIER), A., i, 897.
  influence of optical activity on (KOTAKE and OKAGAWA), A., i, 696.
  of plant cells (OSTERHOUT; BROOKS; KAHHO), A., i, 308.

Permutite, equilibrium of bases in (SCHULZE), A., ii, 486.
  volumes of kations in (LORENZ), A., ii, 196.

Pernitric acid. See under Nitrogen.

Peroxides and glyoximes, structure of (BIGIAVI), A., i, 352.

Peroxydase, estimation of, in blood (BACH and ZUBKOWA), A., i, 392.
  estimation of, in milk (RICE and HANZAWA), A., ii, 407.

Persulphates. See under Sulphur.

Perylene, preparation of (ZINKE), A., i, 132; (HANSGIRG), A., i, 245.

Perylene, 1:12-*di*hydroxy- (ZINKE), A., i, 132.

Petrol, inflammability of mixtures of alcohol and (BOUSSU), A., ii, 557.

Petroleum, determination of the iodine number of (HLADKÝ), A., ii, 722.
  iodine number of, in the Bergius process (WATERMAN and PERQUIN), A., ii, 90.
  ozonides of (KOETSCHAU), A., i, 977.
  light, detection of benzene in (SCHWARZ), A., ii, 531.
    estimation of, the vapour of, in air (FRITZMANN and MACJULEVITSCH), A., ii, 877.
  estimation of aromatic hydrocarbons in (WATERMAN and PERQUIN), A., ii, 399.

Pharbitis nil chois, constituents of the seeds of (ASAHINA and SHIMIDZU), A., i, 506.

Pharmacological action, relation between chemical constitution and (V. BRAUN, BRAUNSDORF, and RÄTH), A., i, 759.

Phaseolus angularis (adsuki bean), proteins of (JONES, FINKS, and GERSDORFF), A., i, 504.

Phaseolus lunatus **(lima bean),** proteins of (JONES, GERSDORFF, JOHNS, and FINKS), A., i, 1101.

Phellandral from eucalyptus oil (PENFOLD), T., 266.

Phellodendron amurense, constituents of (SHIMO), A., i, 99.

Phenacetin, detection of, colorimetrically (EKKERT), A., ii, 169.

α-**Phenacylmethyl-α′-antipyrino-4-methylmethylamine**, and its hydrochloride (Mannich and Heilner), A., i, 373.
as-**Phenacylmethylmethylcarbamide** (Mannich and Heilner), A., i, 372.
Phenanthranaphthazines, amino-, bromo-, hydroxy-, and nitro- (Sircar and Dutt), T., 1945.
Phenanthranaphthazine-12-sulphonic acid, 2-*mono*- and 2:7-*di*-amino-, and 2:7-*di*hydroxy- (Sircar and Dutt), T., 1950.
Phenanthraphenazine, 2-amino-, 2-*mono*- and 2:3:4-*tri*-hydroxy-, and 3:4-*di*nitro-2-hydroxy-, and their derivatives (Schmidt and Spoun), A., i, 665.
Phenanthraquinol methyl ethers (Goldschmidt and Schmidt), A., i, 1149.
Phenanthraquinol, 3:4-*di*nitro-2-hydroxy-, diacetate (Schmidt and Spoun), A., i, 666.
Phenanthraquinone, 2-amino-, acetyl derivative, and its diacetate (Brass and Ferber), A., i, 356.
  *di*bromohydroxy-, 3:4-*di*nitro-2-hydroxy-, and 2:3:4-*tri*hydroxy-, and their derivatives (Schmidt and Spoun), A., i, 666.
Phenanthraquinone colouring matters (Sircar and Dutt), T., 1944; (Dutt), T., 1951.
Phenanthrene, melting and boiling points of (Kirby), A., i, 27.
  vapour pressure of (Nelson and Senseman), A., i, 245.
  solubility of, in organic solvents (Henstock), T., 2124.
  action of aluminium chloride with (Scholl and Schwarzer), A., i, 331.
  estimation of (Williams), A., ii, 90.
Phenanthrene, 2-amino-9- and -10-hydroxy-, and their derivatives (Schmidt and Spoun), A., i, 666.
Phenanthrene series (Schmidt and Spoun), A., i, 665.
Phenanthrone, *di*chloronitro-, derivatives (Schmidt and Spoun), A., i, 666.
Phenanthroxazine, preparation of (Foresti), A., i, 1062.
  detection of nitrates by means of (Foresti), A., ii, 524.
Phenanthroxyls (Goldschmidt and Schmidt), A., i, 1149.
Phenarsazine oxide (Schmidt), A., i, 285.
Phenazarsinic acid, and *di*nitro-, and its sodium salt (Schmidt), A., i, 285.
o-**Phenetidine**, use of, in separation of aluminium and iron (Chalupny and Breisch), A., ii, 588.
p-**Phenetidine**, 2:5-*di*nitro-, and its acetyl derivative (Reverdin and Roethlisberger), A., i, 538.
2-*p*-**Phenetidinobenzoic acid**, 4-nitro- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 469.
β-*p*-**Phenetidino-*p*-phenetolecarbamide** (Speckan), A., i, 580.
Phenetole, iodonitro-derivatives (Apostolo), A., i, 335.
p-**Phenetylcarbamide** (*dulcin*), effect of substitution on the sweetness of, and β-bromo- (Speckan), A., i, 579.
  derivatives of (Hermann), A., i, 1151.
  detection of, microchemically (Denigès and Tourrou), A., ii, 95.
p-**Phenetylcarbamine** cyanide (Fromm and Wenzl), A., i, 438.
p-**Phenetylsulphamic acid**, sodium salt (Weil and Moser), A., i, 444.
Phenoctalene (Aschan, Fontell, and Simola), A., i, 1152.
Phenol, formation of, by bacteria (Sieke), A., i, 902.
  ultra-violet absorption spectrum of (Klingstedt), A., ii, 332.
  latent heat of fusion of (Stratton and Partington), A., ii, 258.
  equilibrium of water and (Leone and Angelescu), A., ii, 743.
  equilibrium of the freezing point of, in mixtures with water (Rhodes and Markley), A., i, 135.
  equilibrium and properties of mixtures of cresols with (Kendall and Beaver), A., i, 136.
  mechanism of the bromination of (Baines), T., 2810.
  catalysis of the hydrogenation of, with sodium carbonate (Armstrong and Hilditch), A., ii, 756.
  ethers, action of nitric acid on (Meyer and Gottlieb-Billroth), A., i, 539.
  detection of, colorimetrically (Bellussi), A., ii, 723.
  estimation of, in mixtures of tar acids (Hoffert), A., ii, 879.
Phenol, 2:4:5-*tri*bromo- (Aktien-Gesellschaft für Anilinfabrikation), A., i, 1145.
  *penta*bromo-, silver salts, chromoisomeric (Lucas and Kemp), A., i, 30.
  3:5-*di*nitro-, solubility and volatility of (Sidgwick and Taylor), T., 1853.
Phenols, tautomerism of (Fuchs and Stix), A., i, 451.
  equilibria of camphor with (Kremann and Odelga), A., i, 159.

Phenols, equilibria of triphenylmethane with (Kremann, Odelga, and Zawodsky), A., i, 131.
equilibria of water and (Leone and Angelescu), A., ii, 743.
introduction of the chloroethyl group into (Clemo and Perkin), T., 642.
condensation of, with hydrochlorides of cyanamides and carbodi-imides (Short and Smith), T., 1803.
interaction of diazonium salts and (Chattaway and Hill), T., 2756.
catalytic hydrogenation of (Senderens and Aboulenc), A., i, 136.
action of nitrous acid on (Schoutissen), A., i, 135.
oxidation of (Pummerer, Melamed, and Puttfarcken), A., i, 1161.
and their derivatives, oxidation of (Goldschmidt), A., i, 1148; (Goldschmidt and Schmidt), A., i, 1149.
and their ethers, oxonium salts from (Kehrmann, Decker, and Solonina), A., i, 32; (Kehrmann, Decker, and Schmajewski), A., i, 32.
sulphonation of (Campbell), T., 847.
physiology of (Pelkan and Whipple), A., i, 499; (Pelkan), A., ii, 399.
monohydric, preparation of halogen substitution products of (Aktien-Gesellschaft fur Anilinfabrikation), A., i, 1145.
dihydric, ultra-violet absorption spectra of (Klingstedt), A., ii, 680.
detection of (Moir), A., ii, 321.
estimation of, in the blood (Pelkan), A., ii, 399.
estimation and separation of (Hanke and Koessler), A., ii, 322.
Phenols, amino-, preparation of (Lewcock, Adam, Siderfin, and Galbraith), A., i, 650.
chloro-, solubility of (Sidgwick and Turner), T., 2256.
halogenated, nitration of (Raiford), A., i, 335.
*tri*iodo-, preparation of, from hydroxy-acids (Krishna and Pope), T., 798.
nitro-, solubility and cooling curves of (Carrick), A., i, 334.
equilibria of, with triphenylcarbinol (Kremann, Hohl, and Müller), A., i, 138.
metallic derivatives of (D. and A. E. Goddard), T., 54; (Goddard and Ward), T., 262.
estimation of nitrogen in, by the Kjeldahl method (Margosches and Vogel), A., ii, 522.
Phenolcamphorein, and its derivatives (Krishna), T., 253; (Singh, Rai, and Lal), T., 1425.
Phenolcamphorein, *m*-amino- (Sircar and Dutt), T., 1286.
Phenolcarboxylic acids, bismuth salts, hydrolysis of, by water (Perling), A., i, 252.
Phenol-4:6-disulphonic acid, *o*-amino-, potassium hydrogen salt (Sakellarios), A., i, 1145.
Phenol-*o*- and -*p*-mercuri-salts (Mameli), A., i, 695.
Phenolphthalein, influence of ethyl alcohol on the colour change of (Wegscheider), A., ii, 387.
Phenolphthalein, bromo- and chloro-derivatives (Thiel and Müller), A., i, 659.
Phenolphthaleins, colour changes of (Thiel), A., i, 455.
Phenol-red, use of, as an indicator (Massink), A., ii, 307.
Phenolsulphamphthalein, and its derivatives, and 2:2′-imino- (Dutt), T., 2390.
Phenolsulphocarboxylic acids, nitro-, action of bromine on (Sakellarios), A., i, 1144.
Phenol-4-sulphonic acid, 2-amino-, cobaltammine salt (Morgan and Moss), T., 2865.
2-bromo-6-amino-, and 2-bromo-6-nitro-, potassium salt (Sakellarios), A., i, 1145.
Phenolsulphonic acids, nitro-, action of bromine on (Sakellarios), A., i, 1144.
Pheno-β-naphthacarbazole, 4-hydroxy- (Bucherer and Wahl), A., i, 464.
Pheno-ββ-naphthacarbazole-1:3-disulphonic acid, 5-hydroxy- (Bucherer and Wahl), A., i, 465.
Pheno-β-naphthacarbazole-1:7-disulphonic acid, sodium salt (Bucherer and Zimmermann), A., i, 465.
Pheno-ββ-naphthacarbazole-1-sulphonic acid, 5-hydroxy- (Bucherer and Wahl), A., i, 464.
Pheno-α-naphthacarbazole-2-sulphonic acid, and 4-hydroxy-, sodium salts (Bucherer and Zimmermann), A., i, 465.
Pheno-β-naphthacarbazole-2-sulphonic acid, 4-hydroxy- (Bucherer and Wahl), A., i, 465.
Phenoxides, nitro-, alkali (D. and A. E. Goddard), T., 54.
lead, magnesium and silver (Goddard and Ward), T., 262.
Phenoxyacetic acid, *m*-amino-, and its acetyl derivative (Minton and Stephen), T., 1597.

Phenoxyacetic acids, chloro-, and their derivatives (Minton and Stephen), T., 1599.
  nitro-, preparation of, and their derivatives (Minton and Stephen), T., 1591.
Phenoxyacetone, *p*-amino-, and *p*-nitro-, and their derivatives (Speckan), A., i, 580.
o-**Phenoxybenzoic acid**, 2:5-*di*chloro- (Eckert and Endler), A., i, 941.
p-**Phenoxybenzoic acid** (Schönberg and Kraemer), A., i, 664.
4-Phenoxybenzonitrile, 3-nitro- (Mattaar), A., i, 251.
4-Phenoxybenzophenone-4′-arsinic acid (Lewis and Cheetham), A., i, 187.
5-Phenoxy-5-*n*-butylbarbituric acid (Dox and Yoder), A., i, 808.
Phenoxy-*n*-butylmalonic acid, ethyl ester (Dox and Yoder), A., i, 808.
Phenoxychloroparaffin (Elektrochemische Werke, Bosshard, and Strauss), A., i, 913.
β-**Phenoxydiethylaniline**, *p*-nitroso- (Clemo and Perkin), T., 645.
7-Phenoxy-7:12-dihydro-γ-benzophenarsazine (Lewis and Hamilton), A., i, 188.
β-**Phenoxyethylaniline** (Clemo and Perkin), T., 645.
Phenoxyethylphenylarsinous acid (Quick and Adams), A., i, 601.
Phenoxymalonic acid, menthyl ester (Shimomura and Cohen), T., 2054.
7-Phenoxy-2-methylxanthone-8-carboxylic acid, and its sodium salt (v. dem Knesebeck and Ullmann), A., i, 360.
Phenoxyparaffin, and its sulphonic acid (Elektrochemische Werke, Bosshard, and Strauss), A., i, 913.
3-Phenoxy-2-phenylbenzopyrylium ferrichloride, and 7-hydroxy- (Pratt and Robinson), T., 1582.
Phenyl allyl ether, *p*-amino-, and its derivatives (Gutekunst and Gray), A., i, 951.
  *iso*amyl ethers, *p*-amino-, and *p*-nitro-, and their derivatives (Gutekunst and Gray), A., i, 951.
  benzyl ether, *p*-amino-, acetyl derivative (Gutekunst and Gray), A., i, 951.
  butyl ethers, *p*-amino- and *p*-nitro-, and their derivatives (Gutekunst and Gray), A., i, 950.
  β-chloroethyl ether, *o*- and *p*-amino-, acetyl derivatives (Clemo and Perkin), T., 645.
  dithiochloride, *o*-nitro- (Lecher and Simon), A., i, 1018.
Phenyl ethyl and *β*-naphthyl *di*sulphides (Lecher and Wittwer), A., i, 642.
  mercaptan, *m*-hydroxy- (Watson and Dutt), T., 2415.
  mercurichloride, 2:4:6-*tri*nitro- (Kharasch), A., i, 190.
Phenylacetaldehyde, preparation of (Kodama), A., i, 349.
  fate of, in the body (Kay and Raper), A., i, 1093.
Phenylacetic acid, and *o*-nitro-, sodium salt, behaviour of, in the animal organism (Schempp), A., i, 403.
  sodium uranyl salt (Barlot and Brenet), A., ii, 167.
  chlorosulphonyl derivative, preparation of (Stewart), T., 2560.
Phenylacetic acid, *o*-amino-, and its salts and derivatives (Neber), A., i, 545.
  2:4-*di*nitro-, mercuric salt (Kharasch), A., i, 190.
Phenylacetic-*o*-sulphinic anhydride (Neber), A., i, 546.
Phenylacetonitrile, action of, with magnesium methyl bromide (Rondou), A., i, 934.
Phenylacetonitriles, dialkylated (Blondeau), A., i, 654.
Phenyl-*o*-acetoxystyrylsulphone and *p*-chloro- (Troger and Bolte), A., i, 267.
Phenylacetyl-*dl*-alanine (Shiple and Sherwin), A., i, 1093.
Phenylacetylene, preparation of (Hessler), A., i, 442.
  hydrogenation of (Zalkind), A., i, 1134.
Phenylacetyl-*dl*-leucine (Shiple and Sherwin), A., i, 1093.
5-Phenylacridine, 2′:4′-chloronitro-, 1-*mono*-, and 1:3-*di*-nitro- (Mayer and Freund), A., i, 866.
β-**Phenylacrylic acid**, *a*-cyano-, preparation of (Lapworth and McRae), T., 1700.
Phenylalanine, behaviour of, in the animal organism (Kotake, Masai, and Mori), A., i, 1217.
  hydrochloride and anilide (Curtius and Sieber), A., i, 722.
dl-**Phenylalaninecholine**, salts of (Karrer, Gisler, Horlacher, Locher, Mäder, and Thomann), A., i, 815.
a-**Phenylallyl alcohol**, and its benzoate (Rupe and Müller), A., i, 40.
3-Phenyl-1- and -2-allylindazoles, and their picrates (v. Auwers and Hültenes), A., i, 683.

Phenylaminoanthraquinone, *di*amino- (Badische Anilin- & Soda-Fabrik), A., i, 942.
N-**Phenyl-β-aminoethyl,** and *p*-chloro-, and *m*-nitro-, hydrogen sulphates (Saunders), T., 2671.
Phenylamino-2- and -4-hydroxy-α-naphthylacetonitriles, and nitro- (Morgan and Reeves), T., 4.
Phenyl-1-amino-β-naphthylamine, preparation of (Dutt), T., 1952.
1-Phenyl-4-*p*-aminophenylbenzene, and its diazonium sulphate (Pummerer, Binapfl, Bittner, and Schuegraf), A., i, 1197.
3-Phenyl-5-anilinomethylene-4-glyoxalone, 2-thiol-, and 2-thiol-3-*p*-chloro- (Dains, Thompson, and Asendorf), A., i, 1185.
γ-Phenyl-α-anisyl-β-methylpropan-β-ol (Le Brazidec), A., i, 457.
γ-Phenyl-α-anisyl-β-methyl-Δ^{α}-propene (Le Brazidec), A., i, 457.
N-**Phenylanthranilic acid,** and *p*-chloro-, formalides and nitriles from (Friedländer and Kunz), A., i, 765.
Phenylarsenious acid, *p*-nitro- (Bart), A., i, 1202.
Phenylarsine, *o*- and *p*-chloro- (Palmer and Adams), A., i, 786.
Phenylarsinic acid, *p*-amino-, sodium salt. See Atoxyl.
  o-chloro- (Palmer and Adams), A. i, 786.
  chloro-, hydroxy-, and nitro-derivatives (Bart), A., i, 1201.
  p-hydroxy-*m*-amino-, sodium salt (Fournier, Guénot, and Schwartz), A., i, 300.
Phenylarsinoacetanilide, and *p*-amino-, and its derivatives (Quick and Adams), A., i, 601.
Phenylarsinoacetic acid (Quick and Adams), A., i, 601.
Phenylarsinoacetoarsanilic acid, and *p*-amino-, and its acetyl derivative (Quick and Adams), A., i, 601.
Phenylarsinoacetophenetidine, and *p*-amino-, and its acetyl derivative (Quick and Adams), A., i, 601.
Phenylarsino-*o*- and -*p*-acetylaminobenzoic acids (Quick and Adams), A., i, 601.
Phenylaziminobenzene. See 2-Phenyl-1:2:3-benztriazole.
2-Phenyl-ψ-aziminobenzene. See 2-Phenyl-ψ-1:2:3-benztriazole.
Phenylazobis-*p*-dimethylaminotriphenylmethane (Wieland, Popper, and Seefried), A., i, 773.
Phenylazobis-*p*′-dimethylaminotriphenylmethane, *p*-chloro- (Wieland, Popper, and Seefried), A., i, 773.
Phenylazocarbonamide, *p*-*mono*- and 2:4-*di*-bromo (Pieroni), A., i, 1072.
Phenylazotri-*p*-aminophenylmethane (Wieland, Popper, and Seefried), A., i, 773.
Phenylazotri-*p*-anisylmethane (Wieland, Popper, and Seefried), A., i, 773.
Phenylazotri-*p*-dimethylaminophenylmethane (Wieland, Popper, and Seefried), A., i, 773.
Phenylazotri-*p*′-dimethylaminophenylmethane, *p*-chloro- (Wieland, Popper, and Seefried), A., i, 773.
Phenylazotri-*p*-tolylmethane, *p*-chloro- (Wieland, Popper, and Seefried), A., i, 773.
Phenylazoxycarbonamide, and *p*-bromo-, and *p*-nitro- (Pieroni), A., i, 1072.
3-Phenylbarbituric acid, 4-imino- (Lifschitz and Hepner), A., i, 768.
N-**Phenylbenzimino-*m*-hydroxyphenyl** ether, and its hydrochloride (Chapman), T., 1676.
5-Phenyl-2:1-benzoacridine (Mayer and Freund), A., i, 866.
2-Phenyl-1:3-benzodioxan (Adams, Fogler, and Kreger), A., i, 661.
2-Phenylbenzoselenazole, 6-*mono*- and 4:6-*di*-amino-, 6-mono-, and 4:6-*di*-nitro-, and their derivatives (Bogert and Chen), A., i, 1183.
2-Phenylbenzoselenazole-azo-β-naphthol (Bogert and Chen), A., i, 1183.
2-Phenylbenzoxazole, 2-*o*-hydroxy-, and its salts (Skraup and Moser), A., i, 575.
  2 *p*-nitro- (Skraup and Moser), A., i, 575.
Phenyl-*o*-benzoyloxystyrylsulphone and *p*-chloro- (Tröger and Bolte), A., i, 267.
Phenyl-β-benzoyl-α-phenylethylphosphinic acid, and its anhydride (Conant and Pollack), A., i, 67.
cis- and *trans*-**β-Phenyl-β-(α-benzoyl)-phenylvinylhydroxylamine,** and their derivatives (Rupe and Wittwer), A., i, 448.
Phenyl-β-benzoyl-α-styrylethylphosphinic acid (Conant, Bump, and Holt), A., i, 68.
2-Phenylbenzthiazole, synthesis of, and 6-amino-, 6-bromo-, and 6-cyano-, and their derivatives (Bogert and Abrahamson), A., i, 576.
2-Phenylbenzthiazole-6-carboxylic acid (Bogert and Abrahamson), A., i, 576.
2-Phenyl-1:2:3-benztriazole, 4′-chloro-4-amino-, acetyl derivative, and 4′-chloro-4-nitro- (Blom), A., i, 28.
2-Phenyl-ψ-1:2:3-benztriazole, 5-amino- (Kalle & Co.), A., i, 61.

β-Phenyl-β-benzylamine, and its hydrochloride (Blondeau), A., i, 655.
***N*-Phenyl-*N*-benzyl-β-aminoethyl** sodium sulphate (Saunders), T., 2674.
β-Phenyl-β-benzylbutanol, and its derivatives (Blondeau), A., i, 655.
α-Phenyl-α-benzylbutyric acid, and its amide, ester, and nitrile (Blondeau), A., i, 654.
β-Phenyl-α-benzylethylphosphinic acid, α-hydroxy- (Conant, MacDonald, and Kinney), A., i, 186.
Phenyl α-benzyl-α-ethylpropyl ketone (Haller and Bauer), A., i, 259.
1-Phenyl-4-benzylidenehydantoin, 1-*p*-chloro-, and 2-thio-1-*p*-chloro- (Hill and Kelsey), A., i, 1141.
Phenylbenzylmethylarsine, and its salts (Steinkopf, Donat, and Jaeger), A., i, 996.
***N*-Phenyl-*O*-benzyl-*N*-methylhydroxylamine** (Meisenheimer and Willmersdorf), A., i, 334.
Phenyl α-benzylpropyl ketone, and its oxime (Haller and Bauer), A., i, 259.
6-Phenyl-4-benzylpyridine-3-carboxylic acid, 2-hydroxy-6-*p*-chloro-, ethyl ester (Kohler and Smith), A., i, 458.
5-Phenyl-3-benzylpyrone, *p*-chloro- (Kohler and Smith), A., i, 458.
5-Phenyl-3-benzylpyrone-2-carboxylic acid, methyl ester, monochloro-derivatives (Kohler and Smith), A., i, 458.
Phenylbiuret-*o*-sulphonic acid, *p*-bromo-, *p*-chloro-, and *p*-iodo-, and their salts and derivatives (Scott and Cohen), T., 2045.
Phenylboric acid (Krause and Nitsche), A., i, 694.
Phenylbromoarsineacetanilide (Quick and Adams), A., i, 601.
Phenylbromoarsineacetic acid (Quick and Adams), A., i, 601.
Phenyl-β-bromo-β-benzoyl-α-phenylethylphosphinic acids (Conant and Pollack), A., i, 67.
Phenyl*di*bromobismuthine, *p*-chloro- (Challenger and Ridgway), T., 110.
α-Phenyl-β-(α′-bromocinnamoyl)-ethylphosphinic acid (Conant, Bump, and Holt), A., i, 67.
Phenyl bromomethyl ketone, 2:4-*di*hydroxy-, and its derivatives (Sonn and Falkenheim), A., i, 1163.
Phenyl bromonitro-*p*-chlorophenylpropyl ketones (Kohler and Smith), A., i, 458.
Phenyl αγ-*di*bromo-β-nitro-γ-*p*-chlorophenylpropyl ketone (Kohler and Smith), A., i, 458.
Phenyl α-bromo-γ-nitro-β-phenylpropyl ketone, *p*-chloro- (Kohler and Smith), A., i, 457.
3-Phenyl-5-*p*-bromophenylaminomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1185.
α-Phenyl-β-(α′β′-*di*bromo-β′-phenylpropionyl)-ethylphosphinic acid (Conant, Bump, and Holt), A., i, 67.
β-Phenyl-bromo-β-phenylvinylhydroxylamine (Rupe and Wittwer), A., i, 449.
Phenyl*iso*butylsuccinic acid (Upson and Thompson), A., i, 343.
γ-Phenylbutyric acid, α-amino-, excretion of, as its *N*-acetyl derivative (Knoop), A., i, 486.
  γ-2:4-*di*hydroxy- (Langley and Adams), A., i, 1154.
Phenylcamphenol, and its anhydride (Nordstrom), A., i, 944.
Phenylcarbamide, *p*-hydroxy-, preparation of ethers of (Riedel), A., i, 579.
Phenylcarbamide-2:4-disulphonic acid, potassium salt (Scott and Cohen), T., 2043.
Phenylcarbamide-*o*-sulphonic acid, *p*-bromo-, and its salts, and acetyl derivative, potassium salt (Scott and Cohen), T., 2047.
Phenylcarbamine cyanide (Fromm and Wenzl), A., i, 438.
Phenylcarbazole, preparation of (Eckert, Seidel, and Endler), A., i, 952.
3-Phenyl-1-*o*-carboxybenzylphthalazone (Ruggli and Meyer), A., i, 345.
α-Phenyl-β-carboxyethylphosphinic acid (Conant, Bump, and Holt), A., i, 67.
Phenylchloroarsineacetic acid (Quick and Adams), A., i, 601.
Phenyl *p*-chlorophenylacetylmethyl ketone, and its copper derivative (Kohler and Smith), A., i, 458.
1-Phenyl-4-*p*-chlorophenylfuran (Kohler and Smith), A., i, 458.
Phenyl*di*chlorostibine, *p*-amino-, acetyl derivative, and *m*-amino-*p*-hydroxy-, and their hydrochlorides (Schmidt), A., i, 1203.
Phenyl*tetra*chlorostibine, *p*-amino-, hydrochloride (Schmidt), A., i, 1204.
α-Phenylcinchonic acid. See 2-Phenylquinoline-4-carboxylic acid.
cis- and *trans*-**α-Phenyl-*o*-coumarophenones**, and their derivatives (Decker and Becker), A., i, 358.
γ-Phenylcrotonic acid, α-cyano-, amide of (Stevenson and Thorpe), T., 1720.

Phenyl*iso*crotylcarbinol (Krestinski), A., i, 1130.

Phenylcyanourethane (Scott and Cohen), T., 2050.

Phenyl-2:4-diacetoxystyrylsulphone, and *p*-chloro- (Tröger and Bolte), A., i, 268.

Phenyldi-*p*-anisyl*iso*oxazoles (Meisenheimer and Weibezahn), A., i, 177.

γ-Phenyl-αγ-di-*p*-anisylpropan-α-one (Ziegler and Ochs), A., i, 1049.

Phenyl-2:4-dibenzoyloxystyrylsulphone, and *p*-chloro- (Troger and Bolte), A., i, 268.

1-Phenyl-2:3-dibenzyl-1:4-naphthaquinoxalinium chloride, *αα'-di*cyano- (Dutt and Sen), T., 2666.

Phenyl αα-dibenzylpropyl ketone (Haller and Bauer), A , i, 259.

1-Phenyl-2:3-dibenzylquinoxalinium chloride, *αα'-di*cyano- (Dutt and Sen), T., 2666.

4-Phenyl-2:6-di-(*p*-bromophenyl)pyridine, and its salts (Dilthey, Nusslein, Meyer, and Kaffer), A., i, 949.

Phenyl di-*p*-chloro-β-phenylstyryl ketone (Meyer and Schuster), A., i, 556.

Phenyldiethylphenylphosphazide (Staudinger and Hauser), A., i, 69.

Phenyldiethylphosphinebenzoylimine (Staudinger and Hauser), A., i, 70.

Phenyldiethylphosphinephenylimine (Staudinger and Hauser), A., i, 69.

β-Phenyl-αβ-diethylpropiophenone (Ramart and Albesco), A., i, 663.

2-Phenyldihydro-1:2:4-*iso*naphthatriazine-3-carboxylic acid, 2-*p*-nitro-, ethyl ester (Fierz and Sallmann), A., i, 870.

9-Phenyl-9:10-dihydro*meso*thioanthracene, and 2-chloro- (Bistrzycki and Brenken), A., i, 268.

4-Phenyl-4:5-dihydro-1:3:4-thiodiazole, 2-thiol-5-thio-, potassium salt, compound of chloropicrin and (Rây and Das), T., 325.

2-Phenyl-1:3-dihydro-1:2:3-triazole-4-carboxylic acid, and its bromo-derivative (Gastaldi and Braunizer), A., i, 626.

Phenyldi-α-hydroxybenzylarsine, *o*- and *p*-chloro- (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy-*o*-carbomethoxybenzylarsine (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy-*p*-chlorobenzylarsine (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxyethylarsine, and its platinichloride, and *p*-chloro- (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy-*n*-heptylarsine (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy-*p*-methoxybenzylarsine (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy-*n*-propylarsine, and its platinichloride (Palmer and Adams), A., i, 786.

Phenyldi-α-hydroxy*iso*valerylarsine, and its platinichloride (Palmer and Adams), A., i, 786.

5-Phenyl 2:7-dimethylacridine, 9-nitro- (Mayer and Freund), A., i, 867.

α-Phenyl-γ-dimethylaminopropan-α-ol, and its derivatives (Mannich and Heilner), A., i, 351.

4-Phenyl-2-*p*-dimethylaminostyrylthiazole methiodide (Mills and Smith), T., 2735.

Phenyldimethylarsine *di*hydroxide, and its salts (Steinkopf and Schwen), A., i, 72.

3-Phenyl-1:2-dimethylindazolium iodide (v. Auwers and Hultenes), A., i, 683.

2-Phenyl-5:5-dimethyloxazoline, and its salts (Dersin), A., i, 142.

1-Phenyl-2:3-dimethyl-5-pyrazolone, 4-amino- and 4-chloroamino-, acetyl derivative, and their derivatives (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 954.

Phenyldi-α-naphthylbromomethane, and its metallic derivatives (Schoepfle), A., i, 338.

Phenyldi-α-naphthylcarbinol, preparation and derivatives of (Schoepfle), A , i, 337.

Phenyldi-α-naphthylchloromethane, and its metallic derivatives (Schoepfle), A., i, 338.

Phenyldi-α-naphthylmethyl (Schoepfle), A., i, 338.

Phenyldiphenylethinylcarbinol, preparation and reactions of (Hess and Weltzien), A., i, 35.

4-Phenyldithiourazole, and 3-imino-, and their derivatives (Arndt, Milde, and Tschenscher), A., i, 377.

2-Phenyl-4:6-di-*p*-tolylpyridine, and 2-*p*-chloro- (Gastaldi), A., i, 368.

2-Phenyl-4:6-di-*p*-tolylpyrylium salts, and 2-*p*-chloro- (Gastaldi), A., i, 368.

***o*-Phenyleneammelyl** chloride (Pellizzari), A., i, 585.

o-**Phenylenediacetic acid,** diethyl ester, preparation of (Perkin and Titley), T., 1565.

m-**Phenylenediacetic acid,** 4:6-*di*nitro-, and its lead salt (Davies and Hickox), T., 2651.

m-**Phenylenediallyldiamine,** 2:4-*di*nitro- (Giua and Angeletti), A., i, 649.

o-**Phenylenediamine,** 3:6-*di*chloro- (Macleod, Pfund, and Kilpatrick), A., i, 1131.

p-**Phenylenediamine,** compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.

Phenylenediamines, equilibria of, with dihydroxynaphthalenes (Kremann, Hemmelmayr, and Riemer), A., i, 1011.
  equilibria of triphenylcarbinol with (Kremann, Hohl, and Müller), A., i, 138.
  hydroferrocyanides (Cumming), T., 1295.

m-**Phenylenediaminecamphorein** (Sircar and Dutt), T., 1286.

p-**Phenylenedimethyldiamine** hydroferrocyanide (Cumming), T., 1296.

m-**Phenylenedisulphamic acid,** sodium salt (Weil and Wassermann), A., i, 1007.

o-**Phenylenemelanuric acid** (Pellizzari), A., i, 586.

β-**Phenylethane,** α-chloro-β-hydroxy- (Detœuf), A., i, 327.

1-Phenyl-6-ethoxybenziminazole, 1-*p*-bromo- (Jacobsen), A., i, 591.

1-Phenyl-6-ethoxybenztriazole, 1-*p*-bromo- (Jacobsen), A., i, 591.

2-Phenyl-3-*p*-ethoxyphenyloxazolidine (Bergmann, Ulpts, and Camacho), A., i, 1182.

Phenylethylacetylaminoacetic acid, and its nitrile (Read), A., i, 955.

N-**Phenyl-*N*-ethyl-*O*-allylhydroxylamine** (Meisenheimer and Greeske), A., i, 334.

Phenyl-*o*-hydroxystyrylsulphone, and *p*-chloro- (Troger and Bolte), A., i, 267.

Phenyl-2:4-*di*hydroxystyrylsulphone, and *p*-chloro-, and their dimethyl ethers (Troger and Bolte), A., i, 268.

Phenyl *β*-hydroxyvinyl ketone, reduction of (Rupe and Müller), A., i, 40.

Phenyliminoketendicarboxylic acid, ethyl ester (Staudinger and Hauser), A., i, 29.

5-Phenylimino-2-thio-3-naphthyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.

5-Phenylimino-2-thio-3-phenyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 876.

5-Phenylimino-2-thio-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 876.
5-Phenylimino-2-thio-3-tolyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.
2-Phenylindazole, 3-hydroxy- (Heller), A., i, 1066.
3-Phenylindazole-2-carboxylic acid, methyl ester (v. Auwers and Hültenes), A., i, 683.
3-Phenylindazole-2-sulphonic acid, metallic salts (v. Auwers and Hültenes), A., i, 683.
3-Phenylindazole-2-sulphonoxide (v. Auwers and Hültenes), A., i, 684.
N-**Phenylindirubin** (Friedlander and Kunz), A., i, 766.
1-Phenylindoxyl, and its sodium salt, and 4-chloro- (Friedlander and Kunz), A., i, 765.
Phenylindoxylic acid, ethyl and methyl esters (Friedländer and Kunz), A , i, 765.
1-Phenylindoxyl-2-thionaphthenones (Friedlander and Kunz), A., i, 766.
Phenyl iodomethyl ketone, 2:4-*di*hydroxy-, and its diacetate (Sonn and Falkenheim), A., i, 1163.
Phenylisatin, 4-chloro- (Friedlander and Kunz), A., i, 766.
1-Phenylisatin-2-*p*-dimethylaminoanil (Friedlander and Kunz), A., i, 765.
Phenylisatinic acid, 4-chloro-, sodium salt (Friedländer and Kunz), A., i, 766.
Phenylketenacetal (Staudinger and Rathsam), A., i, 1015.
Phenyl-lactic acid, behaviour of, in the animal organism (Kotake and Mori; Mori), A., i, 1216.
Phenyl-lactic acid, hydroxy-, excretion of, after administration of tyrosine (Kotake and Okagawa), A., i, 1217.
d- and *l*-**Phenyl-lactic acids**, and hydroxy-, production of acetoacetic acid from, in the liver (Mori), A., i, 1217.
Phenylmalonamide (Dox and Yoder), A., i, 817.
1-Phenyl-2-mercapto-6-ethoxybenziminazole, 1-*p*-bromo- (Jacobsen), A., i, 591.
Phenyl-*p*-methoxyphenylpropanes, *βγ*-*di*bromo- (Ingold and Piggott), T., 2386.
Phenyl-*p*-methoxyphenyl-Δ^2-propenes (Ingold and Piggott), T., 2386.
5-Phenyl-3-methylacridine, 1-amino- and 1-nitro- (Mayer and Freund), A., i, 866.
  7:9-*di*amino- and 7:9-*di*nitro- (Mayer and Freund), A., i, 867.
Phenylmethylaminoethanol, *di*hydroxy-, hydrochloride, preparation of (Nagai), A., i, 652.
N-**Phenyl**-*N*-**methyl**-*β*-**amineethyl** hydrogen sulphate (Dutt and Sen), T., 2674.
Phenylmethylarsine, cyano- (Steinkopf and Schwen), A., i, 72.
4-Phenyl-2-methylbenzoic acid, calcium salt (v. Auwers and Jülicher), A., i, 842.
1-Phenyl-6-methylbenztriazole, 1-*p*-hydroxy- (Jacobsen), A., i, 592.
β-**Phenyl**-*β*-**methylbutanol**, and its derivatives (Blondeau), A., i, 655.
β-**Phenyl**-*β*-**methylbutylamine**, and its hydrochloride (Blondeau), A., i, 655.
Phenyl *α*-**methylbutyl ketone** (Leroide), A., i, 216.
α-**Phenyl**-*α*-**methylbutyric acid**, and its amide, esters, and nitrile (Blondeau), A., i, 654.
Phenyl 3′:4′-methylenedioxystyryl ketone *di*bromide (Bauer and Werner), A., i, 1035.
Phenylmethylethylarsine, and its salts (Steinkopf, Donat, and Jaeger), A., i, 995.
1-Phenyl-3-methyl-2-ethyl-5-pyrazolone, 4-amino- and 4-chloro-amino-, acetyl derivative, (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 954.
β-**Phenyl**-*α* **methylglutaconic acids**, isomeric, and their esters and ozonides (Feist, Breuer, and Lubricht), A., i, 553.
Phenylmethylglyoxime, nickel compound (Ponzio), A., i, 18.
α-**Phenyl**-*ζ*-**methyl**-$\Delta^{\alpha\gamma}$-**heptadien**-*ζ*-**ol**-*ε*-**one** (Scheibler and Fischer), A., i, 1110.
β-**Phenylmethylheptenol** (Helferich and Gehrke), A., i, 9.
as-**Phenylmethylhydrazine**, *p*-nitro-, and its derivatives (Ciusa and Rastelli), A., i, 1073.
4-Phenylmethylhydrazinobenzonitrile, 3-nitro- (Mattaar), A., i, 252.
α-**Phenylmethyl**-*β*-**hydroxypropylamine**, *α*-*p*-hydroxy-, and its hydrochloride (Takeda and Kuroda), A., i, 278.
3-Phenyl-1- and **-2-methylindazoles**, and their picrates (v. Auwers and Hültenes), A., i, 683.
Phenyl-2′-methyl-3′-indolydenemethane, 3:4:5-*tri*hydroxy-, and its derivatives (Rosenmund and Pfannkuch), A., i, 1081.
9-Phenyl-3-methylnaphthacridine, 2-amino- (Browning, Cohen, Gaunt, and Gulbransen), A., i, 612.

5 Phenyl-3-methyl*iso*oxazole-4-carboxylic acids, derivatives of (Betti and Berlingozzi), A., i, 52.

α-Phenyl-δ-methyl-Δ^{α}-penten-δ-ol-one, and its derivatives (Scheibler and Fischer), A., i, 1109.

Phenylmethyl-*n*-propylarsine, and its salts (Steinkopf, Donat, and Jaeger), A., i, 996.

Phenyl α-methyl-α-propylbutyl ketone (Leroide), A., i, 216.

Phenyl-1-methylpyrazole, chloro-4-bromo- (Rojahn), A., i, 1184.

3-Phenyl-1-methylpyrazoline, and its hydrochloride (Mannich and Heilner), A., i, 372.

1-Phenyl-3-methyl-5-pyrazolone, 1-5′-nitro-2′-hydroxy- (Society of Chemical Industry in Basle), A., i, 385.

Phenyl-1-methylpyrazolones (Rojahn), A., i, 1184.

1-Phenyl 3-methyl-5-pyrazolone-3′-carboxylic acid, 1-5′-chloro-2′-hydroxy-, and 1-4′-hydroxy- (Society of Chemical Industry in Basle), A., i, 385.

***N*-Phenyl-2-methylpyridazonexanthone**, 5- and 7-chloro- (v. dem Knesebeck and Ullmann), A., i, 360.

2-Phenyl-6-methylquinoline-4-carboxylic acid, allyl ester (Rosenmund), A., i, 52.

Phenylmethylsuccinic acid (Upson and Thompson), A., i, 343.

Phenylmethylthiazole methiodides (Mills and Smith), T., 2735.

4-Phenyl-3-methyl-2-thiazolenyl-4-quinolylmethane methiodide (Mills and Smith), T., 2736.

Phenyl methyl triketone-α- and -β-trioximes, and their nickel salts and triacetyl derivatives (Ponzio), A., i, 1038.

2-Phenyl-αβ-naphthatriazole, 2-*p*-amino- (Charrier and Viola), A., i, 771.
  6:2- and 9:2-*di*amino-, and 9:2-*di*nitro- (Morgan and Gilmour), A., i, 380.

Phenyl-α-naphthylamine, β-hydroxy- (Wahl and Lantz), A., i, 823.

3-Phenyl-5-naphthylaminomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1185.

Phenyl α-naphthyl ketones, chloro- (Scholl, Seer, and Daimer), A., i, 258.

2-Phenyl-α- and -β-naphthylmethylbenzoic acids, and their salts (McMullen), A., i, 1025.

Phenyl-α- and -β-naphthylphthalides (McMullen), A., i, 1025.

Phenyl-β-naphthylsulphone, 2:4-*di*nitro- (Grandmougin), A., i, 331.

Phenyl γ-nitro-β-*p*-chlorophenylpropyl ketone (Kohler and Smith), A., i, 458.

Phenyl β-nitro-γ-hydroxy-γ-*p*-chlorophenylpropyl ketone (Kohler and Smith), A., i, 458

cis- and *trans*-α-**Phenyl-δ-*p*-nitrophenyl-$\Delta^{\alpha\gamma}$-butadiene** γα-chlorohydrins and oxides (Kleucker), A., i, 734, 735.

3-Phenyl-2-*p*-nitrophenyl-1:4-diphenyl-1:3-dimethindiazidine, 3-*o*-nitro- (Ingold and Piggott), T., 2799.

Phenyl γ-nitro-*p*-phenylpropyl ketone, *p*-chloro- (Kohler and Smith), A., i, 457.

o′-**Phenylnitrosoaminophenyl-*p*-tolylsulphone.** See *o*′-*p*-Toluenesulphonyldiphenylnitrosoamine.

1-Phenyloxindole, 3-*di*chloro- (Stollé), A., i, 762.

5-Phenyl*cyclo*pentane-2:3-dione-1-carboxylic acid, ethyl ester, diphenylhydrazone (Dieckmann), A., i, 1022.

2-Phenylperithiazine (Reissert), A., i, 584.

Phenyl phenacetylmethyl ketone, *p*-chloro-, and its copper derivative (Kohler and Smith), A., i, 458.

10-Phenylphenazonium hydroxide, 2-amino-δ-thiol- (Watson and Dutt), T., 1941.

Phenyl-α-phenyl-β-(α′-bromocinnamoyl)-ethylphosphinic acid (Conant, Bump, and Holt), A., i, 68.

Phenyl-α-phenyl-β-(α′β′-*di*bromophenylpropionyl)-ethylphosphinic acid (Conant, Bump, and Holt), A., i, 68.

Phenyl-α-phenyl-β-carboxyethylphosphinic acid (Conant, Bump, and Holt), A., i, 68.

Phenyl-α-phenyl-β-cinnamoylethylphosphinic acid (Conant, Bump, and Holt), A., i, 68.

γ-Phenyl-α-(β-phenylethyl)propylphosphinic acid, α-hydroxy- (Conant, MacDonald, and Kinney), A., i, 186.

β-Phenyl-β-phenylvinylhydroxylamine (Rupe and Wittwer), A., i, 449.

Phenylphosphinic acid, nitroamino- (Nijk), A., i, 961.

3-Phenyl-1-phthalidophthalazone (Ruggli and Meyer), A., i, 343.

1-Phenylpiperidine, 4-hydroxy-, 4-hydroxy-1-*p*-amino-, and their derivatives (Borsche and Bonacker), A., i, 51.

α-Phenylpropane, αγ-*di*hydroxy-, and its dibenzoate (Rupe and Müller), A., i, 40.

γ-Phenylpropan-α- and -β-ols, β- and α-iodo- (Porcher), A., i, 539.

l-β-Phenylpropionamide, l-β-hydroxy- (McKenzie and Smith), T., 1859.

Phenylpropionic acid, *cis*-β(?)-chloro-*p*-nitro- (Kleucker), A., i, 735.

β-Phenylpropionic acid, α-thiol- (Gränacher), A., i, 850.

β-Phenylpropionolactone, β-2·4-*di*- and β-2:4:6-*tri*-hydroxy-, and β-5-nitroso-2:4-*di*hydroxy- (Langley and Adams), A., i, 1153.

Phenylpropionylphenylmethylhydrazine (Tomiček), A., i, 679.

Phenylpropionyltolylhydrazines (Tomiček), A., i, 679.

γ-Phenylpropyl alcohol, β-amino-, and its hydrochloride (Karrer), A., i, 991.

Phenyl α-propylbutyl ketone (Leroide), A., i, 216.

Phenyl-*n*-propylcyanoarsine (Steinkopf, Donat, and Jaeger), A., i, 996.

α-Phenyl*iso*propylethyl methyl ketone, semicarbazone of (Rupe and Müller), A., i, 41.

α-Phenyl*iso*propyl β-hydroxyvinyl ketone, and its salts (Rupe and Müller), A., i, 41.

Phenyl-*n*-propylsuccinic acid (Upson and Thompson), A., i, 343.

5-Phenyl-*iso*propyltriazole, 3-hydroxy- (Neighbors, Foster, Clark, Miller, and Bailey), A., i, 881.

α-Phenylprozan-βγ-dicarboxylic acid, ethyl ester (Diels and Aubart), A., i, 1194.

Phenylpyridinium bromide, 2:4:5-*tri*-nitro- (Giua), A., i, 691.

1-Phenyl-4-pyridone (Smirnov), A., i, 464.

preparation and derivatives of (Borsche and Bonacker), A., i, 50.

2-Phenylpyrimidine, and 5-bromo-6-hydroxy-, 6-chloro-5-bromo-, and 6-hydroxy-, and their salts (Cherbuliez and Stavritch), A., i, 581.

2-Phenylpyrimidine-4-carboxylic acid, 5-bromo-6-hydroxy-, and 6-hydroxy-, and their derivatives (Cherbuliez and Stavritch), A., i, 581.

1-Phenylpyrroline-5-one-3-carboxylic acid, ethyl ester (Carrière), A., i, 318.

Phenylpyruvic acid, behaviour of, in the animal organism (Kotake and Mori), A., i, 1216.

and hydroxy-, asymmetrical reduction of, in organs (Mori and Kanai), A., i, 1217.

Phenylpyruvic acid, ethyl ester, isomerism of (Gault and Weick), A., i, 1024.

Phenylquinoline, 3-hydroxy-2-*o*-nitro- (Neber), A., i, 545.

2-Phenylquinoline-4-carboxylic chloride (Rosenmund), A., i, 52.

2-Phenylquinoline-4-carboxylic acid (*atophan*), esters of (Rosenmund), A., i, 52.

benzyl ester (Gams and Kaiser), A., i, 51.

2-Phenylquinoline-4-carboxylic acid, 5-amino-6-hydroxy-, and 6-hydroxy- (Halberkann), A., i, 174.

6-hydroxy- (Zuckmayer), A., i, 952.

3-Phenylquinoline-4-carboxylic acid, 2-hydroxy- (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 867.

2-Phenylquinoline-4-formylacetic acid, ethyl ester (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolylaminoethanol dihydrochloride (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyl bromomethyl ketone, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyl diethylaminomethyl ketone, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyldimethylamino-ethanol dihydrochloride (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyl dimethylaminomethyl ketone, and its hydrochloride (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyl methyl ketone, and its hydrobromide (Society of Chemical Industry in Basle), A., i, 1180.

2-Phenyl-4-quinolyl piperidinomethyl ketone, and its hydrochloride (Society of Chemical Industry in Basle), A., i, 1180.

N-Phenylrhodanine, α-oximino-, and its derivatives (Granacher, Reis, and Pool), A., i, 577.

N-Phenylrhodanine-α-acenaphthene-quinone, and its *di*nitro-derivative (Gränacher, Reis, and Pool), A., i, 577.

Phenylstibinic acid, *p*-amino-, and *p*-hydroxy- (Schmidt), A., i, 1204.

p-nitro- (Charrier), A., i, 1080.

Phenylstibinic acids, neutralisation of, with lithium hydroxide (Schmidt), A., i, 482.

Phenylstibinous oxide, *p*-amino-, acetyl derivative (Schmidt), A., i, 1208.
Phenyl styryl ketone (*benzylideneacetophenone*), and its derivatives, absorption spectra of (Shibata and Nagai), A., ii, 413.
Phenyl styryl ketone, α-bromo-, action of alcohols on (Dufraisse and Gérald), A., i, 843.
4-Phenyl-2-styrylthiazole (Mills and Smith), T., 2734.
9-Phenyl-9-styrylxanthene (Ziegler and Ochs), A., i, 1048.
Phenylsuccinic acid, preparation of (Lapworth and McRae), T., 1704.
Phenylsuccinyleosin (Lapworth and McRae), T., 2723.
Phenylsulphamic acid, and *o*- and *p*-chloro-, sodium salts (Weil and Moser), A., i, 444.
Phenylsulphamic acid, *p*-amino-, and its acetyl and benzoyl derivatives, and *m*-nitro-, and their salts (Weil and Wassermann), A., i, 1006.
Phenylsulphamphthalein, 4:4′-*di*amino-2:2′-imino- (Dutt), T., 2392.
2-Phenyltetrahydroquinoline-4-carboxylic acid, and its lithium salt (Zuckmayer), A., i, 574.
2-Phenyltetrahydroquinoline-4-carboxylic acid, 7-amino-, acetyl derivative, and its potassium salt, and 6-hydroxy- (Zuckmayer), A., i, 952.
4 Phenyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole, 5-imino-2-thio- (Guha), A., i, 876.
1-Phenyl-1:2:3:4-tetrazole, 5-amino-, preparation and derivatives of (Stollé), A., i, 689.
4-Phenylthiazole-2-aldehyde *p*-dimethylaminoanil methiodide (Mills and Smith), T., 2735.
4-Phenyl-2-thiazolylphthalonylmethane (Mills and Smith), T., 2734.
Phenylthiocarbamide, *p*-chloro-, compounds of, with chloropicrin and mercuric nitrite (Rây and Das), T., 826.
Phenyl-*n*- and -ψ-thiocarbamine cyanides, salts of (Fromm and Wenzel), A., i, 488.
Phenylthiolacetyl-2:4-dimethylpyrroles, *o*-nitro- (Fischer and Herrmann), A., i, 1055.
Phenylthioldimethylpyrrole-3-carboxylic acids, *o*-nitro-, ethyl esters (Fischer and Herrmann), A., i, 1055.
4-Phenylthiol-2:3:5-trimethylpyrrole, 4-*o*-nitro- (Fischer and Herrmann), A., i, 1055.
Phenylthioxanthyl (Gomberg and Minnis), A., i, 163.
r- and *l*-**Phenyl-*p*-tolylacetamides** (McKenzie and Smith), T., 1357.
Phenyl-*m*- and -*p*-tolylamines, 5-bromo-2:4-*di*nitro- (Giua and Angeletti), A., i, 649.
1-Phenyl-3-*p*-tolyl-5-anilinomethylene-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1185.
***N*-Phenyl-*N*-*p*-tolylhydroxylamine** (Wieland and Kögl), A., i, 727.
4-Phenyl-1-*p*-tolyl-3-methylpyrazole (Rojahn), A., i, 373.
Phenyl-*p*-tolylnitrogen oxide (Wieland and Kögl), A., i, 727.
Phenyl-*p*-tolylsulphone, *o*′- and *p*′-amino- (Halberkann), A., i, 1183.
Phenyl-1-*p*-tolylsulphone, 2:5-*di*amino-, derivatives of (Society of Chemical Industry in Basle), A., i, 579.
β-Phenyl-ααβ-triethylpropionic acid (Ramart and Albesco), A., i, 663.
β-Phenyl-ααβ-triethylpropiophenone (Ramart and Albesco), A., i, 663.
Phenyltrimethylarsonium iodide, compound of iodoform and (Steinkopf and Schwen), A., i, 118.
Phenyltrimethylphenylenediamine, and its derivatives (Fichter and Rothenberger), A., i, 447.
β-Phenyl-β-1:3:4(or -1:3:5)-triphenyl-Δ^2-5(or -4)-pyrrolinylhydroxylamine, and its picrate and chloro-derivative (Rupe and Wittwer), A., i, 449.
4-Phenylurazole, and its derivatives and 3-imino- (Arndt, Milde, and Tschenscher), A., i, 376.
γ-Phenylvaleraldehyde, γ-hydroxy- (Helferich and Gehrke), A., i, 9.
α-Phenylvinylphosphinic acid (Conant, MacDonald, and Kinney), A., i, 186.
3-Phenylvioluric acid, 4-imino- (Lifschitz and Hepner), A., i, 768.
Phloroglucinol, phytochemical synthesis of (Nierenstein), A., i, 136.
  condensation of formic acid with (Schwenk), A., i, 153.

  and fluorescence (Wood), A., ii, 334.
Photo-electric effects, colloids as indicators of (Peskov), A., ii, 828.
Photographic copying process, mechanism of (Weigert and Schöller), A., ii, 10.
  emulsions and films, electrical conductivity of (Rabinovich), A., ii, 605.
  plates, dry, verification of the photochemical equivalent law with (Eggert and Noddack), A., ii, 9.
Photography, new sensitiser for (Mills and Pope), T., 946.
  of crystals (François and Lormand), A., ii, 127.
Photo-haloids, effect of an electric current on (Tubandt and Eschenhagen), A., ii, 346.
Photosynthesis (Baly), A., i, 307; (Kostytschev), A., i, 307, 308, 613.
  and the electron theory (Dixon and Ball), A., ii, 248.
Phototropy and photoelectric effects (Gallagher), A., ii, 11.
  of metallic salts (Singh), T., 782.
  of sulphides, effect of heat on (Mourelo), A., ii, 604.
Phrenosine, behaviour of, in the body (Shimizu), A., i, 91.
Phthalaldehydic acids, preparation of (Davies, Perkin, and Clayton), T., 2214.
Phthaleins, colour changes of (Thiel), A., i, 453.
Phthalic acid, salts, potentials of, against the hydrogen electrode (Wood and Murdick), A., ii, 735.
Phthalic acid, tetrachlorides, constitution and tautomerism of (Ott), A., i, 832.
  amyryl esters, and their silver and strychnine salts (Paolini), A., i, 755.
*iso***Phthalic acid**, 2:4:6-*tri*nitro- (Giua), A., i, 534.
Phthalic anhydride, preparation of, from naphthalene (Conover and Gibbs), A., i, 454.
  Friedel and Crafts' reaction with (McMullen), A., i, 1025.
  substituted derivatives, condensation of toluene and aluminium chloride with (Lawrance), A., i, 340.
Phthalic anhydride, *tetra*bromo-, *di-* and *tetra*-chloro-, additive compounds of (Pfeiffer and Flater), A., i, 341.
Phthalimide, preparation of (British Dyestuffs Corporation, Ltd., Green and Green), A., i, 836.
  potassium and sodium derivatives, preparation of (Hammick and Locket), T., 2362.
Phthalimide, *tetra*chloro-, compound of α-naphthyl methyl ether and (Pfeiffer and Flater), A., i, 342.
Phthalimidoacetaldehyde, and its derivatives (Radde), A., i, 1155.
Phthalimidoacetonitrile (Sonn and Falkenheim), A., i, 1164.
α-Phthalimidoethyl-γ-diethoxyacetoacetic acid, ethyl ester (Pucher and Johnson), A., i, 550.
β-Phthalimidoethylmalonic acid, and its ammonium salt and methyl ester (Radde), A., i, 1155.
α-Phthalimidopropaldehyde, and its semicarbazone (Radde), A., i, 1155.
γ-Phthalimido-*n*-propylmalonic acid (Radde), A., i, 1155.
α-Phthalimino-β-hydroxy-β-methylpropane (Dersin), A., i, 142.
α-Phthalimino-β-methylpropane, β-bromo-, β-chloro-, and β-iodo- (Dersin), A., i, 142.
Phthalyl chlorides, isomeric (v. Braun and Kaiser), A., i, 658.
Phthalyl-α-alanylamide, and its derivatives (Radde), A., i, 1155.
1:2-Phthalylanthraquinone and its azine (Scholl and Neumann), A., i, 262.
Phthalyl-*NN'*-dipiperidide (v. Braun and Kaiser), A., i, 659.
Phthalylglycylamide (Radde), A., i, 1155.
Phthalylglycylanilide (Radde), A., i, 1154.
Phthalylglycylonitrile, and its derivatives (Radde), A., i, 1155.

Phthalylphenylcarbamide (Elliott), T., 206.

Physicist, rôle of the, in development of chemical theory (Walker), T., 735.

Physiological fluids, equilibrated sterilisable (Fleisch), A., i, 964.
  precipitation of proteins from (Grigaut and Zizine), A., ii, 886.

Phytin in foods (Arbenz), A., i, 1102.

Phytosterols, chemistry of (Vesterberg; Vesterberg and Westerlind), A., i, 825.
  iodine value of (Holde, Werner, Tacke, and Wilke), A., ii, 723.

Pichurim bean oil, constituents of (Roure-Bertrand Fils), A., i, 846.

β-Picolinium ruthenibromides (Gutbier and Krauss), A., i, 16.

Picolinoylaminoanthraquinones (Barnett), A., i, 943.

Picric acid, cobaltammines of (Morgan and King), T., 1725.
  hexamminechromic and hexamminecobaltic salts (Ephraim and Mosimann), A., ii, 575.

Picrocrocin, and its derivatives (Winterstein and Teleczky), A., i, 563.

Picrorocellin, constitution of (Forster and Saville), T., 816.

Picrotin ketone, and α-bromo-, and oximino-, and their derivatives (Horrmann and Bischof), A., i, 161.

Picrotoxin (Horrmann and Bischof), A., i, 161.

Pigments, metabolism of. See Metabolism.
  anthocyanin, formation of (Combes), A., i, 412.
  related to anthocyanins, tinctorial properties of (Everest and Hall), A., i, 265.

Pike, constituents and toxicity of the roes of the (McCrudden), A., i, 194.

Pills, estimation of mercury in (François), A., ii, 87.

Pilocarpine, action of, on blood (Bornstein and Vogel), A., i, 80.

d-**Pimaric acid,** preparation of (Knecht and Hibbert), A., i, 1020.

Pimelic acid, *penta*hydroxy-, brucine and quinine salts (Kiliani), A., i, 1112.

Pinabietic acid, nitrosate, nitrosite and nitrosochloride of, and oximino- (Aschan, Fontell, and Simola), A., i, 1152.

Pinacolin transformation, reversed (Nybergh), A., i, 918.
  mobility of ethyl groups in the (Nybergh), A., i, 802.

Pinacolylthiocarbamide, compound of chloropicrin and (Rây and Das), T., 326.

Pinacone, equilibrium in the system, water and (Pushin and Glagoleva), T., 2816.

Pinacyanols, constitution of (König), A., i, 1188.

Pine, Swedish, constituents and properties of (Wahlberg), A., i, 1101.

Pine leaves, constituents of (v. Euler), A., i, 100.

Pine lignin. See Lignin.

Pine needles, wax from (Kaufmann and Friedebach), A., i, 740.

Pine wood, cellulose content of (Klason), A., i, 99.

Pinene hydrochloride, preparation of borneol from (Vavon and Berton), A., i, 943.

Pinonic acid, ethyl esters, semicarbazones (Simonsen), T., 2297.

Pinus sylvestris, constituents of the pollen of (Kiesel), A., i, 799.

iso-**Piperic acid** (Ott, Eichler, and Heimann), A., i, 1027.

Piperidine, compounds of, with metallic salts (Peters), A., i, 48.
  action of formaldehyde on (Putochin), A., i, 1176.
  haloid compounds of (Leonard), A., i, 362.

Piperidine, 1-chloro-, preparation of (Hirst and Macbeth), T., 2173.

Piperidinepropionic acid, 4-hydroxy-, ethyl ester (Ruzicka and Seidel), A., i, 1057.

9 **Piperidino-2-ethoxyacridine,** and its hydrochloride (Farbwerke vorm. Meister, Lucius, & Bruning), A., i, 469.

Piperidinomethylenemalonic acid, ethyl ester (Ingold, Perren, and Thorpe), T., 1785.

4-Piperidone, polymerisation of (Ruzicka and Seidel), A., i, 1057.

1-α-Piperidylethan-1-ol, and its derivatives (Hess and Corleis), A., i, 170.

N-**Piperidyl-*s*.-phthalyl*di*thiourethane** (v. Braun and Kaiser), A., i, 659.

β-4-Piperidylpropionic acid, ethyl ester, benzoyl derivative (Rabe, Kindler, and Wagner), A., i, 361.

Piperil, 6:6′-*di*nitro- (Greene and Robinson), T., 2193.

Piperitone (Read and Smith), T., 574, 1863; (Read, Smith, and Bentivoglio), T., 582.
  constitution and oxidation of, and its semicarbazones (Penfold), A., i, 259, 1035.

dl-**Piperitone,** and its semicarbazones (Read and Smith), T., 1863.

dl-**Piperitoneoximes**, and their derivatives (READ, SMITH, and BENTIVOGLIO), T., 582.

Piperoin, 6′-*mono*- and 6:6′-*di*-nitro- (GREENE and ROBINSON), T., 2192.

Piperonaldehyde, preparation of, from *iso*safrole (NAGAI), A., i, 839.

Piperonyl chloride, *di*chloro- (HAMBURGER), A., i, 556.

Piperonylacetic acid, 6-nitro-, methyl ester (GREENE and ROBINSON), T., 2195.

β-**Piperonylacrylic acid**, α-cyano-, preparation of (LAPWORTH and MCRAE), T., 1701.

N-**Piperonylaminoacetic acid**, α-cyano-, ethyl ester, hydrochloride (SCHEIBLER and BAUMGARTEN), A., i, 656.

N-**Piperonylglycine** hydrochloride (SCHEIBLER and BAUMGARTEN), A., i, 656.

Piperonylideneaminoacetic acid, sodium salt (SCHEIBLER and BAUMGARTEN), A., i, 656.

3-Piperonylideneamino-2-methoxy-*ar*-tetrahydronaphthalene (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 128.

Piperonylideneanthranilic acids, nitro- (EKELEY, ROGERS, and SWISHER), A., i, 935.

Piperonylideneisatinazine (BORSCHE and MEYER), A., i, 54.

Piperonylidenemethyl α-hydroxy*iso*propyl ketone. See α-3:4-Methylenedioxyphenyl-δ-methyl-Δ^{α}-penten-δ-ol-γ-one.

Piperonylideneresorcinol, and its acetyl derivative (FABRE), A., i, 1148.

2-Piperonylquinoline-4-carboxylic acid, esters (ROSENMUND), A., i, 52.

Piperonylsuccinic acid, preparation of (LAPWORTH and MCRAE), T., 1707.

Piperylmethylglyoxime, nickel compound (BIGIAVI), A., i, 353.

Pipettes, testing and graduation of (STOTT), A., ii, 388.
standard dropping (HALPHEN), A., ii, 221.

Pituitary body, tethelin from the (DRUMMOND and CANNAN), A., i, 491.
activity of extracts of (DALE and DUDLEY), A., i, 397.

Pivalic acid (*αα-dimethylpropionic acid*), *di*bromo-, and *di*hydroxy-, and their methyl esters (KOHN and MENDELEWITSCH), A., i, 518.

Plants, chemistry of (NOWAK and ZELLNER), A., i, 615; (SPRINGER), A., i, 797; (ZELLNER), A., i, 799, 1098.

Plants, acidity of juices of, and their growth and feeding power (BAUER and HAAS), A., i, 975.
growth and nutrition of, in relation to hydrogen-ion concentration (ARRHENIUS), A., i, 1097.
growth of the organs of, in absence of air (MAQUENNE and DEMOUSSY), A., i, 707.
biological significance of alkaloids in (CIAMICIAN and RAVENNA), A., i, 797.
absorption of aluminium by the roots of (STOKLASA, ŠEBOR, TYMICH, and CWACHA), A., i, 502.
effect of aluminium compounds on the growth of (CONNER and SEARS), A., i, 613.
genesis of amylase and maltase in (PALLADIN and POPOV), A., i, 614.
distribution of anthocyanidins in (JONESCO), A., i, 797.
effect of arsenic compounds on the growth of (STEWART), A., i, 1221; (STEWART and SMITH), A., i, 1222.
assimilation in (BALY), A., i, 307; (KOSTYTSCHEV), A., i, 307, 308; (MOLISCH; MÜLLER and WARBURG), A., i, 411; (WARBURG and NEGELEIN), A., i, 1097.
formation of chlorophyll in (MANSKY), A., i, 1222.
action of coal gas on (WEHMER), A., i, 211.
corrosion of marble by the roots of (CHEMIN), A., i, 94.
colloids in (SAMEC and FERJANČIĆ), A., i, 115; (SAMEC and MAYER), A., i, 921.
effect of hippuric acid and urea on the nutrition of (BOKORNY), A., i, 1222.
hydrocyanic acid in (SIEGFRIED; ROSENTHALER), A., i, 614.
incrustive tissues of (SCHMIDT and DUYSEN), A., i, 206.
absorption of ions by the roots of (REDFERN), A., i, 614.
action of soluble lead salts on (BONNET), A., i, 412.
rôle of manganese salts in (MCHARGUE), A., i, 906.
manganese content of the leaves of, and its variation with age (BERTRAND and ROSENBLATT), A., i, 411.
effect of neutral salts on heat coagulation of the protoplasm of (KAHHO), A., i, 94, 205.
effect of the reaction of nutritive solutions on the germination and growth of (HIXON), A., i, 1221.
absorption of nutritive substances from soils (CASALE), A., i, 508.

Plants, effect of sunlight on the formation of essential oils in (Canals), A., i, 907.
  behaviour of organic compounds in (Ciamician and Galizzi), A., i, 503.
  pectic substances of (Clayson, Norris, and Schryver), A., i, 206.
  nutrition of, with mineral phosphates (v. Wrangell), A., i, 1098.
  saccharophosphatase in (Němec and Duchoň), A., i, 206.
  action of selenium compounds on the growth of (Stoklasa), A., i, 614.
  action of selenium on the metabolism of, in presence of radioactive air and soil (Stoklasa, Křička, Pěnkava, Zelenka, Chmelař, and Jánský), A., i, 974.
  action of selenium, sulphur and tellurium salts on growth of (Tubina), A., i, 707.
  effect of reaction of soils on the distribution of (Atkins), A., i, 415, 509; (Comber), A., i, 416; (Fisher), A , i, 510.
  germinating, effect of soil acidity on (Lemmermann and Fresenius), A., i, 510.
  chlorophyll-free, vitamin-*B* in (Orton, McCollum, and Simmonds), A., i, 974.
  green, constituents of (Franzen and Schumacher; Franzen and Keyssner; Franzen and Stern), A., i, 311, 975; (Franzen and Ostertag), A., i, 616, 1223; (Franzen and Helwert), A., i, 1102.
  higher, distribution of manganese in (Bertrand and Rosenblatt), A., i, 95.
    nitrogen metabolism of (Chibnall), A., i, 908, 1225.
  detection of the ψ-bases of anthocyanidins in (Combes), A., i, 206.
  detection of tryptophan in (Kretz), A., ii, 668.
  estimation and distribution of chlorine in (Jung), A., i, 1098.
  occurrence and estimation of cobalt and nickel in (Bertrand and Mokragnatz), A., i, 1099.
Plant cells, hydrogen-ion concentration of (Atkins), A., i, 411.
  permeability of (Osterhout; Brooks; Kahho), A., i, 308.
  rhythmic precipitation in the membranes of (Möller), A., i, 94.
  action of bases and salts on masses of (MacDougall), A., i, 205.
  action of lipoids on (Boas), A., i, 94, 613.
Plant plasma, toxic action of salts on (Kahho), A., i, 311.
Platinum, *L*-series spectrum of (Duane and Patterson), A., ii, 463; (Webster), A., ii, 805.
  photoelectric wave-length of (Stuhlman), A., ii, 809.
  heated, emission of electrons from (Lockrow), A., ii, 608.
  loss of weight of, after ignition (Balareff), A., ii, 579.
  diffusion of hydrogen through (Schmidt and Lücke), A., ii, 198.
  properties of hydrogen desorbed from (Anderson), T., 1153.
  catalytic action of (Langmuir), A., ii, 629.
  catalytic decomposition of hydrogen peroxide by (Maxted), T., 1760.
  oxygen-hydrogen catalysis by (Hofmann), A., ii, 490.
  colloidal, action of ultra-violet light on (Spear, Jones, Neave, and Shlager), A., ii, 11.
Platinum salts, hydrolysis of (Archibald and Gale), T., 2849.
  Platinic chloride, compound of triethylene trisulphide and (Rây), T., 1283.
Platinum oxide, use of, in catalytic reduction of organic compounds (Voorhees and Adams), A., ii, 558.
  Chloroplatinic acid, preparation of (Rudnick), A., ii, 303.
Platinum separation:—
  separation of palladium from, by means of dimethylglyoxime (Davis), A., ii, 662.
Platinum bases (*platiniammines*) (Tschugaev and Pschenicyn), A., ii, 856.
  electrical conductivity of nitrites of (Tschugaev and Vladimirov), A., ii, 814.
Platinum black, catalysis by (Vavon and Husson), A., ii, 631.
Platinum electrodes. See Electrodes.
Platinum metals, catalysis by (Hofmann), A., ii, 276.
Plotohæmolysin (Kabeshima), A., i, 608.
Plotospasmin (Kabeshima), A., i, 608.
Plotosus anguillaris, toxin of (Kabeshima), A., i, 608.
Plototoxin (Kabeshima), A., i, 608.
Poison of scorpions (Wilson), A., i, 969.
  tetrodon (Ishihara), A., i, 85.
  toad's, constituents of (Wieland), A., i, 199; (Wieland and Alles), A., i, 784.
Poisons, specificity of (Bergell), A., i, 970.

Poisons, sensitiveness of cells to (Handovsky), A., i, 697.
  influence of the reaction of the solution on the action of, on bacteria or tadpoles (Labes), A., i, 901.
  action of, on enzymes (Santesson), A., i, 1077.
  action of, on striated muscle (Riesser and Neuschlosz), A., i, 1212.
Poisoning by arsenic (Schellbach), A., i, 900.
  by barium salts (Ionescu), A., i, 199 ; (Krafft), A., i, 301 ; (Baumann), A., i, 898.
  by lead compounds, hæmatoporphyrin in urine in (Schumm), A., i, 609.
  with mercuric chloride (Bornstein and Kerb), A., i, 404.
  with methyl alcohol, biochemistry of (Rabinovitch), A., i, 963.
  by strychnine, effect of magnesium sulphate on (Ferrara), A., i, 500.
Polarity, induced, of atoms (Lapworth), T., 416 ; (Kermack and Robinson), T., 427.
Polonium, velocity of emission of the α-rays of (Curie), A., ii, 606.
Polonium hydride (Paneth and Johannsen), A., ii, 777.
*iso***Poly-acids** (Rosenheim and Leyser), A., ii, 50.
Polyamyloses, and their derivatives (Pringsheim and Persch ; Pringsheim and Dernikos), A., i, 632 ; (Pringsheim and Goldstein), A., i, 633.
  physiology of (Pringsheim and Müllfr), A., i, 411.
Polyborates. See under Boron.
Polycyclic compounds, chemistry of, in relation to their homocyclic unsaturated isomerides (Farmer, Ingold, and Thorpe), T., 128 : (Chandrasena, Ingold, and Thorpe), T., 1542.
Polymerisation (Fielding), A., ii, 23, 421.
  under critical conditions (Muller), A., ii, 820.
Polyneuritis in birds, amylolytic activity of the liver and pancreas in (Tiger and Simonnet), A., i, 195.
ϵ-**Polyoxymethylene** (Hammick and Boeree), T., 2738.
Polypeptides, refraction of (Hirsch and Kunz), A., i, 781.
Polysaccharides (Karrer), A., i, 11 ; (Abderhalden), A., i, 82 ; (Karrer, Staub, and Wälti), A., i, 229 ; (Karrer and Bürklin ; Karrer and Smirnov), A., i, 435 ; (Karrer and Fioroni), A., i, 1119.
Polysaccharides, constitution of (Irvine, Steele, and Shannon), T., 1060 ; (Irvine and Hirst), T., 1585 ; (Zwikker), A., i, 230, 432 ; (Komatsu and Kashima), A., i, 811.
  digestion of (Shimizu), A., i, 82.
Polythionic acids. See under Sulphur.
Pompelmus oil, constants of (Gattefossé), A., i, 1167.
Potassium, bright metallic, preparation of, in nitrogen (Bornemann), A., ii, 444.
  absorption spectrum of the vapour of (Datta), A., ii, 678 ; (Narayana and Gunnaiya ; Harrison), A., ii, 679.
  arc spectrum of (Foote, Meggers, and Mohler), A., ii, 598.
  electrical conductivity of, in liquid ammonia (Kraus and Lucasse), A., ii, 252.
  vapour, ionisation of, by light (Williamson), A., ii, 681.
    electrodeless discharge in (Robertson), A., ii, 609.
  chemical constants of (Ladenburg and Minkowski), A., ii, 191.
  crystal structure of (McKeehan), A., ii, 709.
Potassium salts, absorption of, by animal cells (Mitchell, Wilson, and Stanton), A., i, 196.
  action of, on isolated tissues, and its substitutes (Clark), A., i, 399.
  antagonism of calcium salts and (Spiro), A., i, 85.
  replacement of, by uranium and thorium in Ringer's solution (Zwaardemaker), A., i, 1213.
  distribution of, in blood (Kramer and Tisdall), A., i, 1087.
  estimation of magnesium in (Vürtheim), A., ii, 870.
Potassium azide, action of iodine with, in presence of carbon disulphide (Browne and Hoel), A., ii, 847.
  azidodithiocarbonate (Browne and Hoel), A., ii, 848.
  bromide, ionisation of, in aqueous solutions (Pearce and Hart), A., ii, 254.
  antimoniodobromide (Vournazos), A., ii, 651.
  platinibromide, hydrolysis of (Archibald and Gale), T., 2849.
  carbonate, equilibrium of, with barium sulphate and with calcium oxalate (Ramann and Sallinger), A., ii, 131.
  chlorate, action of radium rays on (Kailan), A., ii, 543.

Potassium chlorate, equilibrium of potassium nitrate, water, and (TODA), A., ii, 748.
  *per*chlorate, preparation of, from potassium chlorate (LENHER, STONE, and SKINNER), A., ii, 287.
  chloride, electrical conductivity of solutions of, in presence of sucrose (KIERAN), A., ii, 812.
  platinichloride, refractive index of (RAITERI), A., ii, 541.
  stannichloride, crystal structure of (DICKINSON), A., ii, 287.
  chromate, equilibrium of silver iodate with (RAMANN and SALLINGER), A., ii, 131.
  *di*chromate as a standard in iodimetry (VOSBURGH), A., ii, 863.
  hydroxide, preparation of, in alcoholic solution for volumetric work (McCALLUM), A., ii, 54.
    heats of neutralisation of (RICHARDS and ROWE), A., ii, 425.
  iodate and iodide, action of, on hydroxy-acids (KRISHNA and POPE), T., 798.
  iodide, compound of pyridinebetaine and (CASSELLA & Co.), A., i, 860.
    detection of iodates in (LACHARTRE), A., ii, 716.
  *per*manganate, properties of (FESTER and BRUDE), A., ii, 771.
    absorption spectrum of (HAGENBACH and PERCY), A., ii, 600.
    solubility of, in solutions of potassium and sodium sulphates (TRIMBLE), A., ii, 374.
    thermal decomposition of (MOLES and CRESPI), A., ii, 374.
    velocity of the reduction of, by formic acid (HOLLUTA), A., ii, 448; (HOLLUTA and WEISER), A., ii, 628.
    velocity of reaction of hydrogen peroxide with (ZAWIDZKI), A., ii, 207.
    oxidation of side-chains with (BIGELOW), A., i, 998.
    effect of filter paper on titrations with (SIMPSON), A., ii, 234.
  nitrate, equilibrium of potassium chlorate, water, and (TODA), A., ii, 748.
  cadmium nickel nitrite (CUTTICA), A., ii, 449.
  ammonium phosphates (CORELLI), A., ii, 287.
  plumbite, interaction of methyl iodide and (DRUCE), A., i, 516.
  silicate, equilibrium of potassium tungstate with (VAN LIEMPT), A., ii, 775.

Potassium silicofluoride, refractive index of (RAITERI), A., ii, 541.
  sulphate, equilibrium of aluminium sulphate, water, and (BRITTON), T., 982.
    equilibrium of ammonium and magnesium sulphates, water, and (WESTON), T., 1223.
    equilibrium of copper sulphate, ammonium sulphate, water, and (HAYAMI), A., ii, 748.
  hydrogen sulphate, preparation of (DOMINIK), A., ii, 145.
  alum, mordanting of wool with (PADDON), A., ii, 822.
  tungstate, equilibrium of, with potassium silicate and with sodium tungstate (VAN LIEMPT), A., ii, 775.

Potassium organic compounds:—
  cyanide, crystal structure of (BOZORTH), A., i, 441; (COOPER), A., i, 1128.
  cadmium, mercury, and zinc cyanides, crystal structure of (DICKINSON), A., i, 532.
  ferricyanide, use of, in iodometry (KOLTHOFF), A., ii, 224.
    decomposition of, by heat (CUTTICA), A., i, 441.
  ferrocyanide, decomposition of, in daylight (BAUDISCH and BASS), A., i, 993.
    solubility of, in water (FABRIS), A., i, 329; (VALLANCE), A., i, 724.
    action of, on silver haloids (BONINO), A., ii, 78.
    use of, in electrometric titration (KOLTHOFF), A., ii, 580.
    estimation of, with permanganate (KOLTHOFF), A., ii, 537.
  phenyl selenate (MEYER and WAGNER), A., i, 620.

Potassium detection and estimation:—
  detection of, in animal and vegetable cells (MACALLUM), A., ii, 869.
  estimation of (HAZEN), A., ii, 658.
  estimation of, volumetrically (MACHELEIDT), A., ii, 227.
  estimation of, in presence of magnesium, sodium, phosphates, and sulphates (WATSON), A., ii, 586.
  estimation of, in soils (JONES and REEDER), A., ii, 85.

Potassoxyethoxydiphenylketen (STAUDINGER and MEYER), A., i, 1015.

Potatoes, manganese content of (BODE and HEMBD), A., i, 415.

Potential, differences of, at the surface of two liquids (FREUNDLICH and GYEMANT), A., ii, 342.

Powders, adsorbing, determination of the surface of (PANETH and VORWERK), A., ii, 618.

Praseodymium oxide, density and molecular volume of (PRANDTL), A., ii, 879.

Precipitates, carrying down of soluble salts by (DUTOIT and GROBET), A., ii, 550.

Pregl's solution, composition of (BACHSTEZ), A., ii, 792.

Pregnancy, chemistry of (KILLIAN and SHERWIN; CALDWELL and LYLE), A., i, 489.

Probability, correlation of entropy and (LINHART), A., ii, 257, 738.

Procaine. See Novocaine.

Propane, amino- and hydroxy-chloro-derivatives, constitution of (SMITH and PLATON), A., i, 1121.

*cyclo***Propane**, preparation of, pure (TRAUTZ and WINKLER), A., i, 926.

  isomerisation of (TRAUTZ and WINKLER), A., i, 926.

*cyclo***Propane**, nitro-, action of alkalis on (KOHLER and SMITH), A., i, 457.

*cyclo***Propane-1-carboxylamide-1-carboxylic acid**, ethyl ester (INGOLD, SAKO, and THORPE), T., 1189.

*cyclo***Propanecarboxylhydroxamic** acid, and its salts and derivatives (JONES and SCOTT), A., i, 453.

*cyclo***Propane-1-carboxylic acid**, 1-amino-, and its derivatives, and 1-hydroxy- (INGOLD, SATO, and THORPE), T., 1196.

*cyclo***Propane-1:1-dicarboxylamide** (INGOLD, SAKO, and THORPE), T., 1189.

*cyclo***Propane-1:1-dicarboxylbromoamide** (INGOLD, SAKO, and THORPE), T., 1190.

*cyclo***Propane-1:1-dicarboxylic** acid, ethyl ester, and amides, and condensation products with carbamides (DOX and YODER), A., i, 180.

Propane-αγ-diol, β-chloro-β-nitro-, and its dibenzoate (SCHMIDT and WILKENDORF), A., i, 314.

αγ-Propanedisulphonyldihydrazide (CLUTTERBUCK and COHEN), T., 128.

αγ-Propanedisulphonyldiphenylhydrazide (CLUTTERBUCK and COHEN), T., 127.

5-*cyclo*Propane*spiro*hydantoin, and *di*bromo- (INGOLD, SAKO, and THORPE), T., 1190.

Propanesulphonic acid, βγ-*di*chloro-, ammonium and barium salts (POPE and SMITH), T., 1169.

Propane-αγγ-tricarboxylic acid (DICKENS, KON, and THORPE), T., 1502.

Propan-β-olcamphorcarboxylic acids, isomeric (HALLER and RAMART-LUCAS), A., i, 460.

Propan-β-olcamphorcarboxylolides, isomeric (HALLER and RAMART-LUCAS), A., i, 460.

*iso***Propenylacetylene.** See γ-Methyl-Δ^{α}-butenine.

Propionic acid, lead diphenyl salt (GODDARD, ASHLEY, and EVANS), T., 981.

Propionic acid, bromo-, sodium salt, separation of bromine from (V. EULER and FAHLANDER), A., ii, 360.

  β-bromo- and β-chloro-, preparation of (ROJAHN), A., i, 105.

  α- and β-chloro-, ethyl esters, action of magnesium ethyl bromide with (MOUREU and BARRETT), A., i, 4.

  β-cyano-, ethyl ester, and its oxime (CARRIÈRE), A., i, 318.

Propionitrile, β-hydroxy- (RÖHM and HAAS), A., i, 531.

Propionylbutyric acid (BRUYLANTS), A., i, 531.

3-Propionyl-*p*-cresol, derivatives of (V. AUWERS, HILLIGER, and WULF), A., i, 1192.

Propionyloxypropionyl chloride, α-chloro- and its anilide (BLAISE and MONTAGNE), A., i, 716.

Propiophenones, ααββ-substituted, decomposition of, with sodamide (RAMART and ALBESCO), A., i, 662.

β-Propoxybutyronitriles (BRUYLANTS), A., i, 924.

7-*n*-Propoxy-7:12-dihydro-γ-benzophenarsazine (LEWIS and HAMILTON), A., i, 188.

6-Propoxy-2-methylquinoline, and its ethiodide (GUTEKUNST and GRAY), A., i, 951.

***n*-Propyl** *p*-carbamidophenyl ether, β-hydroxy- (SPECKAN), A., i, 580.

  hydrogen selenate, and its metallic salts (MEYER and WAGNER), A., i, 620.

*iso***Propyl** alcohol, pharmacology of (MACHT), A., i, 1093.

  oxidation of, by potassium permanganate (EVANS and SEFTON), A., i, 1108.

  fate of, in the animal organism (POHL), A., i, 498.

*iso***Propyl alcohol**, α-chloro-α-nitro-, and α-nitro-, sodium derivative (SCHMIDT and WILKENDORF), A., i, 314.

***n*-Propylalanine.** See α-Methyl-*n*-valeric acid, α-amino-.

α-*cyclo*Propylalanine. See α-*cyclo*Propylpropionic acid, α-amino-.

_iso_Propylallylbarbituric acid, preparation of (HOFFMANN-LA ROCHE & Co.), A., i, 872.

***N*-_iso_Propylaminoacetic acid**, α-cyano-, ethyl ester, and its hydrochloride (SCHEIBLER and BAUMGARTEN), A., i, 657.

***n*- and _iso_Propylammonium** rutheni-pentabromides (GUTBIER and KRAUSS), A., i, 16.

_iso_Propylbenzoic acid, *o*-amino-*p*-α-hydroxy-, and *o*-nitro-*p*-α-hydroxy- (PHILLIPS), A., i, 955.

***n*-Propylboric acid** (KRAUSE and NITSCHE), A., i, 22.

Propyl-*n*-butylamine (V. BRAUN and WEISMANTEL), A., i, 1151.

Propylbutylarsinic acid (QUICK and ADAMS), A., i, 600.

*iso***Propyl** *iso***butyl ketone** semicarbazone (LEROIDE), A., i, 217.

***N*-Propylconiine**, γ-hydroxy-, hydrochloride (V. BRAUN, BRAUNSDORF, and RATH), A., i, 760.

3-Propyl-*p*-cresol, α-amino-, benzoyl derivative (V. AUWERS, HILLIGER, and WULF), A., i, 1193.

_iso_Propyl_iso_crotylcarbinol, and its acetyl derivative (KRESTINSKI), A., i, 1129.

Propylene, preparation of, pure (TRAUTZ and WINKLER), A., i, 909.
  production of, from *cyclo*propane (TRAUTZ and WINKLER), A., i, 927.
  action of selenium chloride on (BOORD and COPE), A., i, 421.

Propylenediamine stannichloride (DRUCE), A., i, 639.

α-_cyclo_Propylethyldimethylamine, salts of (DEMJANOV and DOJARENKO), A., i, 1014.

_cyclo_Propylethylene glycol (DEMJANOV and DOJARENKO), A., i, 1014.

9-*n*-Propylfluorene, 2:7-*di*bromo-9-hydroxy- (SIEGLITZ and JASSOY), A., i, 821.

***N*-_iso_Propylglycine**, and its hydrochloride (SCHEIBLER and BAUMGARTEN), A., i, 657.

***N*-_iso_Propylideneaminoacetic acid**, sodium salt (SCHEIBLER and BAUMGARTEN), A., i, 657.

4-_iso_Propylidene_cyclo_hexanone, separation and reduction of (HENDERSON, ROBERTSON, and BROWN), T., 2721.

_iso_Propylindigotin, 6:6′-*di*-α-hydroxy- (PHILLIPS), A., i, 955.

***n*-Propylisatoid** (HELLER and BENADE), A., i, 582.

_iso_Propylmalonamide (DOX and YODER), A., i, 816.

Propylmenthol (OGATA and MIYASHITA) A., i, 844.

***Py*-*N*-Propyl-*Ind*-*N*-methylharmine** chloride (KERMACK, PERKIN, and ROBINSON), T., 1894.

β-Propylmethylheptenol (HELFERICH and GEHRKE), A., i, 9.

Propylphenetidine, βγ-*di*hydroxy-, and its oxalic ester (BERGMANN, ULPTS, and CAMACHO), A., i, 1181.

***N*-Propylpiperidine**, γ-hydroxy-, and its derivatives (V. BRAUN, BRAUNSDORF, and RATH), A., i, 760.

α-_cyclo_Propylpropionic acid, α-amino-, and its salts (ZELINSKY and DENGIN), A., i, 1127.

2-_iso_Propylquinoline, 2-α-hydroxy- (SCHEIBLER and FISCHER), A., i, 1110.

_iso_Propylsemicarbazide, and its salts and derivatives (NEIGHBORS, FOSTER, CLARK, MILLER, and BAILEY), A., i, 881.

_iso_Propylstannonic acid, and its salts and derivatives (DRUCE), T., 1859.

***N*-Propyltetrahydro_iso_quinoline**, γ-hydroxy-, and its salts (V. BRAUN, BRAUNSDORF, and RATH), A., i, 761.

Prosolannellic acid (WIELAND and SCHULENBURG), A., i, 346.

Protamines (GROSS), A., i, 784.

Protease, estimation of, in blood (BACH and ZUBKOWA), A., i, 392.

Proteic acids, hydroxy- (EDLBACHER), A., i, 692, 883.

Proteins, physical chemistry of (COHN), A., i, 882.
  mobility of the ions of (PAULI), A., i, 478.
  potential differences between solutions of (LOEB), A., i, 692.
  heat of coagulation of (HIRSCH-POGANY), A., i, 596.
  colloid chemistry of (FODOR), A., i, 691.
  coagulation of, by sunlight (YOUNG), A., i, 386.
  coagulation of, by heat (LEPESCHKIN), A., i, 1198; (LÜERS and LANDAUER), A., ii, 697.
  influence of acids on the osmotic pressure of solutions of (LOEB), A., ii, 742.
  influence of aggregates on the potential and osmotic pressure of (LOEB), A., i, 883.
  determination of the isoelectric point of (LÜERS and LANDAUER), A., 881.
  effect of salts on the isoelectric point of (LOEB), A., i, 882.
  solubility of, at the isoelectric point (COHN), A., i, 882.
  precipitation of (CRISTOL), A., ii, 583

Proteins and their derivatives, fractionation of (Rakuzin), A., i, 957.
adsorption of, by aluminium hydroxide (Rakuzin), A., i, 1199.
free amino-groups in (Engeland; Edlbacher), A., i, 279.
amino-acids from products of hydrolysis of (Buston and Schryver; Jones and Johns), A., i, 182.
basic derivatives of (Felix), A., i, 295.
electric kataphoresis of metallic compounds of (Benedicenti and Rebello-Alves), A., ii, 683.
action of β-naphthalenesulphonyl chloride on (Edlbacher and Fuchs), A., i, 279.
compounds of nucleic acid and (Steudel and Peiser), A., i, 1200.
sulphur in (Hoffman and Gortner), A., i, 429.
"double-nitrogen" as a measure of degradation of (Hahn), A., i, 291.
toxicity of (Pentimalli), A., i, 302.
action of, in the organism (Luttichau), A., i, 892.
effect of polysaccharides on sparing of (Shimizu), A., i, 83.
replacement of, by urea in diet (Morgen, Schöler, Windheuser, and Ohlmer), A., i, 293.
absorption and utilisation of, in liver diseases (Aub and Means), A., i, 193.
digestibility of (Jones and Waterman), A., i, 893.
digestion of, by trypsin (Northrop), A., i, 693.
Bence Jones', distribution of nitrogen in (Luscher), A., i, 1199.
of blood sera, ultra-violet absorption spectra and rotation of (Lewis), A., ii, 245.
natural (Schmidt and Braunsdorf), A., i, 781.
of organs, decomposition of (Thomas), A., i, 790.
of serum (Piettre and Vila), A., i, 63.
in yeast, decomposition of, during fermentation (Ivanov), A., i, 202.
Proteins and soaps (Fischer, McLaughlin, and Hooker), A., ii, 430, 829.
precipitation of (Hiller and van Slyke), A., i, 1074.
  from physiological fluids (Grigaut and Zizine), A., ii, 886.
detection of, and their derivatives, colorimetrically (Rakuzin), A., ii, 670.
Proteins, estimation of, in blood (Howe), A., ii, 171, 172; (Bierry and Moquet), A., ii, 886.
estimation of, in colostrum (Howe), A., ii, 670.
estimation of, in plasma (Wu), A., ii, 406.
estimation of amino-acids in (Folin and Looney), A., ii, 539.
estimation of ammonia in (Froidevaux), A., ii, 454.
estimation of tryptophan in (Lüscher), A., i, 1199.
estimation of tyrosine in (v. Fürth and Fleischmann), A., ii, 406.
Protocatechualdehyde, preparation of (Hamburger), A., i, 556.
Protocatechuic acid, compound of diketopiperazine and (Povarnin and Tichomirov), A., i, 1185.
Protoplasm, chemical constitution of (Walter), A., i, 308.
relation between the colloidal state and the physiological functions of (Wurmser and Jacquot), A., i, 1221.
Prunus avium (cherry), acids of (Franzen and Helwert), A., i, 1102.
Pseudowavellite (Henrich and Hiller), A., ii, 860.
Psoriasis, composition of the scales in (Abderhalden and Zorn), A., ii, 794.
Ptyalin, thermostability of (Ernström), A., i, 599.
Puerperal fever, changes in blood and urine in (Couinaud and Clogne), A., i, 401.
Pump, water (Wetzel), A., ii, 139.
Purine metabolism. See Metabolism.
Purinecarboxylic acids, preparation of (Merck, Wolfes, and Kornick), A., i, 1071.
Purpura aperta and *lapillus*, colouring matters from (Friedlander), A., i, 793.
Purpurin *di*boroacetate, and its acetyl derivative (Dimroth and Faust), A., i, 157.
  2-methyl ether, 3-bromo- (Dimroth, Schultze, and Heinze), A., i, 158.
Pycnometry (Saar), A., ii, 549.
Pyranhydrones (Schneider and Ross), A., i, 1171.
Pyrazole derivatives, electrochemical oxidation of (Fichter and de Montmollin), A., i, 470.
Pyrazoleanthrone-yellow, constitution of (Mayer and Heil), A., i, 877.
Pyrene, synthesis of (Fleischer and Retze), A., i, 1138.

Pyridine, reduction of (Lebeau and Picon), A., ii, 48; (Dimroth and Frister), A., i, 678.
  derivatives, reduction of (Thielepape and Spreckelsen), A., i, 1191.
  electrolysis of metallic salts in (Müller; Müller and Duschek), A., ii, 612.
  compounds of, with metallic salts (Peters), A., i, 48.
  compound of sodammonium with (Lebeau and Picon), A., i, 48.
  hydroferrocyanide (Cumming), T., 1297.
  aryl derivatives of (Dilthey), A., i, 272.
  di*iso*propyl- and *iso*propyl-stannisalts (Druce), T., 1861.
  additive compounds of, with metallic alkyl and aryl xanthates (Dubsky and Aptekmann), A., i, 104.
  additive compounds of *s*.-trinitroanisole with (Giua), A., i, 572.
  detection of (Lehner; Goris and Larsonneau), A., ii, 795.
  separation of quinoline and (Cumming), T., 1298.
Pyridine, 2-amino-, benzoyl derivative, and its salts (Tschitschibabin and Bylinkin), A., i, 573.
Pyridines, physical properties of aqueous solutions of (Jones and Speakman), A., i, 171.
  methylated, preparation of, pure (Heap, Jones, and Speakman), A., i, 171.
  arylated (Dilthey, Nüsslein, Meyer, and Kaffer), A., i, 949.
Pyridine-4-acetamide, 2:6-*di*hydroxy- (Ingold and Nickolls), T., 1644.
Pyridinebetaine, compounds of, with metallic salts (Cassella & Co.), A., i, 860.
Pyridine-3-carboxylic acid. See Nicotinic acid.
Pyridine-3-carboxylodiethylamide (Society of Chemical Industry in Basle), A., i, 860.
Pyridine-2:3-dicarboxylic acid, methyl ester (Merck), A., i, 950.
Pyridineiridic acid, *penta*chloro-, and its potassium salt (Delépine), A., i, 859.
Pyridine-4-propionic acid, 2:6-*di*hydroxy-, and its salts (Farmer), T., 2018.
Pyridinium salts (Barnett and Cook), T., 792.
  *tetra*chloroferrate (Weinland and Kissling), A., i, 363.
  ruthenipentabromide (Gutbier and Krauss), A., i, 16.
Pyrimidine, 5-bromo-6-hydroxy-, and 6-chloro-5-bromo-, and their salts (Cherbuliez and Stavritch), A., i, 581.
Pyrimidines (Dox and Yoder; Horn), A., i, 374; (Cherbuliez and Stavritch), A., i, 581; (Johnson and Baudisch), A., i, 328.
*spiro***Pyrimidines** (Dox and Yoder), A., i, 180.
Pyrimidines, 2-thiol-, alkylation of (Horn), A., i, 374.
Pyrimidine-4-carboxylic acid, 5-bromo-6-hydroxy-, and 6-hydroxy-, and their derivatives (Cherbuliez and Stavritch), A., i, 581.
Pyrites, use of, as a catalyst in Friedel and Crafts' reaction (Smythe), T., 1270.
  action of acetylene on (Steinkopf and Herold), A., i, 850.
  estimation of sulphur in (Gadais), A., ii, 79; (Chaudron and Juge-Boirard), A., ii, 311.
Pyrocatechol, complex salts of, and its derivatives (Reihlen), A., i, 1146; (Reihlen and Sapper), A., i, 1147.
Pyrofulmin (Langhans), A., i, 328.
Pyrogallol, absorption of oxygen by, in gas analysis (Hoffmann), A., ii, 582.
  compound of diketopiperazine and (Povarnin and Tichomirov), A., i, 1185.
  equilibrium of triphenylcarbinol with (Kremann, Hohl, and Muller), A., i, 138.
  1:3-dimethyl ether, and its acetyl derivative, amino- and nitro-derivatives of (Brand and Collischonn), A., i, 452.
Pyrogallolcamphorein, and its tetraacetyl derivative (Singh, Rai, and Lal), T., 1428.
Pyromellitic acid (Philippi; Philippi and Rie; Philippi and Thelen; Philippi, Seka, and Froeschl; Philippi, Seka, and Robinson), A., i, 837.
Pyromellitic acid, *di*bromo- (Philippi, Seka, and Robinson), A., i, 837.
Pyromucic acid, bactericidal action of (Kaufmann), A., i, 304.
Pyromucylhydroxamic acid, and its acetyl ester, and their salts (Jones and Hurd), A., i, 249.
γ-**Pyrone**, action of aniline on (Borsche and Bonacker), A., i, 50.
Pyrophosphoric acid. See under Phosphorus.
Pyroprosolannellic acid (Wieland and Schulenburg), A., i, 346.

Pyrosolannellic acid (Wieland and Schulenburg), A., i, 346.
Pyrosulphuryl chloride. See under Sulphur.
Pyrrole, catalytic hydrogenation of (Putochin), A., i, 1176.
  behaviour of, in the body (Shimizu), A., i, 91.
  melanin from (Rondoni), A., i, 64.
  derivatives (Kuster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 857.
  iodo-derivatives (Pieroni), A., i, 763.
Pyrroles (Fischer and Zerweck), A., i, 758; (Fischer and Herrmann), A., i, 1054; (Fischer, Schneller, and Zerweck), A., i, 1055.
  constitution of polymeric (Pieroni and Moggi), A., i, 766.
Pyrrolealdehydes (Fischer and Zerweck), A., i, 758.
Pyrrole-3:5-diacetic-2:4-dicarboxylic acid, methyl ester (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 859.
Pyrrole-3:5-dicarboxylic acid, 2:4-*di*nitro-, ethyl ester (Fischer and Zerweck), A., i, 759.
Pyrrolidine, preparation of (Putochin), A., i, 1176.
  action of formaldehyde on (Putochin), A., i, 1176.
5-Pyrrolidine-2-carboxylic acid, *n*-butyl ester (Chiles and Noyes), A., i, 925.
α-Pyrrylcinchonic acid, and its sodium salt (Ciusa), A., i, 1062.
Pyrus aucuparia. See Mountain ash.
Pyrus coronaria, organic acids from (Sando and Bartlett), A., i, 100.
Pyruvaldehyde, *p*-ethoxyphenylhydrazone (Jacobsen), A., i, 596.
Pyruvic acid, as a fermentation product (v. Grab), A., i, 306.
  decarboxylation of, by yeast (Hanke and Koessler), A., i, 409.
  as the acetylating agent of the body (Knoop), A., i, 487.
  in urine (Fricke), A., i, 495.
  p-ethoxyphenylhydrazone (Jacobsen), A., i, 596.
  m-methoxyphenylmethylhydrazone (Kermack, Perkin, and Robinson), T., 1881.
  o- and *p*-nitrophenylhydrazones, alkali salts of (Ciusa and Rastelli), A., i, 1073.
  as-*p*-nitrophenylmethylhydrazone (Ciusa and Rastelli), A., i, 1074.
Pyrylium compounds (Dilthey and Kaffer), A., i, 668.
Pyrylium salts, synthesis of (Pratt and Robinson), T., 1577.

Q.

Quantum theory, application of, to gases (Schaposchnikov), A., ii, 889.
Quartz, heat of crystallisation of (Ray), A., ii, 685.
  crystal structure of (Huggins), A., ii, 641.
Quinaldine synthesis (Lindner), A., i, 687.
Quinaldinic acid, esters and quaternary salts of (Mills and Hamer), T., 2008.
Quince tree, exudation from the stems of (v. Lippmann), A., i, 1223.
Quindoline methochloride and methosulphate (Armit and Robinson), T., 836.
Quindolines (Grandmougin), A., i, 584.
Quinhydrone electrode. See Electrode.
Quinic acid, synthesis of (Kaufmann), A., i, 464.
  derivatives of (Halberkann), A., i, 174.
Quinicylglycineanilide dihydrochloride (Heidelberger and Jacobs), A., i, 673.
Quinicylglycine-*p*-hydroxyanilide (Heidelberger and Jacobs), A., i, 673.
Quinidine oxide, picrate of (Speyer and Becker), A., i, 675.
Quinine, effect of, on blood (Luger), A., i, 81.
  fixation and distribution of, in blood (Rona and Bloch), A., i, 290, 484.
  salts, ionisation and luminescence of (Schmidt), A., ii, 182.
    detection of quinotoxine in (Ganassini), A., ii, 539.
    estimation of (Liversedge and Andrews), A., ii, 669.
  acetoxybenzoyl derivatives of (Merck, Diehl, and Mayen), A., i, 46.
  oxide, salts of (Speyer and Becker), A., i, 675.
  separation of strychnine and (Warren and Clark), A., ii, 171; (Evers), A., ii, 669.
Quinine alkaloids, distribution of, in the organism (Boecker), A., ii, 896.
Quinizarin, action of bromine on (Dimroth, Schultze, and Heinze), A., i, 157.

Quinizarin, 2-fluoro-, and its diacetyl derivative (Dimroth and Hilcken), A., i, 158.
Quinizarin-2:3-dipyridinium *di*bromide, and its phenobetaine (Barnett and Cook), T., 1384.
Quinizarin-2-phenylsulphone, and its diacetyl derivative (Dimroth and Hilcken), A., i, 158.
Quinizarinquinone *di*bromide and methobromide (Dimroth, Schultze, and Heinze), A., i, 157.
Quinizarinquinone, 5- and 6-hydroxy- (Dimroth and Hilcken), A., i, 158.
Quinobenzidine, and its bishydrazine (Wieland, Wecker, and Haas), A., i, 780.
Quinocyanines, chemistry of (König), A., i, 1188.
Quinol, electromotive equilibria of quinone with (Granger and Nelson), A., i, 43.
chlorination of (Eckert and Endler), A., i, 932.
oxidation of, in presence of aliphatic amines (Harger), A., i, 539.
compound of diketopiperazine and (Povarnin and Tichomirov), A., i, 1185.
Quinol, nitro-derivatives, and their benzoates (Kehrmann, Sandoz, and Monnier), A., i, 33.
Quinolcamphorein (Singh, Rai, and Lal), T., 1427.
Quinoline, solubility of lithium chloride in (Walton and Wise), A., i, 370.
hydroferrocyanides (Cumming), T., 1298.
separation of pyridine and (Cumming), T., 1298.
Quinoline, 5-amino-, stanni- and stannochloride (Druce), A., i, 1206.
8-hydroxy-, magnesium compound (Mörner), A., ii, 659.
*iso***Quinoline** (Harris and Pope), T., 1029.
stannichloride (Druce), A., i, 1206.
Quinolines (Palkin and Harris), A., i, 951.
Quinoline series (Thielepape), A., i, 271.
preparation of amino-acids of the (Society of Chemical Industry in Basle), A., i, 1179.
Quinoline-4-carboxylic acid, and its hydrazide, and 2-chloro-, ethyl ester, and 2-iodo- (Thielepape), A., i, 271.
6-Quinoline-2:4-dicarboxylic acid, 6-hydroxy-, and its ammonium hydrogen salt (Halberkann), A., i, 174.
*iso***Quinoline-red** (Harris and Pope), T., 1029.
Quinolinium ruthenibromides (Gutbier and Krauss), A., i, 16.
Quinolsulphamphthalein, hydroxy- (Dutt), T., 2391.
Quinone. See Benzoquinone.
Quinones, action of, on bacteria (Morgan and Cooper), A., i, 204.
o-**Quinones** (Schonberg), A., i, 27; (Schönberg and Kraemer), A., i, 663.
Quinone-1-imide-aci-2(or **4**)-**nitro-4**(or **2**)-**mercury** (Kharasch, Lommen, and Jacobsohn), A., i, 604.
Quinotoxine, salts of tropic acid with (King and Palmer), T., 2584.
detection of, in quinine salts (Ganassini), A., ii, 539.

R.

Rabbits, zinc content of the organs of (Bertrand and Vladesco), A., i, 493.
Racemic acid, optical activation of, by *l*-malic acid (McKenzie and Walker), T., 349.
dissociation of, in solution (Pennycuick), A., i, 624.
Racemic acids, action of bacteria and moulds on (Condelli), A., i, 410.
Racemic compounds, active (Landrieu), A., i, 808.
transformations during the fission of (Wegscheider), A., i, 441.
Racemisation of optically active acid amides (McKenzie and Smith), T., 1348.
Radiation, absorption and dispersion of (Weigert), A., ii, 605.
and chemical reactions (Taylor; Lewis), A., ii, 336.
Radiation theory, and its applications (Perrin; Lewis; Baly; Lowry), A., ii, 628; (Dhar), A., ii, 730.
Radioactive elements (Hoffmann), A., ii, 184.
Meitner nuclear model of (Neuburger), A., ii, 183.
atomic disintegration of (Meitner), A., ii, 15.
isotopy of (Neuburger), A., ii, 107, 250.
oxidising properties of (Lemay and Jaloustre), A., ii, 13.
minerals, new (Schoep), A., ii, 77, 450, 451.
substances, β-ray spectra from (Meitner), A., ii, 416.
disintegration of (Hevesy), A., ii, 608.
adsorption of (Ebler and van Rhyn), A., ii, 15.

Radioactive substances, distribution of, in solutions (Lachs and Wertenstein), A., ii, 681.
- use of, as indicators (Paneth), A., ii, 785.

Radioactivity of water. See under Water.

Radio-elements. See Radioactive elements.

Radiothorium, effect of, on metabolism (Miyadera), A., i, 966.

Radium content of British coal (Drakeley and Smith), T., 237.
- adsorption of, by barium sulphate (Germann), A., ii, 16.
- chemical action of the penetrating rays of (Kailan), A., ii, 466, 543.
- action of the penetrating rays of, on colloids (Fernau and Pauli), A., ii, 202.
- synthesis of carbon compounds from air by means of (Glew), A., ii, 607.
- rays, production of hydrogen peroxide from water by (Kailan), A., ii, 106.
- γ-rays from, absorption of, by luminous compounds (Owen and Page), A., ii, 108.
- effect of, on the germination of seeds (Stoklasa), A., i, 613.
- emanation. See Niton.
- chloride, positive ray analysis of the gases given off by (Thomson), A., ii, 565.
- residues, ionium in (Rona), A., ii, 250.
- solutions, permanency of (Becker), A., ii, 810.
- estimation of small quantities of (Szilard), A., ii, 586.

Radium-B and -C, β-ray spectra of (Chadwick and Ellis), A., ii, 802.
- adsorption of, by ferric hydroxide (Cranston and Hutton), T., 2843.

Radium-C, emission of α-particles by (Shenstone and Schlundt), A., ii, 465.

Raffinase, specific nature of (Willstätter and Kuhn), A., i, 284.

Raffinose, preparation of (Clark), A., i, 323.

Ragweed, constituents of the pollen of (Heyl), A., i, 1224.

Rain-water. See under Water.

Rana temporaria (common frog), constituents of eggs of (Fauré-Fremiet and de Streel), A., i, 85.

Rape oil, fatty acids of (Toyama), A., i, 1113.

Rapic acid (Grabner), A., i, 519.

Raspberry. See *Rubus idæus.*

Raspberry juice, cause of the clouding of (Kunz-Krause), A., i, 210.

Rayfish liver oil, constituents of (Tsujimoto and Toyama), A., i, 297; (Toyama), A., i, 895.

Rays, absorbed, photochemical efficiency of (Winther), A., ii, 808.
- Becquerel, coloration and luminescence produced by (Meyer and Przibram), A., ii, 339.
- positive, analysis by (Thomson), A., ii, 565.
- Rontgen, reflexion of, from crystals (Darwin), A., ii, 416; (Dardord), A., ii, 673.
  - determination of crystal structure by means of (Clark and Duane), A., ii, 483; (Bijvoet and Karssen; Posnjak and Wyckoff), A., ii, 499; (Hull and Davey; Hull), A., ii, 624.
  - investigation of crystal lattices with (Gerlach), A., ii, 36.
  - and thermodynamic equilibrium (de Broglie), A., ii, 249.
  - absorption of (de Broglie; Duane), A., ii, 104; (Richtmyer), A., ii, 105, 804; (Wingårdh), A., ii, 249.
    - in crystals (Aurén), A., ii, 810.
  - scattering of, by anisotropic liquids (Hückel), A., ii, 14.
  - scattering of, by crystals (Bragg, James, and Bosanquet), A., ii, 184
  - soft (Kurth), A., ii, 809.
    - excitation of (Richardson and Bazzoni), A., ii, 14.
  - biological action of (Petry), A., i, 204.
  - spectra of. See Spectra.

α-**Rays**, radioactivity resulting from bombardment by (Shenstone), A., ii, 415.
- ionisation by (Wilkins), A., ii, 607.
- luminous path of, in crystals (Geiger and Werner), A., ii, 183.
- range of, in liquids and gases (Traubenberg and Philipp), A., ii, 12.

β-**Rays**, scattering of, by thin metal sheets (Geiger and Bothe), A., ii, 13.
- relation between the scattering of, and atomic number (Glasson), A., ii, 183.
- relation between γ-rays and (Meitner), A., ii, 416, 732.
- spectra of. See Spectra.

γ-**Rays**, absorption of, by luminous compounds (Owen and Page), A., ii, 108.

- **γ-Rays**, excitation of, by α-particles (Slater), A., ii, 13.
  - wave-lengths of (Meitner), A., ii, 733.
  - relation between β-rays and (Meitner), A., ii, 416, 732.
  - spectra of. See Spectra.
- **Recrystallisation**, theory of (Alterthum), A., ii, 623.
- **Rectification** (Gay), A., ii, 120.
- **Reductases** (Smorodincev), A., i, 1201.
- **Reduction** by the Kishner-Wolff method (Thielepape), A., i, 271; (Thielepape and Spreckelsen), A., i, 1191.
  - simultaneous oxidation and (Kötz and Rathert), A., i, 236.
- **Reductodehydrocholic acid**, and its esters, and derivatives (Borsche and Hallwass), A., i, 1158.
- **Reeds**, sucrose from the roots of (v. Lippmann), A., i, 311.
- **Refraction** and atomic structure (Wasastjerna), A., ii, 1.
  - atomic and molecular, of organic compounds (Swientoslawski), A., ii, 173.
  - double, of colloidal solutions (Zocher), A., ii, 102.
  - molecular, atomic constants of (Huckel), A., ii, 195.
    - coefficients of (v. Auwers and Kolligs), A., ii, 174.
    - relation of, to other properties (Herz), A., ii, 409.
    - of aromatic hydrocarbons (v. Auwers), A., ii, 98.
    - of molten salts (Meyer and Heck), A., ii, 241, 329.
    - of substances with higher melting points (Eisenlohr), A., ii, 1.
- **Refractive index** at corresponding temperatures (Herz), A., ii, 97.
  - of metallic salts in aqueous solution (Limann), A., ii, 173.
  - of organic liquids (Himstedt and Wertheimer), A., ii, 725.
  - of phosphorescent sulphides (Curie), A., ii, 801.
- **Refractivity**, relation between atomic volume and (Le Bas), A., ii, 241.
- **Refractometric analysis**. See Analysis.
- **Refractories**, expansion of, at high temperatures (Bogitch), A., ii, 115.
- **Relativity**, laboratory test of the theory of (King), A., ii, 439.
- **Rennin** (*chymosin*), action of (Hammarsten), A., i, 958.
  - chemical action of (Inichov), A., i, 960.
  - coagulation of milk by (Baur and Herzfeld), A., i, 284.
- **Resacetophenone**, amino-, ω-benzoyl derivative (Sonn and Falkenheim), A., i, 1164.
  - ω-hydroxy- (*fisetole*), synthesis of (Sonn and Falkenheim), A., i, 1163.
- **Resins**, constituents of (Zinke, Friedrich, Johannsen, and Richter), A., i, 667; (Zinke, Hanselmayer, and Ehmer), A., i, 668.
  - from spruce needles (v. Euler), A., i, 283.
  - chemistry of (Vesterberg; Vesterberg and Westerlind), A., i, 825.
  - relation between chemical constitution and ability to form (Herzog and Kreidl), A., i, 1168.
- **Resin acids** of the Coniferæ (Aschan, Fontell and Simola), A., i, 1152.
- **Resonance potentials** of gases (Boucher), A., ii, 608.
- **Resorcinol**, constitution of, and its derivatives (Fabre), A., i, 1147.
  - tautomerism of (Fuchs), A., i, 336.
  - condensation of cinnamic acid with (Short and Smith), T., 1808.
  - compound of diketopiperazine and (Povarnin and Tichomirov), A., i, 1185.
  - use of, in qualitative inorganic analysis (Lavoye), A., ii, 779.
- **Resorcinol**, 4-chloro-2-nitroso- (Fabre), A., i, 1148.
  - *di*nitroso-. See 1:2:3:4-Benzodiquinone-1:3-dioxime.
  - *di*nitrosothiol- (Watson and Dutt), T., 1943.
- **Resorcinolcamphorein** (Krishna), T., 255; (Sircar and Dutt), T., 1284.
- **Resorcinolcamphorein**, *tetra*bromo- (*camphoreosin*) (Sircar and Dutt), T., 1284; (Singh, Rai, and Lal), T., 1429.
- **Resorcinolphenolphthalein**, hydrochloride and acetyl derivative of (Fischer and Bollmann), A., i, 936.
- **Resorcinolphenylsuccinein** (Lapworth and McRae), T., 2722.
- **Resorcinolsulphamphthalein** (Dutt), T., 2390.
- **β-Resorcylaldehyde** methyl ethers, constitution of (Ott and Nauen), A., i, 555.
- **Respiration**, effect of anæsthetics on (Bodine), A., i, 889.
  - effect of extirpation of the spleen on (Asher and Koda; Asher and Doubler), A., i, 286.
  - effect of lack of calcium on basal metabolism in (Pedotti), A., i, 286.

Respiration, influence of hydrogen sulphide on (Haggard and Henderson), A., i, 1206.
relation between oxygen and carbon dioxide in (Thunberg), A., i, 889.
of cells, physical chemistry of (Warburg), A., i, 190.
of dogs, effect of injection of sugars on (Bürger), A., i, 286.
of fishes, physiology of (Powers), A., i, 286.

Respiratory exchange in fresh-water fish (Gardner, King, and Powers), A., i, 1084.
metabolism. See Metabolism.

Retina, photochemistry of the (Weigert), A., ii, 11.
liberation of phosphoric acid by the (Lange and Simon), A., i, 701.

Rhamnonic acid, preparation of (Kiliani), A., i, 223.

δ-*epi*-*l*-**Rhamnonic acid** (*guleonic acid*), and its salts and derivatives (Kiliani), A., i, 1112.

Rhamnus frangula, constituents of the bark of (Oesterle), A., i, 100.

Rhinanthin, comparison of aucubin and (Bridel and Braecke), A., i, 1168.

Rhinanthus crista-galli, aucubin and sucrose from seeds of (Bridel and Braecke), A., i, 1225.

Rhinolith, constituents of a (Debucquet), A., i, 497.

Rhizopus, production of pectinase by (Harter and Weimer), A., i, 507.

Rhizostoma cuvieri, constituents of the gonads of (Haurowitz), A., i, 1210.

Rhodanine (Gränacher, Reis, and Pool), A., i, 576; (Granacher), A., i, 849.

Rhodanine, α-oximino-, and its silver salt (Gränacher, Reis, and Pool), A., i, 577.

Rhodanine-α-acenaphthenequinone (Granacher, Reis, and Pool), A., i, 577.

Rhodium bases (*rhodiumammines*), solubilities of salts of (Brönsted and Petersen), A., ii, 199.

Rhodymenia palmata, pentosan from (Sauvageau and Denigès), A., i, 507.

Rhus glabra, organic acids from (Sando and Bartlett), A., i, 100.

Ribes rubrum (currant), acids in (Franzen and Schumacher), A., i, 310.

Rice, vitamin content of (Fleming), A., i, 93.

Ricinine, constitution of (Späth and Tschelnitz), A., i, 571.

Ricinoleohydroxamic acid (Nicolet and Pelc), A., i, 644.

Rings, four-membered, additive formation of (Ingold and Piggott), T., 2793.

Ringer's solution, replacement of potassium salts in (Zwaardemaker), A., i, 1213.

Roccella fuciformis, picrorocellin from (Forster and Saville), T., 816.

Rochelle salt See Tartaric acid, potassium sodium salt.

Rosaniline-sulphurous acid, and its reactions with aldehydes (Wieland and Scheuing), A., i, 58.

Roses, red, colouring matter of (Currey), A., i, 413.

Roseocobaltic salts. See under Cobalt.

Rotation, inversion of, in anisotropic liquids (Royer), A., ii, 415.
optical, experimental proof of theories of (Wetterfors), A., ii, 247.
of sugars (Maltby), T., 2608.

Rotatory dispersion. See Dispersion.
power and chemical constitution (Rupe and Jaggi), A., i, 840; (Rupe), A., ii, 602
of crystals (Longchambon), A., ii, 603.

Ruban (Rabe), A., i, 360.

9-Rubanone, and its picrate (Rabe, Kindler, and Wagner), A., i, 361.

Rubatoxan (Rabe), A., i, 361.

9-Rubatoxanone, and 8-bromo-, and their salts (Rabe, Kindler, and Wagner), A., i, 361.

Rubicene, and its picrate, and *di*bromo-, and *di*nitro- (Dziewoński and Suszko), A., i, 730.

Rubicenedisulphonic acid (Dziewoński and Suszko), A., i, 731.

Rubidium, induction spectrum of (Dunoyer), A., ii, 729.

Rubidium bromate, preparation of (Buell and McCrosky), A., ii, 146.
silver gold bromides (Suschnig), A., ii, 514.

Rubidium detection:—
detection of (Missenden), A., ii, 658.

Rubilic acid, *hexa*chloro-, and pentachlorohydroxy-, and their derivatives (Küster and Herrmann), A., i, 886.

Rubus fructicosus (blackberry), lactic acid in the leaves of (Franzen and Keyssner), A., i, 310.

Rubus idæus (raspberry), ellagic acid in (Kunz-Krause), A., i, 210.
occurrence of lactic acid and succinic acid in the leaves of (Franzen and Stern), A., i, 311, 975.

Rutaecarpine, constitution of (Asahina and Fujita), A., i, 47.

Ruthenium carbonyls (Mond and Wallis), T., 30.

Ruthenium *tetr*oxide (KRAUSS), A., ii, 75.
  alkali sulphites (REMY), A., ii, 857.
  Ruthenibromides (GUTBIER and KRAUSS), A., i, 16.
Rye straw, lignin from (BECKMANN, LIESCHE, and LEHMANN), A., i, 233.

S.

Sabellaria alveolata, constituents of eggs of (FAURÉ-FREMIET), A., i, 85.
Sabinene, oxidation of, with chromyl chloride (HENDERSON, ROBERTSON, and BROWN), T., 2717.
Sabinenilanaldehyde, and its semicarbazone (HENDERSON, ROBERTSON, and BROWN), T., 2720.
Sabinenilanic acid, and its salts (HENDERSON, ROBERTSON, and BROWN), T., 2720.
Saccharase, diffusion of solutions of (v. EULER and ERICSON), A., i, 886.
  acidity and thermostability of (v. EULER and MYRBACK), A., i, 693.
  removal of, from adsorbed substances (WILLSTATTER and KUHN), A., i, 283.
  specific nature of (WILLSTATTER and KUHN), A., i, 284.
  reactivation of, by dialysis (v. EULER and SVANBERG), A., i, 284.
  inactivation of, by iodine (v. EULER and LANDERGREN), A., i, 1076.
  phosphorus content of preparations of (v. EULER and SVANBERG), A., i, 1200.
  inactivation of, by silver salts (v. EULER and MYRBACK), A., i, 959.
  silver compound of (v. EULER and JOSEPHSON), A., i, 1076.
  inversion of sucrose by (COLIN and CHAUDUN; CHAUDUN), A., i, 389.
  in blood and yeast (KNAFFL-LENZ), A., i, 694.
  in the intestine (v. EULER and SVANBERG), A., i, 296; (KNAFFL-LENZ), A., i, 485.
  analysis of (CANALS), A., i, 1075.
d-**Saccharic acid**, degradation of (BERGMANN), A., i, 7.
Saccharimeter, testing of the (KRAISY), A., ii, 233.
"**Saccharin**" (*o-benzoicsulphinide*), colouring matters from (DUTT), T., 2389.
  estimation of *p*-sulphaminobenzoic acid in (HERZOG and KREIDL), A., ii, 287.
C_4-**Saccharinic acids** (GLATTFIELD and SANDER), A., i, 318.
Saccharomyces cerevisiæ, action of ultraviolet light on (DE FAZI), A., i, 1219.
Saccharomyces Marxianus, fermentation by (v. EULER and JOSEPHSON), A., i, 706.
Saccharophosphatase (TOMITA), A., i, 960.
  occurrence and action of, in plants (NĚMEC and DUCHOŇ), A., i, 206.
Saffron, constituents of (WINTERSTEIN and TELECZKY), A., i, 563.
  detection of the colouring matter of (GUERBET), A., ii, 793.
*iso*Safrole ozonide (NAGAI), A., i, 839.
*iso***Safrolealkamines**, and their salts and derivatives, and bromo- (TAKEDA and KURODA), A., i, 273.
*iso***Safrole-2-imino-oxazolidine**, and bromo-, and their derivatives (TAKEDA and KURODA), A., i, 273.
Sakoa oil from Madagascar (JUMELLE), A., i, 210.
Salicin thiocyanate, tetra-acetyl derivative (ZEMPLÉN and HOFFMANN), A., i, 563.
Salicindiethylamine (ZEMPLÉN and KUNZ), A., i, 564.
Salicinphenylmethylamine (ZEMPLÉN and KUNZ), A., i, 565.
Salicylaldehyde picrate, compound of thiocarbamide and (TAYLOR), T., 2269.
Salicylaldehyde, 5-amino-, and its derivatives (WEIL, TRAUN, and MARCEL), A., i, 1023.
Salicylatotetramminecobaltic salts (MORGAN and SMITH), T., 1956.
Salicylic acid, antipyrine salt, hydrolysis of (KOLTHOFF), A., i, 471.
  cobaltammine salt of (MORGAN and SMITH), T., 2874.
  sodium salt, compound of pyridinebetaine and (CASSELLA & Co.), A., i, 860.
  substituted derivatives of (H. P. and W. KAUFMANN), A., i, 252.
  5-chlorosulphonyl derivative (STEWART), T., 2259.
  estimation of, in blood-serum (HERISSEY), A., ii, 880.
Salicylic acid, 4-nitro- (KONDÔ, NAKAJIMA, and MURAKAWA), A., i, 745.
  5:5′-*di*thio-, and 5-thiol- (STEWART), T., 2559.
Salicylic acids, substituted, reduction of (WEIL and BRIMMER), A., i, 349; (WEIL, TRAUN, and MARCEL), A., i, 1023.
Salicylides, polymeric (PAOLINI and SCELBA), A., i, 746.
Salicylideneanthranilic acid, 3- and 5-nitro- (EKELEY, ROGERS, and SWISHER), A., i, 935.

- **Salicylidene glucosamine** (IRVINE and EARL), T., 2378.
- **2-Salicylidene-1-methyl glucosamine** (IRVINE and EARL), T., 2379.
- **2-Salicylidene-3:5:6-triacetyl-1-ethyl glucosamine** (IRVINE and EARL), T., 2380.
- **2-Salicylidene-3:5:6-triacetyl glucosamine**, 1-bromo- (IRVINE and EARL), T., 2375.
- **2-Salicylidene-3:5:6-triacetyl-1-methyl glucosamine** (IRVINE and EARL), T., 2379.
- **α-Salicylylidenedeoxybenzoin.** See *trans*-*α*-Phenyl-*o*-coumarophenone.
- **Saligenin**, derivatives of (HART and HIRSCHFELDER), A., i, 38.
- **Saliva**, relation of, to gastric juice (NAKAGAWA), A., i, 789.
  - human, hydrogen-ion concentration of (STARR), A., i, 1209.
  - detection of bismuth in (GANASSINI), A., ii, 590.
- **Salts**, relations between temperature and the solubility, activity, and osmotic coefficients of (BRONSTED), A., ii, 354.
  - slow hydrolysis of (TIAN), A., ii, 362.
  - complex, crystallography and optical properties of (KNAGGS), T., 2069.
  - fused (HERZ), A., ii, 739.
    - molecular refraction and dissociation of (MEYER and HECK), A., ii, 241.
    - reactions in mixtures of (HICKS and CRAIG), A., ii, 622.
  - triple (WELLS), A., ii, 560.
  - of weak acids and weak bases, hydrolysis of (GRIFFITH), A., ii, 420.
  - See also Metallic salts.
- **Salt solutions**, osmotic and activity functions in (BRÖNSTED), A., ii, 482.
  - equilibria of (LE CHATELIER), A., ii, 555.
  - redissolution of a salt during evaporation of (RENGADE), A., ii, 31.
- **Salvarsan** (*arsphenamine*), relation between mode of synthesis and toxicity of (CHRISTIANSEN), A., i, 186.
  - colloidal properties of (RAIZISS and GAVRON), A., i, 1202.
  - compounds of aldehydes with (RAIZISS and BLATT), A., i, 1079.
  - sulphur content of, and its relation to toxicity (CHRISTIANSEN), A., i, 601, 1202.
- **Samarium** oxide, density and molecular volume of (PRANDTL), A., ii, 379.
- **Samarskite** (SHIBATA and KIMURA), A., ii, 516.
- **Sandal wood oil**, Dutch East Indies, preparation and properties of (ROJDESTWENSKY), A., ii, 792.
- **Sand spur.** See *Cenchrus tribuloides.*
- **Santal oil**, estimation of santalol in (HARRISON), A., ii, 400.
- **Santalol**, estimation of, in santal oil (HARRISON), A., ii, 400.
- **Saponins** (VAN DER HAAR), A., i, 160, 565, 1168; (VAN DER HAAR and TAMBURELLO), A., i, 160.
  - and their derivatives, effect of alkali or bromine on the biological activity of (SIEBURG and BACHMANN), A., i, 404.
  - surface activity and toxic action of (KOFLER), A., i, 610.
  - differentiation and estimation of (KOFLER), A., ii, 595.
- **Sativic acids** (NICOLET and COX), A., i, 320; (REINGER), A., i, 623.
- *Satureja montana*, constituents of oil from (LEONE and ANGELESCU), A., i, 357.
- **Sauerkraut**, fermentation of (BRUNKOW, PETERSON, and FRED), A., i, 312.
- **Scandium**, arc spectrum of (KING), A., ii, 100.
  - extraction and purification of, from thorveitite (P. and G. URBAIN), A., ii, 504.
- **Scatole**, toxicity of (SALANT and KLEITMAN), A., i, 794.
- **Scheele's green**, composition of (BORNEMANN), A., ii, 852.
- **Scheih oil**, constituents of (ROURE-BERTRAND FILS), A., i, 845.
- **Schiff's reagent**, modified (WERTHEIM), A., ii, 793.
- *Schizoneura lanigera* (blood-louse), colouring matter and wax of (SCHULZ), A., i, 494.
- **Schizophyceæ**, water-soluble colouring matters from (BORESCH), A., i, 210.
- **Schweinfürth green**, estimation of arsenic and copper in (KOLTHOFF and CREMER), A., ii, 86.
- **Scopolamine**, constitution of (HESS and WAHL), A., i, 854.
- **Scopoline** (HESS and WAHL), A., i, 854.
- **Scorpion** venom. See Poison.
- **Scrophulariaceæ**, sugars and glucosides in the (BRAECKE), A., i, 1225.
- **Sea urchin**, constituents of (TAKAHASHI), A., i, 609.
- **Sea water.** See under Water.
- **Sea-wolf liver oil** (LEXOW), A., i, 195.
- **Sebacic acid**, ethyl and ethyl hydrogen esters (GRÜN and WIRTH), A., i, 805.
- **Sebacic dialdehyde.** See Decanedial.
- **Secretin** (VAN EWEYK and TENNENBAUM), A., i, 397.

- **Sedimentation analysis**, apparatus for (F. V. and D. v. Hahn), A., ii, 705.
- *Sedum telephium*, glucoside in the stems and roots of (Bridel), A., i, 799, 1225.
- **Seeds**, evaluation of the vitality of (Němec and Duchoň), A., i, 94, 411.
  - influence of calcium on the germination of (Maquenne and Demoussy), A., i, 905.
  - effect of selenium and radium on the germination of (Stoklasa), A., i, 613.
  - Dutch, manganese in (Wester), A., i, 93.
- "**Seid**" oil, constituents of (Joseph and Whitfeild), A., i, 754.
- **Selachyl alcohol** (Tsujimoto and Toyama), A., i, 297.
- **Selenatopentamminecobalti-salts.** See under Cobalt.
- **Selenious acid.** See under Selenium.
- **Selenium**, constitution of (Pélabon), A., ii, 141.
  - isotopes of (Aston), A., ii, 842.
  - colloidal, and the action of gelatin on its solutions (Gutbier and Emslander), A., ii, 625.
    - effect of freezing on (Gutbier, Heinrich, and Huber), A., ii, 142; (Gutbier and Emslander), A., ii, 283.
  - action of, on gold (Pélabon), A., ii, 303.
- **Selenium compounds**, action of, on the growth of plants (Stoklasa), A., i, 614.
  - effect of, on the germination of seeds (Stoklasa), A., i, 613.
  - pharmacology of (Joachimoglu and Hirose), A., i, 396, 406.
- **Selenium salts**, action of, on growth of plants (Turina), A., i, 707.
  - action of, on plant metabolism in presence of radioactive air and soil (Stoklasa, Křička, Pénkava, Zelenka, Chmelař, and Jánský), A., i, 974.
- **Selenium** *tetra*chloride, action of, on amylene, butylene, and propylene (Boord and Cope), A., i, 421.
    - action of, with β-diketones (Morgan, Drew, and Barker), T., 2433.
  - *di*oxide, preparation of (Meyer), A., ii, 639.
    - hydrates of (Manchot and Ortner), A., ii, 283.
  - oxybromide (Lenher), A., ii, 707.
  - oxychloride, properties of (Lenher), A., ii, 706.
- **Selenium oxychloride**, vapour pressure of (Lenher, Smith, and Town), A., ii, 371.
  - **Selenates**, reflection spectra of (Schaefer and Schubert), A., ii, 179.
    - complex (Mayer), A., ii, 70.
    - double (Tutton), A., ii, 502, 505.
  - **Selenious acid**, and its compounds with molybdenum and vanadium (Rosenheim and Krause), A., ii, 47.
  - **Selenides**, preparation of (Moser and Doctor), A., ii, 46.
- **Selenium organic compounds** (Bogert and Chen), A., i, 1182.
  - aromatic (Farbwerke vorm. Meister, Lucius, & Brüning), A., i, 1066.
  - acetylacetones, and cyano- (Morgan, Drew, and Barker), T., 2443.
  - benzoylacetones, and cyano- (Morgan, Drew, and Barker), T., 2453.
  - dibenzoylmethanes, and cyano- (Morgan, Drew, and Barker), T., 2464.
  - *C*-ethylacetylacetones (Morgan, Drew, and Barker), T., 2460.
  - **Selenic acid**, salts and esters of (Meyer and Wagner), A., i, 620.
- **Selenium detection and estimation**:—
  - detection and estimation of (Müller, Menzel, and Schubert), A., ii, 390.
  - estimation of (Losana), A., ii, 865.
- **Selenium cells**, mode of action and equilibrium of (Späth), A., ii, 189.
- **4-Seleno-2-methylquinazalone** (Bogert and Chen), A., i, 1183.
- **Semicarbazide** hydrochloride (Ochi), A., i, 723.
- **Semicarbazidedithiocarboxylic acid**, thio-, potassium salt (Guha), A., i, 877.
- **Semicarbazido-*dl*-piperitone**, and its hydrochloride (Read and Smith), T., 1869.
- **Semicarbazones**, action of amines on (Wilson, Hopper, and Crawford), T., 866.
  - thio-, reactions of (Wilson and Burns), T., 870.
- **Semina cardui Mariæ**, tyramine from (Ullmann), A., i, 616.
- **Serum**, ionic distribution in (Reichel), A., i, 485.
  - viscosity and velocity of ultrafiltration of (Ellinger and Neuschlosz), A., i, 484.
  - proteins of (Piettre and Vila), A., i, 63.

Serum, condition of sugar in (Rusznyák and Hetényi), A., i, 291.
action of kaolin on the tributyrinase in (Olsen), A., i, 292.
horse, separation of globulins of (Vila), A., i, 1209.
human, estimation of bilirubin in (Thannhauser and Andersen), A., ii, 671.
detection and estimation of nitrates in (Nolte), A., ii, 583.
estimation of non-protein nitrogen in (Cristol), A., ii, 583; (Cristol and Simonnet), A., ii, 887.
estimation of inorganic phosphorus in (Tisdall), A., ii, 392.
Serum albumin. See under Albumin.
Serum globulin. See under Globulin.
Sesquiterpenes, chemistry of (Ruzicka, Meyer, and Mingazzini), A., i, 560.
Shad. See *Clupea alosa.*
Shaking machine, for large quantities of precipitates (Franzen), A., ii, 759.
Shark liver oil, constituents of (Tsujimoto and Toyama), A., i, 297; (Toyama), A., i, 895.
Shark oil, catalytic decomposition of (Mailhe), A., i, 424.
Shikazarin (Majima and Kuroda), A., i, 946.
Shikon. See *Lithospermum erythrorhizon.*
Shikonin, constitution and derivatives of (Majima and Kuroda), A., i, 946.
d-**Siaresinolic acid**, oxidation of (Zinke, Hanselmayer, and Ehmer), A., i, 668.
Silica. See Silicon *di*oxide.
Silicane. See Silicon *tetra*hydride.
Silicanetetra-1-piperidinium chloride (Leonard) A., i, 363.
Silicon, modifications of (Manchot), A., ii, 144; (Manchot and Funk), A., ii, 286, 764.
Silicon compounds, unsaturated, luminescence of (Kautsky and Zocher), A., ii, 464.
Silicon *tetra*chloride, thermal constants of (Latimer), A., ii, 256.
*tetra*hydride (*silicane*), preparation of (Schwarz and Konrad), A., ii, 846.
viscosity and molecular dimensions of (Rankine and Smith), A., ii, 709.
*di*oxide (*silica*), reflection spectra of (Schaefer and Schubert), A., ii, 179.
heat of wetting of gels of (Patrick and Grim), A., ii, 122.
catalytic activity of (Gilfillan), A., i, 709.
Silicon *di*oxide (*silica*), adsorption of ammonia by gels of (Davidheiser and Patrick), A., ii, 262.
action of sodium chloride with (Clews and Thompson), T., 1442.
crucibles. See Crucibles.
estimation of (Murmann), A., ii, 226.
estimation of, in filtered sea-water (Wells), A., ii, 868.
Silicic acid, colloidal, preparation of (Kröger), A., ii, 212, 213; (Bradfield), A., ii, 507.
electrical properties of (Lösenbeck), A., ii, 695.
analysis of gels of (Neuhausen and Patrick), A., ii, 144.
Silicates, ultra-red spectra of (Schaefer and Schubert), A., ii, 727.
colloidal, in soils, effect of alum on (Scofield), A., i, 212.
Silicate rocks, estimation of arsenic in (Hackl), A., ii, 159.
estimation of cobalt and nickel in (Hackl), A., ii, 458.
Silk, action of iodine on (Huebner and Sinha), A., i, 434.
artificial, manufacture of (Hess), A., i, 922.
Silk fibroin, composition and structure of (Abderhalden), A., i, 784.
Silver, Röntgen-ray spectrum of (de Broglie), A., ii, 330.
absorption of *K*-radiation from, in gases (Burbidge), A., ii, 184.
photoelectric wave-length of (Stuhlman), A., ii, 809.
electrolytic potential of (Kolthoff), A., ii, 20.
purity of, for use in atomic weight determinations (Baxter and Woodman), A., ii, 376; (Baxter), A., ii, 377.
oligodynamy of (Doerr and Berger), A., i, 1097.
colloidal (Gutbier, Huber, and Zweigle), A., ii, 485.
colours of (Schaum and Marx), A., ii, 696.
carrageen as a protective colloid for (Gutbier, Wolf, and Kiess), A., ii, 203.
sols of Carey Lea, behaviour of, towards electrolytes and hydrophilic colloids (Freundlich and Loening), A., ii, 696.
Silver alloys with mercury, preparation of (Müller and Hönig), A., ii, 500.
Silver compounds, photochemistry of (Weigert and Schöller), A., ii, 10.

- **Silver salts**, use of ammoniacal solutions of, in valency determinations (COLLENBERG), A., ii, 495.
- **Silver** antimonide, velocity of solution of, in silver (WEISS and HENRY), A., ii, 207.
  - arsenate, compound of acetylene with (OBERDOERFER and NIEUWLAND), A., i, 515.
  - bromate, preparation and properties of (REEDY), A., ii, 56.
  - bromide, action of light on (HARTUNG), T., 682.
    - effect of colloids on the photochemical decomposition of (SCHWARZ and STOCK), A., ii, 731.
  - gold bromides (SUSCHNIG), A., ii, 514.
  - chloride, solubility of, in solutions of chlorides (FORBES and COLE), A., ii, 291.
  - ammonium auric chloride (WELLS), A., ii, 449.
  - *per*chlorate, equilibrium in the system, benzene, water, and (HILL), A., ii, 555.
  - chromate, formation of, in Liesegang's rings (McGUIGAN), A., ii, 38.
    - solvolysis of (HICKS and CRAIG), A., ii, 622.
  - haloids, action of light on (KOCH and SCHRADER), A., ii, 182.
    - chlorination of, in Gooch crucibles (MELLON and SIEGESMUND), A., ii, 781.
    - action of, on potassium ferrocyanide (BONINO), A., ii, 78.
  - iodate, equilibrium of potassium chromate with (RAMANN and SALLINGER), A., ii, 131.
  - iodide, heat of formation of (TAYLOR and ANDERSON), A., ii, 121.
    - adsorption of iodine by (GERMANN and TRAXLER), A., ii, 371.
  - *per*manganate, velocity of decomposition of (SIEVERTS and THEBERATH), A., ii, 360.
  - molybdate, crystal structure of (WYCKOFF), A., ii, 765.
  - nitrate, electrolysis of pyridine solutions of (MÜLLER; MULLER and DUSCHEK), A., ii, 612.
  - oxide, crystal structure of (WYCKOFF), A., ii, 291.
    - equilibrium of oxygen and (KEYES and HARA), A., ii, 353.
    - catalytic influence of oxides on the decomposition of (KENDALL and FUCHS), A., ii, 147.
  - phosphate, compound of acetylene with (OBERDOERFER and NIEUWLAND), A., i, 515.
  - phosphide (MOSER and BRUKL), A., ii, 393.
  - sulphate, action of, on alkyl haloids, in sulphuric acid solution (SCHILOV), A., i, 913.
  - thiosulphates, alkaline, compounds of ammonia with (JONSSON), A., ii, 57.
- **Silver organic compounds**:—
  - **Silver-albumose**, estimation of (HERZOG), A., ii, 798.
  - **Silver-thioglycollic acid**, and its sodium salt (CHEMISCHE FABRIK FLORA), A., i, 425.
- **Silver estimation and separation**:—
  - estimation of, in presence of colloidal silver (GUTBIER, HUBER, and KUPPINGER), A., ii, 396.
  - separation of, from mercurous salts (KOLTHOFF), A., ii, 160.
- **Silver anode.** See Anode.
- **Silver ores** from Nevada (SHANNON), A., ii, 859.
- **Sincosite** (SCHALLER), A., ii, 459.
- **Slags**, dephosphoration, constituents of (DEMOLON), A., ii, 564.
- **Sneezeweed.** See *Helenium hoopesii.*
- **Snow**, analyses of (SCHAFFER), A., i, 512.
- **Soaps**, colloid chemistry and manufacture of (FISCHER, McLAUGHLIN, and HOOKER), A., ii, 430, 829.
  - effect of addition of salt on the viscosity of solutions of (KING), A., i, 621.
  - adsorption of, by wool (BRITISH RESEARCH ASSOCIATION FOR THE WOOLLEN AND WORSTED INDUSTRIES), A., ii, 551.
  - action of blood-serum with (JARISCH), A., i, 1087.
  - estimation of, in wool (BRITISH RESEARCH ASSOCIATION FOR THE WOOLLEN AND WORSTED INDUSTRIES), A., ii, 594.
- **Soap solutions**, preparation and hydrotimetric precision of (JUSTIN-MUELLER), A., ii, 658.
  - constitution of (McBAIN; TAYLOR and LAING), T., 621; (FLECKER and TAYLOR), T., 1101; (NORRIS), T., 2161.
  - effect of electrolytes on the constitution of (SALMON), T., 711; (McBAIN and BURNETT), T., 1320.
  - detergent power of (MEES), A., ii, 268.
  - ultra-filtration of (McBAIN and JENKINS), T., 2325.
- **Sodamide**, syntheses by means of (HALLER and BAUER), A., i, 258; (HALLER and BENOIST), A., i, 350; (HALLER and BOUDIN), A., i, 356.

- **Sodammonium**, action of, on hydrocarbons (Lebeau and Picon), A., i, 801.
  - action of, with hexamethylenetetramine, tetramethyldiaminomethane, and ethylidene-ethylamine (Picon), A., i, 1123.
  - compound of pyridine with (Lebeau and Picon), A., i, 48.
- **Soddite**, radioactive (Schoep), A., ii, 451.
- **Sodium**, bright metallic, preparation of, in nitrogen (Bornemann), A., ii, 444.
  - absorption spectrum of (Ladenburg), A., ii, 6; (Harrison), A., ii, 679.
  - arc spectrum of (Foote, Meggers, and Mohler), A., ii, 598.
  - influence of the pressure of foreign gases on the spectrum of (Minkowski), A., ii, 242.
  - distribution of electrons in the atom of (Bragg, James, and Bosanquet), A., ii, 703.
  - chemical constants of (Ladenburg and Minkowski), A., ii, 191.
  - vapour, electrodeless discharge in (Robertson), A., ii, 609.
  - electrical conductivity of, in liquid ammonia (Kraus and Lucasse), A., ii, 252.
  - ions, electrolytic migration of, through glass (Pirani and Lax), A., ii, 817.
  - heat of vaporisation of (Ladenburg and Minkowski), A., ii, 194.
  - resistance temperature coefficients of solutions of, in liquid ammonia (Kraus and Lucasse), A., ii, 734.
  - equilibrium of mixtures of ammonia and (Kraus and Lucasse), A., ii, 764.
  - equilibrium of mixtures of tellurium and, in liquid ammonia (Kraus and Chiu), A., ii, 765.
  - action of, with bromo-derivatives of benzene and toluene (Fuchs and Metzl), A., i, 442.
- **Sodium alloys** with mercury, electrochemistry of (Richards and Conant), A., ii, 340.
- **Sodium salts**, distribution of, in blood (Kramer and Tisdall), A., i, 1087.
- **Sodium** antimoniodobromide (Vournazos), A., ii, 651.
  - arsenite, action of derivatives of nitric oxide and hydroxyl on (Gutmann), A., ii, 844.
  - azide, action of, with benzylidenebenzhydrazide chloride and dibenzhydrazide chloride (Stollé and Netz), A., i, 690.
- **Sodium** *per*borate, electrolytic preparation of (Alsgaard), A., ii, 375; (Arndt and Hantge), A., ii, 569.
  - bromate and chlorate, crystal structures of (Dickenson and Goodhue), A., ii, 145.
  - carbonate, manufacture of, by the ammonia process (Le Chatelier), A., ii, 375.
    - velocity of absorption of carbon dioxide by (Riou), A., ii, 433.
    - equilibrium of calcium sulphate and (Syrkin), A., ii, 699.
    - equilibrium in the system, sodium chloride, water, and (Freeth), A., ii, 627.
    - equilibrium of sodium sulphate, water, and (Dawkins), T., 776.
    - reaction between nitrogen, carbon and (Ingold and Wilson), T., 2278.
    - minerals from Kenya Colony (Walther), A., ii, 859.
  - hydrogen carbonate, preparation of (Toporescu), A., ii, 375, 642.
  - chloride, effect of albumin on the conductivity of solutions of (Palmer, Atchley, and Loeb), A., i, 692.
    - melting and freezing points of (Ferguson), A., ii, 848.
    - diffusion of (Stiles and Adair), A., ii, 125.
    - equilibrium of ammonium nitrate and (Perman), T., 2473.
    - equilibrium in the system, sodium carbonate, water, and (Freeth), A., ii, 627.
    - equilibrium of sodium laurate, water, and (McBain and Burnett), T., 1320.
    - blue flame produced by, on a coal fire (Smithells), A., ii, 645.
    - reactions of cellulose with (Masters), T., 2026.
    - compounds of pyridinebetaine and (Cassella & Co.), A., i, 860.
    - action of silica with (Clews and Thompson), T., 1442.
  - chloride and sulphate, equilibrium of, with ammonium chloride and sulphate and water (Rivett), T., 379.
  - chlorite (Levi), A., ii, 567.
  - chromate, mixed crystals of sodium sulphate and (Richards and Meldrum), A., ii, 54.
  - hydroxide, preparation of, free from carbon dioxide (Cornog), A., ii, 288.
    - heats of neutralisation of (Richards and Rowe), A., ii, 425.

- **Sodium** hydroxide, heat of neutralisation of, with hydrochloric acid (Keyes, Gillespie, and Mitsukuri), A., ii, 424.
    - reactions of, with aluminium salts (Grobet), A., ii, 573.
- hypochlorite, red colour of solutions of (Mario), A., ii, 457.
- hyposulphite (Heyl and Greer), A., ii, 288.
- iodide, conductivity of, in amyl alcohol (Kraus and Bishop), A., ii, 813.
- nitrate, equilibrium of ammonium nitrate with (Early and Lowry), T., 963.
    - equilibrium of magnesium nitrate, water and (Jackman and Browne), T., 694.
- *per*oxide, estimation of the active oxygen in (Milbauer), A., ii, 521.
- phosphate, action of epichlorohydrin on (Bailly), A., i, 980.
- dihydrogen phosphate, effect of, on body power (Herxheimer), A., i, 970.
- silicate (Erdenbrecher), A., ii, 444.
    - electrolysis of solutions of (Spencer and Proud), A., ii, 611.
    - equilibrium of sodium tungstate with (van Liempt), A., ii, 775.
- silicofluoride, refractive index of (Raiteri), A., ii, 541.
- sulphate, equilibrium of sodium carbonate, water and (Dawkins), T., 776.
    - mixed crystals of sodium chromate and (Richards and Meldrum), A., ii, 54.
- sulphide, use of, instead of hydrogen sulphide in qualitative analysis (Vortmann), A., ii, 653.
- sulphite, alkylation of (Baggesgaard-Rasmussen and Werner), A., i, 104.
- hydrogen sulphite, action of, on nitro-compounds (Weil and Moser), A., i, 443.
- tungstates (Smith), A., ii, 774.
    - equilibrium of, with sodium silicate and with potassium tungstate (van Liempt), A., ii, 775.
    - for use in blood analysis (Folin), A., ii, 596.
- paratungstate, preparation of (Lottermoser), A., ii, 510.

Sodium estimation:—
- estimation of, in aluminium and alumina (Geith), A., ii, 720.
- estimation of, in tinned dishes (Wilson), A., ii, 395.

Sodium amalgam electrode. See Electrodes.

Sodium lamp. See Lamp.

Sodium press, laboratory (Beckmann), A., ii, 369.

Soils, absorbent power of (Casale), A., i, 508.
- absorption and basic exchange in (v. Nostitz), A., i, 511.
- absorption of ammonium salts from solutions by (Aarnio), A., i, 1227.
- absorption of water by colloids in (Robinson), A., i, 1228.
- flocculation of (Comber), A., i, 212.
- precipitation of the constituents of, by calcium salts in presence of hydroxyl ions (Mattson), A., i, 800.
- acidity of (König, Hasenbäumer and Kröger; Lemmermann and Fresenius), A., i, 510.
    - effect of lime, phosphates, etc., on (Bauer and Haas), A., i, 975.
- reaction of, and its relation to plant distribution (Atkins), A., i, 415, 509; (Comber), A., i, 416; (Fisher), A., i, 510; (Salisbury), A., i, 1104.
- relation of hydrogen-ion concentration in, to their lime requirements (Johnson), A., i, 708.
- effect of aluminium salts on ammonification and nitrification in (Denison), A., i, 512.
- carbon-nitrogen ratio in (Read), A., i, 416.
- origin of colloids in (Whitney), A., i, 708; (Gordon), A., i, 1227.
- effect of salts on nitrogen fixation in (Greaves, Carter, and Lund), A., i, 976.
- organic nitrogen in, availability of (Robinson, Winter, and Miller), A., i, 212.
- phosphoric acid in (Fraps), A., i, 616.
- effect of colloids on the availability of salts in (Gordon and Starkey), A., i, 1104.
- effect of alum on colloidal silicates in (Scofield), A., i, 212.
- oxidation of sulphur compounds in (Lipman, Waksman, and Joffe), A., i, 303; (Demolon), A., i, 312; (Waksman), A., i, 706.
- oxidation of sulphur and transformation of phosphates in (Waksman and Joffe), A., i, 416.
- sulphate reducing organism in (Kühr), A., i, 1228.
- effect of drying, on the water-soluble constituents of (Gustafson), A., i 708.

Soils, classification of water in (PARKER), A., i, 616.
  toxicity, acidity and basicity of (CARR), A., ii, 172.
  acid, influence of calcium salts on (ROBINSON and BULLIS), A., i, 976.
    nitrification in (STEPHENSON), A., i, 416.
  arable, cobalt and nickel in (BERTRAND and MOKRAGNATZ), A., i, 975.
  humus, mechanical analysis of (ROBINSON), A., ii, 888.
  mechanical analysis of (ROBINSON), A., ii, 888.
  analysis of, from the formation of layers (UNGERER), A., ii, 96.
  detection of acidity of (HUDIG and HETTERSCHIJ), A., i, 1104.
  estimation of moisture in (DEIGHTON), A., i, 1227.
  estimation of calcium in (SHEDD), A., ii, 527.
  estimation of hydrogen-ion concentration in (HEALY and KARRAKER), A., ii, 519.
  estimation of organic matter in (READ and RIDGELL), A., ii, 540.
  estimation of potassium in (JONES and REEDER), A., ii, 85.
  estimation of sulphates in (HIRST and GREAVES), A., ii, 521.
Soil solutions, method of obtaining (PARKER), A., i, 511.
Soja beans, culture of, and the occurrence of urease in these plants (WESTER), A., i, 311.
  nitrogen distribution of proteins from (FRIEDEMANN), A., i, 505.
Solannellic acid (WIELAND and SCHULENBURG), A., i, 346.
Solanum esculentum. See Tomato.
Solar atmosphere, ionisation in the (RUSSELL), A., ii, 675.
Solids, structure of (THOMSON), A., ii, 355, 745.
  incandescent, luminescence of (NICHOLS and HOWES), A., ii, 597.
  specific heat of (KRASE), A., ii, 421.
  hardness of, and its relation to constitution (REIS and ZIMMERMANN), A., ii, 745.
  interpenetration of, by chemical reaction (WEISS and HENRY), A., ii, 207, 487.
  velocity of chemical reactions in (HINSHELWOOD and BOWEN), A., ii, 628.
  extraction of (CHARITSCHKOV), A., ii, 826.
Sols, hydrophobic, action of, with hydrophilic colloids (FREUNDLICH and LOENING), A., ii, 356.
  lyophile, capillary-electric phenomena in (KRUYT and DE JONG), A., ii, 357.
  mastic, precipitation of (MICHAELIS and HIRABAYASHI), A., ii, 429.
Solubility (HILDEBRAND and JENKS), A., ii, 141; (BRÖNSTED and PETERSEN), A., ii, 199; (BRÖNSTED), A., ii, 481; (EPHRAIM and MOSIMANN), A., ii, 574.
  determination of (DUNDON and HENDERSON), A., ii, 552.
  calculation of (MORTIMER), A., ii, 621.
  partition in (SMITH), A., ii, 430, 431.
  prediction of, in polar solutions (KENDALL, DAVIDSON, and ADLER), A., ii, 34.
  of a compound in presence of other compounds (LEONE and ANGELESCU), A., ii, 743; (LEONE and BENELLI), A., ii, 744.
  of gases in liquids (NEUHAUSEN and PATRICK), A., ii, 264.
  reciprocal, of slightly miscible liquids (CHÉNEVEAU), A., ii, 355, 427.
  in mixed solvents (PUCHER and DEHN), A., ii, 126.
  of substances in two solvents (SCHILOV, LEPIN, and JANTSCHAK), A., ii, 824.
  of substances in mixtures of alcohol and water (WRIGHT), T., 2251.
Solutions, theory of (CASSEL), A., ii, 481; (HERRMANN), A., ii, 552.
  optical properties of (WASASTJERNA), A., ii, 2.
  absorption of light by (LUNELUND), A., ii, 8; (V. HALBAN and SIEDENTOPF), A., ii, 332.
  additive compounds in, and ionisation (KENDALL and GROSS), A., ii, 32.
  thermochemistry of (LEVALT-EZERSKY), A., ii, 819.
  adhesion in (SCHILOV and others), A., ii, 350; (SCHILOV, LEPIN, JANTSCHAK, and DUBININ), A., ii, 626.
  adsorption of (OSTWALD and DE IZAGUIRRE), A., ii, 480.
  concentrated, theory of (TIMMERMANS), A., ii, 25.
  dilute aqueous, application of the ideal equation to (KENDALL), A., ii, 32.
  of metallic salts, crystalline particles in (TRAUBE and KLEIN), A., ii, 201.
  non-aqueous, electrochemistry of (MÜLLER; MÜLLER and DUSCHEK), A., ii, 612.
    of binary electrolytes, physical properties of (WALDEN), A., ii, 345.

- **Solutions,** non-aqueous, analysis of, with the interferometer (Cohen and Bruins), A., ii, 77.
    - dispersoid analysis of (Ostwald), A., ii, 198.
- **Solvates,** theory of (Syrkin), A., ii, 823.
- **Solvatochromism** (Hantzsch), A., i, 556.
- **Solvents,** partition of substances between (Schilov, Lepin, Jantschak, and Dubinin), A., ii, 626; (Schilov, Lepin, and Jantschak), A., ii, 824.
  - recovery of, in extraction processes (Pichler), A., ii, 715.
  - influence of, on the velocity of formation of quaternary ammonium compounds (Hawkins), T., 1170.
  - mixed, solubility in (Pucher and Dehn), A., ii, 126.
    - velocity of reaction in (Cashmore, McCombie, and Scarborough), T., 243; (McCombie, Scarborough, and Settle), T., 2308.

    - *N*-series in (Dolejšek), A., ii, 411.
    - of metallic oxides (Hedval), A., ii, 300.
    - of organic crystalline compounds (Bragg; Becker and Jancke), A., ii, 128.
    - ultra-violet (Kurth), A., ii, 410.
  - series, difference between, of isotopes (Ehrenfest; Bohr), A., ii, 598; (Nicholson), A., ii, 599.
  - Balmer series, structure of (Gehrcke and Lau), A., ii, 3.
  - spark, identification of air lines in (Merrill, Hopper, and Keith), A., ii, 802.
  - ultra-red (Schaefer), A., ii, 727.
  - ultra-violet, absorption (Winther, Baggesgaard-Rasmussen, and Schreiner), A., ii, 729.
    - of dihydric phenols (Klingstedt), A., ii, 680.

Spectra vacuum spark, of metals (Carter), A., ii, 599.
  visible, doublets in (Goudsmit), A., ii, 462.
Spectrograph, mass (Aston and Fowler), A., ii, 241.
  Röntgen ray (Seemann), A., ii, 15.
Spectrography (v. Angerer), A., ii, 3.
Spectrophotometer, double slit (Narayan and Subrahmanyan), A., ii, 329.
Spectroscopy, new apparatus for affording source of light for (Gerlach and Koch), A., ii, 330.
Spectrum, ultra-violet, extension of the (Millikan), A., ii, 100.
  continuous, emission and absorption of (Duclaux), A., ii, 99.
Spectrum lines, errors in the measurement of (Merton and Harrison), A., ii, 673.
Spermatozoa, histochemistry of (Steudel), A., i, 294.
Sphingomyelin, optical properties of (Sano), A., i, 701.
Spilanthol from paracress (Asahina and Asano), A., i, 505.
Spirans (Leuchs, v. Katinsky, and Conrad), A., i, 471, 873.
Spleen, function of the (Asher and Bernet), A., i, 491.
  effect of extirpation of, on blood-corpuscles (Asher and Matsumo), A., i, 298.
  formation of bilirubin in the (Ernst and Szappanyos), A., i, 1089.
  of cattle, nucleic acids from (Steudel), A., i, 297.
Spruce, Swedish, constituents and properties of (Wahlberg), A., i, 1101.
Spruce needles, resins and tannins from (v. Euler), A., i, 233.
Stains, detection of urine in (Jemma), A., ii, 460.
Stannanedi-1-piperidinium chloride, *di*chloro- (Leonard), A., i, 363.
Stannic acid and salts. See under Tin.
Stannous salts. See under Tin.
Staphylolysin, effect of metallic salts on the formation of (Walbum), A., i, 795.
Star anise oil, constants of (Gattefossé), A., i, 1167.
Starch (Zwikker), A., i, 10.
  constitution of (de Hoop), A., i, 434.
  measurement of the liquefaction of (Olsson), A., ii, 401.
  adsorption in solutions of, and their emulsifying action (Clark and Mann), A., ii, 550.
Starch, preservation of solutions of (Kanô), A., i, 280.
  chemistry of (Pringsheim and Persch), A., i, 113, 632; (Pringsheim and Dernikos), A., i, 632; (Pringsheim and Goldstein), A., i, 633.
  decomposition products of (Pictet and Jahn), A., i, 987.
  temperature coefficients in the degradation of (Ernström), A., i, 599.
  effect of amino-acids on the hydrolysis of, by enzymes (Sherman and Walker; Sherman and Caldwell), A., i, 283.
  benzyl derivatives of (Gomberg and Buchler), A., i, 112.
  iodide, constitution of (Lottermoser and Steude), A., i, 10.
  compounds of iodine with (v. Euler and Myrbäck), A., i, 527, 1120; (v. Euler and Bergmann; v. Euler and Landergren), A., i, 921.
  activity of reductase from (Smorodincev), A., i, 1201.
  disappearance of, from leaves (Molisch), A., i, 309.
  estimation of (Ling, Callow, and Price), A., ii, 879.
Starfish, constituents of (Hinard and Fillon), A., i, 87.
Stasite (Schoep), A., ii, 386.
Stearic acid, oxidation of (Asahina and Ishida), A., i, 520.
  cellulose ester (Grün and Wittka), A., i, 114.
  vanillylamide of (Ott and Zimmermann), A., i, 137.
Stearic acid, *di*bromo*di*hydroxy- and *di*chloro*di*hydroxy- (Nicolet and Cox), A., i, 320.
  *tetra*hydroxy-. See Sativic acid.
Stearodipalmitins, isomeric (Amberger and Bromig), A., i, 804.
ι-Stearoxydecoic acid, methyl ester (Grün and Wirth), A., i, 805.
Steel. See under Iron.
Stereochemistry, recent advances in (Singh), A., ii, 103.
  studies in (Holmberg), A., i, 1113.
Stereoisomerides, biological difference of (Jung and Müller), A., i, 486.
Stereoisomerism, ethylenic (Dufraisse), A., i, 534.
Sterols, biochemistry of (Brinkman and Wastl), A., i, 289.
Stibinetri-1-piperidinium chloride (Leonard), A., i, 363.
Stibiobenzene, *mm'*-diamino-*pp'*-*di*hydroxy- (Schmidt), A., i, 1204.

Stilbene, action of aluminium chloride with (SCHOLL and SCHWARZER), A., i, 331.
Stilbene, amino- and nitro-derivatives, stereoisomeric (STOERMER and OEHLERT), A., i, 647.
  nitro-derivatives, preparation of (BISHOP and BRADY), T., 2366.
  4-nitro-2-cyano-, *di*bromide (RUGGLI and MEYER), A., i, 346.
Stilbene-4-carboxylic acids, 2-amino- and 2-nitro-, stereoisomeric, and their esters (STOERMER and OEHLERT), A., i, 648.
Stilbene-2:2′-dicarboxyl chloride, and its derivatives and 7:7′-*di*chloro-, methyl ester (RUGGLI and MEYER), A., i, 345.
Stilbene-2:2′-dicarboxylic acid, esters of (RUGGLI and MEYER), A., i, 344.
Stomach, effect of choline on the movements of the (LE HEUX), A., i, 85.
  enzymes of the (HAMMARSTEN), A., i, 958.
  human, action of calcium and potassium ions on the (TEZNER and TUROLT), A., i, 396.
Straw, lignin from (PASCHKE), A., i, 325.
  estimation of lævulose in (COLLINS), A., ii, 323.
Streptococcus, hæmolytic, extraction of enzymes from (STEVENS and WEST), A., i, 903.
Strontium alloys with lead, constitution of (PIWOWARSKY), A., ii, 644.
Strontium chlorite (LEVI), A., ii, 567.
  hydroxide, crystalline, solubility of (SIDERSKY), A., ii, 501.
  nitrate, crystal structure of (VEGARD), A., ii, 503.
  silicate (ESKOLA), A., ii, 849.
  tungstate (SMITH), A., ii, 774.
Strontium detection:—
  detection of (LUTZ), A., ii, 227.
Strychnine, physiology of (WEISS and HATCHER), A., i, 900.
  poisoning. See Poisoning.
  ferrioxalate (BURROWS and TURNER), A., i, 916.
  hexose- and sucrose-phosphates (NEUBERG and DALMER), A., i, 920.
  separation of quinine from (WARREN and CLARK), A., ii, 171; (EVERS), A., ii, 669.
*iso***Strychnine**, preparation of (LEUCHS and NITSCHKE), A., i, 1175.
Strychnos alkaloids (LEUCHS, OSTERBURG, and KAEHRN), A., i, 362; (LEUCHS and KAEHRN), A., i, 463; (LEUCHS and FRICKER), A., i, 677; (LEUCHS, HILDEBRAND, and LEUCHS), A., i, 1052; (LEUCHS and NITSCHKE), A., i, 1175.
Styphnic acid, retene ester (RUZICKA and MEYER), A., i, 830.
Styrene, chloro-, and its chlorohydrin (FORSTER and SAVILLE), T., 2600.
  ω-nitro-3:4:5-*tri*hydroxy- (ROSENMUND and PFANNKUCH), A., i, 1030.
2-Styrylbenzopyrylium chloride, hydroxy-derivatives (BUCK and HEILBRON), T., 1204.
Styryl α-chloro-*p*-dimethylaminostyryl ketone (BAUER and WERNER), A., i, 1035.
Styryl *di*chloromethyl ketone, nitro-derivatives (HELLER, LAUTH, and BUCHWALDT), A., i, 348.
9-Styryldi-ββ′-naphthoxanthenyl perchlorate (ZIEGLER), A., i, 152.
Styryl furfurylidenemethyl ketone, 2-hydroxy- (BUCK and HEILBRON), T., 1100.
9-Styryl-1-methoxyxanthenyl perchlorate (ZIEGLER), A., i, 152.
Styryl methyl ketone, *o*- and *p*-hydroxy- (BUCK and HEILBRON), T., 1100.
1-Styryl*iso*quinoline (MILLS and SMITH), T., 2732.
9-Styrylxanthenol (ZIEGLER and OCHS), A., i, 1048.
9-Styrylxanthenyl perchlorate (ZIEGLER), A., i, 151.
9-Styrylxanthyl bromide hydrobromide and chloride hydrochloride, and their perhaloids (ZIEGLER and OCHS), A., i, 1047.
  ethyl ether (ZIEGLER and OCHS), A., i, 1048.
Suberdialdehyde, and its diphenylhydrazone (ROSENMUND, ZETZSCHE, and FLÜTSCH), A., i, 39.
Suberone, (?)2:7-*di*bromo- (GODCHOT and BRUN), A., i, 350.
Substance, $C_2H_3N_5$, from azoimide and methylthiocarbimide (OLIVERI-MANDALÀ), A., i, 473.
  $C_8H_8O_4$, and its methyl ether, from glycerol and *Aspergillus glaucus* (TRAETTA-MOSCA and PRETI), A., i, 91.
  C_8H_9N, from *p*-xylene and sulphuryl azide (CURTIUS and SCHMIDT), A., i, 777.
  $C_8H_8O_3N_2S$, from *p*-carbamidotoluene-*m*-sulphonic acid and phosphoryl chloride (SCOTT and COHEN), T., 2041.
  $C_9H_{13}O_4N$, from hydrolysis of ethyl βγ-dicyano-γ-methylbutane-βδ-dicarboxylate (HOPE and SHELDON), T., 2232.
  $C_{10}H_{16}O_4$, from α-bromo*iso*butaldehyde and sodiomalonic ester (FRANKE and GROEGER), A., i, 808.

Substance, $C_{10}H_{18}O_5$, from β-methylbutan-β-ol-γ-one and phosphoric oxide (Scheibler and Fischer), A., i, 1110.

$C_{10}H_9O_5SNa$, and its amino-derivative, from sodium hydrogen sulphite and 2:7-dihydroxynaphthalene (Fuchs and Stix), A., i, 451.

$C_{10}H_{11}O_2N_3S_2$, from oxidation of 3:5-dimethylthiol-1-phenyl-1:2:4-triazole with permanganate (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 378.

$C_{11}H_{20}O$, from ethylene and nitrogen (Miyamoto), A., i, 418.

$C_{12}H_{22}O$, from ethylene and nitrogen (Miyamoto), A., i, 418.

$C_{13}H_{10}O_5$, from oxidation of the lactone of 3-hydroxy-2-*o*-carboxybenzyl-2-methyl*cyclo*propane-1-carboxylic acid (Kon, Stevenson, and Thorpe), T., 663.

$C_{13}H_{10}O_6$, from formic acid and phloroglucinol (Schwenk), A., i, 153.

$C_{13}H_{12}O_7$, from formic acid and phloroglucinol (Schwenk), A., i, 153.

$C_{13}H_{24}O$, from ethylene and nitrogen (Miyamoto), A., i, 418.

$C_{14}H_{14}O_5$, from ethyl 5-aldehydosalicylicate and acetylacetone (Wayne and Cohen), T., 1027.

$C_{14}H_{16}O_3$, from kawaic acid and alcoholic potash (Murayama and Mayeda), A., i, 265.

$C_{14}H_{18}O_4$, and its platinichloride, from hydrolysis of $C_{28}H_{26}N_4$ (Ciusa and Vecchiotti), A., i, 474.

$C_{14}H_8O_4N_2Cl_2$, from urine and dichlorobenzenediazonium chloride (Hermanns), A., i, 1091.

$C_{15}H_8O_5$, from *s*-*o*-phthalyl chloride and sodium salicylate (H. P. and W. Kaufmann and Götting), A., i, 253.

$C_{15}H_{12}O_4$, from the bark of *Rhamnus frangula* (Oesterle), A., i, 100.

$C_{15}H_{28}O$, from ethylene and nitrogen (Miyamoto), A., i, 418.

$C_{15}H_{28}O_2$, from ethylene and nitrogen (Miyamoto), A., i, 418.

$C_{15}H_{16}O_2N_2$, from hydrolysis of anisaldehyde phenylmethylhydrazone hydrochloride (Ciusa and Vecchiotti), A., i, 474.

$C_{15}H_{20}ON_2$, from *cyclo*hexanone and ethyl α-cyanopropionate (Kon and Thorpe), T., 1802.

$C_{16}H_{16}O_3N_2S$, from monothioethylene glycol and phenylcarbimide (Bennett), T., 2146.

$C_{18}H_{34}O$, from ethylene and nitrogen (Miyamoto), A., i, 418.

Substance, $C_{21}H_{14}O$, from 9-styrylxanthenol and acetic acid (Ziegler and Ochs), A., i, 1048.

$C_{22}H_{12}O_4$, and its derivatives, from autoxidation of 2-acetyl-α-naphthol (Fries and Leue), A., i, 462.

$C_{22}H_{15}O_6$, from *m*-cresol and α-nitrophthalic anhydride (Eder and Widmer), A., i, 260.

$C_{22}H_{14}O_5N_2$, from β-ketohydrindene and *p*-nitrobenzaldehyde (Friedlander, Herzog, and v. Voss), A., i, 764.

$C_{22}H_{25}NPI$, from triphenylphosphine-ethylimine and ethyl iodide (Staudinger and Hauser), A., i, 69.

$C_{23}H_{16}O_3$, from β-ketohydrindene and *p*-hydroxybenzaldehyde (Friedlander, Herzog, and v. Voss), A., i, 764.

$C_{23}H_{25}O_2NPI$, from ethyl azidoacetate, triphenylphosphine and methyl iodide (Staudinger and Hauser), A., i, 69.

$C_{25}H_{20}O$, from magnesium phenylethinyl bromide and distyryl ketone (Hess and Weltzien), A., i, 35.

$C_{26}H_{23}O_2N_3$, and its salts, from azodibenzyl and dimethyl-β-naphthylamine (Diels and Kleinfeller), A., i, 1195.

$C_{27}H_{18}O$, from γγ-diphenyl-αα-di-*p*-anisylallene and acetic acid (Ziegler, Ochs, Bremer, and Thiel), A., i, 1049.

$C_{28}H_{14}O_4$, from 2-hydroxyanthraquinone and dextrose (Bradshaw and Perkin), T., 921.

$C_{28}H_{26}N_4$, from hydrolysis of benzaldehyde phenylhydrazone hydrochloride (Ciusa and Vecchiotti), A., i, 474.

$C_{28}H_{24}ON_4$, from *N*-ethylcarbazole-3-diazonium chloride and ammonia (Morgan and Read), T., 2717.

$C_{32}H_{22}O_6$, from oxidation of phenanthraquinyl acetate (Goldschmidt and Schmidt), A., i, 1150.

$C_{33}H_{22}O_6N_6S_3$, from "saccharin" and *m*-phenylenediamine hydrochloride (Dutt), T., 2393.

$C_{33}H_{23}O_9N_7S_3$, from "saccharin" and 4:6-diaminoresorcinol hydrochloride (Dutt), T., 2394.

$C_{34}H_{22}O_2$, from magnesium phenylethinyl bromide and oxalyl chloride (Hess and Weltzien), A., i, 36.

$C_{40}H_{36}O_4$, from diphenylketen and phenylketenacetal (Staudinger and Rathsam), A., i, 1015.

- **Substitution**, influence of, on equilibria in binary systems (KREMANN and MÜLLER; KREMANN, ODELGA, and ZAWODSKY), A., i, 131; (KREMANN, HOHL, and MÜLLER), A., i, 138; (KREMANN and ODELGA), A., i, 159; (KREMANN and STRZELBA), A., i, 176.

  - chemistry of (KILIANI), A., i, 223, 321, 1111.
  - action of amino-acids on (GRÜNHUT and WEBER), A., i, 235.
  - fermentation of, by pentose-fermenting bacteria (PETERSON, FRED, and ANDERSON), A., i, 971.

Sugars, fermentation of, preparation of glycerol from (Vereinigte Chemische Werke), A., i, 980.
in blood (Cammidge, Forsyth, and Howard), A., i, 81; (Rosenberg), A., i, 789; (Neuwirth and Kleiner; Stasiak), A., i, 1208.
distribution of (Falta and Richter-Quittner), A., i, 696.
effect of amino-acids and fatty acids on (Pollak), A., i, 483.
effect of carbon dioxide on (Binswanger), A., i, 962.
in narcosis and disease (Chantraine), A., i, 192.
in arterial and venous blood (Turban), A., i, 482.
relation between the content of, in urine and in blood (Tervaert), A., i, 1215.
in blood and urine, action of phosphates on (Elias and Weiss), A., i, 1085.
in cerebrospinal fluid, aqueous humour, and blood plasma (Coope; de Haan and van Creveld; Stevenson), A., i, 295.
steric transformation of, in tissues (Isaac and Adler), A., i, 297.
stereoisomeric, permeability of the glomerulus membrane for (Hamburger), A., i, 490, 491, 790, 919.
synthesis of acylated halogen derivatives of (Freudenberg and Ivers), A., i, 523.
action of hydrogen peroxide on solutions of (Schonebaum), A., i, 920.
metabolism of. See Metabolism.
oxidation of acids derived from (Greinert), A., i, 1111.
unsaturated reduction products of (Bergmann, Schotte, and Lechinsky), A., i, 227; (Bergmann and Miekeley), A., i, 618.
transportation, retention and excretion of (Folin and Berglund), A., i, 487.
excretion of, in urine (Murschhauser), A., i, 198; (Neuwirth), A., i, 485.
reducing, action of ammonia on (Ling and Nanji), A., i, 631.
clarification of solutions containing, by means of lead acetate (Englis and Tsang), A., ii, 459.
estimation of (Quisumbing and Thomas), A., ii, 92; (Hanak), A., ii, 166; (Fleury and Boutot), A., ii, 879.
estimation of, in blood (Labbé, Nepveux, and Nomidis), A., ii, 663.

Sugars, reducing, estimation of, in urine (Smith), A., ii, 663.
estimation of, by fermentation methods (Lange), A., ii, 93.
estimation of, iodometrically (Auerbach and Bodländer), A., ii, 878.
estimation of, in blood (Rosenberg), A., i, 482; (Guy), A., ii, 94; (Reist), A., ii, 323; (Stepp), A., ii, 592; (Ernst and Weiss), A., ii, 724; (Csonka and Taggart), A., ii, 879.
estimation of, in blood and urine (Tervaert), A., ii, 166.
estimation of, in urine (Folin and Berglund), A., ii, 400.
Sulphamidophthalic acid, constitution of, and its salts and esters (Zincke and Greune), A., i, 550.
p-**Sulphaminobenzoic acid**, sodium salt (Weil and Moser), A., i, 444.
estimation of, in commercial saccharin (Herzog and Kreidl), A., ii, 237.
Sulphamphthaleins (Dutt), T., 2389.
cis-**Sulphatodiethylenediaminecobaltic** bromide (Duff), T., 452.
"**Sulphatoethylaniline.**" See *N*-Phenyl-β-aminoethyl hydrogen sulphate.
1:1-Sulphatomercuridimethylene-bis-1:2-dihydrobenzofuran (Adams, Roman, and Sperry), A., i, 947.
Sulphatopentamminecobaltiselenate. See under Cobalt.
Sulphides. See under Sulphur.
Sulphide colouring matters, red (Watson and Dutt), T., 1939, 2414.
Sulphidobisdimethylpyrrole-3-carboxylic acids, ethyl esters (Fischer and Herrmann), A., i, 1055.
Sulphiformin (*methanalsulphurous acid*) (Malvezin), A., i, 222.
Sulphilimines (Mann and Pope), T., 1052.
Sulphimidophthalic acid, constitution of, and its salts and derivatives (Zincke and Greune), A., i, 551.
p-**Sulphinobenzoic acid** (Smiles and Harrison), T., 2024.
5-Sulphinosalicylic acid (Stewart), T., 2559.
Sulphite liquor lactone (Hintikka), A., i, 347.
cis-**Sulphitodiethylenediaminecobaltic** bromide (Duff), T., 452.
Sulphoacetic acid as a condensing agent (Schneider and Kraft), A., i, 749.
salts, detection and estimation of, in cellulose acetates (Entat and Vulquin), A., ii, 533.
cobalt and copper salts (Backer and Dubsky), A., i, 423.

Sulpho-acid groups, steric hindrance of (van Duin), A., i, 189.

8-*p*-Sulphobenzeneazo-5-amino-6-methoxyquinoline (Jacobs and Heidelberger), A., i, 671.

5-Sulphobenzeneazo-2:4-dimethylpyrrole-3-carboxylic acid, ethyl and methyl esters (Küster, Weber, Maurer, Niemann, Schlack, Schlayerbach, and Willig), A., i, 858.

8-*p*-Sulphobenzeneazo-5-hydroxy-6-methoxy-2-phenylquinoline-4-carboxylic acid (Halberkann), A., i, 175.

8-*p*-Sulphobenzeneazo-5-hydroxy-6-methoxyquinoline (Jacobs and Heidelberger), A., i, 672.

5-*p*-Sulphobenzeneazo-6-hydroxy-2-phenylquinoline-4-carboxylic acid (Halberkann), A., i, 174.

Sulphobenzide. See Diphenylsulphone.

Sulphocarboxylic acids, salts of (Backer and Dubsky), A., i, 423.

m-**Sulphocinnamic acid**, and its aniline hydrogen salt (Moore and Thomas), A., i, 454.

Sulphohæmoglobinæmia (van den Bergh), A., i, 793.

1-3′-Sulpho-2-hydroxyphenyl-3-methyl-5-pyrazolone, 5′-chloro- (Society of Chemical Industry in Basle), A., i, 385.

1-5′-Sulpho-2′-hydroxyphenyl-3-methyl-5-pyrazolone-3′-carboxylic acid (Society of Chemical Industry in Basle), A., i, 385.

Sulphonamides, aliphatic (Clutterbuck and Cohen), T., 120.

substituted, preparation of (Farbenfabriken vorm. F. Bayer & Co.), A., i, 999.

Sulphonation of phenols (Campbell), T., 847.

α-**Sulphonedibutyric acid**, resolution of (Ahlberg), A., i, 625.

Sulphonic acids, esters, action of, with amines (Foldi), A., i, 732.

Sulphonic acids, *o*-amino-, aromatic, condensation of *iso*cyanic acid with (Scott and Cohen), T., 2034.

2.2′-Sulphonidotriphenylcarbinol (Gomberg and Britton), A., i, 163.

2:2′-Sulphonidotriphenylcarbinyl chloride (Gomberg and Britton), A., i, 163.

2:2′-Sulphonidotriphenylmethane (Gomberg and Britton), A., i, 163.

2:2′-Sulphonidotriphenylmethyl, and its peroxide (Gomberg and Britton), A., i, 163.

Sulphonyl chlorides, aromatic (Stewart), T., 2555.

2-*p*-Sulphophenyl-6-methyl-ψ-aziminobenzene, 5-amino- (Kalle & Co.), A., i, 61.

α-**Sulphopropionic acid**, cobalt and copper salts (Backer and Dubsky), A., i, 423.

Sulphosalicylaldehyde, preparation and derivatives of (Weil and Brimmer) A., i, 349.

Sulphosalicylic acid, action of, on the swelling of gelatin and albumin (Ostwald and Kuhn), A., i, 598.

5-Sulphosalicylic acid, 3-nitro-, potassium hydrogen salt (Sakellarios), A., i, 1145.

Sulphoxylic acid, estimation of, volumetrically (de Bacho), A., ii, 311.

Sulphur, absorption spectrum of (Fukuda), A., ii, 728.

Röntgen-ray spectrum of (Lindh), A., ii, 542.

latent heat of fusion of (Stratton and Partington), A., ii, 258.

rhombic, solubility of (Hildebrand and Jenks), A., ii, 141.

solubility of, in organic liquids (Delaplace), A., ii, 706.

valency of (Lecher and Simon), A., i, 1018.

absorption of active hydrogen and nitrogen by (Wendt; Newman), A., ii, 639.

colloidal, physico-chemical investigation of (Rossi), A., ii, 485.

hydrophobic and hydrophilic sols of (Freundlich and Scholz), A., ii, 841.

effect of heating charcoal with (Wibaut), A., ii, 52, 373.

action of, on cuprous chloride (Pinkard and Wardlaw), T., 1300.

equilibrium between iodine and, in solution (Amadori), A., ii, 561.

and its compounds, action of, on terpenes (Budnikov and Schilov), A., i, 944.

metabolism. See Metabolism.

in proteins (Hoffman and Gortner), A., i, 429.

Sulphur compounds in agar (Neuberg and Ohle), A., i, 323.

action of, on growth of plants (Turina), A., i, 707.

oxidation of, by bacteria in soils (Lipman, Waksman, and Joffe), A., i, 303; (Waksman), A., i, 706.

fate of, in the animal organism (Schmidt and Clark), A., i, 968.

Sulphur *mono*chloride, action of aniline with (Coffey), A., i, 132.

Sulphur :—
- **Sulphuryl** chloride, action of, on aromatic amines (Eller and Klemm), A., i, 448.
  - chlorination of benzene with (Silberrad), T., 1015.
  - action of, on organic compounds (Durrans), T., 44.
- **Pyrosulphuryl** chloride, action of toluene on (Steinkopf and Buchheim), A., i, 122.
- **Thionyl** chloride, action of, on glycollic acid (Blaise and Montagne), A., i, 520.
  - action of, on α-hydroxy-acids (Blaise and Montagne), A., i, 715.
- **Sulphides**, phosphorescent, refractive index of (Curie), A., ii, 801.
    - action of red rays on (Curie), A., ii, 246.
  - effect of heat on phototropy of (Mourelo), A., ii, 604.
  - preparation of sols of (v. Hahn), A., ii, 856.
  - fate of, in the blood (Haggard and Charlton), A., i, 287.
  - estimation of (Budnikov and Krause), A., ii, 717, 782.
  - estimation of, volumetrically (Willard and Cake), A., ii, 80.
- **Sulphur** *di*oxide, specific heat of (Partington and Cant), A., ii, 191.
  - solubility of, in suspensions of calcium and magnesium hydroxides (Smith and Parkhurst), A., ii, 761.
  - vapour pressure of (Bergstrom), A., ii, 423.
  - viscosity and molecular dimensions of (Smith), A., ii, 686.
  - equilibrium between water and (Bichowsky), A., ii, 270.
  - oxidising properties of (Wardlaw and Pinkard), T., 210.
  - oxidising and reducing properties of (Stewart and Wardlaw), T., 1481.
  - estimation of (Barham), A., ii, 520.
  - *tri*oxide, physical properties of (Berthoud), A., ii, 638.
    - equilibrium of chromium trioxide, water and (Gilbert, Buckley, and Masson), T., 1934.
    - equilibrium of ferric oxide, water and (Posnjak and Merwin), A., ii, 772.
  - *tetr*oxide (Meyer, Bailleul, and Henkel), A., ii, 843.
- **Sulphurous acid**, autoreduction of (Bennett) T., 1794.

Sulphur :—
- **Sulphurous acid**, reaction between iodic acid and (Skrabal), A., ii, 488.
  - action of iodine with (Macaulay), T., 552.
  - estimation of (Coppetti), A., ii, 80.
- **Sulphites**, preparation of, pure (Shenefield, Vilbrandt, and Withrow), A., ii, 45.
  - alkali hydrogen, equilibria in aqueous solutions of (Baly and Bailey), T., 1813.
  - detection of, in foods (Chapman), A., ii, 520.
- **Sulphuric acid**, lead chamber process for (Forrer), A., ii, 761.
  - and its salts, electrical conductivity of mixtures of (Kendall, Adler, and Davidson), A., ii, 126.
  - determination of the transport numbers for (Ferguson and France), A., ii, 113, 114.
  - properties of mixtures of ethyl ether, water and (Pound), T., 941.
  - heat developed on mixing nitric acid, water and (McDavid), A., ii, 617.
  - absorption of ethylene by (Damiens), A., i, 1105.
  - action of, with aromatic disulphides (Smiles and McClelland), T., 86.
  - detection and estimation of, in cellulose acetate (Entat and Vulquin), A., ii, 533.
  - estimation of, as barium sulphate (Balareff), A., ii, 864.
  - estimation of, in presence of aluminium (Moser and Kohn), A., ii, 782.
- **Sulphates**, diffusion of (Stiles), A., ii, 125.
  - double hydrated, dissociation pressures of (Caven and Ferguson), T., 1406.
  - estimation of (Kolthoff), A., ii, 81.
  - estimation of, as barium sulphate (Chatterjee), A., ii, 390.
  - estimation of, volumetrically (Jellinek and Ens), A., ii, 864.
  - estimation of, in soils (Hirst and Greaves), A., ii, 521.
  - estimation of, in blood (Denis), A., ii, 225.
- **Persulphates**, estimation of (Scagliarini and Torelli), A., ii, 81.
- **Hyposulphurous acid**, estimation of, volumetrically (de Bacho), A., ii, 311.

Sulphur:—
  Thiosulphuric acid, occurrence and estimation of, in the animal organism (DEZANI), A., i, 968.
  Thiosulphates, periodicity of reactions between arsenites or arsenates and (FORBES, ESTILL, and WALKER), A., ii, 271.
    reaction of, with nitrites (FALCIOLA), A., ii, 453.
    ageing of standard solutions of (HAHN and WINDISCH), A., ii, 873.
  Dithionates, estimation of, volumetrically (FISCHER and CLASSEN), A., ii, 453.
  Polythionic acids, and their salts (RIESENFELD and FELD), A., ii, 45.
  Polythionates, analysis of (KURTENACKER and FRITSCH), A., ii, 521.
Sulphur organic compounds (MANN and POPE), T., 1052.
  autoxidation of (DELÉPINE), A., i, 621, 914.
  thiocyanates (LECHER and WITTWER; LECHER and GOEBEL), A., i, 640.
  Sulphuric acid, glucose esters of (LEVENE, MEYER, and WEBER), A., i, 987.
    mixed, anhydrides of, with carboxylic acids (VAN PESKI), A., i, 106.
Sulphur estimation:—
  estimation of (LOSANA), A., ii, 582, 656.
  estimation of, microchemically (HOLTZ), A., ii, 521.
  estimation of, in antimony sulphide (LUFF and PORRITT), A., ii, 225.
  estimation of, in illuminating gas, by means of perhydrol (KLEMMER), A., ii, 224.
  estimation of, in commercial ichthyol preparations (PÉPIN and REAUBOURG), A., ii, 784.
  estimation of, in cast iron and steel (MARINOT), A., ii, 224.
  estimation of, in organic compounds (MEULEN), A., ii, 311.
  estimation of, in pyrites (GADAIS), A., ii, 79; (CHAUDRON and JURE-BOIRARD), A., ii, 311.
  estimation of, in vulcanised rubber (DYER and WATSON), A., ii, 656, 782.
  estimation of, in urine (ROBISON), A., ii, 389.
Sulphur group, heteropoly-acids of the elements of the (MEYER and STATECZNY), A., ii, 773.
Sulphuric and Sulphurous acids. See under Sulphur.
Sulphuryl chloride. See under Sulphur.
Sulphurylazide, action of, on benzene (SCHMIDT), A., i, 777.
  action of, on p-xylene (CURTIUS and SCHMIDT), A., i, 776.
Sunlight, effect of various rays of, on the formation of essential oils in plants (CANALS), A., i, 907.
  coagulation of colloids by (GANGULY and DHAR), A., ii, 604.
Surfaces, orientation of molecules in (HARKINS and ROBERTS), A., ii, 422.
Surface tension, measurement of (SUGDEN), T., 858; (ELDER), A., ii, 618.
  calculation of (CREIGHTON), A., ii, 426.
  effect of addition of electrolytes on (IZAGUIRRE), A., ii, 262.
  effect of, on rate of solution (GANGULY and BANERJI), A., ii, 821.
  of corresponding states (LORENZ and HERZ), A., ii, 261.
  of thin layers of liquids (MARCELIN), A., ii, 686.
Suspensoids, coagulation of (v. HAHN), A., ii, 37.
Symphoricarpus racemosus, sugars from the fruit of (v. LIPPMANN), A., i, 311.
Synergism, ionic (MICHAELIS and HIRABAYASHI), A., ii, 429.
Synovial fluid, analyses of (MALMÉJAC), A., i, 703.
Syphilis, action of bismuth compounds on (SAZERAC and LEVADITI), A., i, 89; (FOURNIER and GUÉNOT), A., i, 301.
  action of sodium p-hydroxy-m-aminophenylarsinate on (FOURNIER, GUÉNOT, and SCHWARTZ), A., i, 300.
Systems, binary. See Binary systems.
  conjugated, of double linkings, combination in (BERGMANN), A., i, 1106.
  disperse, optical properties of (LIFSCHITZ and BECK), A., ii, 597.
  heterogeneous, equilibria in (SYRKIN), A., ii, 699.
    velocity of reaction in (COLLENBERG and BODFORSS), A., ii, 431.
  symmetrical tautomeric triad, mobility of (INGOLD and PIGGOTT), T., 2381.

T.

Tadpoles, influence of the reaction of the solution on the action of poisons or drugs on (LABES), A., i, 901.

Takadiastase, inactivation of (Jacoby and Shimizu), A., i, 481.
Tallow, Mafurra (Rindl), A., i, 1102.
Tannase (Freudenberg and Vollbrecht), A., ii, 285.
estimation of (Rhind and Smith), A., ii, 407.
Tannin, detection of (Atkinson and Hazleton), A., ii, 793.
estimation of, in wines (Malvezin), A., ii, 172.
Tannins (Freudenberg, Böhme, and Purrmann), A., i, 756; (Freudenberg and Vollbrecht), A., i, 1046.
from *Acer ginnala* (Perkin and Uyeda), T., 66.
catechu (Nierenstein), T., 23.
Chinese (Freudenberg and Scilasi), A., i, 1169.
crystalline synthetic (Karrer and Salomon), A., i, 266.
from spruce needles (v. Euler), A., i, 233.
estimation of, in wines (Fresenius and Grunhut), A., ii, 96.
Tanning of hides and leather (Rakuzin), A., i, 703.
Tantalum *di*chloride (Lindner), A., ii, 509.
*penta*chloride, preparation of, and its insulating properties (Biltz and Voigt), A., ii, 303.
reduction of (Ruff and Thomas), A., ii, 513.
*pent*oxide, action of light on (Renz), A., ii, 61.
Tantalum separation:—
separation of, from columbium (Merrill), A., ii, 230.
Tapiolite from South Dakota (Headden), A., ii, 387.
Tar acids, estimation of phenol in (Hoffert), A., ii, 878.
l-**Tartardialdehyde**, and its derivatives (Bergmann), A., i, 8.
Tartaric acid, and its salts, rotatory dispersion of (Lowry and Austin), A., ii, 414.
active racemic compound of (Landrieu), A., i, 808.
and its salts, action of uranyl acetate on (Kopatschek), A., i, 984.
potassium sodium salt, piezo-electricity of crystals of (Scott), A., ii, 609.
ethyl ester, preparation and properties of (Lowry and Cutter), T., 532.
green coloration of (Patterson), T., 1042.
methyl ester, acetyl derivative (Freudenberg and Brauns), A., i, 628.
Tartaric acid, estimation of, volumetrically, in presence of alkaline earth chlorides (Simon and Zivy), A., ii, 880.
Tartaric acid, *di*hydroxy- (Lachman), A., i, 109.
Taste, peppery, relation between chemical constitution and (Ott and Zimmermann), A., i, 187.
Tautomerism, complex (Ley and Grau), A., i, 536.
of dyads (Usherwood), T., 1604.
intra-annular (Farmer, Ingold, and Thorpe), T., 128.
keto-enolic (Kaufmann), A., i, 985.
application of Claisen's rule to (Dieckmann), A., i, 1020.
ring-chain (Kon, Stevenson, and Thorpe), T., 650; (Deshapande and Thorpe), T., 1430; (Ingold, Perren, and Thorpe), T., 1765.
Taxine, and its derivatives (Winterstein and Iatrides), A., i, 572.
Taxus baccata (yew), taxine from (Winterstein and Iatrides), A., i, 572.
Telegraphy, wireless, new detectors for (Heike), A., ii, 19.
Telluric acid. See under Tellurium.
Tellurium, absorption spectrum of (Lindsay), A., ii, 599.
allotropy of (Damiens), A., ii, 498.
amorphous, crystallisation of (Damiens), A., ii, 562.
metallurgy of (Hulot), A., ii, 142.
equilibrium of mixtures of sodium and, in liquid ammonia (Kraus and Chiu), A., ii, 765.
Tellurium alloys with antimony and with lead (Dreifuss), A., ii, 503.
Tellurium compounds, pharmacology of (Joachimoglu and Hirose), A., i, 396, 406.
Tellurium salts, action of, on growth of plants (Turina), A., i, 707.
action of, on bacteria (Joachimoglu), A., i, 1095.
Telluric acid, preparation of (Meyer and Moldenhauer), A., ii, 49.
Tellurides, preparation of (Moser and Ertl), A., ii, 48.
Tellurium organic compounds:—
*tetra*bromide, compounds of amines with (Lowy and Dunbrook), A., i, 446.
bisacetylacetone dichloride (Morgan and Drew), T., 929.
bisbenzoylacetone dichloride (Morgan and Drew), T., 930.
bischloroacetylacetone dichloride (Morgan and Drew), T., 936.
bispivalylacetone dichloride (Morgan and Drew), T., 938.

- **Tellurium organic compounds** :—
  - chloroacetylacetone, and its dichloride (Morgan and Drew), T., 985.
  - dibenzoylmethane trichloride (Morgan and Drew), T., 939.
  - 3-ethylacetylacetone and its dihaloids (Morgan and Drew), T., 932.
  - *O*-ethylpivalylacetone trichloride (Morgan and Drew), T., 937.
  - 3-methylacetylacetone, and its dihaloids (Morgan and Drew), T., 931.
- **Tellurium detection and estimation** :—
  - detection and estimation of (Muller, Menzel, and Schubert), A., ii, 390.
- **Temperature** curves (Ariano), A., ii, 470.
  - of combustion (Bronn), A., ii, 548.
  - high, determination of, by effusion of gases (Yamaguchi), A., ii, 470.
    - investigations at (Ruff, Schmidt, and Mugdan), A., ii, 818.
  - constant high, attainment of (Moser), A., ii, 115.
  - low, maintenance of constant (Cioffi and Taylor), A., ii, 817.
  - of the body, influence of the thyroid on regulation of (Grafe and v. Redwitz; Schenck), A., i, 491.
- **Teraconic acid**, preparation of (Farmer, Ingold, and Thorpe), T., 150.
- **Terephthaldialdehyde**, phenylhydrazones of (Rosenmund, Zetzsche, and Flutsch), A., i, 39.
- **Terephthalylbisdiphenylamide** (Rosenmund, Zetzsche, and Flütsch), A., i, 39.
- **Terephthalyldianilide** (Rosenmund, Zetzsche, and Flütsch), A., i, 39.
- **Terephthalyldi-α-naphthalide** (Rosenmund, Zetzsche, and Flutsch), A., i, 39.
- **Terephthalylideneanthranilic acid** (Ekeley, Rogers, and Swisher), A., i, 935.
- **Terephthalylidenedi-α-naphthylamine** (Rosenmund, Zetzsche, and Flütsch), A., i, 39.
- **Terpenes**, chemistry of (Vesterberg; Vesterberg and Westerlind), A., i, 825.
  - action of sulphur and sulphur compounds on (Budnikov and Schilov), A., i, 944.
  - dicyclic, formulæ of (Dupont), A., i, 1042.
- **Terpene compounds** (Ruzicka and Meyer), A., i, 547, 829; (Ruzicka, Meyer, and Mingazzini), A., i, 560; (Ruzicka and Seidel), A., i, 562.
- **Terpene compounds**, solubility, capillary activity, and hæmolytic activity of (Rhode), A., i, 964.
- **Terpin**, commercial, melting point of (Clavera), A., i, 1042.
  - hydrate, identity of flagstaffite with (Guild), A., ii, 76.
- **Terpineol**, preparation of (Marchand), A., i, 262.
  - hydrate, detection of (Denigès), A., ii, 789.
- **Tetany**, effect of sodium salts on the production of (Tisdall), A., i, 1216.
  - calcium in blood in (Robles), A., i, 192.
  - phosphorus metabolism in (Elias and Spiegel), A., i, 401.
- **Tethelin** (Drummond and Cannan), A., i, 491.
- **5:7:12:14-Tetra-acetoxydibenzothianthren** (Brass and Kohler), A., i, 1051.
- **Tetra-acetoxystearic acid** (Nicolet and Cox), A., i, 320.
- **Tetra-acetyl-ζ-bromoglucose** (Wrede), A., i, 226.
- **Tetra-acetyl*tri*chloroacetylglucoses** (Brigl), A., i, 225.
- **Tetra-acetylgallaldehydecyanohydrin** (Rosenmund and Pfannkuch), A., i, 1031.
- **Tetra-acetylglucose**, mandelic acid derivatives of (Karrer, Nageli, and Smirnov), A., i, 253.
- **Tetra-acetylmannose**, chloro- (Brauns), A., i, 433.
- **Tetra-acetylsalicinphenylmethylamine** (Zemplén and Kunz), A., i, 564.
- **Tetra-acetylsalicintrimethylammonium** bromide (Zemplén and Kunz), A., i, 565.
- α-**Tetra-amylose** dodeca-acetate (Pringsheim and Dernikos), A., i, 632.
- **Tetra-aquodipyridinemagnesium** salts (Spacu), A., i, 859.
- **5:7:12:14-Tetrabenzoyloxydibenzothianthren** (Brass and Köhler), A., i, 1051.
- **Tetrabenzyl-benzylglucoside** (Gomberg and Buchler), A., i, 112.
- **2:2:4:4-Tetracarboxy*cyclo*butane-1-malonic-3-acetic acid**, ethyl ester (Ingold, Perren, and Thorpe), T., 1788.
- **Tetracosoic acid**, esters of (Brigl and Fuchs), A., i, 712.
- *n*-**Tetracosyl alcohol**, and its derivatives (Brigl and Fuchs), A., i, 713.
- **Tetraethylammonium**, and its derivatives (Schlubach and Ballauf), A., i, 15.
  - ruthenipentabromide (Gutbier and Krauss), A., i, 16.

Tetraethyldiphenoquinoneimonium *per*chlorate (Kehrmann, Roy, and Ramm), A., i, 468.

Tetraethylphosphonium bromide and iodide, compounds of iodoform with (Steinkopf and Schwen), A., i, 118.

Tetraethylstibinium iodide, compound of iodoform and (Steinkopf and Schwen), A., i, 118.

Tetraglucosan, and its derivatives (Pringsheim and Schmalz), A., i, 1118.

Tetrahydroacenaphthene derivatives (v. Braun, Hahn, and Seemann), A., i, 728.

Tetrahydroacenaphthene, 4-hydroxy-, and 4-thiol-, and their derivatives (v. Braun and Kirschbaum), A., i, 728.

Tetrahydroacenaphthene-4-sulphinic acid (v. Braun and Kirschbaum), A., i, 728.

Tetrahydroacenaphthene-4-sulphonic acid, and its salts and derivatives (v. Braun and Kirschbaum), A., i, 728.

Tetrahydroaceto-α-naphthalide, 6:7-*di*- and 4:6:7-*tri*-bromo- (Rowe and Davies), T., 1005.

Tetrahydrobenzyl alcohol (de Pommereau), A., i, 825.

Tetrahydrobufotalin (Wieland), A., i, 200.

l-**Tetrahydrocarvone** (Simonsen and Rau), T., 881.

Tetrahydrocinchonine (Jacobs and Heidelberger), A., i, 672.

Tetrahydro-ψ-codeine, and its salts (Speyer and Wieters), A., i, 47.

α- and β-**Tetrahydrodeoxycinchonines** (Jacobs and Heidelberger), A., i, 672.

γ-5-**Tetrahydrodiphenyleneoxide-*n*-butyric acid,** and its derivatives (Mayer and Krieger), A., i, 747.

γ-5-**Tetrahydrodiphenyleneoxide-γ-keto-*n*-butyric acid,** ethyl ester (Mayer and Krieger), A., i, 747.

γ-5-**Tetrahydrodiphenyleneoxide-*n*-propylamine,** and its hydrochloride and acetyl derivative (Mayer and Krieger), A., i, 748.

Tetrahydrodipyridyl hydrate, and its salts (Peters), A., i, 48.

Tetrahydrodipyridyls, dialkyl derivatives, action of iodine on (Emmert and Parr), A., i, 179.

Tetrahydrodurene (Skita and Schenck), A., i, 241.

Tetrahydromethystic acid (Goebel), A., i, 657.

Tetrahydromethysticole, and its semicarbazone (Goebel), A., i, 657.

Tetrahydro-β-naphthaldehyde, and its phenylhydrazone (Weil and Ostermeier), A., i, 139.

ar-α- and -β-**Tetrahydronaphthaldehydes,** and their derivatives (v. Braun, Moldaenke, Dirlam, and Gruber), A., i, 749.

Tetrahydronaphthalene (*tetralin*), physical properties of (Herz and Schuftan), A., i, 647.

preparation of derivatives of (Stevenson and Thorpe), T., 1717.

derivatives, dehydrogenation of (v. Braun, Hahn, and Seemann), A., i, 728.

fate of, in the organism (Röckemann), A., i, 499.

Tetrahydronaphthalene, *di*bromonitro- (v. Braun, Hahn, and Seemann), A., i, 729.

nitro-derivatives (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 123.

ar-**Tetrahydronaphthalenes,** *tri*amino-, and their derivatives (Schroeter, Kindermann, Dietrich, Beyschlag, Fleischhauer, Riebensahm, and Oesterlin), A., i, 126.

5:6:7:8-Tetrahydronaphthalene-1- and **-2-aldehydes,** and their derivatives (Fleischer and Feldmeier), A., i, 1160.

ar-**Tetrahydronaphthalenecarboxylic acids,** aminohydroxy-, hydroxy- and nitrohydroxy-, and their derivatives (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 129.

ar-**Tetrahydronaphthalenesulphonic acids,** and nitro-, and their salts and derivatives (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 126.

ar-**Tetrahydronaphthalene-1-thiolacetic acid** (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 127.

α- and β-**Tetrahydronaphthanthraquinones** (Tetralin G. m. b. H.), A., i, 1040.

7:8:9:10-Tetrahydro-β-naphthaquinoline, and its salts (v. Braun and Gruber), A., i, 762.

Tetrahydronaphthazines, and its salts and derivatives (v. Braun and Gruber), A., i, 762.

ar-**Tetrahydro-α-** and **-β-naphthols** (Schroeter and Tetralin G. m. b. H.), A., i, 1036.

and amino-, bromo-, chloro- and nitro-derivatives, and their derivatives (Schroeter, Svanoe, Einbeck, Geller, and Riebensahm), A., i, 127.

ar-**Tetrahydro-β-naphthol-4-azobenzene-*p*-sulphonic acid** (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 130.

ar-**Tetrahydro-β-naphthol-3-sulphonic acid**, and 1-bromo-, and their salts and derivatives (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 127.

ar-**Tetrahydronaphthonitrile** (V. BRAUN, MOLDAENKE, DIRLAM, and GRUBER), A., i, 749.

α- and **β-Tetrahydronaphthoylacetyl** chlorides (SCHROETER and TETRALIN G. M. B. H.), A., i, 1137.

α- and **β-Tetrahydronaphthoylacetylmalonic acids**, ethyl esters (SCHROETER and TETRALIN G. M. B. H.), A., i, 1137.

β-Tetrahydronaphthoyl-*o*-benzoic acid, and its derivatives (TETRALIN G. M. B. H.), A., i, 1039.

α- and **β-Tetrahydronaphthoylpropionic acids** (SCHROETER and TETRALIN G. M. B. H.), A., i, 1137.

Tetrahydronaphthylacetic acid, and its ethyl ester (DE POMMEREAU), A., i, 828.

ar-**Tetrahydro-α-naphthylamine**, electrolytic oxidation of (ONO), A., i, 1008.

Tetrahydro-β-naphthylamine, β-hydroxy-, and its salts (TAKEDA and KURODA), A., i, 275.

ar-**Tetrahydro-α- and -β-naphthylamines**, and their derivatives and nitro- (SCHROETER, KINDERMANN, DIETRICH, BEYSCHLAG, FLEISCHHAUER, RIEBENSAHM, and OESTERLIN), A., i, 124.

ar-**Tetrahydronaphthylaminesulphonic acids** (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 129.

α- and **β-Tetrahydronaphthylbutyric acids** (SCHROETER and TETRALIN G. M. B. H.), A., i, 1137.

β-Tetrahydronaphthylbutyryl chloride (SCHROETER and TETRALIN G. M. B. H.), A., i, 1137.

2-β-Tetrahydronaphthylcinchoninic acid, and its salts and ethyl ester (V. BRAUN, HAHN, and SEEMANN), A., i, 728.

Tetrahydro-β-naphthyldimethylamine, β-hydroxy-, and its salts (TAKEDA and KURODA), A., i, 275.

ar-**Tetrahydronaphthylenediamines**, and their derivatives (SCHROETER, KINDERMANN, DIETRICH, BEYSCHLAG, FLEISCHHAUER, RIEBENSAHM, and OESTERLIN), A., i, 125.

2:3-*ar*-Tetrahydronaphthylenephenanthrazine (SCHROETER, KINDERMANN, DIETRICH, BEYSCHLAG, FLEISCHHAUER, RIEBENSAHM, and OESTERLIN), A., i, 125.

Tetrahydronaphthylethanol, and its phenylurethane (DE POMMEREAU), A., i, 828.

Tetrahydro β-naphthylmethylamine, β-hydroxy-, and its salts (TAKEDA and KURODA), A., i, 275.

Tetrahydronaphthylmethylamines, and their salts and derivatives (V. BRAUN, MOLDAENKE, DIRLAM, and GRUBER), A., i, 749.

ar-**Tetrahydro-α- and -β-naphthylmethylamines**, acetyl derivatives (SCHROETER, KINDERMANN, DIETRICH, BEYSCHLAG, FLEISCHHAUER, RIEBENSAHM, and OESTERLIN), A., i, 124.

o-**β Tetrahydronaphthylmethylbenzoic acid** (TETRALIN G. M. B. H.), A., i, 1040.

β-Tetrahydronaphthylphthalide (TETRALIN G. M. B. H.), A., i, 1039.

2-β-Tetrahydronaphthylquinoline, and its derivatives (V. BRAUN, HAHN, and SEEMANN), A., i, 729.

2-*ar*-Tetrahydronaphthylquinoline-4-carboxylic acid, and 7-bromo- (CHEMISCHE FABRIK AUF AKTIEN VORM. E. SCHERING), A., i, 952.

1- and **2-Tetrahydronaphthylthiols** (TETRALIN G. M. B. H.), A., i, 340.

ar-**Tetrahydronaphthylthiols** (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 126.

ar-**Tetrahydronaphthyl-2-thiolacetic acid** (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 127.

1- and **2-Tetrahydronaphthylthiolacetic acids** (TETRALIN G. M. B. H.), A., i, 340.

Tetrahydropyran-4:4-dicarboxylic acid, ethyl ester (KAMM and WALDO), A., i, 105.

Tetrahydropyran-4:5-*spiro*-2:4:6-triketohexahydropyrimidine (KAMM and WALDO), A., i, 105.

Tetrahydropyrido-3:4-iminazole. See 1:3:5-Benztriazole.

Tetrahydrothiodiazole, *di*thio- (GUHA), A., i, 877.

bis-*ar*-**Tetrahydrothionaphthendisulphonic acid**, sodium salt (SCHROETER, SVANOE, EINBECK, GELLER, and RIEBENSAHM), A., i, 127.

2:3:5:6-Tetraketo-1:4-dimethylpiperazine (FORSTER and SAVILLE), T., 824.

Tetralævoglucosan, and its derivatives (PRINGSHEIM and SCHMALZ), A., i, 1118.

Tetralin. See Tetrahydronaphthalene.

1:3:5:7-Tetramethoxyanthraquinone, and 2:4:6:8-*tetra*nitro- (Heller and Lindner), A., i, 1040.

4:4′:6:6′-Tetramethoxyarsenobenzene, 3:3′-*di*amino-, dihydrochloride (Christiansen), A., i, 1203.

4:6:3′:4′-Tetramethoxy-3-ethoxy-3-phenylchroman, 2-hydroxy- (Nierenstein), T., 610.

7:8:5′:6′-Tetramethoxy-2-methyl-3:4-indeno(2′:1′)-benzopyrylium ferrichloride (Crabtree and Robinson), T., 1041.

4:6:3′:4′-Tetramethoxy-3-phenylchroman, and 3-bromo-, 3-bromo-2-hydroxy-, and 2-chloro- (Nierenstein), T., 609.

2:8-Tetramethyl*di*aminoacridine (Moudgill), T., 1506.

3:6-Tetramethyl*di*aminocyanoselenopyronin, and its salts (Battegay and Hugel), A., i, 669.

Tetramethyl*di*aminodiphenylmethane, compound of tellurium tetrabromide with (Lowry and Dunbrook), A., i, 446.

4:4′-Tetramethyl*di*aminodiphenylmethane, 3:3-*di*nitro- (Moudgill), T., 1507.

4′:4″-Tetramethyl*di*amino*di*hydroxyfuchsones (Mukerji), T., 551.

4:4′-Tetramethyl*di*amino-2:2′-oxidophenylsulphamphthalein (Dutt), T., 2394.

3:6-Tetramethyl*di*aminoselenoxanthone (Battegay and Hugel), A., i, 669.

Tetramethylammonium aluminate, condition of, in solution (Březina), A., i, 638.
- ruthenipentabromide (Gutbier and Krauss), A., i, 16.
- chlorite (Levi), A., i, 528.
- iodide, compound of iodoform and (Steinkopf and Schwen), A., i, 118.

Tetramethylarsonium iodide, compound of iodoform and (Steinkopf and Schwen), A., i, 118.

1:2:4:6-Tetramethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ol (v. Auwers and Ziegler), A., i, 121.

1:3:7:9-Tetramethyldeoxyuric acid, and its salts (Biltz and Heidrich), A., i, 384.

Tetramethyldiallyl. See βη-Dimethyl-$\Delta^{\beta\zeta}$-octadiene.

Tetramethyldiamylose (Pringsheim and Persch), A., i, 632.

Tetramethyldiethanol*tri*aminotriphenylcarbinol hydrochloride (British Dyestuffs Corporation, Ltd., Green, Saunders, and Bate), A., i, 1068.

Tetramethyldiphenoquinoneimonium perchlorate (Kehrmann, Roy, and Ramm), A., i, 467.

Tetramethylenediguanidine, and its salts (Kiesel), A., i, 531.
- action of arginase on (Kiesel), A., i, 413.

Tetramethylethanol*tri*aminodiphenylnaphthylcarbinol hydrochloride (British Dyestuffs Corporation, Ltd., Green, Saunders, and Bate), A., i, 1068.

1:1:3:6-Tetramethyl-4-ethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ol (v. Auwers and Ziegler), A., i, 121.

1:1:3:6-Tetramethyl-4-ethylidene-$\Delta^{2:5}$-*cyclo*hexadiene (v. Auwers and Ziegler), A., i, 121.

1:3:4:6-Tetramethyl fructrose (Irvine and Patterson), T., 2697.

Tetramethylglycerol chlorohydrin. See βδ-Dimethylpentane, γ-chloro-βδ-*di*hydroxy-.

ββδδ-Tetramethylheptan-γ-one, η-chloro- (Billon), A., i, 717.

Tetramethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ols (v. Auwers and Ziegler), A., i, 120.

1:2:4-Trimethyl*cyclo*hexanes, stereoisomeric (Skita and Schenck), A., i, 241.

2:2:3:3-Tetramethylindoline, and 5-nitroso- and their salts (Knoevenagel), A., i, 1061.

Tetramethyl-4-methylene-$\Delta^{2:5}$-*cyclo*hexadienes (v. Auwers and Ziegler), A., i, 121.

Tetramethylmucic acid, amide and methyl ester of (Karrer and Peyer), A., i, 809.

γγεε-Tetramethyloctan-δ-one, η-chloro- (Billon), A., i, 717.

Tetramethylolphosphonium chloride, and its derivatives (Hoffman), A., i, 8.

1:2:2:3-Tetramethyl*cyclo*pentyl benzyl ketone (Rupe and Jäggi), A., i, 840.

1:2:2:3-Tetramethyl*cyclo*pentyl α-naphthyl ketone (Rupe and Jäggi), A., i, 840.

1:2:2:3-Tetramethyl*cyclo*pentyl-β phenylethyl ketone (Rupe and Jäggi), A., i, 840.

1:2:2:3-Tetramethyl*cyclo*pentyl phenyl ketone (Rupe and Jäggi), A., i, 840.

1:2:2:3-Tetramethyl*cyclo*pentylpropylcarbinol (Leroide), A., i, 217.

***NN′*-Tetramethylphthalamide** (v. Braun and Kaiser), A., i, 659.

2:4:2′:4′-Tetramethylpyrocoll-3:3′-dicarboxylic acid, ethyl ester (Küster, Schlack, Schlayerbach, and Willig), A., i, 858.

Tetramethylsaccharic acid, salts, amide and methyl ester of (Karrer and Peyer), A., i, 809.
2:2:3:3-Tetramethyl-*ar*-tetrahydro-*a*-naphthindoline, and its salts (Knoevenagel), A., i, 1061.
1:3:7:9-Tetramethylthiouric acids (Biltz and Heidrich), A., i, 383.
Tetramminecobaltiselenates. See under Cobalt.
2:4:5:6-Tetraphenylpyridine picrate (Dilthey, Nüsslein, Meyer, and Kaffer), A., i, 949.
Tetraphthene. See Tetrahydroacenaphthene.
s-**Tetrapropylethane.** See δε-Dipropyloctane.
Tetrapyridinecobaltiselenate, *di*chloro-(Meyer and Moldenhauer), A., ii, 73.
Tetrapyridineferritetetrachloroferrate, *di*hydroxy-(Weinland and Kissling), A., i, 364.
Tetrapyridinium μ-dichlorodinitratohexachlorodiferrate (Weinland and Kissling), A., i, 364.
Tetraquinolinium μ-dichloro-octachlorodiferrate (Weinland and Kissling), A., i, 364.
Tetraquochromihexaquochromiselenate. See under Chromium.
Tetrazoles, preparation of (Stollé), A., i, 689.
Tetrodon poison. See Poison.
Textile fibres. See Fibres.
Thallium, electrode potential of, and its amalgams (Richards and Smyth), A., ii, 341.
    flame reactions of (Papish), A., ii, 528.
Thallium compounds, studies on (Berry), T., 394.
Thallium chloride, photochemistry of (Renz), A., ii, 66.
    chlorides, action of, on organo-metallic compounds (D. and A. E. Goddard), T., 256.
    chromates (Canneri), A., ii, 297.
    cadmium nickel nitrite (Cuttica), A., ii, 449.
    arseno-, bismutho-, and stibio-thiosulphates (Canneri), A., ii, 378.
    Thallic-thallous sulphate (Benrath and Espenschied), A., ii, 504.
    Thallous borates (Canneri and Morelli), A., ii, 571.
        bismuth bromide and iodide (Canneri and Perina), A., ii, 512.
        chlorite (Levi), A., ii, 567.
Thallium:—
    Thallous haloids, compounds of ammonia with (Biltz and Stollenwerk), A., ii, 67.
        nitrite, double salts of metallic nitrites and (Cuttica and Paciello), A., ii, 377.
Thallium organic compounds:—
    dialkyl salts and diaryl haloids (Goddard), T., 36; (D. and A. E. Goddard), T., 256.
    diphenyl oxide and salts (A. E. and D. Goddard), T., 486.
Thallium estimation:—
    estimation of, in organic compounds (A. E and D. Goddard), T., 488.
Thapsic acid, electro-synthesis of, and its ethyl ester (Carmichael), T., 2545.
Thaumasite, constitution of (Holden), A., ii, 860.
Theobromine, chloroform extraction apparatus for (Schaap), A., ii, 797.
    soluble compounds of, with alkali benzoates and salicylates (Knoll & Co.), A., i, 464.
    estimation of, in urine (Gunzberg), A., i, 703.
Theobromine-1-acetic acid (Merck, Wolfes, and Kornick), A., i, 1071.
Theophylline, soluble compounds of, with alkali benzoates and salicylates (Knoll & Co), A., i, 464.
Theophylline-7-acetic acid (Merck, Wolfes, and Kornick), A., i, 1071.
Thermochemistry, unit of measurement in (Swientoslawski), A., ii, 548.
    of organic compounds (Swientoslawski), A., ii, 195; (Fajans), A., ii, 818; (Thiel), A., ii, 819.
    of solutions (Levalt-Ezersky), A., ii, 819.
Thermo-compression (Deleuer), A., ii, 684.
Thermodynamics, relation between statistical mechanics and (Tolman), A., ii, 257.
    of mixtures (Wagner), A., ii, 116.
Thermo-electric force of metals (Latimer), A., ii, 814.
Thermo-regulator (Starkey and Gordon), A., ii, 547.
Thermos flask, use of, in the laboratory (Bourlet and Thomas), A., ii, 139.
Thermostat to determine the effect of temperature on diffusion (Öholm), A., ii, 621.
    adjustable (Lewis and Wood), A., ii, 612.
    electrical heating apparatus for (Rawling), A., ii, 612.

- **Thiazoles** (Bogert and Abrahamson), A., i, 576; (Bogert and Meyer), A., i, 868.
- **Thienoylhydroxamic acid,** and its salts and esters (Jones and Hurd), A., i, 249.
- *Thiobacillus thio-oxydans*, growth of (Lipman, Waksman, and Joffe), A., i, 303.

catalysis of the formation of, in the glow discharge (Paneth), A., ii, 363.
hydride (Paneth, Johannsen, and Mathies; Paneth, Matthias, and Schmidt-Hebbel), A., ii, 383.
oxides, hydrated (Weiser), A., ii, 853.
Stannous chloride, reduction of nitro-compounds by (Goldschmidt, Storm, and Hassel), A., ii, 361.
oxide and its hydrates, preparation and reactions of (Bury and Partington), T., 1998.
Stannic hydroxide, amphoteric properties of (Collins and Wood), T., 441.
Tin:—
Stannic acids, isomerism of (Collins and Wood), T., 441.
action of hydrochloric acid on (Collins and Wood), T., 1122.
action of alkali hydroxides on (Collins and Wood), T., 2760.
Tin organic compounds (Druce), A., i, 639, 1206.
di*iso*propyloxide and haloids and *iso*propyl tribromide (Druce), T., 1861.
mercaptides (Wuyts and Vangindertaelen), A., i, 250.
tetraethyl and tetraphenyl, action of thallic chloride on (D. and A. E. Goddard), T., 259.
tetraphenyl, use of, in preparation of organo-metallic compounds (Goddard, Ashley, and Evans), T., 978.
Tin detection, estimation and separation:—
detection of (Heller), A., ii, 458.
estimation of, iodometrically (Kohler), A., ii, 530.
estimation of, volumetrically (Smith), A., ii, 398.
estimation of, in bearing metals (Nágel), A., ii, 721.
estimation of, volumetrically, in red brass (Mück), A., ii, 722.
estimation of, and its separation from antimony, copper, and lead (Kling and Lassieur), A., ii, 86.
Tissues, permeability of (Schaeppi), A., i, 290.
non-protein constituents of, and endogenous katabolism (Mitchell, Nevens, and Kendall), A., i, 897.
action of potassium salts on (Clark), A., i, 399.
oxidation of xanthine by (Morgan, Stewart, and Hopkins), A., i, 1078.
animal. See Animal tissues.
animal, vegetable, and tumour, copper salts in (White), A., i, 399.
subcutaneous, swelling in (Morawitz and Denecke), A., i, 492.
detection of urea in (Bonnet and Haushalter), A., ii, 794.
estimation of chlorine in (Pico and Murtagh), A., ii, 716.
estimation of the reducing power of (Lipschitz and Gottschalk), A., i, 298.
estimation of urea in (Gad-Andresen), A., ii, 536.
Tissue extracts, estimation of uric acid in (Steudel and Suzuki), A., ii, 538.
Titanetetra-1-piperidinium chloride (Leonard), A., i, 363.

Titanium salts, photochemical reduction of (Benrath and Obladen), A., ii, 781.
  reduction of nitroparaffins with (Henderson and Macbeth), T., 892.
Titanium *tri*chloride, reduction with (Rathsburg), A., i, 242.
  action of, on halogen organic compounds (Black, Hirst, and Macbeth), T., 2527.
  *tetra*chloride, thermal constants of (Latimer), A., ii, 256.
  *sesqui*oxide, catalytic activity of (Gilfillan), A., i, 709.
   catalytic action of, on acetates Adkins and Krause), A., i, 422.
  *di*oxide, action of light on (Renz), A., ii, 61.
   estimation of, volumetrically, in bauxite (Winch and Chandratreya), A., ii, 459.
  sulphate, use of solutions of, in controlling the course of catalysis (Hofmann), A., ii, 490.
   use of, in estimation of iron and copper (Thornton), A., ii, 528.
Titanium estimation:—
  estimation of (Kikuchi; Kanô), A., ii, 721.
  estimation of, by reduction (Treadwell, Blumenthal, and Starkle), A., ii, 788.
Toads, poison from. See Poison.
Tobacco, biochemistry of (Paris), A., i, 211.
  carbon monoxide in the smoke of (Armstrong and Evans), A., i, 1226.
  estimation of nicotine in (Liotta), A., ii, 404.
Tohaku oil, composition and properties of (Iwamoto), A., i, 98.
o-**Tolidine** hydroferrocyanide (Cumming), T., 1296.
Toluene, physical constants of (Timmermans, van der Horst, and Onnes), A., ii, 258.
  compressibility of (Richards, Bartlett, and Hodges), A., ii, 28.
  equilibrium of ethyl alcohol, water, and (Ormandy and Craven), A., i, 215
  nitration of (Gibson, Duckham, and Fairbairn), T., 270.
  action of pyrosulphuryl chloride on (Steinkopf and Buchheim), A., i, 122.
  estimation of (Zaborowski), A., ii, 877.
Toluene, 3:5-*di*bromo-, action of sodium with (Fuchs and Metzl), A., i, 442.

Toluene, chloro-derivatives, isomeric (Wahl, Normand, and Vermeylen), A., i, 442.
  6-chloro-3-amino- (Goldschmidt and Strohmenger), i, 1005.
  *di*chloronitro-derivatives (Davies), T., 812.
  nitro-derivatives, equilibrium of, with carbazole and acenaphthene (Kremann and Strzelba), A., i, 176.
  m-nitro-, nitration of (Brady), T., 328.
Toluenes, bromo-, oxidation of, with potassium permanganate (Bigelow), A., i, 998.
  nitro-, equilibria in binary systems of (Bell and McEwen), A., i, 726.
p-**Tolueneazofurfurylidene-β-naphthylamine** (Fischer and Meier), A., i, 956.
Tolueneazo-*o*-hydroxybenzylidene-β-naphthylamine (Fischer and Meier), A., i, 956.
Toluene-4-azo-β-naphthol, 2:6-*di*chloro- (Davies), T., 813.
o-**Tolueneazo-β-naphthylamine**, and its acetyl derivative (Fischer and Schwappacher), A., i, 957.
p-**Toluene-1-azo-5-nitro-β-naphthylamine** (Morgan and Chazan), A., i, 181.
1-*p*-Tolueneazo-8-nitro-β-naphthylamine (Morgan and Gilmour), A., i, 380.
2-*o*-Tolueneazophenol (Chattaway and Hill), T., 2758.
p-**Toluenediazonium** chloride, compound of bismuth trichloride and (Challenger and Wilkinson), T., 103.
o-**Toluenesulphonamide**, electrochemical oxidation of (Fichter and Löwe), A., i, 242.
  oxidation of (Pamfilov), A., i, 928.
p-**Toluenesulphonamide**, compound of triphenylarsine-*p*-toluenesulphonylimine and (Mann and Pope), T., 1054.
o- and *p*-**Toluenesulphonamides**, thermal analysis of the system (Dobrjanski), A., i, 1132.
p-**Toluene-*p*-sulphonbenzylamide** (Farbenfabriken vorm. F. Bayer & Co.), A., i, 999.
Toluene-*p*-sulphondi-*p*-tolylamide, and its derivatives (Halberkann), A., i, 1134.
3-*p*-Toluenesulphonecoumarin, 7-hydroxy- (Tröger and Bolte), A., i, 268.
p-**Toluene-*p*-sulphonethylamide** (Farbenfabriken vorm. F. Bayer & Co.), A., i, 999.

Toluene compounds, Me = 1.

Toluenesulphonic acid, 4-toluenesulphonmethylamidophenyl ester (SOCIETY OF CHEMICAL INDUSTRY IN BASLE), A., i, 31.

Toluene-*m*-sulphonic acid, 6-chloro-5-nitro-, metallic salts and amide of (DAVIES), T., 789.

Toluene-*p*-sulphonic acid, 1-methylpapaverinium, 1-methylpyridinium and phenyltrimethylammonium salts (FÖLDI), A., i, 732.
  β-chloroethyl ester (CLEMO and PERKIN), T., 644.
  transformations of diarylamides of (HALBERKANN), A., i, 1132.

Toluene-*p*-sulphonphenyl-*p*′-tolylamide, and its derivatives (HALBERKANN), A., i, 1133.

m-**Toluenesulphonyl** chloride, 6-chloro-, and 6-chloro-5-nitro- (DAVIES), T., 787.

5-Toluene-*p*-sulphonylaminoacenaphthene (FLEISCHER and SCHRANZ), A., i, 1144.

p-**Toluenesulphonyl-*o*″-anilino-*p*′-benzeneazo-*β*-naphthol** (HALBERKANN), A., i, 1133.

p-**Toluenesulphonylbenzeneazo-*β*-naphthol** (HALBERKANN), A., i, 1133.

3-*p*-Toluenesulphonylcoumarin (TRÖGER and BOLTE), A., i, 267.

3-Toluene-*p*-sulphonyldextrose (FREUDENBERG and IVERS), A., i, 524.

Toluene-*p*-sulphonyldextrosediacetone (FREUDENBERG and IVERS), A., i, 524.

o′-*p*-**Toluenesulphonyldiphenylnitrosoamine** (HALBERKANN), A., i, 1132.

3-*p*-Toluenesulphonyl-2-methylquinolline, and its salts and derivatives (TRÖGER and MENZEL), A., i, 269.

p-**Toluenesulphonyl-2-nitro-3-anilino-*p*-phenetidine** (REVERDIN and ROETHLISBERGER), A., i, 538.

p-**Toluenesulphonyl-3:5-*di*nitro-2-anilino-*p*-phenetidine** (REVERDIN and ROETHLISBERGER), A., i, 538.

p-**Toluenesulphonyl-2:3-*di*nitro-*N*-methyl-*p*-phenetidine** (REVERDIN and ROETHLISBERGER), A., i, 538.

p-**Toluenesulphonyl-*mono*-, *di*- and *tri*-nitro-*p*-phenetidines,** and their derivatives (REVERDIN and ROETHLISBERGER), A., i, 538.

3-*p*-Toluenesulphonyl-1:3-oxazolid-2-one (FROMM and HONOLD), A., i, 530.

p-**Toluenesulphonyl-*p*-phenetidine,** nitro-derivatives (REVERDIN and ROETHLISBERGER), A., i, 538.

β-*p*-**Toluenesulphonylquinophthalone** (TRÖGER and MENZEL), A., i, 270.

Toluene compounds, Me = 1.

Toluene-*p*-sulphonyltetra-acetylglucose (FREUDENBERG and IVERS), A., i, 524.

p-**Toluenesulphonyl-*p*-tolylsulphoxidethylene** (FROMM and SIEBERT), A., i, 543.

p-**Toluenesulphonyl-*p* tolylthiolethane** (FROMM and SIEBERT), A., i, 543.

Toluene-*p*-sulphonyltriacetylbromoglucose (FREUDENBERG and IVERS), A., i, 524.

Toluene *p*-sulphonyltriacetylmethylglucoside (FREUDENBERG and IVERS), A., i, 524.

o-**Toluic acid,** 3-hydroxy- (ASAHINA and KONDO), A., i, 657.

p-**Toluic acid,** bromo-2-amino-, and its derivatives (WHEELER and SMITHEY), A., i, 332.

Toluic acids, solubility of, in xylenes (CHAPAS), A., i, 339.

Toluic acids, bromo- and chloro-derivatives, and their ethyl esters, amides, bromides, and chlorides (DAVIES and PERKIN), T., 2202.
  *di*nitroamino-, methyl ester, and *tri*nitro-, and their silver salts and ethyl ester (GIUA), A., i, 534.

Toluidine hydrochloride, formation of, from methylaniline hydrochloride (BECKMANN, CORRENS, and LIESCHE), A., i, 535.
  hydroferrocyanides (CUMMING), T., 1293.

o-**Toluidine,** separation of, from *p*-toluidine (CUMMING), T., 1293.

m-**Toluidine,** *di*-*ω*-chloro- (GOLDSCHMIDT and STROHMENGER), A., i, 1005.
  6-iodo-, and its hydrochloride and acetyl derivative (BURTON and KENNER), T., 680.
  5-nitro-, preparation of (BRADY, DAY, and ROLT), T., 527.

p-**Toluidine,** 2:6-*di*chloro-, and 2:6-*di*chloro-3-nitro-, and their derivatives (DAVIES), T., 813.
  2:3- and 2:5-*di*nitro- (SCOTT and ROBINSON), T., 844.

Toluidines, *di*nitro- (BRADY, DAY, and ROLT), T., 526.

Toluidine-blue, metachromism of (SCHWARZ and HERRMANN), A., i, 930.

p-**Toluidine-*m*-sulphonic acid,** salts of (SCOTT and COHEN), T., 2039.

o- and *p*-**Toluidinesulphonitriles,** and their salts (OLIVERI-MANDALÀ), A., i, 1008.

Toluidinoanthraquinones, amino- (BADISCHE ANILIN- & SODA-FABRIK), A., i, 942.

Toluene compounds, Me = 1.

4-Toluidinobenzonitriles, 3-nitro- (Mattaar), A., i, 251.

o-p′-**Toluidinobenzoylbenzene**, *o*-2′-nitro- (Mayer and Freund), A., i, 866.

β-*p*-Toluidinobutyric acid, ethyl ester, and its hydrochloride (Stoermer and Robert), A., i, 519.

***p*-Toluidinoethylitaconic acid**, ethyl ester (Carrière), A., i, 319.

1-*p*-Toluidino-2-furyl-5-methylbenziminazole (Fischer and Meier), A., i, 957.

1-*o*-Toluidino-2-furylnaphthiminazole (Fischer and Schwappacher), A., i, 957.

1-*p*-Toluidino-2-furylnaphthiminazole, and its nitrosoamine (Fischer and Meier), A., i, 956.

1-*p*-Toluidino-4-hydroxynaphthalene (Kalle & Co.), A., i, 824.

1-*p*-Toluidino-2-*o*-hydroxyphenyl-5-methylbenziminazole, and its diacetyl derivative (Fischer and Meier), A., i, 957.

1-*p*-Toluidino-2-*o*-hydroxyphenylnaphthiminazole, and its diacetyl derivative (Fischer and Meier), A., i, 956.

1-*o*-Toluidino-2-hydroxyphenylnaphthiminazoles, and their derivatives (Fischer and Schwappacher), A., i, 957.

3-*p*-Toluidino-5-keto*iso*oxazole, and its derivatives (Worrall), A., i, 874.

3-*p*-Toluidino-5-ketopyrazole, and its hydrochloride and acetyl derivative (Worrall), A., i, 875.

4-*p*-Toluidino-2-methylanthraquinone, 1-amino- (Badische Anilin- & Soda-Fabrik), A., i, 942.

1-*o*-Toluidino-2-methylnaphthiminazole, and its acetyl derivative (Fischer and Schwappacher), A., i, 957.

3-*o*- and -*p*-Toluidino-1:4-napthaquinones,2:3-*di*bromo-5-hydroxy- (Wheeler and Andrews), A., i, 354.

1-*o*-Toluidino-α-naphthiminazole, and its nitrosoamine (Fischer and Schwappacher), A., i, 957.

β-Toluidino-*p*-phenetolecarbamides (Speckan), A., i, 580.

1-*o*-Toluidino-2-phenyl-α-naphthiminazole, and its picrate (Fischer and Schwappacher), A., i, 957.

1-*p*-Toluidino-2-phenyl-α-naphthiminazole, and its nitrosoamine (Fischer and Meier), A., i, 957.

2-*p*-Toluidinophenyl-*p*-tolylsulphone, and its derivatives (Halberkann), A., i, 1183.

Toluene compounds, Me = 1.

5-*m*-Toluidino-1-*m*-tolyl-1:2:3:4-tetrazole (Stollé), A., i, 689.

***p*-Toluoylaminobenzoic acids** (Lawrance), A., i, 340.

***p*-Toluoyl-*o*-benzoic acid**, preparation of (McMullen), A., i, 140.

***p*-Toluoyl-*m*-benzoic acid**, and its silver salt and methyl ester (Smith), A., i, 141.

Toluoylbenzoic acids, aminohydroxy-, hydroxy-, and nitrohydroxy- (Eder and Widmer), A., i, 261.
  *tetra*bromo-, *tetra*iodo- and nitro-, and their methyl esters (Lawrance), A., i, 340.

***m*-Toluoylbenzoic acids**, 3:4- and 3:6-*di*chloro-2-*p*-hydroxy- (v. dem Knesebeck and Ullmann), A., i, 359.

***o*-Tolyl** β-chloroethyl ether, and *p*-nitro- (Clemo and Perkin), T., 645.

***p*-Tolyl** *p′*-amino- and *p′*-nitro-benzyl ethers (Pummerer, Melamed, and Puttfarcken), A., i, 1163.
  methyl ether, 3-chlorosulphonyl derivative, preparation of (Stewart), T., 2558.

***p*-Tolyl-*o*-acetoxystyrylsulphone** (Troger and Bolte), A., i, 268.

***N*-*o*-Tolyl-β-aminoethyl** hydrogen sulphate (Saunders), T., 2673.

3-Tolyl-5-anilinomethylene-4-glyoxalones, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1185.

***p*-Tolyl-1-anilino-*m*-tolylsulphone**, and its derivatives (Halberkann), A., i, 1134.

o- and ***p*-Tolylarsines** (Palmer and Adams), A., i, 786.

1-*p*-Tolylbenzothiazole, and its derivatives (Bogert and Meyer), A., i, 868.

***p*-Tolyl-*o*-benzoyloxystyrylsulphone** (Troger and Bolte), A., i, 268.

1-*m*-Tolyl-4-benzylidenehydantoin, and 2-thio- (Hill and Kelsey), A., i, 1142.

***p*-Tolylbiuret** (Fromm and Wenzl), A., i, 438.

α-*p*-Tolyl*iso*butyric acid, ββ-*di*chloro- (v. Auwers and Ziegler), A., i, 140.

***p*-Tolylcarbamine** cyanide (Fromm and Wenzl), A., i, 438.

Tolyl-2:4-diacetoxystyrylsulphone (Tröger and Bolte), A., i, 268.

Tolyl-2:4-dibenzoyloxystyrylsulphone (Tröger and Bolte), A., i, 268.

1-*p*-Tolyl-2:3-dibenzyl-6-methylquinoxaline, αα′-*di*cyano- (Dutt and Sen), T., 2666.

Toluene compounds, Me = 1.

o- and *p*-**Tolyldi-α-hydroxybenzylarsines** (Palmer and Adams), A., i, 786.

o- and *p*-**Tolyldi-α-hydroxyethylarsines** (Palmer and Adams), A., i, 786.

m- and *p*-**Tolyldiphenylmethane**, *di*hydroxy- (Mackenzie), T., 1698.

2:4-Tolylenediamine hydroferrocyanide (Cumming), T., 1295.
  compound of tellurium tetrabromide with (Lowy and Dunbrook), A., i, 446.

p-**Tolylethylcarbinol** (v. Auwers and Kolligs), A., ii, 176.

1-*p*-**Tolyl-4-ethylpyrroline-5-one-3-carboxylic acid**, and its ethyl ester (Carrière), A., i, 319.

p-**Tolylfuryl-2-keto-3-methyl*cyclo*hexylmethane** (Wolff), A., i, 668.

3-*m*-Tolyl-4-glyoxalone, 2-thiol- (Dains, Thompson, and Asendorf), A., i, 1185.

1-*m*-**Tolylhydantoin**, and 2-thio- (Hill and Kelsey), A., i, 1142.

p-**Tolylhydrazine**, *m*-nitro-, preparation of (Davies), T., 720.

p-**Tolylhydrazinesulphonic acid**, *m*-nitro-, ammonium salt (Davies), T., 720.

p-**Tolyl-*o*-hydroxystyrylsulphone** (Tröger and Bolte), A., i, 267.

Tolyl-2:4-*di*hydroxystyrylsulphone, and its dimethyl ether (Troger and Bolte), A., i, 268.

m-**Tolylideneanthranilic acid** (Ekeley, Rogers, and Swisher), A., i, 935.

5-Tolylimino-2-thio-3-naphthyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.

5-Tolylimino-2-thio-3-phenyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 877.

5-Tolylimino-2-thio-3-tolyl-2:3:4:5-tetrahydro-1:3:4-thiodiazole (Guha), A., i, 876.

m-**Tolyl-6-methylbenziminazole** 1:6-hydroxy-, and its salts (Jacobsen), A., i, 593.

2-*m*-Tolyl-3-methylindole, 2-*p*-hydroxy- (v. Auwers, Hilliger, and Wulf), A., i, 1193.

o-**Tolylmethylnitrosoamine** (Schmidt and Fischer), A., i, 822.

2-*p*-Tolyl-αβ-naphthatriazole, 6-amino-, and its derivatives and 6-nitro- (Morgan and Chazan), A., i, 181.
  9-amino-, and 9-nitro- (Morgan and Gilmour), A., i, 380.

p-**Tolyl-αβ-naphthatriazoleazo-β-naphthol** (Morgan and Chazan), A., i, 181.

Toluene compounds, Me = 1.

α-*o*- and -*p*-**Tolylnaphthylamines**, β-hydroxy- (Wahl and Lantz), A., i, 823.

Tolyloxides, nitro-, lead (Goddard and Ward), T., 265.

Tolyloxyacetic acids, amino-, nitro-, and their derivatives (Minton and Stephen), T., 1594.

2- and 3-*p*′-Tolyloxy-*p*-cresols, and their derivatives (Pummerer, Melamed, and Puttfarcken), A., i, 1163.

2-*p*-Tolyloxy-2:3-dihydro-*p*-benzoquinomethane, and its derivatives (Pummerer, Melamed, and Puttfarcken), A., i, 1162.

α-*p*-**Tolylpropionic acid**, βββ-*tri*chloro- (v. Auwers and Julicher), A., i, 842.

β-*o*-**Tolylpropionolactone**, β-3:5-*di*hydroxy- (Langley and Adams), A., i, 1154.

α-*p*-**Tolylprozan-βγ-dicarboxylic acid**, ethyl ester (Diels and Aubart), A., i, 1194.

1-*p*-**Tolylpyrroline-5-one-3-carboxylic acid**, ethyl ester (Carrière), A., i, 318.

o-**Tolylsulphamic acid**, *p*-amino-, benzoyl derivative, sodium salt (Weil and Wassermann), A., i, 1006.

p-**Tolylsulphamic acid**, sodium salt (Weil and Moser), A., i, 444.

o-**Tolyl-*p*-sulphamsulphonic acid**, amino-, sodium salt (Weil and Wassermann), A., i, 1007.

p-**Tolylsulphonyl-*p*-tolylthiolethylene** (Fromm and Siebert), A., i, 543.

1-*p*-**Tolyl-1:2:3:4-tetrazole**, 5-amino- (Stollé), A., i, 689.

p-**Tolylthiolacetaldehyde**, phenylhydrazone and tolylmercaptal derivatives of (Fromm and Siebert), A., i, 542.

p-**Tolylthiolthioacetic acid**, *p*-tolyl ester (Fromm and Siebert), A., i, 543.

m-**Tolyltoluquinonedi-imide** (Goldschmidt and Strohmenger), A., i, 1006.

Tomato (*Solanum esculentum*), proteins of the seeds of (Johns and Gersdorff), A., i, 800.

Toxicity (Rona and Bloch; Rona and Bach), A., i, 65; (Rona and Reinicke), A., i, 67; (Rona, Airila, and Lasnitzki), A., i, 959.

Toxins, formation of, by bacteria (Walbum), A., i, 902.
  chemical nature of (Salkowski), A., i, 1216.
  adsorption of, by aluminium hydroxide (Rakuzin), A., i, 1199.
  action of metals on (Erdstein and Fürth), A., i, 90.

Trees, Indian forest, oils and fats from the seeds of (Rau and Simonsen), A., i, 1100.

Trehalose, fermentation of, by bacilli (Koser), A., i, 407.

Triacetin, hydrolysis of (Yamazaki), A., i, 422.

3:4:5-Triacetoxystyrene, ω-nitro- (Rosenmund and Pfannkuch), A., i, 1030.

γεζ-Triacetyl-β-chloroacetylglucose, α-chloro- (Brigl), A., i, 225.

γεζ-Triacetyl-β-*tri*chloroacetylglucose, α-chloro- (Brigl), A., i, 225.

Triacetyl-ethylglucoside-ζ-bromohydrin (Wrede), A., i, 226.

Triacetylgallaldehyde, and its derivatives (Rosenmund and Pfannkuch), A., i, 1030.

γ-εζ-Triacetylglucose, α- and β-forms of, and its αβ-anhydride (Brigl), A., i, 1117.

γεζ-Triacetylglucose, α-chloro-, and its β-chlorosulphinite and αβ-*di*chloro- (Brigl), A., i, 225.

3:5:6-Triacetyl-1-methyl glucosamine (Irvine and Earl), T., 2381.

γεζ-Triacetyl-α-methylglucoside (Brigl), A., i, 1117.

Tri*iso*amylphosphine-ethylimine (Staudinger and Hauser), A., i, 70.

Tri*iso*amylphosphinephenylimine (Staudinger and Hauser), A., i, 70.

Tri*iso*amylphosphinephenylphosphazide (Staudinger and Hauser), A., i, 70.

Trianilinoarsine hydrochloride (Schmidt), A., i, 285.

3:4:5-Tri-*p*-anisyl*iso*oxazole (Meisenheimer and Weibezahn), A., i, 177.

Triaquotripyridinemagnesium chloride (Spacu), A., i, 859.

Triazo-group (Forster and Saville), T., 2595.

3-Triazocarbazole (Morgan and Read), T., 2714.

α-Triazo-β-hydroxy-β-phenylpropionic acid (Forster and Saville), T., 2595.

1:2:3-Triazole, 4:5-*di*cyano-, and its derivatives (Grischkevitsch-Trochimovski), A., i, 724.

1:2:4-Triazole, 5-amino-3-thiol-, and 3:5-*di*thiol, and their salts (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 379.

Triazoles (Arndt, Milde, Tschenscher, Bielich, and Eckert), A., i, 277.
  synthesis of (Fromm, Kayser, Briegleb, and Föhrenbach), A., i, 377.

Triazoles, aromatic, preparation of (Kalle & Co.), A., i, 61.

1:2:3-Triazole-5-carboxylic acid, 4-cyano-, ethyl ester (Grischkevitsch-Trochimovski), A., i, 724.

α-Triazo-β-methoxy-β-phenylpropionic acid (Forster and Saville), T., 2601.

Triazosulphole, and its compound with mercuric oxide (Oliveri-Mandalà), A., i, 1008.

Tribenzoylgallaldehyde, and its derivatives (Rosenmund and Pfannkuch), A., i, 1030.

Tribenzoylphenylmethane (Meisenheimer and Weibezahn), A., i, 178.

Tribenzylamine, *tri-o*-hydroxy-, hydrochloride (Zemplén and Kunz), A., i, 564.

Tribenzylmethyl chloride (Jones and Scott), A., i, 454.

Tri*iso*butylcarbinol (Skraup and Freundlich), A., i, 540.

Tributyrinase, action of kaolin on the activity of, in serum (Olsen), A., i, 292.

2:4:4-Tricarboxy*cyclo*butane-1-acetic-3-α-propionic acid, 2-cyano-, ethyl ester (Ingold, Perren, and Thorpe), T., 1788.

2:4:4-Tricarboxy*cyclo*butane-1-malonic-3-α-propionic acid, 2-cyano-, ethyl ester (Ingold, Perren, and Thorpe), T., 1788.

Trichilia emetica, mafurra tallow from the nuts of (Rindl), A., i, 1102.

*iso***Tricosoic acid**, and its ethyl ester (Levene and Taylor), A., i, 715.

*iso***Tricosyl** iodide (Levene and Taylor), A., i, 715.

*iso***Tricosyl alcohol** (Levene and Taylor), A., i, 715.

*iso***Tricosylmalonic acid**, and its diethyl ester (Levene and Taylor), A., i, 715.

Tridymite from Italy (Billows), A., ii, 578.

2:4:5-Tri-*p*-ethoxyphenyloxazole (Schönberg and Kraemer), A., i, 664.

Triethylamine, action of, on ketopinyl chloride (Wedekind and Weinand), A., i, 549.

Triethylammonium ruthenipentabromide (Gutbier and Krauss), A., i, 16.

Triethylene *tri*- and *tetra*-sulphides, and their compounds with mercuric salts, and with ethyl iodide (Rây), T., 1279.

Triethylphosphinebenzoylimine (Staudinger and Hauser), A., i, 70.

Triethylphosphine-ethylimine (Staudinger and Hauser), A., i, 70.

Triethylphosphineimineazine (Staudinger and Hauser), A., i, 70.
Triethylphosphinemethylimine (Staudinger and Hauser), A., i, 70.
Triethylphosphinephenylimine (Staudinger and Hauser), A., i, 70.
Triethylsulphonium bromide, absorption spectra of, in various solvents (Taylor and Lewis), T., 665.
β-Trigalloyllævoglucosan, and its potassium salt (Karrer and Salomon), A., i, 267.
Triglycolamidic acid, tri-*p*-anisylamide of (Hill and Kelsey), A., i, 1141.
Trihexosan, and its nona-acetyl derivative (Pictet and Jahn), A., i, 987.
2:3:5-Triketo-6-α-methoxybenzyl-1:4-dimethylpiperazine (Forster and Saville), T., 824.
2:3:5-Triketo-6-α-methoxybenzyl-1(or 4)-methylpiperazine (Forster and Saville), T., 824.
2:4:5-Trimercuriacetanilide, acetate of (Rossi), A., i, 605.
2:3:5-Trimethoxybenzoic acid (Faltis and Neumann), A., i, 570.
2:4:4′-Trimethoxybenzophenone (Ziegler and Ochs), A., i, 1049.
2:4:5-Trimethoxybenzylideneanthranilic acid (Ekeley, Rogers, and Swisher), A., i, 935.
6:7:8-Trimethoxy-1:2-dimethyl-1:2:3:4-tetrahydro*iso*quinoline, salts of (Spath), A., i, 165.
7:5′:6′-Trimethoxy-2-ethyl-3:4-indeno-(2′:1′)-benzopyrylium ferrichloride (Crabtree and Robinson), T., 1037.
Trimethoxy-β gambier-catechincarboxylic acid (Nierenstein), T., 28.
6:7:8-Trimethoxy-1-methyl-3:4-dihydro*iso*quinoline, and its salts (Spath), A., i, 165.
7:5′:6′-Trimethoxy-2-methyl-3:4-indeno-(2′:1)-benzopyrylium ferrichloride (Crabtree and Robinson), T., 1036.
6:7:8-Trimethoxy-1-methyl-1:2:3:4-tetrahydro*iso*quinoline, salts of (Spath), A., i, 165.
2:3:4-Trimethoxyphenyl styryl ketone (Brand and Collischonn), A., i, 452.
6:7:8-Trimethoxy-1:2:3:4-tetrahydro*iso*quinoline, and its salts (Spath), A., i, 165.
Trimethylamine chlorite (Levi), A., i, 528.
  hydroferrocyanide (Cumming), T., 1297.
Trimethylammonium ruthenipentabromide (Gutbier and Krauss), A., i, 16.
2:3:5-Trimethylaniline, 4(?)-chloro- (Goldschmidt and Strohmenger), A., i, 1005.
2:3:4-Trimethylbenzaldehyde, 6-hydroxy-, and its semicarbazone (v. Auwers and Ziegler), A., i, 121.
2:3:5-Trimethylbenzene, 1-*di*chloroamino- (Goldschmidt and Strohmenger), A., i, 1005.
ββγ-Trimethylbutane (Chavanne and Lejeune), A., i, 417.
βγγ-Trimethyl-Δ^{α}-butylene (Chavanne and Lejeune), A., i, 417.
ααβ-Trimethylbutyric acid, β-hydroxy-, ethyl ester (Leroide), A., i, 218.
Trimethylcamphorylmethylammonium bromide, preparation of (Rupe), A., i, 666.
1:2:3-Trimethyl-5-*di*-ω-chloroethylbenzene (v. Auwers and Ziegler), A., i, 121.
1:2:6-Trimethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-one, and its derivatives (v. Auwers and Ziegler), A., i, 121.
1:3:6-Trimethyl-1-*di*chloromethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-one, 5-chloro- (v. Auwers and Ziegler), A., i, 145.
1:7:9-Trimethyldeoxyuric acid, and its salts (Biltz and Bulow), A., i, 383.
3:4:5-Trimethyl-2:6-dibromomethylphenol (v. Auwers and Saurwein), A., i, 1033.
3:4:5-Trimethyl-2:6-dihydroxymethylphenol (v. Auwers and Saurwein), A., i, 1033.
Trimethylene chlorobromide, action of, on aliphatic ketones (Billon), A., i, 717.
  dinitrate (Blechta), A., i, 518.
2:4:5-Tri-*mp*-methylenedioxyphenyloxazole (Schonberg and Kraemer), A., i, 665.
Trimethylene glycol, poly-ethers of (Rojahn), A., i, 103.
  preparation of, β-bromo- and β-chloropropionic acids from (Rojahn), A., i, 105.
  estimation of, in crude glycerol (Cocks and Salway), A., ii, 232.
***peri*Trimethylenenaphthalene,** and its derivatives (Fleischer and Retze), A., i, 1188.
Trimethylethylene. See β-Methyl-Δ^{β}-butylene.
1:1:3-Trimethyl-4-ethyl-$\Delta^{2:5}$-*cyclo*hexadiene (v. Auwers and Ziegler), A., i, 120.
1:1:3-Trimethyl-4-ethyl-$\Delta^{2:5}$-*cyclo*hexadien-4-ol (v. Auwers and Ziegler), A., i, 120.

Trimethylethylmethane. See ββ-Dimethylbutane.

5:1′:6′-Trimethyl-2-ethylthio*iso*cyanine iodide (Braunholtz and Mills), T., 2007.

Trimethyl*iso*eugenolalkamine, and its hydrochloride (Takeda and Kuroda), A., i, 275.

2:3:5-Trimethylglucose, oxidation of (Haworth and Leitch), T., 1929.

2:3:6-Trimethylglucose, and its derivatives (Irvine and Hirst), T., 1213.

αββ-Trimethylglutaric acid, αα′-*di*cyano-, *N*-methyl-ω-imide (Kon and Thorpe), T., 1799.

βδδ-Trimethylheptan γ-one, η-chloro- (Billon), A., i, 717.

Trimethylhomogalloylhomoveratrylamine, and its derivatives (Spath and Böhm), A., i, 1175.

Trimethylmelamine, *tri*cyano- (Madelung and Kern), A. i, 440.

1:1:2-Trimethyl-4-methylene-$\Delta^{2:5}$-*cyclo*hexadiene (v. Auwers and Ziegler), A., i, 120.

2:3:6-Trimethyl methylglucoside (Irvine and Hirst), T., 1221.

Trimethyl methylxyloside, preparation of (Carruthers and Hirst), T., 2304.

Trimethylmucic acid, methyl ester (Karrer and Peyer), A., i, 809.

3:4:5-Trimethylphenol. See Hemimellitenol.

3:5:6-Trimethylphenol. See *iso*-ψ-Cumenol.

βγγ-Trimethyl-δ-propylheptan-βδ-diol (Leroide), A., i, 218.

Trimethyl*iso*propylmethane. See ββγ-Trimethylbutane.

αββ-Trimethylpropylphosphinic acid, α-hydroxy-, lead salt (Conant, MacDonald, and Kinney), A., i, 186.

2:4:6-Trimethylpyridine platinichloride (Emmert and Werb), A., i, 680.

2:4:6-Trimethylpyridinium benzyliodide and perchlorate (Weitz and Konig), A., i, 1188.

2:4:6-Trimethylquinoline, and its salts (Knoevenagel and Bahr), A., i, 751.

1:7:9-Trimethyl-8-thiouric acids (Biltz and Bülow), A., i, 383.

Trimethyltricarballylic acid, methyl ester and anhydride of (Hope and Sheldon), T., 2235.

Trinitrides. See Azides.

1:2:4-Trioxy-5:8-*di*hydroxyanthraquinone, amminocobaltic salt (Morgan and Smith), T., 168.

α-Trioxymethylene, preparation of (Hammick and Boeree), T., 2738.

Triphenylacethydroxamic acid, and its acetyl ester, and their salts (Jones and Hurd), A., i, 249.

Triphenyl-3-acetyl-2:4-dimethylpyrrylmethane (Fischer and Luckmann), A., i, 276.

Triphenylallene (Meyer and Schuster), A., i, 540.

Triphenylamines, *o*- and *m*-amino-, and their derivatives (Piccard and Brewster), A., i, 370.

Triphenylarsine bromocyanide (Steinkopf and Schwen), A., i, 72.

Triphenylarsine-*p*-toluenesulphonylimine, compound of *p*-toluenesulphonamide with (Mann and Pope), T., 1054.

Triphenylbiphenylene-ethyl and its chloride (Schlenk and Mark), A., i, 1004.

Triphenylbismuthine dichloride and difluoride (Challenger and Wilkinson), T., 96.

Triphenylbismuthine, *tri-p*-bromo- and *tri-p*-chloro-, and their dibromides and dichlorides (Challenger and Ridgway), T., 108.

4:5:6-Triphenyl-2-(*p*-bromophenyl)pyridine, and its picrate (Dilthey, Nüsslein, Meyer, and Kaffer), A., i, 949.

Triphenyl-3-carbethoxy-2:4-dimethylpyrrylmethane (Fischer and Luckmann), A., i, 276.

Triphenylcarbinol, equilibria of, with pyrogallol, nitrophenols, nitrobenzenes, and phenylenediamines (Kremann, Hohl, and Müller), A., i, 138.

Triphenylcarbinol, *pp′p″-tri*thiol- (Watson and Dutt), T., 1940.

Triphenyl-*p*-dimethylaminophenylmethane (Fischer and Luckmann), A., i, 276.

1:3:4-Triphenyldipyrazole (Rojahn), A., i, 373.

Triphenylethinylcarbinol, preparation and reactions of (Hess and Weltzien), A., i, 35.

Tri-β-phenylethylcarbinol (Hess and Weltzien), A., i, 36.

1:3:5-Triphenyl-$\Delta^{1:4}$-*cyclo*heptadiene (Gastaldi), A., i, 367.

Triphenylhydrazine, action of tetranitromethane on (Goldschmidt and Renn), A., i, 478.

1:2:6-Triphenyl-4-*p*-hydroxyphenylpyridinium chloride (Dilthey), A., i, 272.

Triphenylmethane, coloured alkali salts of (Hantzsch), A., i, 25.
  halochromism of derivatives of (Hantzsch), A., i, 26.

Triphenylmethane, equilibria of amines and phenols with (KREMANN, ODELGA, and ZAWODSKY), A., i, 181.
  unsaturated halogen derivatives of, and their conductivity (STRAUS and DÜTZMANN), A., i, 148.
Triphenylmethane colouring matters, absorption spectra of (ADINOLFI), A., ii, 601.
  free radicles of (WIELAND, POPPER, and SEEFRIED), A., i, 772.
  peroxidation products of the leuco-bases of (KEHRMANN, ROY, and RAMM), A., i, 467.
Triphenylmethanesulphonic acids, photochemistry of (HOLMES), A., ii, 465.
Triphenylmethyl (GOMBERG and SULLIVAN), A., i, 929.
α-Triphenylmethylaminocamphor (RUPE and SCHMID), A., ii, 604.
Triphenylmethylarsonium bromide, and its compound with iodoform (STEINKOPF and SCHWEN), A., i, 118.
Triphenyl*iso*oxazole, *tri-p*-nitro- (MEISENHEIMER and WEIBEZAHN), A., i, 177.
2:4:4-Triphenyl-1:3-oxthiophan-5-one, action of sulphuric acid on (BISTRZYCKI and BRENKEN), A., i, 268.
Triphenylpararosaniline hydrochloride, preparation of (HORIUCHI), A., i, 1067.
Triphenylphosphine, phosphazines from (STAUDINGER and LÜSCHER), A., i, 237.
Triphenylphosphineacetylglyoxylic acid, ethyl ester, azine of (STAUDINGER and LÜSCHER), A., i, 238.
Triphenylphosphinebenzaldehydeazine, preparation and reactions of (BRAUNHOLTZ), T., 305.
Triphenylphosphinebenzilazine (STAUDINGER and LÜSCHER), A., i, 237.
Triphenylphosphinebenzophenoneazine, reactions of (BRAUNHOLTZ), T., 301.
Triphenylphosphinebenzoylimine (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphine-ethylimine (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphineglyoxylic acid-azine, ethyl ester, reactions of (BRAUNHOLTZ), T., 304.
Triphenylphosphineimineazide (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphinemethylimine (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphine-α-naphthylazide (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphine-α-naphthylimine (STAUDINGER and HAUSER), A., i, 69.
Triphenylphosphine*di*nitroquinoneazine (STAUDINGER and LÜSCHER), A., i, 238.
αβγ-Triphenylpropane-αβ-diol, dehydration of (ORÉKHOFF and TIFFENEAU), A., i, 438.
2:4:6-Triphenylpyrylium nitrate (GASTALDI), A., i, 367.
1:2:6-Triphenyl-4-quinopyridan (DILTHEY), A., i, 272.
Triphenylstibine, and *tri-p*-amino-, derivatives of (SCHMIDT), A., i, 1203.
Triple salts. See Salts.
Tripropylcarbinol phenylurethane (LEROIDE), A., i, 217.
Tripyridineiridium, *tri*chloro- (DELÉPINE), A., i, 860.
Tripyridinium hexachloroferrate and μ-dichloro-heptachloropyridinediferrate (WEINLAND and KISSLING), A., i, 364.
Trisalicinamine, dodeca-acetyl derivative (ZEMPLÉN and KUNZ), A., i, 564.
2:4:6-Tri-*p*-tolylpyridine (GASTALDI), A., i, 368.
Tri-(triacetylgalloyl)lævoglucosan and its potassium salt (KARRER and SALOMON), A., i, 266.
Tri-trimethylene glycol ether diacetate (ROJAHN), A., i, 103.
αβδ-Tri*iso*valerylaminobutane (WINDAUS, DÖRRIES, and JENSEN), A., i, 60.
Trivinylarsenic oxide, ββ′β″-*tri*chloro- (MANN and POPE), T., 1757.
Trivinylarsine, ββ′β″-*tri*chloro-, salts (MANN and POPE), T., 1757.
Trivinylarsine-*p*-toluenesulphonylimine, ββ′β″-*tri*chloro- (MANN and POPE), T., 1758.
Trivinylhydroxyarsonium nitrate, ββ′β″-*tri*chloro- (MANN and POPE), T., 1757.
Trivinylmethylarsonium iodide, ββ′β″-*tri*chloro- (MANN and POPE), T., 1758.
Trochic acid (YANAGISAWA and TAKASHIMA), A., i, 652.
Trochodiol and its phenylcarbamate (NISHIZAWA), A., i, 653.
Trochophytosterol, and its acetyl derivative (YANAGISAWA and TAKASHIMA), A., i, 652.
Troilite from California (EAKLE), A., ii, 858.
Tropic acid, resolution of, and its salts (KING and PALMER), T., 2577.
  esters of (v. BRAUN, BRAUNSDORF, and RÄTH), A., i, 759.
  fate of, in the body (KAY and RAPER), A., i, 1093.

Tropinecarboxylic acid, and its methyl ester (Merck, Wolfes, and Maeder), A., i, 1173.
Tropinone (Merck, Wolfes, and Maeder), A., i, 1174.
Tropinonecarboxylic acid, esters, preparation of (Merck and Wolfes), A., i, 567; (Merck, Wolfes, and Maeder), A., i, 568, 1173; (Willstatter, Wolfes, and Maeder; Wolfes and Maeder), A., i, 938.
Tropinonedicarboxylic acid, ethyl ester (Merck, Wolfes, and Maeder), A., i, 1173.
N-β-**Tropoxyethylpiperidine**, and its acetyl derivative, and their hydrochlorides (v. Braun, Braunsdorf, and Rath), A., i, 760.
N-γ-**Tropoxypropylpiperidine** hydrochloride (v. Braun, Braunsdorf, and Rath), A., i, 760.
Trout. See *Trutta fario*.
Trust-deed establishing the Harrison Memorial Fund, T., 2917.
Trutta fario (trout), constituents of the eggs of (Fauré-Fremiet and Garrault), A., i, 700.
Truxillic acids, constitution of (de Jong), A., i, 339.
configuration of (Stoermer and Bachér), A., i, 830.
Truxinic acids, configuration of (Stoermer and Bachér), A., i, 830.
δ-**Truxinic acids**, and their salts and derivatives (Stoermer and Bachér), A., i, 832.
Trypaflavin. See 1-Methylacridinium chloride, 3:6-*di*amino-.
Trypsin, influence of reaction on the action of (Ringer), A., i, 282.
inactivation of (Northrop), A., i, 282.
kinetics of digestion by (Northrop), A., i, 693.
digestion of casein with (Fränkel and Feldsberg), A., i, 184.
action of, on diastase (Biedermann), A., i, 480.
estimation of (Kai), A., ii, 672.
Tryptophan, content of, in foods (v. Furth and Lieben), A., i, 293; (Ide), A., i, 414.
detection of, microchemically, in plants (Kretz), A., ii, 668.
estimation of, in proteins (Folin and Looney), A., ii, 539; (Lüscher), A., i, 1199.
d-**Tryptophan** anhydride (Frankel and Feldsberg), A., i, 184.
l-**Tryptophan**, action of *Bacillus proteus* on (Sasaki and Otsuka), A., i, 302.
Tschermigite, from Wyoming (Erickson), A., ii, 304.
Tuberculosis, chlorine metabolism in (Boenheim), A., i, 1092.
lipoids of blood in (Henning), A., i, 963.
protein requirements in (McCann), A., i, 497.
Tumours, amyloid, constituents of (Eppinger), A., i, 497.
Tungsten, Rontgen-ray spectrum of (Yoshida and Tanaka), A., ii, 805.
valency of, in the octacyanide (Collenberg), A., ii, 508.
attempts to decompose, at high temperatures (Wendt and Irion), A., ii, 773.
and its oxides, equilibria of, with hydrogen and water vapour and with carbon oxides and oxygen (v. Liempt), A., ii, 301.
reduction of thorium oxide by (General Electric Co.), T., 2236.
Tungsten alloys, analysis of (Seel), A., ii, 876.
with carbon and iron (Daeves), A., ii, 70.
with cobalt (Kreitz), A., ii, 381.
Tungsten *di*chloride (Lindner), A., ii, 509.
hydroxide, preparation of hydrosols of (Kroger), A., ii, 212, 213.
oxide, catalytic activity of (Gilfillan), A., i, 709.
*tri*oxide, crystal structure of, and its hydrates (Burger), A., ii, 508.
green colour of (van Liempt), A., ii, 73.
hydrates of (Huttig and Kurre), A., ii, 773.
Tungstates (Smith), A., ii, 774.
complex, preparation of (Lottermoser), A., ii, 510.
Tungsten detection, estimation and separation:—
detection of (van Liempt), A., ii, 787.
estimation of (Lavers), A., ii, 164.
colloidal, estimation of, in tungsten powder (Lottermoser), A., ii, 230.
estimation of aluminium in (V. and K. Froboese), A., ii, 397.
estimation of molybdenum in (Hall), A., ii, 660.
separation of, from molybdenum (Merrill), A., ii, 229.
Tungsten furnace. See Electric furnace.
Turbidity, standard for (Bechhold and Hebler), A., ii, 693.
reversible (Liesegang), A., ii, 369.
Turkey. See *Meleagris gallipavo*.
Turpentine oil, Aleppo, composition of (Dupont), A., i, 357; (Vèzes and Dupont), A., i, 1043.

Tyramine, estimation of (Hanke and Koessler), A., ii, 322.

Tyramine, *di*chloro-, hydrochloride, preparation of (Zeynek), A., ii, 254.

Tyrosine, deaminating of, in the organism (Kotake, Matsuoka, and Okagawa), A., i, 1218.
  detection of, in urine (Schumm and Papendieck), A., i, 899.
  estimation of (Hanke and Koessler), A., ii, 322.
  estimation of, in proteins (v. Furth and Fleischmann), A., ii, 406; (Folin and Looney), A., ii, 539.

Tyrosine, 3:5-*di*-bromo-, and -chloro-, preparation of (Zeynek), A., i, 254.

d-**Tyrosine anhydride** (Fränkel and Feldsberg), A., i, 184.

Tyrosine-choline, and its salts (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 814.

U.

Ultra-filtration (McBain and Jenkins), T., 2325.

Ulva, spectrum of chlorophyll from (Romieu and Obaton), A., i, 793.

Umbelliferæ, hesperidine in (Nilsson), A., i, 211.

Undecenoic acid, arylamides of (Ott and Zimmermann), A., i, 137.

Undecenol, and its hydrogen sulphate (Grun and Wirth), A., i, 805.

Unsaturated compounds, formation of, from halogenated open-chain derivatives (Chandrasena and Ingold), T., 1306; (Ingold), T., 2626.
  homocyclic, chemistry of polycyclic compounds in relation to isomeric (Farmer, Ingold, and Thorpe), T., 128; (Chandrasena, Ingold, and Thorpe), T., 1542.
  determination of the iodine value of (Holde, Werner, Tacke, and Wilke), A., ii, 533; (Holde), A., ii, 665.

Uracil, action of diazomethane on (Johnson, Hill, and Case), A., i, 471.

Uranium, Rontgen ray spectrum of (de Broglie), A., ii, 330.
  N-series spectrum of (Dolejšek), A., ii, 463.
  disintegration of, and its isotopes (Neuburger), A., ii, 185.

Uranium alloys with iron (Polushkin), A., ii, 152.

Uranium salts, action of light on (Aloy and Rodier; Baur and Rebmann), A., ii, 337; (Baur and Haggenmacher), A., ii, 338.

Uranium salts, triboluminescence of (Siemssen), A., ii, 511.

Uranium oxides (Jolibois and Bossuet), A., ii, 301; (Lebeau), A., ii, 302.
  radioactivity of (Staehling), A., ii, 106.
  tri- and *tetr*-oxides, hydrates of (Huttig and v. Schroeder), A., ii, 510.
  Uranyl nitrate, hydrate of (Germann), A., ii, 649.
    radioactivity of the precipitate from sodium hydroxide and (Jolibois and Bossuet), A., ii, 575.
  hypophosphites (Rosenheim and Trewendt), A., ii, 650.

Uranium organic compounds:—
Uranylacetic acid, sodium salt, refractive index of (Raiteri), A., ii, 541.

Uranium detection and estimation:—
  detection of (Buell), A., ii, 590.
  detection of, spectroscopically (Meyer and Greulich), A., ii, 6.
  estimation of (Kikuchi; Kano), A., ii, 721.
  estimation of, electrometrically (Ewing and Eldridge), A., ii, 661.
  estimation of, by reduction (Treadwell and Blumenthal), A., ii, 788.
  estimation of, in carnotite (Scott), A., ii, 788.
  estimation of, in presence of phosphoric acid (Schoep and Steinkuhler), A., ii, 530.

Uranium-*V* (Piccard and Stahel), A., ii, 185; (Hahn), A., ii, 340.

Uranium-*X*, adsorption of, by basic ferric acetate (Brown), T., 1736.

Uranium-lead, band spectra of, and of lead (Grebe and Konen), A., ii, 4.

Urazole, thio-, and its derivatives (Arndt, Milde, and Tschenscher), A., i, 375.
  *di*thio-, constitution of, and its derivatives (Guha), A., i, 875.
  *di*thio-, and iminothio-, preparation of (Fromm), A., i, 62.

Urea (*carbamide*), influence of amino-acids on formation of (Folin and Berglund), A., i, 702.
  replacement of proteins by, in diet (Morgen, Schöler, Windheuser, and Ohlmer), A., i, 293.
  excretion of, according to Ambard's laws (Lublin), A., i, 400.
  as a plant nutrient (Bokorny), A., i, 1096.
  in fungi (Goris and Costy), A., i, 1220.

- **Urea** (*carbamide*), distribution of, in blood (Etienne and Vérain), A., i, 963.
  - detection of (Bonnet and Haushalter; Barrenscheen and Weltmann), A., ii, 794; (Pincussen), A., ii, 884.
  - detection of, in tissues, by means of xanthydrol (Stubel), A., i, 397.
  - estimation of (Aszódi), A., ii, 536; (Carra), A., ii, 668.
  - estimation of, gasometrically (Mezger), A., ii, 170.
  - estimation of, by the hypobromite method (Menaul; Stehle), A., ii, 403.
  - estimation of, by the xanthydrol method, effect of sodium fluoride on (Polonovski and Auguste), A., ii, 668.
  - estimation of, microchemically, in blood (Nicloux and Welter), A., ii, 170.
  - estimation of, in blood, tissues, etc. (Gad-Andresen), A., ii, 536.
  - estimation of, in cow's milk (Morimoto), A., i, 703.
  - estimation of, in wine (Janet), A., ii, 794.
  - See also Carbamide.
- **Urease** (Lövgren), A., i, 185.
  - inactivation of, by metals (Jacoby), A., i, 480; (Jacoby and Shimizu), A., i, 481.
  - in soja beans (Wester), A., i, 311.
  - distribution of, in plants (Kiesel and Troitzki), A., i, 410.
  - in fungi (Goris and Costy), A., i, 1220.
  - effect of chemicals on the ureolitic power of (Wester), A., i, 391.
- **Ureometers** (Clogne), A., ii, 237; (Sciortino), A., ii, 794.
- **Urethane,** equilibrium in the system, *m*-dinitrobenzene and (Pushin and Fioletova), T., 2822.
- **Uric acid,** synthesis of, in the organism (Kollmann), A., i, 293.
  - dissociation of, and its salts (Kanitz), A., i, 277.
  - influence of hydrogen-ion concentration on the solubility of (Jung), A., i, 1070.
  - colloidal and supersaturated solutions of (Schade), A., i, 1192.
  - in human blood (Morris and Macleod), A., i, 392.
  - distribution of, in blood (Theis and Benedict), A., i, 82; (Rouzaud and Thiéry), A., i, 394; (Chauffard, Brodin, and Grigaut), A., i, 1086.
- **Uric acid,** estimation of (Morris and Macleod), A., ii, 328; (Jackson and Palmer), A., ii, 328, 795.
  - estimation of, in blood (Guillaumin), A., ii, 170, 796; (Grigaut; Benedict), A., ii, 405; (Pucher), A., ii, 668; (Bauman and Keeler), A., ii, 796.
  - estimation of, in tissue extracts (Steudel and Suzuki), A, ii, 538.
  - estimation of, in urine (Thiéry), A., ii, 238; (Vaillant), A., ii. 668; (Benedict and Franke), A., ii, 669; (Khouri), A., ii, 885.
- **Urine,** effect of radium emanation on (Hauenstein), A., i, 80.
  - viscosity of (Joel), A., i, 198.
  - composition of, under various conditions (Campbell and Webster), A., i, 197, 495.
  - effect of loss of carbon dioxide on the hydrogen-ion concentration of (Marshall), A., i, 494.
  - acidity of (Blatherwick and Long), A., i, 967.
  - relation between the reaction of, and the alveolar tension of carbon dioxide (Endres), A., i, 1214.
  - acetaldehyde in (Stepp and Feulgen), A., i, 495.
  - organic acids in (Goiffon and Nepveux), A., i, 1215.
  - aldehyde in, in diabetes (Stepp and Feulgen), A., i, 300.
  - alkalinity of, after meals (Fiske), A., i, 88.
  - amino-acids and hippuric acid in, in pellagra (Murlin), A., i, 965.
  - amino-nitrogen in (Ciaccio), A., i, 88.
  - excretion of ammonia in, following administration of acids (Keeton), A., i, 300.
  - reactions of, after treatment with arsenobenzene (Gaviati and Pavolini), A., i, 496.
  - excretion of caffeine in (Friedberg), A., i, 88; (Okushima), A., i, 703.
  - carbonates and bicarbonates in (Gamble), A., i, 494.
  - substance in, giving the diazo-reaction (Hermanns), A., i, 1091.
  - action of *p*-dimethylaminobenzaldehyde on (Hári), A., i, 88.
  - formaldehyde in, after administration of hexamethylenetetramine (Voit), A., i, 1218.
  - in lead poisoning, hæmatoporphyrin in (Schumm), A., i, 609.
  - aromatic hydroxy-acids in (de Sanctis and Fiori), A., i, 609.

Urine, iodine number of (Weltmann), A., i, 88.
  excretion of iron in (Kisch), A., i, 898; (Ehrenberg and Karsten), A., i, 967.
  effect of diet on the distribution of nitrogen in (Robison), A., i, 495.
  effect of phenylacetic and phenylpropionic acids on the excretion of nitrogen in (Hijikata), A., i, 495.
  excretion of phosphates in (Fiske), A., i, 88.
    during water diuresis and purine diuresis (Bock and Iversen), A., i, 1090.
  proteic acids of (Edlbacher), A., i, 692.
  pyruvic acid in (Fricke), A., i, 495.
  association of radicles in (White), A., i, 1214.
  action of phosphates on sugar in (Elias and Weiss), A., i, 1085.
  relation between the sugar in, with that in blood (Tervaert), A., i, 1215.
  excretion of sugars in (Murschhauser), A., i, 198; (Neuwirth), A., i, 485.
  albuminous, proteolytic enzymes in (Hedin), A., i, 609.
  whales', composition of (Schmidt-Nielsen and Holmsen), A., i, 704.
Urine, analytical methods relating to:—
  analysis of (Pincussen and Floros; Pincussen and Momferratos-Floros), A., ii, 408.
  detection of, in stains, by indican reactions (Jemma), A., ii, 460.
  detection of acetaldehyde in (Stepp), A., ii, 403.
  detection of acetone in (Troise), A., ii, 595.
  detection of albumin in (Renoux), A., ii, 797.
  detection of aldol in, in diabetes (Fricke), A., ii, 326.
  detection of aldol and acetaldehyde in (Fricke), A., i, 300.
  alkapton, detection of (Katsch and Német), A., i, 198.
  detection of bile pigments in (Silberstern), A., ii, 799.
  detection of bismuth in (Aubry), A., ii, 165; (Ganassini), A., ii, 590.
  detection and estimation of blood in (Johannessen), A., ii, 724.
  detection of dextrose in (Rodillon), A., ii, 166.
  detection of formaldehyde in (Stepp), A., ii, 793.
  detection of lactose in (Herzberg), A., ii, 167.
Urine, analytical methods relating to:—
  detection of small quantities of lead in (Schumm), A., ii, 317.
  detection and estimation of nitrates in (Nolte), A., ii, 583.
  detection of tyrosine in (Schumm and Papendieck), A., i, 899.
  detection of urobilin in (Rodillon), A., ii, 888.
  estimation of acetone in (Lax), A., ii, 326; (Kading), A., ii, 793.
  estimation of acetone substances in (Hubbard), A., ii, 234.
  estimation of albumin in (Gérard), A., ii, 670.
  estimation of the amino-acid nitrogen in, colorimetrically (Folin), A., ii, 536.
  estimation of ammonia in (Mestrezat and Janet), A., ii, 453.
  estimation of total bases in (Fiske), A., ii, 408.
  estimation of calcium in (Shohl and Pedley), A., ii, 395.
  estimation of colloids in (Ottenstein), A., i, 609.
  estimation of citric acid in (McClure), A., ii, 791.
  use of zinc ferrocyanide in estimation of dextrose in (Carrez), A., ii, 233.
  estimation of hippuric acid in (Snapper and Laqueur), A., ii, 92.
  estimation of homogentisic acid in (Briggs), A., ii, 534.
  estimation of hydrogen-ion concentration in (Silberstein), A., ii, 452.
  estimation of oxalic acid in (Salkowski), A., ii, 92; (Mislowitzer), A., ii, 325.
  estimation of purine bases in (Steudel and Chou), A., ii, 239; (Salkowski), A., ii, 405.
  estimation of sugar in (Tervaert), A., ii, 166; (Folin and Berglund), A., ii, 400.
  estimation of reducing sugars in (Smith), A., ii, 663.
  estimation of sulphur in (Robison), A., ii, 389.
  estimation of theobromine in (Günzberg), A., i, 703.
  estimation of thiosulphuric acid in (Dezani), A., i, 968.
  estimation of urea in (Janet), A., ii, 794.
  estimation of uric acid in (Thiéry), A., ii, 238; (Vaillant), A., ii, 668; (Benedict and Franke), A., ii, 669; (Khouri), A., ii, 885.

- **Urobilin**, absorption spectrum of (Lewin and Stenger), A., ii, 414.
  - detection of, in urine (Rodillon), A., ii, 888.
- **Urocanic acid**, production of, from histidine in dogs (Kotake and Konishi), A., i, 1217.
  - production of acetoacetic acid from, in the liver (Konishi), A., i, 1211.
- **Urochrome** as a chlorophyll derivative (Roaf), A., i, 401.
- **Urusene** (Majima and Takayama), A., i, 263.
- **Urushiol**, and its derivatives (Majima), A., i, 262.
- **Uterus**, anticoagulating substances from the mucous membrane of the (King), A., i, 701.

V.

- **Vacciniin**, constitution of (Ohle), A., i, 1018.
- **Valency** (Caven; Smith), A., ii, 279; (Huttig), A., ii, 849.
  - determination of, by means of ammoniacal silver solutions (Collenberg), A., ii, 495.
  - theories of (Lapworth), T., 416; (Kermack and Robinson), T., 427.
  - electron theory of, applied to organic compounds (Stieglitz), A., ii, 560.
  - octet theory of (Perkins), A., ii, 138.
  - in relation to Röntgen-ray spectra (Wentzel), A., ii, 607.
  - in relation to chemical reaction (Perkins), A., ii, 438.
  - neutralisation of (Dubsky and Aptekmann), A., i, 104.
  - types of (Langmuir), A., ii, 137.
  - negative, and co-ordination number (Schilov), A., ii, 839.
  - of organic compounds (Henrich), A., ii, 704; (Stieglitz), A., ii, 705.
  - polar and non-polar, in organic compounds (Garner), A., ii, 758.
  - secondary (Smith), A., ii, 270, 430, 431.
  - subsidiary (Clark and Buckner), A., ii, 300.
- **Valeranilide**, ββγ-*tri*chloro-α-hydroxy- (Passerini), A., i, 732.
- **Valeric acid**, lead diphenyl salt (Goddard, Ashley, and Evans), T., 981.
- *iso***Valeric acid**, α-amino-β-hydroxy-, preparation and derivatives of (Schrauth and Geller), A., i, 1125.
- **Valine-choline**, and its salts (Karrer, Gisler, Horlacher, Locher, Mäder, and Thomann), A., i, 814.
- **Valinol**, and its hydrochloride (Karrer, Gisler, Horlacher, Locher, Mader, and Thomann), A., i, 814.
- **Vanadic acid.** See under Vanadium.
- **Vanadioselenites.** See under Vanadium.
- **Vanadium** *pent*oxide, coagulation of sols of (Wiegner, Magasanik, and Gessner), A., ii, 356.
  - **Vanadic acid**, estimation of, by reduction by mercury (McCay and Anderson), A., ii, 530.
  - **Vanadioselenites** (Rosenheim and Krause), A., ii, 48.
- **Vanadium detection and estimation**:—
  - detection and estimation of, in steel (Misson), A., ii, 459.
  - estimation of (Kanô), A., ii, 721.
  - estimation of, after reduction with hydrogen sulphide (Lundell and Knowles), A., ii, 88.
  - estimation of, in ferrovanadium (Kelley, Wiley, Bohn, and Wright), A., ii, 89.
  - estimation of, colorimetrically, in steel (Kropf), A., ii, 590.
  - estimation of, in steel, by precipitation with ammonium phosphomolybdate (Cain and Hostetter), A., ii, 520.
- **Vanillin**, preparation of (Sievers and Givaudan & Co.), A., i, 38.
  - estimation of (Tschirsch), A., ii, 403.
- **Vanillin glyceride** (Dodge), A., i, 748.
- **Vanillylamides**, (Ott and Zimmermann), A., i, 137.
- **Vanillylideneresorcinol**, and its acetyl derivative (Fabre), A., i, 1148.
- **Vaporisation**, process of (Harkins and Roberts), A., ii, 422.
  - coefficients of (Volmer and Estermann), A., ii, 193.
- **Vapours**, precipitated, rhythmic deposition of (Karrer), A., ii, 496.
- **Vapour density**, apparatus for measurement of (Magnus and Schmid), A., ii, 260.
  - at low pressures and extended range of temperature (Maass and Boomer), A., i, 912.
- **Vapour pressure**, formula for (Henglein), A., ii, 118.
  - at high temperatures (Ingold), T., 2419.
  - intersecting curves of (v. Rechenberg), A., ii, 120.
  - of binary mixed liquids (Schmidt), A., ii, 119; (Faust), A., ii, 423; (Cassel; Schulze), A., ii, 424.
  - of non-associated liquids (Mortimer), A., ii, 615.

Vapour pressure of metallic salts (v. Wartenberg and Schulz), A., ii, 146; (v. Wartenberg and Bosse), A., ii, 739.
  of saturated solutions (Edgar and Swan), A., ii, 349.
Vascular system, action of organic bases on the (Teschendorf), A., i, 90.
Velardeñite from California (Shannon), A., ii, 517.
Velocity of chemical reaction in solids (Hinshelwood and Bowen), A., ii, 628.
Velocity of crystallisation under pressure (Hasselblatt), A., ii, 35.
Velocity of decomposition of crystals (Sieverts), A., ii, 700.
Velocity of hydrolysis of esters (Smith and Olsson), A., ii, 701.
Velocity of reaction, theory of (Dhar), A., ii, 39; (Bronsted), A., ii, 699.
  Michael's rule for (Smith), A., ii, 751.
  lecture experiment to show (Meyer), A., ii, 636.
  influence of catalysts on the thermodynamics of (van Thiel), A., ii, 754.
  and equilibria (Brandsma), A., ii, 699.
  in heterogeneous systems (Collenberg and Bodforss), A., ii, 431.
  of liberation of halogens (Freundlich and Bartels), A., ii, 489.
  in mixed solvents (Cashmore, McCombie, and Scarborough), T., 243; (McCombie, Scarborough, and Settle), T., 2308.
Velocity of saponification of esters (McCombie, Scarborough, and Settle), T., 2308.
  of oils and fats (Norris and McBain), T., 1362.
Veratraldehyde, 5-amino- (Spath and Röder), A., i, 853.
  6-amino-, and its derivatives, and 6-bromo-, 6-chloro-, and 6-iodo- (Rilliet), A., i, 839.
Veratrylideneaniline, 6-amino- and 6-nitro- (Rilliet), A., i, 839.
Veratrylidene-*p*-anisidine, 6-amino- and 6-nitro- (Rilliet), A., i, 839.
Veratrylidenegallacetophenone dimethyl ether, preparation of (Crabtree and Robinson), T., 1038.
Veratrylidenetoluidines, 6-amino- and 6-nitro- (Rilliet), A., i, 839.
Vernin, detection of (Steudel and Freise), A., ii, 585.
Veronal, effect of lecithin on the excretion of (Bachem), A., i, 400.
  detection of (Fabre), A., ii, 795.
Veronal derivatives, detection of (Handorf), A., ii, 884.
Viburnum opulus, detection of dextrose in fruits of (Arnold), A., i, 311.
Vine, Canadian. See *Vitis hederacea*.
Vinegar, detection of mineral acids in (Kling and Lassieur), A., ii, 284; (Kling, Lassieur, and Lassieur), A., ii, 519.
Vinyl chloride, polymerisation of, on exposure to ultra-violet light (Plotnikow), A., i, 419.
  compounds, preparation and polymerisation of (Traun's Forschungslaboratorium), A., i, 516, 517.
  haloids, preparation of (Traun's Forschungslaboratorium), A., i, 517.
Vinyl alcohol, formation of, from acetaldehyde, in presence of potassium hydroxide (Evans and Looker), A., i, 102.
Vinylarsenious sulphide, β-chloro- (Mann and Pope), T., 1756.
Vinylarsines, β-chloro-, and their salts (Mann and Pope), T., 1754.
Vinylarsinic oxide, β-chloro- (Mann and Pope), T., 1755.
Vinylarsinic acid, β-chloro-, and its ammonium salt (Mann and Pope), T., 1755.
Vinyl carbinols, poly-arylated (Ziegler and Ochs), A., i, 1047.
Vinylidene glycol diethyl ether. See Ketenacetal.
Vinyl*cyclo*propane, and its dibromide (Demjanov and Dojarenko), A., i, 1014.
Vinylsulphuric acid, preparation of (Traun's Forschungslaboratorium), A., i, 517.
Viola odorata (violet), oil from the roots of (Goris and Vischniac), A., i, 848.
Violet. See *Viola odorata*.
Violuric acids, imino-, chromoisomerism of (Lifschitz and Hepner), A., i, 767.
Viscera, extraction of alkaloids from (Colledge), A., ii, 327.
Viscosity, calculation of (Creighton), A., ii, 426.
  and compound formation in binary mixtures of acids with ketones and with esters (Kendall and Brakeley), A., ii, 126.
  of amphoteric electrolytes (Hedestrand), A., ii, 821.
  of gases (Smith), A., ii, 549.
  of hydrocarbons (Chavanne and van Risseghem), A., ii, 352.
  of liquids (Herz), A., ii, 821.
  negative (Rabinowitsch), A., ii, 478.

Viscostalagmometer, new (Traube), A., ii, 122.

Vitamins (Gralka and Aron), A., i, 395; (Frankel and Hager; Fränkel and Scharf), A., i, 409.

structure of (Williams), A., i, 280.

physical chemistry of (LaMer), A., i, 281.

isolation of (Seidell), A., i, 887.

inactivation of (Zilva), A., i, 488.

rôle of, in the chemistry of cells (Hess), A., i, 399, 788.

relation of, to cell oxidation processes (Abderhalden), A., i, 607.

in lemon juice (Leichtentritt and Zielaskowski), A., i, 1094.

in rice, and their stimulation of yeast (Fleming), A., i, 93.

in yeast (Funk and Dubin), A., i, 203.

antineuritic. See Vitamin-*B*.

fat-soluble, estimation of (Zilva and Miura), A., i, 194.

detection of, in foodstuffs (Drummond and Watson), A., ii, 596.

Vitamin-*A*, synthesis of, by marine diatoms (Jameson, Drummond, and Coward), A., i, 1099.

Vitamin-*B*, preparation and properties of (Tsukiye), A., i, 974.

isolation of (Seidell), A., i, 1078.

extraction of, with glacial acetic acid (Levine, McCollum, and Simmonds), A., i, 975.

presence of, in chlorophyll-free plants (Orton, McCollum, and Simmonds), A., i, 974.

bacteria as a source of (Damon), A., i, 201.

physiological action of (Blohm, Santesson, and v. Euler), A., i, 1218.

estimation of (v. Euler and Myrbäck), A., i, 293.

effect of temperature and hydrogen-ion concentration on the destruction of (Sherman, LaMer, and Campbell), A., i, 207; ii, 225.

estimation of (Sherman, LaMer, and Campbell), A., ii, 407.

Vitis hederacea (Canadian vine), grape oil from (Anon.), A., i, 97.

Volcanic gases. See Gases.

Volcanism, chemistry of (Allen), A., ii, 219.

Volume, atomic, relation between refractivity and (Le Bas), A., ii, 241.

atomic and molecular, relation between, at the absolute zero (Herz), A., ii, 29.

molecular, regularities of, of inorganic compounds (Henglein), A., ii, 260.

Volumes, relative, of chemical elements (Collins), A., ii, 28.

Volumenometer for microanalysis (Bolland), A., ii, 221.

Vulcanisation, accelerators of (Twiss Brazier, and Thomas), A., i, 460.

W.

War memorial, unveiling of, T., 2895.

Water, catalytic formation of, from hydrogen and oxygen (Pease and Taylor), A., ii, 701.

band spectrum of (Weichmann), A., ii, 5, 331.

specific volume of molecules of fixed (Tromp), A., ii, 476.

molecular structure of (Piccard), A., ii, 212.

surface tension of mixtures of alcohol and (Bircumshaw), T., 887.

velocity of extension of oils on the surface of (Woog), A., ii, 197.

kataphoresis of, in organic liquids (Gyemant), A., ii, 684.

vapour, catalysis of the reaction of carbon with (Taylor and Neville), A., ii, 143.

chemical reactions involved in purification of (Greenfield and Buswell), A., ii, 653.

Natural Water :—

Potable or drinking water, estimation of nitrates in (Reuss), A., ii, 454.

Rain-water, analyses of (Schaffer), A., i, 512.

Sea-water, chemical constituents of (Bertrand, Freundler, and Ménager), A., ii, 441.

filtered, estimation of silica in (Wells), A., ii, 868.

Spring and mineral waters, radioactivity of (Ebler and van Rhyn), A., ii, 16.

of Bagnoles-de-l'Orne, radioactivity of (Loisel), A., ii, 15.

Water analysis :—

lactose-fermenting bacteria in relation to (Levine), A., i, 901.

estimation of, in fuel (Marinot), A., ii, 223.

estimation of lead in (Avery, Hemingway, Anderson, and Read), A., ii, 161.

Water pump. See Pump.

Wattle, gidgee. See *Acacia cambagei*.

Wax, bees', Indian, constants of (Roberts and Islip), A., ii, 534.

fossil, of Monte Falò (Ciusa and Vois), A., ii, 386.

Wax, montan, acids of (TROPSCH and KREUTZER), A., i, 317, 804.
colouring constituents of (MARCUSSON and SMELKUS), A., i, 807.
paraffin. See Paraffin wax.
from pine needles (KAUFMANN and FRIEDEBACH), A., i, 740.
Weights, brass, protection of, from rust (MANLEY), A., ii, 840.
Weights, molecular, determination of (RAST), A., ii, 421.
determination of, by means of osmotic pressure (FOIX), A., ii, 621.
determination of, in alcoholic solution by means of the flash-point elevation (WRIGHT), T., 2247.
Weinschenkite (HENRICH and HILLER), A., ii, 860.
Whale, urine of. See Urine.
Wheat, hydrolysis of gliadin from (VICKERY), A., ii, 754.
estimation of starch in (LING, CALLOW, and PRICE), A., ii, 879.
White metal, analysis of (KLING and LASSIEUR), A., ii, 87; (BERTIAUX), A., ii, 396.
Willia javanica, occurrence of emulsin and of cellobiase in (GROENEWEGE), A., i, 903.
Wines, odour and chemical composition of (MALVEZIN), A., i, 1220.
effect of radioactive substances on the acetic fermentation of (LABORDE, JALOUSTRE, and LEULIER), A., i, 1219.
detection of formic acid in (FRESENIUS and GRUNHUT), A., ii, 234.
estimation of the acids in (v. FELLENBERG), A., ii, 534; (MALVEZIN), A., ii, 880.
estimation of tannin in (MALVEZIN), A., ii, 172.
estimation of tannin and colouring matters in (FRESENIUS and GRÜNHUT), A., ii, 96.
Wood, detection of, by a colour reaction (ADLER), A., ii, 401.
estimation of cellulose in (HEUSER and CASSEUS), A., ii, 664.
Wool, adsorption of neutral soap by (BRITISH RESEARCH ASSOCIATION FOR THE WOOLLEN AND WORSTED INDUSTRIES), A., ii, 551.
action of iodine on (HUEBNER and SINHA), A., i, 434.
mordanting of, with potash alum (PADDON), A., ii, 822.
deaminated, dyeing of (PADDON), A., i, 608.
estimation of soap in (BRITISH RESEARCH ASSOCIATION FOR THE WOOLLEN AND WORSTED INDUSTRIES), A., ii, 594.
Worms, parasitic, hæmotoxins from (SCHWARTZ), A., i, 493.
Wurtz-Fittig synthesis (FUCHS and METZL), A., i, 442; (SCHLUBACH and GOES), A., i, 1204.

X

X-rays. See Rays, Rontgen.
Xanthic acid, cobalt, nickel, potassium and sodium alkyl and aryl salts, and their compounds with pyridine (DUBSKY and APTEKMANN), A., i, 104.
diphenylbisazo-2-hydroxy-7-naphthyl ester (WATSON and DUTT, T., 2417.
Xanthine, oxidation of, by tissues and by milk (MORGAN, STEWART, and HOPKINS; ARMSTRONG), A., i, 1078.
Xanthone, condensed derivatives of (ECKERT and ENDLER), A., i, 941.
Xanthone, 1:4-*di*chloro-, and 4-chloro-1-hydroxy- (ECKERT and ENDLER), A., i, 941.
1:3-*di*hydroxy- (NISHIKAWA and ROBINSON), T., 841.
Xanthone series (v. DEM KNESEBECK and ULLMANN), A., i, 359.
Xanthone-4-carboxylic acid, and its salts and derivatives (ANSCHÜTZ and CLAASEN), A., i, 456.
Xanthorocellin (FORSTER and SAVILLE), T., 821.
Xanthosterol (DIETERLE), A., i, 652.
identity of lupeol with (ULTÉE), A., i, 826.
Xanthydrol, use of, in detection of urea in tissues (STÜBEL), A., i, 397.
3-Xanthylbenzoic acid, 2:4-*di*hydroxy- (FABRE), A., i, 1148.
4-Xanthyl-1:2-diethylresorcinol 3-ethyl ether (FABRE), A., i, 1148.
3-Xanthylpyrocatechol, and 4-chloro- (FABRE), A., i, 1148.
2-Xanthylquinol, and 3-chloro- (FABRE), A., i, 1148.
2-Xanthylresorcinol, 4-chloro-, and 4-nitroso- (FABRE), A., i, 1148.
4-Xanthylresorcinol, and its diacetyl derivative, and 2-nitroso- (FABRE), A., i, 1148.
Xenon, isotopes of (ASTON), A., ii, 844.
estimation of (MOUREU and LEPAPE), A., ii, 394.
Xylan (SALKOWSKI), A., i, 323.
preparation and hydrolysis of (HEUSER, BRADEN, and KÜRSCHNER), A., i, 113.
and its acetyl derivatives (KOMATSU and KASHIMA), A., i, 811.
methyl ethers of (HEUSER and RUPPEL), A., i, 810.

(o-*Xylene*, *Me* : *Me* = 1:2 ; m-*xylene*, *Me* : *Me* = 1:3 ; p-*xylene*, *Me* : *Me* = 1:4.)

- **Xylene**, equilibrium of ethyl alcohol, water and (Ormandy and Craven), A., i, 215.
  - estimation of (Zaborowski), A., ii, 877.
- *m*-**Xylene**, vapour pressure of liquid mixtures of ammonia and (Kraus and Zeitfuchs), A., i, 725.
  - action of carbonyl chloride on, in presence of aluminium chloride (Wilson and Fuller), A., i, 827.
- *p*-**Xylene**, action of sulphuryl azide on (Curtius and Schmidt), A., i, 776.
- **Xylenes**, *tri*nitro-, oxidation of (Giua), A., i, 534.
- **Xylene cyanole** *FF* as an indicator (Hickman and Linstead), T., 2502.
- *p*-**Xylenedi-*p*-thiodimethylaniline** (Smiles and Graham), T., 2510.
- **Xylenol**, *tri*bromo-, action of, on tubercle bacilli (Duboc), A., i, 972.
- **Xylenol-blue**, use of, as an indicator (Cohen), A., ii, 387.
- *p*-**Xylidine** hydroferrocyanide (Cumming), T., 1294.
- *ψ*-**Xylidine**, and its salts (Curtius and Schmidt), A., i, 776.
- *β*-*m*-**Xylidino-*p*-phenetolecarbamide** (Speckan), A., i, 580.
- **Xylose**, action of lactic bacteria on (Fred, Peterson, and Anderson), A., i, 201.
  - methylation of (Carruthers and Hirst), T., 2299.
- *p*-**Xylylene-2:5-diacetic acid**, 3:6-*di*bromo- (Philippi, Seka, and Robinson), A., i, 837.
- *p*-**Xylylene-2:5-diglyoxylic acid**, 3:6-*di*bromo- (Philippi, Seka, and Robinson), A., i, 837.
- **4-*o*-Xylyl ethyl ketone**, and its semicarbazone (v. Auwers and Ziegler), A., i, 120.
- *a*-*m*-**4-Xylylpropionic acid**, and *ββ*-*di*chloro-, ethyl ester (v. Auwers and Ziegler), A., i, 140.
- *m*-**Xylylpyruvic acid**, *di*nitro- (Davies and Hickox), T., 2646.

Y.

- **Yeast**, longevity of (Ling and Nanji), A., i, 92.
  - changes in nitrogenous substances during autolysis by (Ivanov), A., i, 202.
  - action of, on acid amides (Dieter), A., i, 795.
  - action of, on aldehydes (Kumagawa), A., i, 305.
  - influence of mineral water on the carbohydrate exchange in (Mayer), A., i, 972.
  - toxicity of chlorine derivatives of methane, ethane and ethylene towards (Plagge), A., i, 93.
  - extracts, effect of, on the action of enzymes (Abderhalden and Wertheimer), A., i, 796.
  - fat of (Maclean), A., i, 304, 795.
  - fermentation by (Abderhalden; Abderhalden and Fodor), A., i, 92; (Willstatter and Steibelt), A., i, 306.
    - effect of acids on (Somogyi), A., i, 201.
    - stimulants for (Neuberg and Sandberg), A., i, 408.
    - in presence of urea (Sandberg), A., i, 502.
  - gum in (Salkowski), A., i, 304.
  - invertase activity of (Miller), A., i, 202.
  - lactase content of (Willstatter and Oppenheimer), A., i, 203.
  - destruction of lactic acid by cells of (Lieben), A., i, 796; (v. Fürth and Lieben), A., i, 1219.
  - bleaching of methylene-blue by (Kumagawa), A., i, 306.
  - nitrogenous constituents of (Meisenheimer), A., i, 304; (Schenck), A., i, 305.
  - nitrogenous nutrition of (Swoboda), A., i, 795.
  - hydrolysis of the protein of (Kiesel), A., i, 408.
  - decomposition of proteins in, during fermentation (Ivanov), A., i, 202.
  - effect of quinine, phenol, and mercuric chloride on the growth of (Joachimoglu), A., i, 903.
  - action of silver salts on (Zerner and Hamburger), A., i, 307.
  - urea as a nutrient for (Bokorny), A., i, 1096.
  - vitamins in (Funk and Dubin), A., i, 203.
  - stimulation of, by vitamins (Fleming), A., i, 93.
  - rate of growth of, in beer wort (Clark), A., i, 501.
  - zymase formation in (Hayduck and Haehn), A., i, 611.
  - Japanese, fermentation by species of (Kumagawa), A., i, 972.
  - oxygenated, action of amino-acids on (Lieben), A., i, 1219.
  - *R*, fermentation by (v. Euler and Josephson), A., i, 706.
  - See also *Willia javanica*.

- **Yeast-cells**, carbohydrate metabolism of (Elias and Weiss), A., i, 485.
  - decomposition of lactic acid by (v. Fürth and Lieben), A., i, 502.
  - action of saponins on (Boas), A., i, 502.
- **Yeast-nucleic acid** (Steudel and Peiser), A., i, 279, 782.
  - action of human fæces on (Rother), A., i, 292.
  - hydrolysis of, by boiled pancreatic extracts (Jones), A., i, 479.
- **Yew.** See *Taxus baccata.*
- **Yohimba bark**, estimation of yohimbine in (Schomer), A., ii, 797.
- **Yohimbine**, estimation of, in yohimba bark (Schomer), A., ii, 797.
- **Ytterbium**, *L*-series spectrum of (Dauvillier), A., ii, 463.
- **Yttrium**, atomic weight of (Fogg and James), A., ii, 297.
  - arc spectra of (Kiess, Hopkins, and Kremers), A., ii, 244; (Yntema and Hopkins), A., ii, 462.

Z.

- **Zeeman effect** (Woltjer), A., ii, 102.
- **Zinc**, heat of solution of, in hydrochloric acid (Richards and Thorvaldsen), A., ii, 475.
  - liquid, density and surface tension of (Hogness), A., ii, 29.
  - rate of solution of, in ferric alum (Collenberg and Bodforss), A., ii, 431.
- **Zinc alloys** with arsenic (Heike), A., ii, 60.
  - with copper and nickel (Voigt), A., ii, 295.
  - with magnesium, heat of formation of (Biltz and Hohorst), A., ii, 350.
- **Zinc compounds**, content of, in animal organs (Bertrand and Vladesco), A., i, 493.
  - in the animal and human organism (Rost), A., i, 87.
  - in carcinoma (Cristol), A., i, 497.
- **Zinc salts**, feeding of animals with (Bertrand and Benzon), A., i, 893.
- **Zinc arsenide** as detector for wireless telegraphy (Heike), A., ii, 19.
  - borate (Broeksmit), A., ii, 377.
- **Zinc** bromate hexahydrate, crystal structure of (Wyckoff), A., ii, 710.
  - antimonioiodobromide (Vournazos), A., ii, 651.
  - sulphate, electrical conductivity of solutions (Tartar and Keyes), A., ii, 186.
  - sulphide, phosphorescent (Guntz), A., ii, 502.
    - containing copper (Gudden and Pohl), A., ii, 680.
  - sulphides, phosphorescent, action of ultra-violet light on (Loeb and Schmiedeskamp), A., ii, 8.
- **Zinc organic compounds**, action of, on acid chlorides (Mauthner), A., i, 457.
  - with olefines and nitrogen oxides (Schaarschmidt, Veidt, and Schlosser), A., i, 645.
- **Zinc estimation and separation**:—
  - estimation of (Urbasch), A., ii, 317.
  - estimation of, by electrometric titration (Kolthoff), A., ii, 580.
  - estimation of, gasometrically (Beyne), A., ii, 85.
  - estimation of, as pyrophosphate (Balareff), A., ii, 228.
  - estimation of, as sulphate (Gutbier and Staib), A., ii, 396.
  - estimation of, volumetrically (Monasch), A., ii, 160.
  - estimation of, volumetrically, with ferrocyanides (Treadwell and Chervet), A., ii, 786.
  - estimation of, volumetrically, with sodium sulphide (Olivier), A., ii, 396.
  - separation of, by means of ammonium phosphate (Luff), A., ii, 456.
  - separation of, from nickel (Ludwig), A., ii, 786.
- **Zinc blende.** See Blende.
- **Zirconium** (Marden and Rich), A., ii, 153.
- **Zirconium organic compounds**:—
  - ferri- and ferro-cyanides (Venable and Moehlmann), A., ii, 712.
- **Zymase**, formation of, in yeast (Hayduck and Haehn), A., i, 611.
  - of yeast, action of (Abderhalden and Fodor), A., i, 92.
- **Zymogens**, adsorption of (Jacoby and Shimizu), A., i, 481.
  - artificial (Jacoby), A., i, 480 (Jacoby and Shimizu), A., i, 481.

INDEX TO PATENTS.

Austrian Patent.
86136, A., i, 954
British Patents.
144681, A., i, 1009
145060, A., i, 992
147001, A., i, 178
147118, A., i, 112
147119, A., i, 111
148419, A., i, 340
153605, A., i, 262
153917, A., i, 567
154579, A., i, 430
154907, A., i, 420
155577, A., i, 481
156103, A., i, 425
156117, A., i, 516
156121, A., i, 517
156116, A., i, 514
156122, A., i, 515
156136, A., i, 528
156148, A., i, 522
156215, A., i, 559
156538, A., i, 559
158558, A., i, 582
160433, A., i, 178
161539, A., i, 639
164302, A., i, 560
164326, A., i, 236
164715, A., i, 257
165446, A., i, 585
165770, A., i, 132
165771, A., i, 132
167157, A., i, 926
167781, A., i, 529
171292, A., i, 942
172682, A., i, 259
173004, A., i, 222
173006, A., i, 260
173063, A., i, 254
173097, A., i, 218
173166, A., i, 260
173540, A., i, 252
174101, A., i, 354
175019, A., i, 448
176038, A., i, 468
176925, A., i, 560
177189, A., i, 517
177807, A., i, 1172
179753, A., i, 650
180016, A., i, 625
181247, A., i, 872
182986, A., i, 853
183044, A., i, 836
183351, A., i, 941
183897, A., i, 914
184625, A., i, 1058
185612, A., i, 1068
185913, A., i, 1179
186859, A., i, 1179

Canadian Patent.
217486, A., i, 828

Dutch Patents.
6352, A., i, 962
6581, A., i, 961

French Patents.
22347, A., i, 385
521119, A., i, 75
521281, A., i, 579
521469, A., i, 75
523108, A., i, 810
525539, A., i, 531
526129, A., i, 801
526686, A., i, 942

German Patents (D.R.-P.).
301278, A., i, 993
301279, A., i, 992
338735, A., i, 631
338737, A., i, 565
338738, A., i, 46
338853, A., i, 46
338926, A., i, 61
339101, A., i, 579
339350, A., i, 553
339494, A., i, 605
339561, A., i, 554
339562, A., i, 514
339945, A., i, 556
339947, A., i, 46
340744, A., i, 464
340872, A., i, 315
340873, A., i, 365
340874, A., i, 365
341112, A., i, 762
341837, A., i, 567
342048, A., i, 574
342733, A., i, 824
343054, A., i, 861
343055, A., i, 854
343056, A., i, 819
343057, A., i, 823
343147, A., i, 819
343148, A., i, 860
343149, A., i, 867
343249, A., i, 822
343321, A., i, 980
343322, A., i, 867
343930, A., i, 934
344027, A., i, 952
344028, A., i, 949
344029, A., i, 950
344030, A., i, 950
344140, A., i, 948
344501, A., i, 952
344878, A., i, 913
345145, A., i, 918
345361, A., i, 1066
346065, A., i, 818
346188, A., i, 942
346236, A., i, 915
346325, A., ii, 706
346383, A., i, 991
346461, A., i, 950
346462, A., i, 991
346673, A., i, 1039
346810, A., i, 999
346888, A., i, 949
347377 A., i, 991
347604, A., i, 980
347609, A., i, 992

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, January 19th, 1922, at 8 p.m., SIR JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

The PRESIDENT referred to the loss sustained by the Society, through death, of the following Fellows :

	Elected.	Died.
Giacomo Ciamician (Honorary Fellow) ...	March 2nd, 1911	
Ganesh Sakharan Agashe	June 15th, 1916	Dec. 2nd, 1921
James Albert Allison	Dec. 7th, 1905	Dec. 9th, 1921
Charles Edward Cassal	Feb. 6th, 1899	Dec. 22nd, 1921
William King	June 21st, 1917	Nov. 7th, 1921

The PRESIDENT announced :

(1) That in accordance with the Bye-laws the following vacant places fall due to be filled at the Annual General Meeting on March 30th, 1922 :

Vice-Presidents who have filled the office of President	Two vacancies.
Vice-Presidents who have not filled the office of President	Two vacancies.
Secretary	One vacancy.
Ordinary Members of Council :	
(*a*) Town Members (that is, those living within a radius of 50 miles from London)	Three vacancies.
(*b*) Country Members (that is, those living beyond a radius of 50 miles of London)	Three vacancies.

The Council has nominated Dr. Irvine Masson to the office of Secretary.

The names of the Members of Council who retire at the Annual General Meeting on March 30th, 1922, and who are ineligible for re-election to the same office until the lapse of one year, are as follows :

Vice-Presidents who have filled the office of President:
Sir James J. Dobbie and Sir William J. Pope.

Vice-Presidents who have not filled the office of President:
Professor J. B. Cohen and Dr. H. J. H. Fenton.

Ordinary Members of Council:

(*a*) Town Members:

Mr. J. A. Gardner, Dr. C. A. Keane, and Sir Robert Robertson.

(*b*) Country Members:

Dr. E. F. Armstrong, Professor F. E. Francis, and Principal J. C. Irvine.

(2) That arrangements have been made with the Society of Chemical Industry whereby provincial Local Sections of that Society may give opportunity to Fellows of the Chemical Society to read papers on pure chemistry and to attend the meetings at which such papers are read. Further information in regard to the scheme will be circulated at an early date.

(3) That a pamphlet entitled "Notes on the Furnishing and Equipment of Chemical Laboratories" has just been issued by the Society. Arising from a Conference held in July, 1920, to consider whether economies could be effected in the equipment of chemical laboratories, a small Committee was appointed by the Council to look into and report upon the matter. These "Notes" represent the results of the inquiry and can be obtained free of charge on application to the Assistant Secretary.

Certificates were read for the first time in favour of:

Jnanendra Kumar Adhya, M.Sc., 30, Judge's Court Road, Alipore, Calcutta.
Gilbert James Avey, Northern Polytechnic Institute, Holloway, N. 7.
Bhagwan Das Batta, B Sc., F. C. College, Lahore, India.
Darrell Webb Beesley, A.I.C., 29, King Edward Road, Dentons Green, St. Helens.
William Alfred Bishop, B.A., 33, Banstead Road, Purley.
Leslie James Burrage, B.Sc., 32, Emerson Road, Ilford.
Gabriel Cofman-Nicoresti, 15, Ludlow Road, Ealing, W. 5.
Archibald Neil Currie, M.A., B.Sc., A.I.C., 44, Fisher Street, Dennistoun, Glasgow.
James Owen Chesshyre Dalton, B.A., The Plot, Adams Road, Cambridge.
Arthur William Edwards, 4, Dunvegan Road, Eltham, S.E. 9.
Samuel Ellingworth, M.Sc., 74, Millfield Road, York.
Kenneth Fisher, M.A., Ph.D., Eton College, Windsor.
Miri Lal Goel, M.Sc., Royal Artillery Bazar, Ambala, India.
George Grimshaw Hammond, B.Sc., 254, Mill Street, Toxteth, Liverpool.
William Allen Hamor, M.A., Mellon Institute of Industrial Research, The University, Pittsburg, Pa., U.S.A.
Frank Mouat Irvine, B.Sc., A.I.C., 30, Clayton Road, Jesmond, Newcastle-on-Tyne.

John Albert Jenkinson, B.Sc., School House, Little Sutton, Birkenhead.
Rowland Nicholas Johnson, B.Sc., Greenstede, West Hill, East Grinstead.
David John Lake, B.Sc., 36, Gerald Street, Hafod, Swansea.
Herbert Langwell, Wentworth, Denham Road, Epsom.
Vernon Howes Legg, B.Sc., 95, Carter Knowle Road, Sheffield.
John Alexander McRae, M.A., Ph.D., F.I.C., Queen's University, Kingston, Ont., Canada.
Walter Thomas James Morgan, 171, Kensington Avenue, Manor Park, E. 12.
John Sydney Morrison, 23, Seymour Road, Cheadle Hulme, Manchester.
Partridge Leslie Podd, B.Sc., 8, St. Peter's Street, Ipswich.
Krishnarajpet Venkata Rau, B.A., B.Sc., Ananda College, Colombo, Ceylon.
Frank Crafer Ray, B.A., 47, Alfriston Road, Clapham Common, S.W. 11.
Jessie Stewart, B.Sc., School House, Helmington Row, Crook, Co. Durham.
George Taylor, Frigorifico, Campana F.C.C.A., Argentine.
James Rawson Walmsley, A.I.C., Dean Brook Cottage, Dean Lane, Moston, Manchester.
Walter Arthur White, 144, Shelley Avenue, Manor Park, E. 12.
Robert Norman Wright, B.Sc., A.I.C., 16, Redcliffe Street, S. Kensington, S.W. 10.

Prof. A. SMITHELLS then gave an account of the Lewis-Langmuir theory of atomic structure, the exposition being illustrated with a large number of models. On the motion of Prof. Sir W. H. Bragg, supported by Prof. Lowry and the President, a cordial vote of thanks to the lecturer was passed with acclamation, and Prof. Smithells made suitable acknowledgment.

ORDINARY SCIENTIFIC MEETING.

The next Ordinary Scientific Meeting will be held on Thursday, February 2nd, 1922, at 8 p.m.

LECTURE.

At the Ordinary Scientific Meeting to be held on Thursday, February 9th, 1922, at 8 p.m., in the Lecture Hall of the Institution of Mechanical Engineers, Storey's Gate, S.W.1., Sir Ernest Rutherford, M.A., D.Sc., F.R.S., will deliver his Lecture, entitled "Artificial Disintegration of Elements."

SETS OF THE BERICHTE AND OF THE ZENTRALBLATT.

The Council has secured a few sets of the *Berichte* and of the *Zentralblatt* from August, 1914, to December, 1920, inclusive. These can be obtained, *in complete sets only*, from the Assistant Secretary, price £10 a set of the *Berichte*, or of the *Zentralblatt*.

The number of sets is strictly limited, and applications will be dealt with in the order in which they are received.

ADDITIONS TO THE LIBRARY.

I. *Donations.*

Deutsche Chemische Gesellschaft. Chemisches Zentralblatt. Generalregister IV, über die Jahrgänge 1912–1916. Edited by Ignaz Bloch. Leipzig 1921. pp. vi + 2016. (*Reference.*)
From the Deutsche Chemische Gesellschaft.

Fédération des Industries Chimiques de Belgique. Bulletin. Vol. I., etc. Gand 1921 +. [Issued with the *Bull Soc. Chim. Belg.*] (*Reference.*)
From the Société Chimique de Belgique.

Fourneau, Ernest. Préparation des médicaments organiques. Paris 1921. pp. viii + 350. 25 *fr.* (*Recd.* 13/12/21.)
From the Author.

Parkes, Samuel. The rudiments of chemistry; illustrated by experiments, and eight copper-plate engravings of chemical apparatus. London 1810. pp. xii + 294. ill. (*Reference.*)
From Mr. W. Livingstone Gunn.

II. *By Purchase.*

Fischer, Ferdinand. Kraftgas: Theorie und Praxis der Vergasung fester Brennstoffe. (*Chem. Tech. in Einzeldarstellungen.*) 2nd edition. Edited by J. Gwosdz. Leipzig 1921. pp. viii + 428. ill. (*Recd.* 21/12/21.)

Ministry of Munitions and **Department of Scientific and Industrial Research.** Technical records of explosives supply. 1915–1918. No. IV. The theory and practice of acid mixing. London 1921. pp. vi + 94. ill. 12*s.* net. (*Recd.* 8/12/21.)

Vanino, Ludwig. Handbuch der präparativen Chemie. 2nd edition. Vol. I. Anorganischer Teil. Stuttgart 1921. pp. xxiv + 821. ill. (*Recd.* 13/12/21.)

III. *Pamphlets.*

Mees, Charles Edward Kenneth, and **Clarke, Hans Thatcher.** The preparation of synthetic organic chemicals at Rochester. [A lecture delivered before the Society of Chemical Industry, Montreal, August 31, 1921.] Rochester, N.Y. 1921. pp. 40. ill.

Moir, James. (1) The permanganate absorption-spectrum: a claim for priority. (2) A formula for calculating the uranium spectrum. (From the *Trans. Roy. Soc. S. Africa*, 1921, **10**.)

SCIENTIFIC AND INDUSTRIAL RESEARCH, DEPARTMENT OF. Bulletin No. 5. The cleaning and restoration of museum exhibits: report upon investigations conducted at the British Museum. London 1921. pp. 12. ill.

—— First report of the Gas Cylinders Research Committee. London 1921. pp. 126. ill.

—— *Food Investigation Board.* Special Report No. 5. Report on heat insulators by the Engineering Committee of the Food Investigation Board. Experiments by EZER GRIFFITHS. London 1921. pp. 61. ill.

—— *Fuel Research Board.* Technical Paper No. 3. The efficiency of low temperature coke in domestic appliances. By MARGARET WHITE FISHENDEN. London 1921. pp. 35. ill.

WRIGHT, ALLISTER MACLEAN. The anticomplementary properties observed in certain serum reactions. (From the *Trans. New Zealand Inst.*, 1921, **53.**)

WRIGHT, ALLISTER MACLEAN, BEVIS, MISS J. F., and the late PERCY S. NELSON. The chemistry of flesh foods. No. 5. The nitrogenous constituents of meat-extracts. (From the *Trans. New Zealand Inst.*, 1921, **53.**)

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, FEBRUARY 16TH, 1922.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

ADHYA, JNANENDRA KUMAR, M.Sc. (Cal.), 30, Judge's Court Road, Alipore, Calcutta. Chemical Laboratory Assistant, Govt. Test House, Alipore, Calcutta. Took the M.Sc. degree of the Calcutta University in 1920. Served as an asst. chemist in the Research Dept. of Messrs. Bird & Co., Calcutta. At present employed as a Chemical Laboratory Assistant, Govt. Test House, Alipore, Calcutta. Late Hon. Secretary, Presidency College Chemical Society, Calcutta. (*Signed by*) N. Brodie, J. Bhaduri, B. B. Dey.

APPLEBEE, HARRY CHARLES, 509, Edge Lane, Droylsden, nr. Manchester. Chief Works Chemist, Manchester Corporation Gas Works, Bradford Road, Manc. Finsbury Technical College (Chemical Department), 1902–1905 (Certificate). Associate of the Institute of Chemistry (1918). Lecturer, Chemistry of Gas Manufacture, Manchester College of Technology. (*Signed by*) E. F. Morris, F. M. Rowe, Frank Lee Pyman, F. S. Sinnatt, E. Williams.

AVEY, GILBERT JAMES, Chemical Department, Northern Polytechnic Institute, Holloway, London, N.7. Lecturer in Chemistry. Wish to receive the Journals of the Society. (*Signed by*) T. J. Drakeley, Raymond R. Butler, Philip Schidrowitz.

Baker, John William, 20, Redfield Lane, Earls Court Rd., S.W.5. Research Student in Organic Chemistry at the Imperial Coll. of Science and Technology. Royal Scholarship in Chemistry, 1916. A.R.C.S. Chem., First Class, 1921. B.Sc. Hons. Chem., First Class, 1921 (London). (*Signed by*) Jocelyn Thorpe, James C. Philip, M. A. Whiteley, C. K. Ingold.

Batta, Bhagwan Das, Nabha State, Panjab (India). Demonstrator in Chemistry, F. C. College, Lahore. Appearing for the Panjab University M.Sc. Degree. B.Sc., Panjab University. Demonstrator in chemistry at Forman Christian College, Lahore. Working on the "Active principle of *Melia Azideracta* (India) leaves." (*Signed by*) N. A. Yajnik, Edwin Theodore Dean, S. R. Khosla.

Beesley, Darrell Webb, 29, King Edward Rd., Dentons Green, St. Helens. Technical Chemist. Associate of Institute of Chemistry. Asst. works manager, Messrs. Tennants (Lancs.), Ltd., Manchester; previously head chemist for same; prior to this, asst. chemist with United Alkali Co. (*Signed by*) Chas. W. Carpenter, E. L. Rhead, Wm. E. Kay.

Bishop, William Alfred, 33, Banstead Rd., Purley, Surrey. Chemist. B.A. Cantab. (*Signed by*) H. J. H. Fenton, C. T. Heycock, F. W. Dootson.

Brisley, Charles William, 105, Thurlow Park Road, London, S.E.21. Student at University of Oxford. B.A. Honours (Chemistry). At present doing research for Part II. School of Natural Science (Chemistry). (*Signed by*) F. D. Chattaway, E. Hope, S. G. P. Plant, M. P. Applebey, L. Gowing-Scopes.

Burke, Katharine Alice, 17, Lion Gate Gardens, Richmond, Surrey. Assistant Lecturer in Chemistry, University College, W.C.1. B.Sc. London. Published papers in the *Journal of the Chemical Society*, and *Zeitschrift fur Physikalische Chemie.* Translated "Thermochemistry," by Julius Thomsen, in Sir Wm. Ramsay's series. (*Signed by*) J. N. Collie, Irvine Masson, F. G. Donnan.

Burrage, Leslie James, 32, Emerson Road, Ilford, Essex. Undergraduate at King's College, London. Taking Hons. B.Sc., Chemistry (Oct. 1921). B.Sc. degree obtained Oct. 1921. Being now engaged on research work at King's College I wish to keep in touch with fresh chemical developments. (*Signed by*) Arthur Fairbourne, A. J. Allmand, Harold Toms.

Byles, John Edward, 87, Newlands Park, Sydenham, S.E.26. Chemist, Class II, Government Laboratory. B.Sc. (Manchester), A.I.C. Nine years at Government Laboratory. (*Signed by*) A. G. Francis, F. S. Aumonier, J. R. Nicholls.

Child, Reginald, Yateley Lodge Cottage, Yateley, Camberley. Honours Student of King's College, London. (*Signed by*) Samuel Smiles, H. W. Cremer, C. S. Salmon.

Christie, George Hallatt, 155, Sharrow Vale Rd., Sheffield. Engaged in Research in Organic Chemistry with Dr. J. Kenner, Sheffield University. Master of Science (1st Class Hons. Chemistry, Sheffield University). Organic Chemical Research under Dr. Kenner since June 1920. I wish to have access to the Society's Library and receive the Society's Journal. (*Signed by*) W. P. Wynne, J. Kenner, F. G. Tryhorn, A. W. Chapman, Thos. B. Smith.

Cofman-Nicoresti, Gabriel, 15, Ludlow Road, Ealing, W.5. Pharmacist Manufacturing Chemist, Member of the Pharmaceutical Society. Director of the Solidol Chemical Co., Mill Street, Dockhead, S.E.1. Inventor and patentee of improvements in or connected with stoves for burning solidified spirit or the like, No. 101569/16, and also improved liniment, No. 18060/15. I desire to make use of the Library and keep in touch with current chemical literature. (*Signed by*) Jules Cofman-Nicoresti, Hartley Shaw, S. B. Tallantyre.

Courtney, William Barry, 12, Caithness Road, Mitcham, Surrey. Student, engaged on research work. I have been a student of the Chemical Department of the South-Western Polytechnic Institute for five years, and have passed the B.Sc. (Honours) examination of the London University in Oct. 1921. (*Signed by*) J. B. Coleman, F. H. Lowe, F. Arnall, J. C. Crocker.

Crutchlon, Bernard William Alfred, 65, Durlston Rd., Upper Clapton, E.5. Honours Student of King's College, London. (*Signed by*) Samuel Smiles, H. W. Cremer, C. S. Salmon.

Currie, Archibald Neil, M.A., B.Sc. A.I.C., 44, Fisher St., Dennistoun, Glasgow. (The applicant holds the Glasgow University B.Sc. degree with special distinction in his principal subject—Chemistry.) Biochemist to the Glasgow Royal Cancer Hospital. The applicant has two papers ready for publication. The first is " The Fat of Adipose Tissue in Malignant Disease," and will be published shortly either as a Hospital Bulletin or in the *Journal of Exptl. Pathology and Bacteriology.* The second, which is one of a series of " Studies in Fat Pigment," is entitled: " A Preliminary Note on the Separation of Pigment from Accompanying Fat." (*Signed by*) G. G. Henderson, T. S. Patterson, J. Roberts.

Dalton, James Owen Chesshyre, The Plot, Adams Road, Cambridge. Engaged in Research work at Cambridge University. Honours Degree in Nat. Science Tripos Part II., June 1921. (*Signed by*) W. J. Pope, T. M. Lowry, W. H. Mills.

Edwards, Arthur William, 4, Dunvegan Road, Eltham, S.E.9. Chemist. (1) Early education at Dorchester Grammar School; winner of the science prize in 1902. (2) Studied Analytical Chemistry and Physics at Duncan's School of Pharmacy under Mr. William Duncan, F.C.S., Ph.C., also at Darlington Technical College, and under private tutors. (3) Matriculated at Edinburgh University in 1909, for the study of chemistry. (4) Passed the minor examination of the Pharmaceutical Society of Great Britain in 1909; Member of the British Pharmaceutical Conference. (5) Engaged in bacteriological and pharmaceutical chemistry under Mr. J. E. Langford Moore, F.C.S., at St. Bartholomew's Hospital. (6) For five years with the English Company of Farbenfabriken vorm. Friedrich Bayer & Co., Elberfeld and Leverkusen, under Dr. C. R. Henning, Ph.D., F.C.S. (7) Served in the Royal Engineers—gas services—during the War. (8) At present with Messrs. R. W. Greeff & Co., Ltd., of Thames House, Queen Street Place, E.C.4, in an advisory and technical capacity. (9) Keenly desirous of keeping in touch with up-to-date Chemical Research and receiving the publications of the Chemical Society. (*Signed by*) J. E. Langford Moore, Percy Barrs, Frank B. Arnold, William Duncan, Charles Cockle.

Ellingworth, Samuel, 74, Millfield Road, York. Research Chemist, Dept. of Organic Chemistry, University of Leeds. B.Sc. (Leeds), 1st Class Honours, 1916. M.Sc. 1918. Chemist to the British Dyestuffs Corporation (Huddersfield), Ltd. (1916–1921). (*Signed by*) J. B. Cohen, P. K. Dutt, Arthur Smithells, Akira Shimomura.

Fisher, Kenneth, Eton College. Schoolmaster. M.A. (Oxon), Ph.D. (Jena). (*Signed by*) W. H. Perkin, D. Ll. Hammick, R. H. Thomas, T. W. J. Taylor, E. Hope, N. V. Sidgwick.

Frederikse, William Alexander, Amsterdam, Honthorststraat 2. Chemical Student, University of Amsterdam. Qualifications none. Desires to become a fellow of the Chemical Society, in order to profit by the Journal and other publications. (*Signed by*) H J. Backer, J. C. Irvine, R. Robinson.

Goel, Miri Lal, Royal Artillery Bazar, Ambala, Punjab (India). 2nd Professor of Chemistry, Meerut College, Meerut (U.P.). B.Sc. with Honours in Chemistry; M.Sc. of the Punjab University; Research Scholar of the Punjab University for some time; Demonstrator of the B.Sc. IV year class Govt. College Chem. Lab. while student of the M.Sc. class; Professor of the Divisional College, Meerut (U.P.), since November 1919, taking both Intermediate and B.Sc. classes. Joint author of the paper published in J.C.S. (Trans., 210; 1921 Feb.); worked as Consulting Chemist of the Goel Scientific and Technical Works, Meerut; Organised "Iswar" Soap Factory, R.A. Bazar, Ambala; doing research work on essential oils and dyeing extracts from vegetable dyestuffs in the College at present. (*Signed by*) Horace B. Dunnicliff, N. A. Yajnik, Edwin Theodore Dean, Shanti Swarupa Bhatnagar, Bawa Kartar Singh.

Goss, Frank Robert, 4, Abbotsford Rd., Goodmayes, Ilford, Essex. Neil Arnott Research Scholar of the University of London. Student from 1918 to 1921 at the Royal College of Science, obtaining on completion of course the Associateship (A.R.C.S.) in Chemistry, and B.Sc. (Lond.) with Honours in Chemistry. I have been awarded the Neil Arnott Medal in Chemistry of the Univ. of London, and am at present working in the Organic Chemistry Research Laboratories of the Royal Coll. of Science. (*Signed by*) Jocelyn Thorpe, M. A. Whiteley, C. K. Ingold.

Grey, Egerton Charles, Medical School, Cairo, Egypt. Professor of Chemistry. D.Sc., M.B. Author of several papers on the Chemical Action of Bacteria, published in the Proc. of the Royal Society. (*Signed by*) Arthur Harden, F. R. Henley, Robert Robison, Ida Smedley Maclean.

Grimwood, Robert Charles, 11, Billiter Square, E.C.3. Research Student, Royal College of Science. Associate City and Guilds, Finsbury Institute. Registered Student at Institute of Chemistry. (*Signed by*) Jocelyn Thorpe, Robt. G. Grimwood, M. A. Whiteley, C. K. Ingold.

Hammond, George Grimshaw, 254, Mill Street, Toxteth, Liverpool. Analyst and Chemist. Bachelor of Science (Manchester). Member of The Pharmaceutical Society. (*Signed by*) Arthur W. Duncan, Frederick Owen, Walter Salmon.

Hamor, William Allen, Mellon Institute of Industrial Research, University of Pittsburgh, Pittsburgh, Pa., U.S.A. Assistant Director of the Mellon Institute of Industrial Research. Educated, University of Pittsburgh, 1904–1907; Master of Arts, 1913. Research Chemist, College of the City of New York, 1907–1914. Assistant to the Director, Mellon Institute, Pittsburgh, Pa., 1914–1916. Assistant Director, Mellon Institute, since 1916. Shale Oil Expert, Department of Mines of Canada, 1908. Editorial Staff, *Journal of Industrial and Engineering Chemistry*, 1912–1914. Editorial Board Member, "The Science History of the Universe," 1909. Commissioned a Major in the Chemical Warfare Service, United States Army, November 28, 1917; served in France ten months as assistant chief of the Technical Division, C.W.S., A.E.F.; honourably discharged, December 6, 1918. Member of the National Research Council on the Division of Research Extension, 1921–1924. Member of the National Research Council's Sub-Committee on Airplane Fuels, 1917. Member of various committees of the American Chemical Society, 1913–1921. Specialist in hydrocarbon chemistry. Author of the following books: "A History of Chemistry," 1909; "The American Petroleum Industry" (with R. F. Bacon), 2 vols., 1916; "The Examination of Petroleum" (with F. W. Padgett), 1920; and "American Fuels" (with R. F. Bacon), 2 vols., 1922. Also author of a series of papers and reports of researches on oil-shales, petroleum, fuels, and anæsthetics. Contributor to scientific journals on educational subjects, especially on the value of industrial research and chemistry. Member of the American Chemical Society, American Electrochemical Society, and Alpha Chi Sigma and Phi Lambda Upsilon fraternities. Residence: 1030, Victoria Avenue, New Kensington, Pa. Business Address, Mellon Institute of Industrial Research, Pittsburgh, Pa., U.S.A. (*Signed by*) Marston Taylor Bogert, Raymond F. Bacon, Chas. Baskerville.

HART, LESLIE RALPH, 'Beaulieu,' St. Albans, Herts. Research Student. London University B.Sc. Examination in Honours Chemistry, 1st Class, November 1921. (*Signed by*) Samuel Smiles, A. J. Allmand, A. Fairbourne, D. T. Gibson.

HUME-ROTHERY, WILLIAM, Mendip House, Headington Hill, Oxford Research Student in Chemistry. I am a Natural Science Demy of Magdalen College, Oxford, and have taken the Oxford B.A. Degree in Chemistry (Part I of the Final Honours Course) and am now engaged in Research Work in Inorganic Chemistry (for Part II of the Final Honours Course). I intend to devote my life to Research Work and wish to join the Society to keep in touch with the developments of the Science. (*Signed by*) Frederick Soddy, B. Lambert, M. P. Applebey, A. F. Walden, W. H. Perkin, E. Hope.

IRVINE, FRANK MOUAT, 30, Clayton Road, Jesmond, Newcastle-on-Tyne. Lecturer in Chemistry at Armstrong College, Newcastle. B.Sc. (1st Class Hons. Chemistry) (Dunelm), A.I.C. Formerly Research Chemist with Messrs. Cookson & Co., Ltd., Lead and Antimony Manufacturers, Willington, Quay-on-Tyne. (*Signed by*) W. N. Haworth, Grace C. Leitch, J. A. Smythe, C. F. Allpress.

JENKINSON, JOHN ALBERT, School House, Little Sutton, nr. Birkenhead. Science Master at the Plympton Grammar School, South Devon. Student at Liverpool University (Final Examination 1921). B.Sc. (Hons. Chem.). Teacher of Science at Plympton Grammar School. (*Signed by*) E. C. C. Baly, W. C. McC. Lewis, I. M. Heilbron.

JOHNSON, ROWLAND NICHOLAS, 'Greenstede,' West Hill, East Grinstead, Sussex. Research Student at King's College, London. Honours B.Sc. (London), November 1921. First Class in Chemistry with Physics. (*Signed by*) A. J. Allmand, Samuel Smiles, A. Fairbourne.

KOHLI, SARAL JANG, M.Sc., Sat Updesh, Lahore (Punjab), India. Professor of Chemistry, Prince of Wales College (Kashmir State College), Jammu (Kashmir), India. (1) A First Class B.Sc. of the Punjab University, standing first in my combination (Physics and Chemistry) of subjects. (2) A First Class M.Sc. in Chemistry, standing first in the Punjab University. (3) Have done some work on the Radioactivity of Indian Minerals. (4) Have great desire to continue my studies and research work. (5) Am working as a Professor of Chemistry, teaching B.Sc. classes. (*Signed by*) N. A. Yajnik, E. T. Dean, S. R. Khosla.

LAKE, DAVID JOHN, 36, Gerald St., Hafod, Swansea. Science Master, Daventry Grammar School. Passed B.Sc. (London), 1920. Student Swansea Technical College, 1916–1920; Student Swansea University, 1920–Jan. 1921; since Jan. 1921, Science Master, Daventry Grammar School, Northants. (*Signed by*) E. A. Tyler, T. H. Hooper, D. G. Hopkins.

LANGWELL, HUBERT, Wentworth, Denham Road, Epsom, Surrey. Research Chemist. Ten years research on the fermentation of celluloses. (*Signed by*) C. F. Cross, Robt. Ensoll, E. J. Charlton, William Bacon.

Legg, Vernon Howes, 95, Carter Knowle Road, Sheffield. Student, Sheffield University. Took the three years' day course in Chemistry at Sheffield University and obtained the B.Sc. Honours Degree (Chemistry). Am at present engaged in Research Work at the Applied Science Dept. (*Signed by*) W. P. Wynne, R. V. Wheeler, J. Kenner, Arthur W. Chapman.

McRae, John Alexander, Queen's University, Kingston, Ont., Canada. Assistant Professor of Chemistry, Queen's University. M.A. (Queen's Univ., Kingston), Ph.D. (Manchester), F.I.C. 1912–1915, Lecturer on Chemistry, Queen's University, Kingston, Canada. 1915–1919, Asst. Professor of Chemistry, Queen's University, Kingston, Canada. 1919–1921, Research Student at Univ. of Manchester as holder of Special Fellowship from the Honorary Advisory Council for Scientific and Industrial Research of Canada. (*Signed by*) Arthur Lapworth, F. P. Burt, Henry Stephen, F. Fairbrother, Frederick Challenger.

Matthews, Marcus Aurelius, 'Burghley,' 47, Spratthall Rd., Wanstead, E.11. Student for M.Sc. Student at East London College for three years. B.Sc., Second Class Honours in Chemistry. (*Signed by*) F. G. Pope, F. W. Turner, J. R. Partington.

Maxted, Durban Roy, 7, New Road, Reading. Lecturer, University College, Reading. A.R.C.Sc. (1918); B.Sc. (London). 1st Class Hons, Chemistry, 1919. Assistant chemist to Bow Bridge Dye Works, London, E., June 1919–Jan. 1920. Lecturer in Organic Chemistry, University College. Reading, since Feb. 1920. (*Signed by*) H. Bassett, Reginald G. Durrant, J. W. Dodgson.

Morgan, Walter Thomas James, 171, Kensington Avenue, Manor Park, London, E.12. Student, East London College (University of London), Entering for B.Sc. (Hons. Chem.) in Oct. 1922. Inter. B.Sc., 1920. Assistant chemist in the Research Laboratory of the South Metropolitan Gas Company from June 1917–Oct. 1918. (*Signed by*) E. V. Evans, J. R. Partington, F. G. Pope.

Morrison, John Sydney, 23, Seymour Rd., Cheadle Hulme, Manchester. Technical Chemist and English Representative of Messrs. Perry & Hope, Ltd., Firth and Clyde Chemical Works, Nitshill, nr. Glasgow. 1908–1913, Manc. School of Technology, awarded diploma for pure and applied chemistry, also courses in gas engineering, gas manufacturing, bleaching and dyeing, dairy analysis. Ministry of Munitions, D.E.S., London, 1916–1919. Superintendent Chemist and Assistant Manager at Folly explosive gas factories, Gretna, Litherland, West Gorton, and Sutton Oak. Awarded O.B.E. July 1920. Messrs. Perry & Hope, Ltd., Glasgow, 1920–1921, Technical Chemist and Representative. (*Signed by*) James Booth, Herbert H. H. Lorenz, John H. Jeffery, John Turnbull.

Owen, Edward John, Porthdafarch Farm, Holyhead, N. Wales. Organic Chemist, employed by Messrs. The British Drug Houses, Ltd., City Road, London, N.1, in the manufacture of complex organic compounds since Oct. 3, 1921. B.Sc. (Wales) with Second Class Honours in Chemistry. (*Signed by*) Kennedy Orton, Owen Owen, L. Hunter, H. B. Watson, Frederick Soper.

Parsons, Alfred Tennyson, 25, Westwell Rd., Streatham, S.W.16. Chemist, Class 2, Government Laboratory. B.Sc. (Dunelm), A.I.C. (*Signed by*) Robert Robertson, Geo. Stubbs, J. Carmichael.

Patterson, William Hamilton, University of London Club, 21, Gower St., W.C.1. Lecturer in Chemistry, East London College, University of London, M.Sc., University of Manchester, A.I.C. Assistant Versuchsanstalt, Karlsruhe, Germany. Carnegie Research Scholar, Iron and Steel Institute,

1913. Various Research Publications. (*Signed by*) F. G. Pope, O. L. Brady, W. E. Garner.

Podd, Partridge Leslie, 8, St. Peter's St., Ipswich. Post-graduate Research Student at University College, London. Passed B.Sc. Honours Exam. of London University, 1921. As a research student, I desire to have the privilege of using the library of the Society, and I also desire to keep in touch with the advance in knowledge of all branches of chemistry through the medium of the Chemical Society. (*Signed by*) Irvine Masson, Henry Terrey, J. N. E. Day.

Rau, Krishnarajpet Venkata, Ananda College, Colombo, Ceylon. Assistant Master, Ananda College. B.A. (Madras), B.Sc. (London). Ten years' teaching experience. (*Signed by*) J. P. C. Chandrasena, W. N. Rae, M. Parthasarathy.

Ray, Frank Crafer, 47, Alfriston Rd., West Side, Clapham Common, S.W.11. Assistant Lecturer, Chemical Department, Battersea Polytechnic, S.W.11. B.A. (Cantab.) (*Signed by*) Harold Hunter, A. Houssa, S. Greenberg, J. L. White, Robert H. Pickard, J. Kenyon.

Stevenson, Francis Malcolm, 26, Albert St., Belper, nr. Derby. Dyers' Chemist. Graduated at Leeds University in Colour Chemistry (Hons.), and now desirous of keeping in touch with chemical advances and research. *Signed by*) A. G. Perkin, R. B. Forster, J. B. Cohen.

Stewart, Jessie, School House, Helmington Row, Crook, Co. Durham. Research Student. B.Sc. Durham University. First Class Honours in Chemistry. (*Signed by*) Samuel Smiles, A. J. Allmand, David T. Gibson.

Tatner, Gilbert Henry, 52, Melrose Street, Hull. Student, University of Leeds. Studying for Honours B.Sc. (Chemistry). Date of Honours Examination, 1922. (*Signed by*) Arthur Smithells, J. B. Cohen, H. M. Dawson, M. Sybil Leslie, W. Lowson.

Tansley, Leonard Beaumont, M.C., M.A., 'Espérance,' Purley, Surrey. Science Coach. Honours Graduate in Chemistry, etc., of Trinity College, Cambridge University. Lecturer and Examination Coach in Science at the General Engineering College, S.W.5. (*Signed by*) Francis Arnall, Frank Matthews, J. C. Crocker.

Taylor, George, Frigorifico, Campana, F.C.C.A., Argentine, S. America. Chief Chemist. Member of British Assn. of Chemists. Late Asst. Chemist to Liverpool Gas Co. (*Signed by*) Harold A. Auden, Frank B. Small, J. C. Frodsham.

Thomson, Robert William Murray, 117, Highbury Hill, London, N.5. Lecturer. B.Sc. of St. Andrews University. Assistant Lecturer in Physical Chemistry at King's College, University of London. (*Signed by*) Samuel Smiles, H. W. Cremer, John H. Foulger.

Walmsley, James Rawson, Dean Brook Cottage, Dean Lane, Moston, Manchester. Analyst and Pharmaceutical Chemist. Member of the Pharmaceutical Society of Gt. Britain. Associate of the Institute of Chemistry. Associate of the Manc. College of Technology (Genl. Chemical Technology). Lecturer (part-time) College of Technology, Manc. (*Signed by*) Frederick Owen, Samuel E. Hodgkinson, Walter Salmon, William Jackson Lund, Jas. Grant.

White, Walter Arthur, 144, Shelley Avenue, Manor Park, E.12. Assistant Analytical Chemist. Assistant to Dr. G. W. Clough in his analytical practice at the Royal Veterinary College, Camden Town. Formerly assistant to Dr. G. D. Lander. Student at the Sir John Cass Institute for the Final B.Sc. (Honours Chemistry) Examination of the University of London. (*Signed by*) G. W. Clough, W. H. Barker, E. D. Griffiths, W. T. Clough.

Wightman, William Persehouse Delisle, 59, Holmewood Gardens, Streatham Hill, London, S.W.2. Student. Student for degree in Chemistry. (*Signed by*) James C. Philip, M. A. Whiteley, H. F. Harwood, H. Ellingham.

Wiseman, Julius, B.Sc., 102, Cambridge Rd., Mile End, E.1. Demonstrator Chemistry Dept., Guy's Hospital, and Student in Medicine. (*Signed by*) C. S. Gibson, A. J. Allmand, Samuel Smiles.

Woosley, Duncan Pax, 96, Roxborough Road, Harrow, Middlesex. Chemical Laboratory Assistant. With The British Drug Houses, Ltd., Graham St., City Rd., N.1., since Aug. 1919. Student at Birkbeck College Univ. of London, Sept. 1919 to date, reading for B.Sc. Hons. Chem. I desire to have access to the Library and to keep in touch with modern developments. (*Signed by*) Francis H. Carr, O. A. Le Beau, James Taylor.

Wright, Robert Norman, 16, Redcliffe St., South Kensington, S.W.10. Assistant Chemist to the Dried Milk Dairy Products Company, Hemyock, Devon. A.R.C.S. (1st Class in Chemistry), B.Sc. (Lond.). (1st class Honours), A.I.C. Dec. 1920, appointed assistant chemist in the Research Laboratory of Messrs. J. Lyons & Co., Ltd. (*Signed by*) H. B. Baker, James C. Philip, A. E. Dunstan, F. B. Thole, Philip C. Bull.

Certificates have been accepted by the Council under Bye-Law I (2) in favour of the following :

Bearpark, Arthur Frederick, 'Kingsfold,' Mill Street, Capetown. Postal Address, P.O. Box 1159, Capetown. Postal address in U.K. c/o Henry Tyrer & Co., Ltd., 360, Royal Liver Building, Liverpool. General Manager, Whaling Companies. Three years pupil with H. Thompson, Esq., F.C.S., Hull. Five years chemist to British Oil and Cake Mills, Limited. Member of the Royal Society of South Africa. Member of the South African Chemical Institute. Member of the Chemical, Metallurgical and Mining Society of South Africa. (*Signed by*) Harry Thompson, *Edward B. Maxted.*

Sen, Suresh Chandra, Mungpoo P.O., Riyang D. H. Ry., India. Assistant Quinologist, Government of Bengal. B.Sc. (Calcutta), B.A. (Cantab.). Desires to receive the Journal. (*Signed by*) G. E. Shaw.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, February 2nd, 1922, at 8 p.m., Professor H. E. ARMSTRONG, LL.D., F.R.S., Vice-President, in the Chair.

The Chairman referred to the loss sustained by the Society, through death, of the following Fellows :

	Elected.	Died.
Thomas Duxbury	Dec. 15th, 1892.	Nov. 26th, 1921.
James Hill Fairweather	June 18th, 1908.	
Herbert Garland	May 15th, 1913.	April, 1921.
David Emrys Williams	Dec. 6th, 1917.	Jan. 9th, 1922.

The following were formally admitted Fellows of the Chemical Society: H. C. Bell, S. F. Birch, W. A. P. Challenor, P. C. Chaumeton, L. G. F. Dolley, D. T. Gibson, E. J. Hartung, D. N. Jackman, J. H. Middleditch, J. R. Pickering, E. H. Usherwood, I. W. Wark, and L. D. Williams.

Certificates were read for the first time in favour of :

George Macdonald Bennett, M.A., M.Sc., F.I.C., 94, Mercers Road, Tufnell Park, N.19.
Eric Sykes Brooks, Verandah Buildings, Dalton-in-Furness, Lancs.
Fred Brumfitt, 123, Tennyson Place, Bradford.
Carlton Butler, B.Sc., A.I.C., 23, Winifred Road, Urmston, Manchester.
Francis Arthur Freeth, O.B.E., M.Sc., F.I.C., Heather Croft, Hartford.
Thomas Weatherill Harrison, B.Sc., F.I.C., 18, Elfindale Road, S.E.24.
Eusebius Holmes, B.Sc., Eastern Green, Coventry.
Lingaiah Basavalingaiah Manjunath, B.A., University College, Gower Street, W.C.2.
George Flaxman Underhay, B.Sc., Allerton, Woodside Avenue, Muswell Hill, N.10.
William Andrew Shakespeare Vardy, Winksley Vicarage, Ripon.

A Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of:

Suresh Chandra Sen, B.A., B.Sc., Mungpoo P.O., Riyang, D.H.Ry., India.

The following papers were read:

"The action of light on silver bromide." By E. J. HARTUNG.
"The structure of the benzene nucleus. Part I. Intra-nuclear tautomerism." By C. K. INGOLD.
"The structure of the benzene nucleus. Part II. Synthetic formation of the bridged modification of the nucleus." By C. K. INGOLD.
"The structure of the benzene nucleus. Part III. The suppression of intra-nuclear change." By C. K. INGOLD and H. A. PIGGOTT.
"Platinum catalyst for automatic gas lighters." By L. D. WILLIAMS.

Ordinary Scientific Meeting, held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, February 9th, 1922, at 8 p.m., SIR JAMES WALKER, D.Sc., LL.D., F.R.S., President, in the Chair.

SIR ERNEST RUTHERFORD, D.Sc., F.R.S., delivered his Lecture entitled "Artificial Disintegration of Elements." A vote of thanks to the Lecturer, proposed by Professor H. E. Armstrong, seconded by Professor F. G. Donnan, and supported by the Chairman, was carried with acclamation, and acknowledged by Sir Ernest Rutherford.

Ordinary Scientific Meeting, Thursday, February 16th, 1922, at 8 p.m., SIR JAMES WALKER, D.Sc., LL.D., F.R.S., President, in the Chair.

The PRESIDENT announced that the Society had lost, through death, the following Fellows:

	Elected.	Died.
Charles Baskerville	April 21st, 1898	Jan. 28th, 1922
George Gilbert Pond	April 22nd, 1903	May 20th, 1920

The following were formally admitted Fellows of the Chemical Society: A. N. Campbell, W. Davies, A. A. Davis, F. Dickens, A. S. Russell, P. M. Tookey, and M. Williams.

Certificates were read for the first time in favour of:

Frederick Mason Brewer, Lincoln College, Oxford.
Alfred Duncan Gay, 49, Thornlaw Road, West Norwood, S.E.27.
Douglas Cecil Henry, M.A., Hulme Hall, Victoria Park, Manchester.

William Hurst, 2, Edditch Grove, Tonge, Bolton.
Thomas Iredale, B.Sc., 94, Tyrwhitt Road, Brockley, S.E.4.
George Lewis Kennaby, B.Sc., Anglo-Persian Oil Co., Abadan, Persian Gulf.
George Allan Russell, B.Sc., A.I.C., Barnsheen, Ditton, Widnes.
Ernest Arthur Seeley, B.Sc., 10, Hamilton Road, N.5.
Brian Duncan Shaw, Ferns' Hollow, Station Road, Ilkeston.
Arthur Frederick Watson, M.Sc., A.I.C., Brockwell Hall, Herne Hill, S.E.23.
Llywelyn Williams, B.Sc., Herne Bay College, Kent.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of:

Walter Albert Lawrance, M.A., Ph.D., Bates College, Lewiston, Maine, U.S.A.

Messrs. R. Whytlaw Gray and F. G. Pope were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

Jnanendra Kumar Adhya, M.Sc.
Harry Charles Applebee, A.I.C.
Gilbert James Avey.
John William Baker, B.Sc.
Bhagwan Das Batta, B.Sc.
Arthur Frederick Bearpark.
Darrell Webb Beesley, A.I.C.
William Alfred Bishop, B.A.
Charles William Brisley, B.A.
Katharine Alice Burke, B.Sc.
Leslie James Burrage, B.Sc.
John Edward Byles, B.Sc., A.I.C.
Reginald Child.
George Hallatt Christie, M.Sc.
Gabriel Cofman-Nicoresti.
William Barry Courtney, B.Sc.
Bernard William Alfred Crutchlow.
Archibald Neil Currie, M.A., B.Sc., A.I.C.
James Owen Chesshyre Dalton, B.A.
Arthur William Edwards.
Samuel Ellingworth, M.Sc.
Kenneth Fisher, M.A., Ph.D.
William Alexander Frederikse.
Miri Lal Goel, M.Sc.
Frank Robert Goss, B.Sc.
Egerton Charles Grey, D.Sc., M.B.
Robert Charles Grimwood.
George Grimshaw Hammond, B.Sc.
William Allen Hamor, M.A.
Leslie Ralph Hart, B.Sc.
William Hume-Rothery, B.A.
Frank Mouat Irvine, B.Sc., A.I.C.
John Albert Jenkinson, B.Sc.
Rowland Nicholas Johnson, B.Sc.
Saral Jang Kohli, M.Sc.
David John Lake, B.Sc.
Hubert Langwell.
Vernon Howes Legg, B.Sc.
John Alexander McRae, M.A., Ph.D., F.I.C.
Marcus Aurelius Matthews, B.Sc.
Durban Roy Maxted, B.Sc.
Walter Thomas James Morgan.
John Sydney Morrison.
Edward John Owen, B.Sc.
Alfred Tennyson Parsons, B.Sc., A.I.C.
William Hamilton Patterson, M.Sc., A.I.C.
Partridge Leslie Podd, B.Sc.
Krishnarajpet Venkata Rau, B.A., B.Sc.
Frank Crafer Ray, B.A.
Suresh Chandra Sen, B.A., B.Sc.
Francis Malcolm Stevenson, B.Sc.
Jessie Stewart, B.Sc.
Gilbert Henry Tatner.
Leonard Beaumont Tansley, M.A.
George Taylor.
Robert William Murray Thomson, B.Sc.
James Rawson Walmsley, A.I.C.
Walter Arthur White.
William Persehouse Delisle Wightman.
Julius Wiseman, B.Sc.
Duncan Pax Woosley.
Robert Norman Wright, B.Sc., A.I C.

The following papers were read:

"A theoretical derivation of the principle of induced alternate polarities." By A. **Lapworth.**

"An explanation of the property of induced polarity of atoms and an interpretation of the theory of partial valencies on an electronic basis." By W. O. **Kermack** and R. **Robinson.**

"Some reactions of benzanthrone." By A. G. **Perkin** and G. D. **Spencer.**

"A rapid iodimetric estimation of copper and iron in mixtures of their salts." By I. W. **Wark.**

ANNUAL GENERAL MEETING.

The Annual General Meeting will take place on Thursday, March 30th, at 4.30 p.m. An Informal Meeting will be held the same evening at 8 p.m.

REPORTS ON THE PROGRESS OF APPLIED CHEMISTRY.

(*Issued by the Society of Chemical Industry.*)

The Society of Chemical Industry has generously offered to supply Volume VI of these Reports to Fellows of the Chemical Society, who are not Members of the Society of Chemical Industry, at the reduced price of 10/-, post free.

Orders, with remittance, should be sent to Dr. J. P. Longstaff, Secretary, Society of Chemical Industry, 46 and 47, Finsbury Square, London, E.C. 2.

ADDITIONS TO THE LIBRARY.

I. *Donations.*

Kingzett, Charles Thomas. The popular chemical dictionary. 2nd edition. London 1921. pp. viii + 540. (*Reference.*) 21*s.* net. From the Author.

Russell, T. H. The planning and fitting-up of chemical and physical laboratories. London 1903. pp. xx + 178. ill. (Second Copy.) (*Recd.* 10/1/22.) From the Author.

II. *By Purchase.*

Chamot, Émile Monnin. Elementary chemical microscopy. 2nd edition. New York 1921. pp. xvi + 480. ill. 25*s.* net. (*Recd.* 21/1/22.)

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, March 2nd, 1922, at 8 p.m., Dr. M. O. Forster, F.R.S., Treasurer, in the Chair.

It was announced that the Society had lost, through death, the following Fellows:

	Elected.	Died.
James Robert Appleyard..................	May 15th, 1890.	Oct. 1921.
Thomas Lynton Briggs	April 19th, 1883.	April 3rd, 1921.
Edward William Taylor Jones	April 6th, 1871.	Feb. 19th, 1922.

The following were formally admitted Fellows of the Chemical Society: F. B. Arnold, J. W. Baker, A. W. Edwards, F. R. Goss, H. Hunter, W. H. Patterson, F. C. Ray, and S. P. Schotz.

The following List of Nominations for vacant places on the Council, the names of those nominated by the Council being indicated by an asterisk, was read from the Chair:

Vice-Presidents who have filled the office of President (*two vacancies*).—*H. B. Dixon; *P. F. Frankland.

Vice-Presidents who have not filled the office of President (*two vacancies*).—*E. C. C. Baly; *T. M. Lowry.

Secretary (*one vacancy*).—*Irvine Masson.

Ordinary Members of Council: (*a*) Town Members, that is, those resident within 50 miles of Charing Cross (three vacancies).—C. Dorée; J. J. Fox; J. R. Partington. (*b*) Country Members, that is, those resident beyond 50 miles from Charing Cross (three vacancies).—*I. M. Heilbron; J. W. McBain; *W. H. Mills.

Certificates were read for the first time in favour of:

Brojo Kishore Banerjee, B.Sc., Jamshedpur Technical Institute, Tatanagar, India.

Benoy Bhusan Basu, B.Sc., M.B., 1/1, Nepal Bhattacherji's Street, Kalighat P.O., Calcutta.

Leslie Ashburn Dunn, 9, Pembroke Terrace, Bridlington.
Richard Fisher, Hudshaw House, Hexham, Northumberland.
Herbert Hodgson, 35, Ryan Street, Bradford.
Arthur Cyril Percy Lunn, King's College, Cambridge.
Robert Craig McDowall, 6, Ascog Street, Crosshill, Glasgow.
Akella Suryanarayana Rao, B.Sc., Vizagapatam, India.
Harry Lister Riley, 7, Trafalgar Square, Chelsea, S.W.3.
James Robinson, B.Sc., Milton High School, Bulawayo, S. Rhodesia.
Suhramania Sastry, B.A., 5, Krishnappa Naik Agraharam, Georgetown, Madras.

The following papers were read:

"New halogen derivatives of camphor. Part II. α'-Bromocamphor." By T. M. LOWRY, V. STEELE, and H. BURGESS.

"The rotatory dispersive power of organic compounds. Part X. The preparation and properties of pure ethyl tartrate." By T. M. LOWRY and J. O. CUTTER.

"The molecular configuration of polynuclear aromatic compounds. Part I. The resolution of γ-6 : 6'-dinitro- and 4 : 6 : 4' : 6'-tetranitrodiphenic acids into optically active components." By G. H. CHRISTIE and J. KENNER.

Ordinary Scientific Meeting, Thursday, March 16th, 1922, at 8 p.m., SIR JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

A. T. Parsons was formally admitted a Fellow of the Chemical Society.

Certificates were read for the first time in favour of:

John William Blagden, M.A., Ph.D., F.I.C., Apple Tree House, Grove Road, Woodford, E.18.
Charlie Lyons Carter, M.Sc., 9, Carr Street, N.E. Valley, Dunedin, N.Z.
Arthur Rockett Chadwick, Corporation Sewage Works, Marley, Keighley.
Douglas Creese Harrison, B.Sc., 18, Church Crescent, Muswell Hill, N. 10.
Henry Unwin Harrow, 13, Southwark Bridge Road, S.E. 1.
Ethel Mary James, B.Sc., 1, Rusham Road, Balham, S.W. 12.
Edward Ingleson Lawson, 65, Warrington Road, Newcastle-on-Tyne.
John Mylne Mullaly, 14, Bardwell Road, Oxford.
Harold Edward Charles Powers, B.Sc., 4, Grove Crescent, Woodford, E. 18.
Albert W. Smith, B.S., Ph.D., Case School of Applied Science, Cleveland, Ohio, U.S.A.
Clarence Stott, B.Sc., A.I.C., Benroyd, Holywell Green, Halifax.
William Thomas, B.A., M.Sc., A.I.C., Penfro, Stoneywood, Aberdeen.
John George Walters, B.Sc., 46, Durham Road, East Finchley, N. 2.
William Wallace Watt, 29, Woodstock Road, Golders Green, N.W. 4.
Harry Alexander Wood, Santa Elena, Entre Rios, Argentine.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2):

Harilal Basu, P.O. Box 84, Rangoon, Burma.

The following papers were read :

Change of properties of substances on drying." By H. B. BAKER.

' The influence of nitro-groups on the reactivity of substituents in the benzene nucleus. Part VI. The elimination of halogen during the reduction of halogenated nitro-compounds." By H. BURTON and J. KENNER.

REPORTS ON THE PROGRESS OF APPLIED CHEMISTRY.

(*Issued by the Society of Chemical Industry.*)

The Society of Chemical Industry has generously offered to supply Volume VI of these Reports to Fellows of the Chemical Society, who are not Members of the Society of Chemical Industry, at the reduced price of 10*s*. post free.

Orders, with remittance, should be sent to Dr. J. P. Longstaff, Secretary, Society of Chemical Industry, 46 and 47, Finsbury Square, London, E.C.2.

ADDITIONS TO THE LIBRARY.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, MAY 4TH, 1922.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

BANERJEE, BROJO KISHORE, Jamshedpur Technical Institute, G. Town, Jamshedpur, Tatanagar, India. Assistant, Chemical and Analytical Department, Jamshedpur Technical Institute, Tatanagar, India. B.Sc. (Calcutta University). Read up to M.Sc. Chemistry with Inorganic Chemistry as special subject in the post-graduate classes of the Calcutta University. Had been assistant in the Chemical and Metallurgical Dept. of the Bengal Engineering College, Sibpur, India, for two and a half years nearly. Now assistant in the Chemical and Analytical Dept. of the Jamshedpur Technical Institute since August 1921. Lecturing on General Inorganic Chemistry since March 1919. (*Signed by*) R. N. Sen, P. C. Chattopadhyay, J. Bhaduri.

BASU, BENOY BHUSAN, 1/1, Nepal Bhattacherji's Street, Kalighat P.O., Calcutta, India. B.Sc., M.B. Assistant Chemical Analyst to the Calcutta Corporation, intending to keep in touch with the modern advancement in Chemistry and the chemical world. (*Signed by*) B. N. Ghosh, T. K. Ghose, K. B. Sen.

BENNETT, GEORGE MACDONALD, 94, Mercers Road, Tufnell Park, N.19. Demonstrator, Chemical Department, Guy's Hospital Medical School. B.A., M.Sc. (London), M.A. (Cantab.), F.I.C. Fellow of St. John's College, Cambridge. Author of several papers in the Transactions since 1913. (*Signed by*) C. S. Gibson, D. C. Vining, Eustace E. Turner, H. C. Bell.

BLAGDEN, JOHN WILLIAM, Apple Tree House, Grove Road, Woodford, E.18. Head of Research Dept., Messrs. Howards & Sons, Ilford. M.A. (Cantab.), Ph.D. (Würzburg), F.I.C. 1899–1900 Demonstrator at the Electrochemical Institute of the Polytechnic, Darmstadt. 1900–1914 Research Chemist with Messrs. Boehringer & Sons, Mannheim. (1914–1919 Civilian Prisoner of War at Ruhleben.) 1919–1922 with Messrs. Howards & Sons as above stated. (*Signed by*) H. B. Baker, J. T. Hewitt, M. O. Forster.

BREWER, FREDERICK MASON, 42, Aberdeen Park, London, N.5. Student. Science Scholar of Lincoln College, Oxford. (*Signed by*) W. H. Perkin, T. W. J. Taylor, D. Ll. Hammick, E. Hope, S. G. P. Plant, N. V. Sidgwick.

BROOKS, ERIC SYKES, M.P.S., Verandah Buildings, Dalton-in-Furness, Lancs. Chemist. Member of Pharmaceutical Society of Great Britain. Student of Chemistry for the past eight years, also as private coach for elementary chemistry. (*Signed by*) Alex. W. McLaren, Chas. Morton, Alfred Thomas.

Brumfitt, Fred, 123, Tennyson Place, Bradford. Director and Manager, Wholesale Druggists. Diploma Chemistry and Dyeing, Bradford Technical College. Wholesale Druggist. (*Signed by*) V. Steele, F. W. Richardson, Barker North.

Butler, Carlton, B.Sc., A.I.C., 23, Winifred Road, Urmston, nr. Manchester. Research Student in the Victoria University of Manchester. Lanc. C.C. Scholar 1917. Served Sp. Brig. R.E. until Jan. 1919. First Class Honours Chemistry 1921. Research, and part-time demonstrator, session 1921–22. (*Signed by*) H. B. Dixon, Colin Campbell, Frederick Challenger, Henry Stephen.

Carter, Charlie Lyons, 9, Carr Street, N.E. Valley, Dunedin. Lecturer on Chemistry, Otago University, Dunedin, New Zealand. M.Sc. with 1st Class Honours in Chemistry, N.Z., 1919. A.I.C. (London), 1921. Demonstrator in chemistry, Otago University, 1917–19. Lecturer on Chemistry, 1919. Publication : "Mutton-bird Oil," *Jour. Soc. Chem. Ind.*, Sept. 1920, p. 220. (*Signed by*) J. K. H. Inglis, J. Williams, C. S. Hicks.

Chadwick, Arthur Rockett, Corporation Sewage Works, Marley, Keighley. Chemist and Manager, Keighley Corporation Sewage Works. Eighteen and a half years' experience in the Chemistry of Sewage Disposals. Chemist and Manager, Keighley Corporation Sewage Works for two years. Chemist and Manager, Bingley U.D.C. Sewage Works for five years. Chemist and Manager, Prestwich U.D.C. Sewage Works for one and a half years. Chemist and under-Manager at the Thornhill Sewage Works of the County Borough of Dewsbury for ten years. Eight years student at the Dewsbury Technical School in Chemistry and Allied Subjects, and hold Board of Education certificates for all stages. I desire to join your Society so that I can keep in touch with modern methods of water, sewage and trades-waste purification, to obtain your publications and to have the use of your library. (*Signed by*) James H. Kershaw, Herbert J. Taylor, John Senior.

Dunn, Leslie Ashburn, 9, Pembroke Terrace, Bridlington. Assistant Works Chemist, employed by Messrs. Raines & Porter, Ltd., Hull. Was educated at Bridlington School (by scholarship). Studied Chemistry (inorganic, organic, and industrial) at Hull Technical College. Served with 1st E. Yorks. Regt. during the war. Finally assistant to T. A. Nightscales, Esq., F.C.S. (*Signed by*) Thos. A. Nightscales, Harry Thompson, W. Geary.

Fisher, Richard, Hudshaw House, Hexham, Northumberland. Student. During war I was employed in the Hydrophone Department of the Navy (Special Technical Branch). After the war I took up Medical Studies and have always wished for up-to-date chemical information. (*Signed by*) F. C. Garrett, C. R. Gent, John Gibson.

Freeth, Francis Arthur, Heather Croft, Hartford. Chief Chemist, Messrs. Brunner, Mond & Co., Ltd. M.Sc. (Liv.), F.I.C., F.Inst.P., O.B.E. (*Signed by*) F. G. Donnan, W. E. Garner, Henry Terrey, Irvine Masson.

Gay, Alfred Duncan, 49, Thornlaw Road, West Norwood, S.E.27. Analytical Chemist. Three years Junior Assistant to Dr. Bernard Dyer. Fifteen months Assistant Chemist to The Magadi Soda Co., Ltd., B.E.A. Recently engaged as Analytical Chemist to Schweppes, Ltd., Mineral Water Manufacturers. (*Signed by*) R. Lessing, Bernard Dyer, Wm. H. Woodcock, George Taylor.

Harrison, Douglas Creese, 18, Church Crescent, Muswell Hill, London, N.10. Research Student in Organic Chemistry under Prof. Smiles at King's College, London. Passed Exam. for B.Sc. (London) with 1st Class Honours, with Chemistry as principal subject and Physics subsidiary. (*Signed by*) Samuel Smiles, A. J. Allmand, A. Fairbourne.

Harrison, Thomas Weatherill, 18, Elfindale Road, S.E.24. Chemist, Government Laboratory, London. B.Sc. (London). F.I.C. "Titration with Permanganate in Presence of Hydrochloric Acid." "The Action of Dimethyl Sulphate upon Oils of the Aromatic and Aliphatic Series." (*Signed by*) E. Grant Hooper, Geo. Stubbs, J. J. Fox.

Harrow, Henry Unwin, 13, Southwark Bridge Road, S.E.1. Senior Assistant Chemist, Barclay, Perkins' Brewery. Inter. B.Sc. (London), 1906. Chemist, South African Breweries, Johannesburg, from 1913 to 1920. Sitting for B.Sc. Hons. (London) in 1923 (October). (*Signed by*) J. Kenyon, J. L. White, S. Greenberg.

Henry, Douglas Cecil, M.A., Hulme Hall, Victoria Park, Manchester. Lecturer in Chemistry at the University of Manchester; Fellow of Trinity College, Cambridge; late Coutts-Trotter Scholar. Two years' research work, not at present published, on Adsorption from Solution, the results embodied in a thesis; won a Fellowship of Trinity College, Cambridge (Oct. 1921). Teaching experience—two years' coaching and tutorial work for Trinity, Cambridge. Lecturing and demonstrating at Manchester. (*Signed by*) Harold B. Dixon, Arthur Lapworth, F. P. Burt, J. E. Myers, Henry Stephen, Angus F. Core, Colin Campbell.

Hodgson, Herbert, 35, Ryan Street, Bradford, Yorks. Analytical Chemist. Over twenty years assistant to Mr. F. W. Richardson, City Analyst of Bradford, and County Analyst of W.R. of Yorks. Also with the firm of Messrs. Richardson & Jaffé, Industrial Chemists. Experience in most branches of Analytical Chemistry. Also with R.E. "Anti-Gas," University College, London. (*Signed by*) F. W. Richardson, A. Jaffé, Geoffrey A. Bracewell.

Holmes, Eusebius, Eastern Green, Coventry. Student of Chemistry. Qualified for B.Sc. (Birm.). Desiring access to recent chemical literature. (*Signed by*) C. E. Wood, Wm. Wardlaw, F. Ashley Cooper.

Hurst, William, 2, Edditch Grove, Tonge, Bolton. Analytical and Manufacturing Chemist, c/o Thos. Moscrop & Co., Bolton, Oil Blenders and Refiners, Lubricants, etc. 1st Class Certificates, Lancs. and Cheshire Inst.: Mathematics 3rd year, and Chemistry, Inorganic and Organic, 4th year. Final Certificate of The City and Guilds Inst., London, in Oils, Fats, and Waxes. Two and a half years' Senior Chemistry Course (full time), Mining and Technical College, Wigan, 1919–1921. At present attending the College of Technology, Manchester. (*Signed by*) John Allan, Frank Lee Pyman, E. B. Naylor, T. H. Winstanley.

Iredale, Thomas, 94, Tyrwhitt Road, St. Johns, S.E.4. Scholar of the 1851 Exhibition. B.Sc. (Sydney, Australia), 1919. Have since been engaged in research. Papers published in Transactions of Chem. Soc. (1921). *Signed by*) F. G. Donnan, I. W. Wark, E. J. Hartung, D. C. Jones.

James, Ethel Mary, 1, Rusham Road, Balham, S.W.12. Assistant Science Mistress, Clapham County Secondary School, S.W.11. B.Sc. (Lond.); Hons. Chem. 1920, after studying at Bedford College from 1916–20. At present teacher of chemistry at the above school. (*Signed by*) Holland Crompton, J. F. Spencer, M. S. Crewdson.

Kennaby, George Lewis, Abadan, Persian Gulf. Chemist. B.Sc.

(London), 3rd Class Honours in Chemistry, 1920, since which I have been working for the Anglo-Persian Oil Co. at their refinery in Persia. I am desirous of keeping in touch with the recent developments in chemistry with the object of taking my A.I.C. at some future date. (*Signed by*) F. G. Donnan, W. E. Garner, Irvine Masson, Henry Terrey.

Lawson, Edward Ingleson, 65, Warrington Road, Newcastle-on-Tyne. Teacher of Chemistry at Dame Allan's School, Newcastle-on-Tyne. Student of Chemistry for four years at Leeds University. Teacher of Chemistry for four years at Newcastle. (*Signed by*) J. R. Scott, R. M. Woodman, John Stanley Carter, Edgar Rhodes.

Lunn, Arthur Cyric Percy, King's College, Cambridge. Student. Part I Nat. Science Tripos, 1921. Taking Part II (Chemistry, May 1922). (*Signed by*) Hamilton McCombie, Harold A. Scarborough, A. E. Cashmore, C. T. Heycock, W. H. Mills, Douglas F. Harrison.

McDowall, Robert Craig, 6, Ascog Street, Crosshill, Glasgow. Analytical Chemist to Messrs. Perry & Hope, Ltd., Forth & Clyde Chemical Works, Nitshill. Cream of Tartar Subs., Malt Extract, Food Products generally 1904–1911 (7 years). Technical and Chemical Adviser to Messrs. Craig, McDowall & Co., Thornliebank, Glasgow, Cream of Tartar Subs., Baking Powders, and other Food Products, Mag. Sulph., Ferro Sulph., Soda Sulph., etc., 1911–1915 (4½ years). Glasgow Highlanders, H.M. Forces, 1915–1918 (3½ years). Technical Chemist and Representative, also Process Superintendent to Messrs. Perry & Hope, Ltd., Forth & Clyde Chemical Works, Nitshill, 1918–1922 (4 years). Having been connected for the past sixteen years with the manufacture and analysis of foodstuffs I am desirous of keeping in touch with all latest books and papers appertaining to same. (*Signed by*) James Booth, J. Turnbull, Herbert Lorenz, W. McHutchison.

Manjunath, Lingaiah Basavalingaiah, London. Student of the London University. B.A. degree in Chemistry of the Madras University. At present a student for the London M.Sc. degree in Chemistry in the University College. (*Signed by*) O. L. Brady, E. H. Thierry, J. N. E. Day.

Mullaly, John Mylne, 14, Bardwell Road, Oxford. Student of Chemistry. Part author of paper *Trans. Chem. Soc.* CXIX, p. 1802 (1921). Commoner of Balliol College. (*Signed by*) H. Hartley, C. N. Hinshelwood, E. J. Bowen, H. R. Raikes.

Powers, Harold Edward Charles, 4, Grove Crescent, Woodford, E.18. Analytical Chemist. B.Sc. Hons. (2nd Class). About six years' practical experience in technical laboratory. (*Signed by*) Hugh Main, George Senter, F. Barrow, S. Sugden, Alfred J. White.

Rao, Akella Suryanarayana (Junior), Vizagapatam, India. B.Sc. in Chemistry, Botany (National University, Adyar, Madras). I intend joining the Society fully believing that by doing so I shall be in the know of the recent work in chemistry, which would be of immense use to me as a prospective research chemist. (*Signed by*) T. S. Natrajan, S. N. Dhar, K. C. Viraraghavan.

Riley, Harry Lister, 7, Trafalgar Square, Chelsea, S.W.3. Student (Research) at the Royal College of Science. A.R.C.Sc. and B.Sc. (Hons.) London. (*Signed by*) H. B. Baker, James C. Philip, J. N. Sugden, H. J. T. Ellingham, A. A. Eldridge.

Robinson, James, Bulawayo, S. Rhodesia. Science Master, Milton High School, Bulawayo. B.Sc., Univ. of Wales. Completed 1st year London Final Sc. Course in Mechanical Engineering (Matriculated 1st Div. Inter. Sc., London). Completed advanced practical courses on Fibres, Detergents, Alkaloids, Assays. One session's research work on "The Action of SO_2, Sulphites, Meta-bisulphate on various Peroxides (BaO_2, H_2O_2, CeO_2, PbO_2) in Comparison with MnO_2 and with the action on $K_2Mn_2O_8$,CrO_3, and Persulphates as Oxidising Agents," under Prof. Herbert Jackson, King's College, London. (*Signed by*) Geo. A. Pingstone, Arthur Slator, A. L. Stern.

RUSSELL, GEORGE ALLAN, Barnsheen, Ditton, Widnes. Chemist to Messrs. T. Vickers & Sons, Ltd., Phosphate Works, Widnes. B.Sc. (Dun.). A.I.C. Five years' laboratory and works experience with the United Alkali Co., Ltd., Widnes, in the manufacture of monochlorbenzene, chloracetic acid, and concentration of sulphuric acid, and subsequently two and a half years' (to date) experience with Messrs. T. Vickers & Sons, Ltd., Widnes, in the manufacture of sulphuric acid, Fertilisers and Phosphate of Soda, and in the corresponding analytical work. (*Signed by*) F. C. Garrett, J. A. Smythe, P. L. Robinson, John W. Towers, *John Hargreaves.*

SASTRY, M. SUHRAMANIA, 5, Krishnappa Naik Agraharam, Georgetown, Madras, India. Chemical Assistant, Government Leather Trades Institute, Madras. B.A. (Madras). Post Graduate Course for two and a half years (Madras University). Chemical Assistant. (*Signed by*) Kalyan C. Srinivasan, T. S. Natrajan, K. C. Viraraghavan, *S. N. Dhar.*

SEELEY, ERNEST ARTHUR, 10, Hamilton Road, London, N.5. Chemical Research Student. B.Sc. 1st Class Hons. Chem. (Lond.), A.R.C.S. (1st Chem.). D.I.C. (Organic Chemistry Research). (*Signed by*) Jocelyn Thorpe, C. K. Ingold, L. C. Nickolls.

SHAW, BRIAN DUNCAN, Ferns' Hollow, Station Road, Ilkeston. Student. Second Year Hon. Chem. Student (for B.Sc. Lond.) at University College, Nottingham. (*Signed by*) F. S. Kipping, F. C. Laxton, G. Green.

SMITH, ALBERT W., Case School of Applied Science, Cleveland, Ohio, U.S.A. Professor of Chemistry. Graduate of Chemical Dept. of Case School of Applied Science (B.S.). University of Zürich, Switzerland (Ph.D.). (*Signed by*) Olin F. Tower, Chas. F. Guhlmann, Chas. H. Herty.

STOTT, CLARENCE, Benroyd, Holywell Green, nr. Halifax. Works Chemist. (*a*) B.Sc. (Leeds); (*b*) A.I.C.; (*c*) Diploma in Gas Engineering (Leeds); (*d*) War Service: Army, 4½ years; B.E.F. France, 3½ years; rank: Capt. The last two years of service overseas were spent in Chemical Warfare as Gas Officer to the 49th (West Riding) Division. Honours: (1) Mentioned in Despatches; (2) Military Cross. (*e*) Works experience: 1¾ years' laboratory and plant experience with the Farnley Iron Co., nr. Leeds. (*Signed by*) John W. Cobb, Arthur Smithells, Herbert Ingle.

THOMAS, WILLIAM, Penfro, Stoneywood, Aberdeen. Lecturer in Chemistry, University, Aberdeen. M.Sc. (Wales). B.A. (Cantab.). A.I.C. (*Signed by*) Alex. Findlay, T. Harold Reade, Edward Bloom.

UNDERHAY, GEORGE FLAXMAN, Allerton, Woodside Avenue, Muswell Hill, N.10. Research at University College, London. 2nd Class Honours B.Sc. (Chemistry). Now engaged on research under Prof. F. G. Donnan, C.B.E., F.R.S., at University College. (*Signed by*) F. G. Donnan, J. N. Collie, Irvine Masson, O. L. Brady.

VARDY, WILLIAM ANDREW SHAKESPEARE, Winksley Vicarage, Ripon. Analytical Chemist, relinquished on account of ill-health. Late Student in Science and Member of Ripon G.S. Scientific Society. Analytical Chemist. (*Signed by*) A. Mortimer, Barker North, T. W. Price.

WALTERS, JOHN GEORGE, 46, Durham Road, East Finchley, N.2. Teacher. B.Sc. (London). Senior Chemistry Master, County Secondary School, Hendon, N.W.4. Late Commandant XVII Corps Gas School, B.E.F., and Chemical

Adviser XVII Corps, B.E.F. (*Signed by*) T. J. Drakeley, P. Schidrowitz, Raymond R. Butler.

WATT, WILLIAM WALLACE, 29, Woodstock Road, Golders Green, N.W.4. Consulting Petroleum Technologist. Chief Chemist, Burmah Oil Co., Rangoon (13½ years). Technical Staff (London), Anglo-Persian Oil Co. (1½ years). Deputy Controller of Oil to H.M. Govt. of India (1 year). Technical Adviser Caltex Oil Co., London (1½ years). (*Signed by*) F. B. Thole, A. E. Dunstan, J. C. Crocker, F. Arnall.

WATSON, ARTHUR FREDERICK, Brockwell Hall, Herne Hill, S.E.23. Research Chemist. University College, London, 1913–15, 1919–21; B.Sc. (War) degree, 1917. B.Sc. (Honours Chemistry), 1920. A.I.C. 1921. Research in Biological Chemistry, 1920–1921. M.Sc. (Physiological Chemistry), 1921, London. (*Signed by*) J. C. Drummond, Irvine Masson, F. G. Donnan.

WILLIAMS, LLYWELYN, Herne Bay College, Kent. Assistant Master. B.Sc. (Wales) in Chemistry and Physics. My present appointment is that of Senior Science and Mathematics Master at Herne Bay College, Kent. (*Signed by*) T. Campbell James, C. R. Bury, L. J. Hudleston.

WOOD, HARRY ALEXANDER, Santa Elena, Entre Rios, Argentine Republic. Industrial Chemist. (*a*) Analytical Assistant to Prof. James Hendrick, B.Sc., F.I.C., Professor of Agriculture, Aberdeen University (3 years); (*b*) Analytical Assistant to Dr. J. F. Tocher, F.I.C., Public Analyst and Official Agricultural Analyst (3 years); (*c*) Works Chemist: Establecimientos Argentinos de Bovril Santa Elena, Entre Rios, Argentine Republic (1½ years). (*Signed by*) James Hendrick, J. F. Tocher, A. Searl.

The following Certificates have been authorised by the Council for presentation to ballot under Bye-law I (2):

BASU, HARILAL, Care of the Inspector-General of Civil Hospitals, Burma, Rangoon, Post Box No. 84. Civil Surgeon and District Public Health Officer of Yamethin District and Superintendent of Yamethin District Jail (Prison). L.M. & S. (Calcutta University). A good and successful student in the chemistry classes and always takes special interest in practical chemical work. Registered Medical Practitioner of the British Medical Council (London). Attended pulp making from bamboo for making of paper. Wants to do research work in chemistry. (*Signed by*) L. B. Seal, M. Hunter.

LAWRANCE, WALTER ALBERT, Lewiston, Maine, U.S.A. Professor of Chemistry, Bates College. Degrees: B.A., M.A. (McMaster); M.A., Ph.D. (Toronto). "Poly-nitro-compounds," *Proc. Royal Soc. Can.*, May 1918. "Friedel-Crafts' Reaction," *J. Am. Chem. Soc.*, Sept. 1920. "Friedel-Crafts' Reaction," *J. Am. Chem. Soc.*, Dec. 1921. "Friedel-Crafts' Reaction," *J. Am. Chem. Soc.* (in course of publication). (*Signed by*) W. Lash Miller.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, April 6th, 1922, at 8 p.m., PROFESSOR H. E. ARMSTRONG, LL.D., F.R.S., Vice-President, in the Chair.

Reference was made to the loss sustained by the Society, through death, of:

	Elected.	Died.
Philippe Auguste Guye (Honorary Fellow)	Mar. 7th, 1912.	Mar. 27th, 1922.
Seward Whiting Williams	June 18th, 1891.	Aug. 25th, 1921.

It was announced—

(1) That in order to commemorate the centenary of the birth of Pasteur the University and town of Strasbourg have decided to erect a statue facing the University where, as a professor, Pasteur commenced his career. The inauguration ceremonies, under the patronage of the President of the Republic and other distinguished men, will be held on May 1st, 1923, and will include the unveiling of the statue and the opening of an Exhibition of Hygiene and Bacteriology.

With the object of evincing the sympathy of this country with the project in view, a British Committee has been formed of the following: Chairman, Sir Charles Sherrington, G.B.E. (President of the Royal Society), Treasurer, Mr. A. Chaston Chapman, F.R.S. (President of the Institute of Chemistry), Mr. H. E. Field (President of the Institute of Brewing), Professor Percy F. Frankland, C.B.E., F.R.S., Sir John M'Fadyean, M.R.C.V.S., LL.D. (Principal of the Royal Veterinary College), Professor C. J. Martin, C.M.G., F.R.S. (Director of the Lister Institute), Sir William J. Pope, K.B.E., F.R.S., Sir James Walker, F.R.S. (President of the Chemical Society), and Sir Almroth Wright, K.B.E., F.R.S. (Principal of the Institute of Pathology and Research).

It is hoped there may be many British chemists desirous of contributing to the Memorial Fund. Contributions may be sent to Monsieur Th. Héring, 6, Rue des Veaux, Strasbourg, or to Mr. A. Chaston Chapman, Institute of Chemistry, 30, Russell Square, W.C. 1. The subscription list will close about the end of next June.

Manufacturers and business firms in this country to whom the Exhibition may be of interest are cordially invited to offer assistance, and those able and willing to do so should communicate with Professor Borrel, 3, Rue Koeberlé, Strasbourg.

(2) That the following Committees for 1922—1923 had been appointed by the Council:

Finance Committee.—Messrs. E. F. Armstrong, A. Chaston Chapman, C. A. Hill, G. T. Moody, and the Officers.

House Committee.—Messrs. J. L. Baker, Sir Herbert Jackson, Alexander Scott, Sir William A. Tilden, E. W. Voelcker, and the Officers.

Library Committee.—Messrs. P. P. Bedson, O. L. Brady, Sir Thomas K. Rose, E. J. Russell, J. M. Thomson (Chairman), Sir William A. Tilden, the Editor, the Librarian, and Officers, together with the following representatives of contributing Societies: Messrs. J. L. Baker, C. Dorée, J. C. Drummond, A. Harden, C. A. Keane, R. L. Mond, and G. Senter.

Publication Committee.—Messrs. A. J. Allmand, O. L. Brady, C. H. Desch, I. M. Heilbron, J. T. Hewitt, J. C. Irvine, H. King, T. M. Lowry, J. W. McBain, R. H. Pickard, N. V. Sidgwick, J. F. Thorpe, and the Officers.

Research Fund Committee.—Messrs. H. B. Baker, D. L. Chapman, Sir James J. Dobbie, F. G. Donnan, G. G. Henderson, F. S. Kipping, R. H. Pickard, Sir William J. Pope, R. Robinson, S. Smiles, and the Officers.

The following were formally admitted Fellows of the Chemical Society: H. B. Courtney and G. Thompson.

Certificates were read for the first time in favour of:

George Baborovský, Ph.D., Falkensteinerova ul. 7, Brno, Czecho-Slovakia.
Stanley John Bailey, B.A., The Braes, South Nutfield, Redhill.
Robert Stanley Colborne, B.Sc., A.R.C.S., 57, County Road, Swindon.
James Brierley Firth, D.Sc., F.I.C., 44, Lucknow Avenue, Mapperley Park, Nottingham.
Dorothea Annie Hoffert, 50, Hampstead Way, N.W. 11.
Ralph Henry Parker, Radio House, Wilson Road, Smethwick, Staffs.
Edmond Samuels, 40, Castlereagh Street, Sydney, N.S.W.
Ronald William Stevenson, M.C., M.A., Eaglehurst, Ditton Hill, Surbiton.

A Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of:

Robert Swainson-Hall, Government Plantations Department, Victoria, British Cameroons, West Africa.

The following papers were read:

"Constitution of picrorocellin, a nitrogenous constituent of *Roccella fuciformis*." By M. O. Forster and W. B. Saville.

"The determination of surface tension from the maximum pressure in bubbles." By S. Sugden.

"The variation of refractive index and specific gravity of benzene with temperature." By W. B. Parker and G. Thompson.

"The influence of substituents on the formation and stability of heterocyclic compounds. Part I. Hydantoins." By C. K. Ingold, S. Sako, and J. F. Thorpe.

ORDINARY SCIENTIFIC MEETING.

The next Ordinary Scientific Meeting will be held on Thursday, May 4th, 1922, at 8 p.m., when a ballot for the election of Fellows will be held.

INFORMAL MEETING.

The next Informal Meeting will be held on Thursday, May 18th, 1922, after the conclusion of the formal business of the Ordinary Scientific Meeting, to be held at 8 p.m.

RESEARCH FUND COMMITTEE.

A meeting of the Research Fund Committee will be held in June next. Applications for Grants, to be made on forms which can be obtained from the Assistant Secretary, Chemical Society, Burlington House, W. 1., must be received on or before Thursday, June 1st, 1922.

All persons who receive grants in June, 1921, or in June of any previous year, whose accounts have not been declared closed by the Council, are reminded that reports must be returned by Thursday, June 1st.

SETS OF THE BERICHTE AND OF THE ZENTRALBLATT.

The Society still has a few remaining sets of the *Berichte* and of the *Zentralblatt* from August, 1914, to December, 1920, inclusive, for disposal. These can be obtained, in complete sets only, from the Assistant Secretary, price £10 per set of the *Berichte*, and of the *Zentralblatt*.

The number of sets is strictly limited and application should be made without delay.

LIST OF FELLOWS, 1922.

The Council has decided to supply the List of Fellows for 1922 to those Fellows only who make application to the Assistant Secretary before August 31st, 1922.

ADDITIONS TO THE LIBRARY.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, May 4th, 1922, at 8 p.m., Professor J. F. THORPE, C.B.E., F.R.S., Vice-President, in the Chair.

The CHAIRMAN referred to the loss sustained by the Society, through death, of the following Fellows :

	Elected.	Died.
Sir William Phipson Beale	Dec. 5th, 1867.	April 13th.
Joseph Albert Hughes	Dec. 3rd, 1908.	Jan. 9th.
Charles Mann Luxmoore	Feb. 16th, 1893.	April 16th.
James Morris	May 1st, 1919.	Mar. 31st.

The CHAIRMAN announced :

1. That the Council had sealed the following Address of Congratulation to be presented to the Royal University of Padua on the celebration of the Seven Hundredth Anniversary of its Foundation to be held on May 14th to 17th, 1922 :

THE CHEMICAL SOCIETY

TO

THE RECTOR, SENATE, PROFESSORS AND ALUMNI

OF THE

ROYAL UNIVERSITY OF PADUA.

On behalf of the Chemical Society, we have the honour to convey our warmest felicitations on the celebration of the Seven Hundredth Foundation Anniversary of the Royal University of Padua.

The knowledge that your University flourished in the 13th century, that six hundred years ago it pointed the way of learning to the peoples—not only of Italy, but of Europe—and that inscribed on the roll of its learned professors in science are to be found the immortal names of Galileo and Morgagni, is indeed an inspiration to the whole world. It is our earnest wish that the lamp of learning, kindled so long ago in your ancient University, may continue to burn with increasing radiance.

In the name of the Fellows and Council of the Chemical Society we welcome this happy opportunity of recording our deep appreciation of the commanding position achieved by your University in the advancement of knowledge, uniting therewith our most sincere wishes for the continued prosperity of this illustrious and venerable seat of learning.

Signed on behalf of the Council of
The Chemical Society.
JAMES WALKER, President.
M. O. FORSTER, Treasurer.
IRVINE MASSON, } Secretaries.
JAMES C. PHILIP, }
ARTHUR W. CROSSLEY, Foreign Secretary.

L.S.

Sealed in Council this Fourth day of May, One Thousand Nine Hundred and Twenty-Two.

2. That Mr. G. H. Gabb had presented to the Society's collection a medal of Joseph Priestley, executed by Halliday about 1804. The inscription on the reverse of the medal is taken from the tablet erected in the new Meeting House, Birmingham, to the memory of Priestley and was written by Dr. Parr.

The following were formally admitted Fellows of the Chemical Society: P. Appleyard, K. A. Burke, M. H. Cocks, K. J. Isaac, L. O. Kekwick, and H. L. Saunders.

Certificates were read for the first time in favour of:

Frank Belton, B.Sc., Athlone, Bush Hill Park, Enfield.
Robert Keith Cannan, M.Sc., 4, Antrim Mansions, N.W. 3.
Bibhu Charan Chatterjee, M.Sc., University College of Science, 92, Upper Circular Road, Calcutta, India.
Shiavaksha Hormasji, Contractor, Karanjia Building, opp. Moos Building, Grant Road, Bombay, India.
Margaret White Fishenden, D.Sc., 19, Shepherd's Hill, Highgate, N. 6.
Frederick Walter Goddard, M.A., 12, College Street, Winchester.
Edmund Langley Hirst, M.A., B.Sc., Ph.D., Ainslie Villa, Largo Road, St. Andrews.
William Job Jenkins, 37, Marston Road, Knowle, Bristol.
Peppo Joseph Levy, 42, Granville Gardens, Shepherd's Bush, W. 12.
David McCall, B.Sc., 4, Lime Street, Dundee.
Richard Edmund Anthony Mallet, B.A., Redford, Ockley, Surrey.

Ronald George Wreyford Norrish, B.A., Emmanuel College, Cambridge.
John Goodrich Oats, 3, Montpelier Terrace, Ilfracombe.
Claude Bernard Meister Platt, M.B.E., Middleton House, Beckett Road, Doncaster.
Arthur Plowman, B.Sc., A.R.C.S., A.I.C., 8, Rowantree Road, Bycullah Park, Enfield.
John Pryde, B.Sc., 4, Gowrie Street, Blackness Avenue, Dundee.
Juda Hirsch Quastel, B.Sc., A.R.C.S., A.I.C., Trinity College, Cambridge.
John Charles Smith, B.Sc., 31, Bidwell Street, Wellington, N.Z.
Valerie Emeline Sophie Swainson, B.Sc., 21, Hungerford Road, N. 7.
Nowroji Jamshedji Vazifdar, 17, Queens Road, opp. Charin Road Station, Bombay, India.
George William Wigg, 72nd Northumbrian Bde., R.F.A., Barrack Road, Newcastle-on-Tyne.

Messrs. C. Gilling and J. Reilly were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

Brojo Kishore Banerjee, B.Sc.
Benoy Bhusan Basu, B.Sc., M.B.
Harilal Basu.
George Macdonald Bennett, M.A., M.Sc., F.I.C.
John William Blagden, M.A., Ph.D., F.I.C.
Frederick Mason Brewer.
Eric Sykes Brooks.
Fred Brumfitt.
Carlton Butler, B.Sc., A.I.C.
Charlie Lyons Carter, M.Sc., A.I.C.
Arthur Rockett Chadwick.
Leslie Ashburn Dunn.
Richard Fisher.
Francis Arthur Freeth, M.Sc., F.I.C.
Alfred Duncan Gay.
Douglas Creese Harrison, B.Sc.
Thomas Weatherill Harrison, B.Sc., F.I.C.
Henry Unwin Harrow.
Douglas Cecil Henry, M.A.
Herbert Hodgson.
Eusebius Holmes, B.Sc.
William Hurst.
Thomas Iredale, B.Sc.
Ethel Mary James, B.Sc.
George Lewis Kennaby, B.Sc.
Walter Albert Lawrance, M.A., Ph.D.
Edward Ingleson Lawson.
Arthur Cyric Percy Lunn, B.A.
Robert Craig McDowall.
Lingaiah Basavalingaiah Manjunath, B.A.
John Mylne Mullaly.
Harold Edward Charles Powers, B.Sc.
Akella Suryanarayana Rao, B.Sc.
Harry Lister Riley, B.Sc.
James Robinson, B.Sc.
George Allan Russell, B.Sc., A.I.C.
M. Suhramania Sastry, B.A.
Ernest Arthur Seeley, B.Sc.
Brian Duncan Shaw.
Albert William Smith, B.Sc., Ph.D.
Clarence Stott, B.Sc., A.I.C.
William Thomas, B.A., M.Sc., A.I.C.
George Flaxman Underhay, B.Sc.
William Andrew Shakespeare Vardy.
John George Walters, B.Sc.
Arthur Frederick Watson, M.Sc., A.I.C.
William Wallace Watt.
Llywelyn Williams, B.Sc.
Harry Alexander Wood.

The following papers were read:

"On dopplerite. Studies in the composition of coal." By F. V. Tideswell and R. V. Wheeler.

"Bromo-derivatives of glyoxaline." By I. E. Balaban and F. L. Pyman.

"The properties of ammonium nitrate. Part IV. The reciprocal salt-pair $NH_4NO_3+NaCl \rightleftarrows NH_4Cl+NaNO_3$." By E. P. PERMAN.

"The reactivity of ammonia." By E. C. C. BALY and H. M. DUNCAN.

"Photocatalysis. Part II. The photosynthesis of nitrogen compounds from nitrates and carbon dioxide." By E. C. C. BALY, I. M. HEILBRON, and D. P. HUDSON.

Ordinary Scientific Meeting, Thursday, May 18th, 1922, at 8 p.m., SIR JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

Reference was made to the loss sustained by the Society, through death, of:

	Elected.	Died.
Adolphus Collenette	March 1st, 1883.	May 7th, 1922.

The following were formally admitted Fellows of the Chemical Society: G. M. Bennett and J. G. Mitchell.

Certificates were read for the first time in favour of:

Harry Baines, B.Sc., 22, Henry Road, West Bridgford, Nottingham.
Victor Cecil Branson, B.Sc., A.R.C.S., A.I.C., Messrs. Naparma Oilfields, Ltd., San Fernando, Trinidad, B.W.I.
Albert Hassell, 47, Stanley Street, Tunstall, Stoke-on-Trent.
Edith Annie Peach, 43, St. Gabriel's Road, Cricklewood, N.W.2.
Clifford Dane Thomas. B.Sc., 10, Lansdowne Place, Blackheath, S.E.10.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-law I (2):

Walter Herbert Fulweiler, B.Sc., c/o The United Gas Improvement Co., Philadelphia, Pa., U.S.A.

The meeting was then adjourned and the Informal Meeting declared open. A selection of autograph letters from the Roscoe collection and of books of historical interest from the Library was exhibited.

LECTURE.

At the Ordinary Scientific Meeting to be held on Thursday, June 8th, 1922, at 8 p.m., in the Lecture Hall of the Institution of Mechanical Engineers, Storey's Gate, S.W.1, Dr. H. H. Dale, C.B.E., F.R.S., will deliver his Lecture entitled: "Chemical and Physiological Properties."

LIST OF FELLOWS, 1922.

The Council has decided to supply the List of Fellows for 1922 to those Fellows only who make application to the Assistant Secretary before August 31st, 1922.

List of Papers received between April 7th and May 18th, 1922:

"A synthesis of *iso*brazilein and certain related anhydropyranol salts. Part II. Synthesis of *iso*hæmatein." By H. G. Crabtree and R. Robinson.

"Studies in catalysis. Part XVI. The inversion of sucrose by hydrogen ion." By T. Moran and W. C. McC. Lewis.

"2-*p*-Dimethylaminostyrylpyridine methiodide, a new photographic sensitiser." By W. H. Mills and W. J. Pope.

"On dopplerite. Studies in the composition of coal." By F. V. Tideswell and R. V. Wheeler.

"Bromo-derivatives of glyoxaline." By I. E. Balaban and F. L. Pyman.

"The oxidation of hexadecane and saturated fatty acids by air or oxygen." By A. H. Salway and P. N. Williams.

"Estimation of lead peroxide." By C. Ramasomayajulu.

"Dyes derived from phenanthraquinone (naphthaflavindulines)." By S. C. Datta.

"Researches on sulphuryl chloride. Part II. A new chlorinating agent; preparation of poly-chloro-derivatives of benzene." By O. Silberrad.

"The decomposition of benzyl disulphoxide." By J. A. Smythe.

"The use of iron pyrites in a Friedel-Crafts' reaction." By J. A. Smythe.

"The properties of ammonium nitrate. Part IV. The reciprocal salt-pair, $NH_4NO_3 + NaCl \rightleftharpoons NH_4Cl + NaNO_3$." By E. P. Perman.

"The reactivity of ammonia." By E. C. C. Baly and H. M. Duncan.

"Photocatalysis. Part II. The photosynthesis of nitrogen compounds from nitrates and carbon dioxide." By E. C. C. Baly, I. M. Heilbron, and D. P. Hudson.

"Attempts to prepare red sulphide dyes. Part I." By E. R. Watson and S. Dutt.

"Limits for the propagation of flame in vapour–air mixtures. Part I. Mixtures of air and one vapour at the ordinary temperature and pressure." By A. G. White.

"Studies on hypophosphorous acid. Part IV. Its reaction with cupric chloride." By A. D. Mitchell.

"The labile nature of the halogen atom in organic compounds. Part III. The absorption spectra of bromomalonic derivatives and nitroparaffins, and their bearing on the question of an oxygen–halogen linking." By H. Graham and A. K. Macbeth.

"The labile nature of the halogen atom in organic compounds. Part IV. The tautomeric hydrogen hypothesis and the removal of the halogen atom from aromatic nitro-compounds." By A. K. Macbeth.

"The action of sulphur on cuprous chloride." By F. W. Pinkard and W. Wardlaw.

"Dyes derived from phenanthraquinone. Part I. Phenanthranaphthazines." By A. C. Sircar and S. B. Dutt.

"Physical chemistry of the oxides of lead. Part IV. Red lead and lead sesquioxide." By S. Glasstone.

"The sulphilimines, a new class of organic compounds containing quadrivalent sulphur." By F. G. Mann and W. J. Pope.

"The aldehydo-salicyclic acids and their derivatives." By E. J. Wayne and J. B. Cohen.

"The effect of an electrolyte on solutions of pure soap. Phase rule equilibria in the system sodium laurate–sodium chloride–water." By J. W. McBain and A. J. Burnett.

"Investigations into the analytical chemistry of tantalum, columbium, and their mineral associates. Part III. A critical study of the volumetric estimation of columbium." By W. R. Schoeller and E. F. Waterhouse.

"Mercury compounds of hydroxybenzaldehydes." By T. A. Henry and T. M. Sharp.

"*iso*Quinoline and the *iso*quinoline-reds." By J. E. G. Harris and W. J. Pope.

"Studies in optically active dyes. Part I. Camphoreins." By B. K. Singh, R. Rai, and R. Lal.

"The hydroferrocyanides and hydroferricyanides of the organic bases." Part I. By W. M. Cumming.

"The viscosity of cellulose in cuprammonium hydroxide solution. Part I. The determination of the viscosity." By R. A. Joyner.

"The oxidising and reducing properties of sulphur dioxide. Part IV. Mercury chlorides." By L. M. Stewart and W. Wardlaw.

"The conditions underlying the formation of unsaturated and cyclic compounds from halogenated open-chain derivatives. Part IV. Products formed from halogen derivatives of muconic acid. The constitution of muconic acid." By J. P. C. Chandrasena and C. K. Ingold.

"Studies in the coumaranone series. Part II. The preparation of 6- and 4-chlorocoumaran-2-ones and their conversion into 4- and 2-chloroflavanols respectively and some derivatives of *o*- and *p*-chlorophenoxyacetic acids." By T. H. MINTON and H. STEPHEN.

"The preparation of *o*-, *m*-, and *p*-nitrophenoxyacetic acids and various nitrotolyloxyacetic acids and their derivatives." By T. H. MINTON and H. STEPHEN.

"Some properties of hydrogen desorbed from platinum and palladium." By P. ANDERSON.

"The reactivity of doubly-conjugated unsaturated ketones. Part III. Unsymmetrical hydroxy- and methoxy-derivatives." By J. S. BUCK and I. M. HEILBRON.

"Phenopyryllium salts of distyryl ketones. Part I." By J. S. BUCK and I. M. HEILBRON.

"The mathematics of the dicyclic colour theory and a new theory of the nitrogen atom." By J. MOIR.

"Physical chemistry of the oxides of lead. Part V. The electromotive behaviour of lead dioxide." By S. GLASSTONE.

"Studies of the constitution of soap solutions. Sodium behenate and sodium nonylate." M. TAYLOR.

"Studies in the anthracene series. Part II." By E. DE B. BARNETT and J. W. COOK.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, JUNE 15TH, 1922.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

Baborovský, George, Ph.D. (Prague), Brno, Falkensteinerova, ul. 7. Professor in the Technical High School of Brno, Tchechoslowackia. Member of the Société chimique de France, Tchechoslowack Chemical Society, formerly member of the American Electrochemical Society, formerly Professor in the University of Prague. 1900–1905 assistant, 1905–1911 lecturer in physical chemistry; 1911–1912 professor of physical chemistry in the Czech University of Prague; since 1912 professor of physical chemistry in the Czech Technical High School of Brno. Publications on different physico-chemical and electrochemical subjects in following periodicals: *Bulletin of the Czech Acad. of Science, Zeit. f. phys. Chem., Zeit. f. Elektrochem., Phys. Zeitschr., Chem. Listy.* Books: "Electrochemistry" (with Prof. F. Plzák), "Theoretical and Physical Chemistry" (1920) (boh.). (*Signed by*) Gerald Druce, A. Šimek, J. Heyrovský.

Bailey, Stanley John, The Braes, South Nutfield, Surrey. Student (Cambridge University), Natural Science Tripos, Part I, in 1921, including Chemistry. (*Signed by*) T. Martin Lowry, Alfred Greeves, Hamilton McCombie, William J. Pope.

Baines, Harry, 22, Henry Rd., West Bridgford, Notts. British. Research Student. B.Sc. (Lond.), external, 1st Class Hons. in Chemistry. Now engaged on research course. (*Signed by*) F. Stanley Kipping, S. J. Pentecost, F. C. Laxton.

Belton, Frank, "Athlone," Bush Hill Park, Enfield. Headmaster, County Secondary School, Edmonton, N.9. (1) B.Sc. (London), Chemistry at Final Exam. (2) Studied chemistry at the Royal Technical College, Salford; with a short course at the Royal College of Science, London. (3) Head of Science Dept. and teacher of chemistry, Central Higher Grade School, Salford. (4) Author of text-books on physics and chemistry. (*Signed by*) B. Prentice, E. Clark, E. Green.

Branson, Victor Cecil, Naparma Oilfields, Ltd., San Fernando, Trinidad, B.W.I. Analytical Chemist. A.R.C.Sc. (1st class chemistry), B.Sc. Lond. (1st class honours in Chemistry), A.I.C. Chemist to the Naparma Oilfields, Ltd., since Jan. 1920. (*Signed by*) L. H. Parker, James C. Philip, H. B. Baker.

Cannan, Robert Keith, 4, Antrim Mansions, N.W.3. Assistant in Biochemistry, University College, London. Several papers in *Biochemical Journal* and *Journal of Physiology*. M.Sc. (Lond.) in Biochemistry. (*Signed by*) J. C. Drummond, R. H. A. Plimmer, Irvine Masson.

Chatterjee, Bibhu Charan, Ariadah, 24, Perganas, Bengal. Research Scholar in Chemistry. B.Sc. (Hons. in Chemistry), 1919; M.Sc. in Chemistry, 1921; first in Class I; conducted a piece of research work in organic chem. entitled, "On carbamic esters; chlorine as a simultaneous oxidising and chlorinating agent"; Sir T. N. Palit Research Scholar in Chemistry, Calcutta University. (*Signed by*) P. C. Rây, R. L. Datta, J. N. Mukherjee.

Colborne, Robert Stanley, 57, County Road, Swindon. Research Student in Physical Chemistry (Imperial College, London). Student at Imperial College since 1919 (Oct.); A.R.C.S. (1st Class) 1921 (July); B.Sc. (Hons. 1st Class) 1921 (Nov.). (*Signed by*) H. B. Baker, M. A. Whiteley, James C. Philip, H. J. T. Ellingham.

Contractor, Shiavaksha Hormasji, F.N.B.A., F.S.Sc. (Lond.), Karanjia Building, opp. Moos Building, Grant Rd., Bombay. Scientist, Artist and Craftsman. Inventor of gold mirror glasses; Permanent blotters; Sizing Composition, etc. Recipient of 50 gold, silver, and bronze medals, and hundreds of diplomas at the world's various exhibitions. (*Signed by*) J. C. Mascarenhas, N. M. Bhathena, D. D. Kanga.

Firth, James Brierley, 44, Lucknow Avenue, Mapperley Park, Nottingham. Lecturer in Chemistry, University College, Nottingham. D.Sc. (Manc.), M.Sc. (Dunelm), F.I.C. Author or joint-author of some sixteen published researches, most of which have appeared in the *Journal of the Chemical Society*. (*Signed by*) F. S. Kipping, Henry Stephen, J. E. Myers, Colin Campbell, Norman Smith, Arnold Weston.

Fishenden, Margaret White, 19, Shepherds Hill, Highgate, N.6. Scientific Investigator for Fuel Research Board. 1909, B.Sc. (Manchester), 1st Class Honours Physics; 1919, D.Sc. Have published a number of papers on Meteorology (upper air) and conditions in weaving factories and spinning mills. Also the following: "The Coal Fire" (Special Report, No. 3, of Fuel Research Board). "The Efficiency of Low Temperature Coke in Domestic Appliances" (Technical Paper, No. 3, of Fuel Research Board). (*Signed by*) George Beilby, Harold B. Dixon, Frank Lee Pyman.

Goddard, Frederick Walter, 12, College St., Winchester. Assistant Master, Winchester College. M.A. (Cantab.); 1st Class Nat. Science Tripos

(1st Class Chemistry, Physics, Mineralogy); 1st Class Maths. Tripos, Pt. 1. War Service. Five years teaching Chemistry at Win. Coll. to Scholarship Candidates and post scholarship. Head of Chem. Dept., Win. Coll. (*Signed by*) Llewellyn L. Garbutt, D. Ll. Hammick, A. J. Berry.

Hassell, Albert, 47, Stanley Street, Tunstall, Stoke-on-Trent. Science Master, Denstone College, Staffs. Chemistry Master, Denstone College, Staffs. I wish to obtain the Transactions so as to keep in touch with current chem. literature. (*Signed by*) Joseph West, H. V. Thompson, F. H. Clews.

Hirst, Edmund Langley, Ainslie Villa, Largo Rd., St. Andrews. Assistant in Chemistry Department, University of St. Andrews. Degrees: M.A., B.Sc., Ph.D. Assistant in Chemistry at St. Andrews University from October 1920. Publication: "The constitution of the disaccharides, Part V (Cellobiose)," by Walter Norman Haworth and Edmund Langley Hirst (T., 1921, **119**, 193). (*Signed by*) J. C. Irvine, R. Robinson, R. C. Menzies, A. Killen Macbeth.

Hoffert, Dorothea Annie, 50, Hampstead Way, London, N.W.11. Research worker under the Food Investigation Board. 1916–1920, four years' experience in analytical and research work on dopes and varnishes for aeroplanes (war work). One year, 1920–1921, student in training for research, Cambridge University, with grant from Scientific and Industrial Research Department. (*Signed by*) William J. Pope, W. H. Mills, Charles T. Heycock, Frances M. Hamer, Ida Smedley Maclean, J. N. Goldsmith.

Jenkins, William Job, 37, Marston Road, Knowle, Bristol. Research Chemist. Plant chemist at H.M. Factory, Pembrey, 1915–1918. Research Chemist at Messrs. Nobels Ardeer Factory, 1920–1921. Research worker under Department of Scientific and Industrial Research, 1921–1922. (*Signed by*) Wm. Rintoul, N. Picton, R. A. Joyner, Wm. Barbour.

Levy, Peppo Joseph, 42, Granville Gardens, Shepherds Bush, London W.12. Spanish. Chemist (M.F.G.) intending. I am a student at the day school of Chemistry of the Polytechnic and wish to follow the latest developments in chemical science, and to use the Society's library. (*Signed by*) Frank E. Weston, W. H. Collier, Frank Matthews.

McCall, David, 4, Lime Street, Dundee. Head of Pharmacy Dept., Technical College, Dundee. Degree of B.Sc. (St. Andrews), July 1919. Diploma of Pharmaceutical Chemist, April 1922. Member of Pharmaceutical Society of Gt. Britain. Lecturer on Botany, Pharmacy, and Materia Medica. Head of Pharmacy Dept., Technical College, Dundee, 1919. (*Signed by*) Alex. McKenzie, John S. Lumsden, John S. W. Boyle, John Foggie, H. J. Plenderleith.

Mallet, Richard Edmund Antony, "Redford," Ockley, Surrey. Research Chemist. B.A. of Oxford University. Honours degree passed with distinction. Now employed as chemist at the British Museum. Have been engaged in research work at Oxford with Prof. T. R. Merton, F.R.S. (*Signed by*) Alexander Scott, D. Ll. Hammick, C. N. Hinshelwood, H. R. Raikes, H. Hartley.

Norrish, Ronald George Wreyford, Emmanuel College, Cambridge, and 48, Kimberley Rd., Cambridge. Research Student in Photochemistry. Scholar of Emmanuel College, Cambridge. Natural Sciences Tripos, Part I, Class I. Natural Sciences Tripos, Part II Chemistry), Class I. Paper: "The Transition Elements and the Octet Theory," *Chem. News*, 1922, **124**, 16–22. My reason for seeking admission is that I hope to make the study of Chemistry my chief occupation and interest in life. (*Signed by*) W. J. Pope, W. H. Mills, Eric K. Rideal, T. M. Lowry.

Oats, John Goodrich (junr.), 3, Montpelier Terrace, Ilfracombe. Engineering Student at R. A. Lister & Co., Dursley. Also chemical student (private laboratory). Student of metallurgy, chemistry, and analysis; holding a diploma from the International Correspondence Schools, including the subjects: mathematics, physics, inorganic chemistry, qualit. analysis, quant. analysis, and the manufacture of iron and steel. (*Signed by*) F. Southerden, Alfred L. Grey, R. Barton, G. F. Hall, Ernest F. Hooper, Jas. Walker.

Parker, Ralph Henry, "Radio House," Wilson Rd., Smethwick, Staffs. Student in Electrical and Mechanical Engineering and allied subjects. Research Student. (1) Took the 3 years' course in physics (mechanics, heat, electricity, and magnetism) at the (full time) Junior Day Technical School, Smethwick, years 1915–1918. (2) For three years continued with part day classes, 2 years' evening tuition, also matriculation class in chemistry, Smethwick Municipal Tech. (3) Studying Organic Chemistry at present time (1922). I will endeavour to forward the interests of the Society to the best of my ability and endeavour to keep abreast with modern chemical science. (*Signed by*) Arthur Adams, Joseph Lones, J. H. Wood.

Peach, Edith Annie, 43, St. Gabriel's Road, Cricklewood, N.W.2. Student of Chemistry at University College, London. Desirous of receiving the *Journal* and of using the Library. (*Signed by*) Irvine Masson, F. G. Donnan, J. C. Drummond.

Platt, Claude Bernard Meister, Captain, M.B.E., R.E., Middleton House, Beckett Rd., Doncaster. Colliery Chemist, and Fuel Technologist. Two years as assistant to Prof. R. V. Wheeler, D.Sc., F.I.C., F.C.S.; engaged on research on spontaneous combustion of coal, composition of coal, research on explosions in mines and general laboratory work at Home Office Experimental Station. 2nd year Imperial College of Science and Technology (interrupted by the war). During war engaged on Army Wireless Telegraphy. At present chemist to Doncaster Collieries Association, Ltd., and assistant to Hot and Deep Mines Research Committee of Dept. of Scientific and Industrial Research. Published in *Trans. Chem. Soc.*, 1913, **103**, 1713. M.Soc.C.I., A.M.I.Min.E. Twelve months' experience on technical side of boiler practice—especially as regards fuel combustion. (*Signed by*) R. Lessing, W. Payman, R. V. Wheeler.

Plowman, Arthur, 8, Rowantree Rd., Bycullah Park, Enfield. Research Student. B.Sc. (Lond.), A.R.C.S., A.I.C. (*Signed by*) R. Winton West, G. A. R. Kon, E. H. Farmer.

Pryde, John, 4, Gowrie St., Blackness Ave., Dundee. Research Chemist, St. Andrews University, N.B. Degree: B.Sc. (Pure Science). 1851 Exhibition Research Scholar, 1921. Publication (with J. A. Hewitt): "Metabolism of Carbohydrates, Pt. I," *Biochem. J.*, XIV, 3 and 4, 395. (*Signed by*) J. C. Irvine, R. Robinson, R. C. Menzies, A. Killen Macbeth.

Quastel, Juda Hirsch, Trinity College, Cambridge. Research Student, Biochemical Dept., Cambridge. Obtained A.R.C.S. (Lond. First Cl.), June 1921; elected Associate of Institute of Chemistry, June 1921; obtained B.Sc. Hons. (Lond. First Cl.) in October 1921. Accepted as candidate for Ph.D. (Cambridge). I wish to receive the Society's publications and to take part in its activities. (*Signed by*) F. G. Hopkins, H. B. Baker, James C. Philip.

Samuels, Edmond, 40, Castlereagh St., Sydney, N.S.W. Pharmaceutical Chemist. Chemistry course, Sydney University. Interested in preparation of pharmaceutical products for physicians' use. Originator of several medicinal products. Member of Pharmaceutical Society of N.S.W.; member of Millions Club, N.S.W.; member of Justices Association, N.S.W. (*Signed by*) J. Laker Macmillan, G. Spurge, Francis L. Watt.

SMITH, JOHN CHARLES, 31, Bidwell Street, Wellington, N.Z. Student of Chemistry. B.Sc. (N.Z.) 1919–20. Thesis on " The Condensation of Phenolic Substances with Basic Imino-haloids," presented for the degree of M.Sc. (N.Z.), Nov. 1921. (*Signed by*) F. P. Worley, W. F. Short, A. H. Bowell.

STEVENSON, RONALD WILLIAM, M.C., M.A., Major, Eaglehurst, Ditton Hill, Surbiton, Surrey. Manufacturing Chemist, Analytical and Research work. Director, Messrs. Stevenson and Howell, Ltd., Manufacturing Chemists. M.A., Cambridge (Science). (*Signed by*) Arthur Hutchinson, William Stevenson, Vernon J. Tilley.

SWAINSON, VALERIE EMELINE SOPHIE, 21, Hungerford Rd., N.7. Secondary School teacher (teaching Chemistry up to Intermediate Standard). B.Sc. (Hons.) Lond. in Chemistry. Demonstrator (temporary), mainly in Inorganic Chemistry, for two terms, at University College, Dundee (Jan.–June, 1921). (*Signed by*) H. Crompton, M. S. Crewdson, J. F. Spencer.

THOMAS, CLIFFORD DANE, 10, Lansdowne Place, Blackheath, S.E.10. British. Research Chemist. Second Class Honours, B.Sc., 1920. One year's research under Dr. O. L. Brady at University College, 1920–1921. Junior Research Assistant at Research Dept., Woolwich. (*Signed by*) Eustace E. Turner, Sydney A. Pearman, W. J. Powell.

VAZIFDAR, NOWROJI JAMSHEDJI, 17, Queens Road, Opp. Charin Road Station, Bombay. First Assistant Chemical Analyser to Government. L.M. & S. Bombay. Teacher in Chemistry, Grant Medical College, Bombay. Chemical analyser to Govt. for Sind, Karachi, 1914–15; 1916–17. Author of " Physiology of the Nervous System and Special Senses." Coach in physiology for the last 15 years. (*Signed by*) D. D. Kanga, M. J. Gajjar, K. G. Naik.

WIGG, GEORGE WILLIAM, 72nd Northumbrian Bde., R.F.A., Barrack Rd., Newcastle-on-Tyne. Lt., R.F.A. 4th–5th year medical student, University of Durham, College of Medicine. 3rd year honours chemistry student, Armstrong college, Newcastle-on-Tyne. (*Signed by*) W. N. Haworth, Frank M. Irvine, D. Arthur Ruell.

The following Certificates have been authorised by the Council for presentation to ballot under Bye-law I (2):

HALL, ROBERT SWAINSON, F.L.S., F.A.M.S., c/o Govt. Plantations Dept., Victoria, British Cameroons, West Africa. Supt. of agriculture to Nigerian Government. Three years' training in chemistry, Waterloo Secondary School, Oldham, Lancs. Four years' practical experience in agricultural chemistry in Portuguese Congo, S.W. Africa. Contribution to science mostly on mycological and agricultural matter; see *Kew Bulletin*, *Bull. of Imperial Institute*, etc. (*Signed by*) John Taylor.

FULWEILER, WALTER HERBERT, Wallingford, Pa., U.S.A. Chemical Engineer with The United Gas Improvement Co., Phila., Pa. B.S. in Chemistry, University of Pennsylvania, 1901. Chemist with Phila. Gas Works, 1901–1902. Chief chemist, The United Gas Improvement Co., 1913–1920. Chemical engineer, The United Gas Improvement Co., 1920–date. (*Signed by*) H. Jermain Creighton.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, June 1st, 1922, at 8 p.m., Professor T. M. Lowry, C.B.E., F.R.S., Vice-President, in the Chair.

The Chairman referred to the loss sustained by the Society, through death, of:

	Elected.	Died.
George Robertson Hislop	Jan. 20th, 1870.	May 18th, 1922.

The following were formally admitted Fellows of the Chemical Society: A. D. Gay and E. A. Seeley.

Certificates were read for the first time in favour of:

Allin Cottrell, 3, Oxford Terrace, Edinburgh.
Reginald William Griffiths, B.Sc., 137, Holly Road, Handsworth, Birmingham.
John Watson Jenkin, B.Sc., A.I.C., Tregardock, St. Austell.
Ghulam Safdar Khan, B.Sc., Veterinary College, Lahore, India.
Hiroshi Nomura, Chemical Institute, Imperial University, Sendai, Japan.
Harold Pickles, The Gasworks, Kildwick, Keighley.
Stephen John Watson, B.Sc., 35, Oakfield Terrace, Gosforth, Newcastle-on-Tyne.
Alexander Mitchell Williams, M.A., D.Sc., Shirley Institute, Didsbury, Manchester.

The following papers were read:

"The reactivity of doubly-conjugated unsaturated ketones. Part III. Unsymmetrical hydroxy- and methoxy-derivatives." By J. S. Buck and I. M. Heilbron.

"Phenopyryllium salts of distyryl ketones. Part I." By J. S. Buck and I. M. Heilbron.

"Ring-chain tautomerism. Part II. The effect of the gem-diethyl group on the carbon tetrahedral angle." By S. S. Deshapande and J. F. Thorpe.

Ordinary Scientific Meeting, held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, June 8th, 1922, at 8 p.m., Professor H. E. ARMSTRONG, LL.D., F.R.S., Vice-President, in the Chair.

Dr. H. H. Dale, C.B.E., F.R.S., delivered his Lecture entitled: "Chemical and Physiological Properties." A vote of thanks to the Lecturer, proposed from the Chair, and seconded by Mr. Francis H. Carr, was carried with acclamation, and acknowledged by Dr. Dale.

Ordinary Scientific Meeting, Thursday, June 15th, 1922, at 8 p.m., Sir JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

Reference was made to the loss sustained by the Society, through death, of:

	Elected.	Died.
William Gowland	Feb. 2nd, 1871.	June 10th.
Thomas Henry Johnson	May 5th, 1921.	Feb. 19th.

The following were formally admitted Fellows of the Chemical Society: R. A. Fitzsimons, H. U. Harrow, E. M. James, and H. L. Riley.

Certificates were read for the first time in favour of:

William Leslie Carter, Ellesmere, Bloxcidge Street, Langley Green, Birmingham.
Wilfred Thomas Grey Davies, B.Sc., Plas y Coed, Derllwyn Road, Tondu, Bridgend.
Roy Gardner, B.Sc., Technical High School, Dunedin, New Zealand.
John Ernest Jewell, 34, Grove End Road, St. John's Wood, N.W. 8.
Charles William Moorhead, 23, Newbridge Road, Bath.
Albert Bramah Pearce Page, A.R.C.S., 27, Tanza Road, Hampstead, N.W. 3.
Arthur Scholefield, Poulton Hey, Bromborough, Birkenhead.
Stanley James Corrall Snedker, The Rowans, Wood Hey, Rock Ferry, Birkenhead.

Dr. H. M. Atkinson and Dr. P. C. Austin were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

George Baborovský, Ph.D.
Stanley John Bailey, B.A.
Harry Baines, B.Sc.
Frank Belton, B.Sc.
Victor Cecil Branson, B.Sc., A.R.C.S., A.I.C.
Robert Keith Cannan, M.Sc.
Bibhu Charan Chatterjee, M.Sc.
Robert Stanley Colborne, B.Sc., A.R.C.S.
James Brierley Firth, D.Sc., F.I.C.
Margaret White Fishenden, D.Sc.
Walter Herbert Fulweiler, B.S.
Frederick Walter Goddard, M.A.
Robert Swainson Hall.
Albert Hassell.

Edmund Langley Hirst, M.A., B.Sc., Ph.D.
Dorothea Annie Hoffert.
William Job Jenkins.
Peppo Joseph Levy.
David McCall, B.Sc.
Richard Edmund Antony Mallet, B.A.
Ronald George Wreyford Norrish, B.A.
John Goodrich Oats (Junr.).
Ralph Henry Parker.
Edith Annie Peach.
Claude Bernard Meister Platt, M.B.E.
Arthur Plowman, B.Sc., A.R.C.S., A.I.C.
John Pryde, B.Sc.
Juda Hirsch Quastel, B.Sc., A.R.C.S.
Edmond Samuels.
John Charles Smith, B.Sc.
Ronald William Stevenson, M.C., M.A.
Valerie Emeline Sophie Swainson, B.Sc.
Clifford Dane Thomas, B.Sc.
Nowroji Jamshedji Vazifdar.
George William Wigg.

The following papers were read:

"Ring-chain tautomerism. Part III. The occurrence of tautomerism of the three-carbon (glutaconic) type between a homocyclic compound and its unsaturated open-chain isomeride." By C. K. Ingold, E. A. Perren, and J. F. Thorpe.

"The tautomerism of dyads. Part I. Experiments on the detection of tautomeric equilibria in hydrocyanic acid." By E. H. Usherwood.

LIST OF FELLOWS, 1922.

The List of Fellows for 1922 is being prepared, and changes of address received after July 31st, 1922, cannot be included therein. Fellows whose Christian names and degrees do not appear in full are particularly requested to notify the Assistant Secretary.

Owing to the heavy cost of printing, the List will be sent only to those Fellows who make application prior to August 31st, 1922.

THE LIBRARY.

The Library will be closed for Stocktaking from Monday, August 7th, until Saturday, August 19th, 1922, inclusive.

During the four weeks August 21st to September 16th the Library will close daily at 5 p.m.

List of Papers received between May 19th and June 15th, 1922:

"The interaction of sodium chloride and silica." By F. H. Clews and H. V. Thompson.

"Ring-chain tautomerism. Part II. The effect of the gem-diethyl group on the carbon tetrahedral angle." By S. S. Deshapande and J. F. Thorpe.

"Dyes derived from saccharine. The sulphim-phthaleins." By S. Datta.

"Dyes derived from diphenyl-ketipic-dinitrile." By S. Datta and N. K. Sen.

"Thermal expansion of gelatin gels." By A. Taffel.

"The rôle of protective colloids in catalysis. Part II." By T. Iredale.

"The chlorinated dialkyl sulphides." By W. J. Pope and J. L. B. Smith.

"Gallotannin. Part XIII. The identity of digallic acid from gallotannin with synthetic *m*-digallic acid." By M. Nierenstein and C. W. Spiers.

"Experiments on the synthesis of the polyacetic acids of methane. Part VI. Conditions of formation by the cyanoacetic ester method of unstable methanetriacetic esters and a new synthesis of methanetriacetic acid." By C. K. Ingold and E. A. Perren.

"Tables of average specific and atomic heat capacities of chemical elements in the order of the increment of the atomic weights and their interpretations. The law of Dulong and Petit." By P. N. Tchirvinsky.

"The dissociation pressures of hydrated double sulphates. Part I. Hydrated cupric alkali sulphates." By R. M. Caven and J. Ferguson.

"The action of sodium sulphite on lead iodide." By G. Singh.

"2 : 3 : 6-Trimethyl glucose." By J. C. Irvine and E. S. Steele.

"Researches on the constitution of coal." By S. R. Illingworth.

"The composition of paraffin wax. Part II." By F. Francis, C. M. Watkins, and R. W. Wallington.

"Ring-chain tautomerism. Part III. The occurrence of tautomerism of the three-carbon (glutaconic) type between a homocyclic compound and its unsaturated isomeride." By C. K. Ingold, E. A. Perren, and J. F. Thorpe.

"Note on the effect of a magnetic field on catalysis by ions in the presence of a para-magnetic salt." By W. E. Garner and D. N. Jackman.

"Reciprocal induced polarity effects in cresols and their derivatives. Properties of the isomeric methoxybenzyl bromides." By A. Lapworth and J. B. Shoesmith.

"Intermetallic actions. The system aluminium–arsenic." By Q. A. Mansuri.

"The tautomerism of dyads. Part I. Experiments in the detection of tautomeric equilibria in hydrocyanic acid." By E. H. Usherwood.

"The nitro-derivatives of metanitrodimethylaniline." By A. FORSTER and W. COULSON.

"Catalytic racemisation of optically active acid amides." By A. McKENZIE and I. A. SMITH.

"The sorption of phosgene by beech wood charcoal." By H. M. BUNBURY.

"The adsorption of uranium-*X* and its isotope thorium by basic ferric acetate." By A. C. BROWN.

"The reactions of cellulose with sodium chloride and other neutral salt solutions. Part I. Preliminary survey." By H. MASTERS.

"The imino-aryl ethers. Part I. *N*-Phenylbenzimino-*m*-hydroxyphenyl ether and the synthesis of 2 : 4-dihydroxybenzophenone." By A. W. CHAPMAN.

"The intermolecular condensation of methylethyl ketone in the presence of carbide." By O. BECKER and J. F. THORPE.

"The equilibrium in systems composed of water and alcohols. The system methyl alcohol–water." By N. A. PUSHIN and A. A. GLAGOLEVA.

"The equilibrium in the system dinitrobenzene–urethane." By N. A. PUSHIN and A. FIOLETOVA.

"The chemistry of polycyclic structures in relation to their homocyclic unsaturated isomerides. Part III. Intra-annular tautomerism of α-campholytic acid." By J. P. C. CHANDRASENA, C. K. INGOLD, and J. F. THORPE.

"Adsorption and catalysis in Fuller's earth." By E. K. RIDEAL and W. THOMAS.

"The formation and stability of *spiro*-compounds. Part VIII. The Dieckmann-Komppa reaction." By F. DICKENS, G. A. R. KON, and J. F. THORPE.

"The cyanine dyes. Part V. The virtual tautomerism of the thio-cyanines." By W. H. MILLS and W. T. K. BRAUNHOLTZ.

ADDITIONS TO THE LIBRARY.

I. *Donations.*

BERNTHSEN, AUGUST. A textbook of organic chemistry. New edition, revised to date. By JOHN JOSEPH SUDBOROUGH. London 1922. pp. xvi + 908. 12*s*. 6*d*. net. (*Recd.* 16/5/22.)

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, October 5th, 1922, at 8 p.m., Sir JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

Reference was made to the loss sustained by the Society, through death, of the following Fellows:

	Elected.	Died.
Frederick Bedford	June 20th, 1901.	July 13th.
Frederick Douglas Brown	Mar. 20th, 1876.	Aug. 2nd.
William Kellner	Mar. 19th, 1874.	Sep. 12th.
George William MacDonald	Dec. 6th, 1894.	Aug. 7th.
Alfred Ernest Moore	June 17th, 1903.	Mar. 1st.
Arthur Faraday Price	May 4th, 1882.	Mar. 17th.
Alexander Smith	April 17th, 1890.	Sep. 8th.
Lionel William Stansell	Feb. 3rd, 1887.	May 22nd.
James Stenhouse	May 5th, 1892.	Mar. 18th.
Matthew Carrington Sykes	Feb. 19th, 1891.	Aug. 25th.
Jokichi Takaminé	Feb. 3rd, 1887.	July 22nd.
Stanley Goulden Thompson	May 1st, 1919.	Feb. 23rd.
James Waterhouse	Feb. 7th, 1901.	Sep. 28th.

In announcing the resignation of Dr. M. O. Forster from the office of Treasurer, the President referred to the many valuable services Dr. Forster had rendered to the Society during the past twenty years. His resignation was received with profound regret and his presence at the meetings would be greatly missed, and the President wished him, in the name of the Society, every success in the important work he was about to undertake as Director of the Institute of Science at Bangalore. Dr. Forster briefly responded.

It was stated that the Council had nominated Professor J. F. Thorpe, C.B.E., F.R.S., to fill the office of Treasurer until the date of the next Annual General Meeting, and that Dr. J. T. Hewitt, F.R.S., had been nominated to fill, for the same period, the vacancy amongst the Vice-Presidents caused by Professor Thorpe's appointment.

The President further announced that some time ago the American Chemical Society submitted to the Council certain proposals according to which we should be associated with them in the future conduct and control of the *Journal of Physical Chemistry.* Advantage was taken of the recent presence in this country of Dr. Parsons, Secretary of the American Chemical Society, to carry through the negotiations. The Council has to report that a satisfactory issue has been reached, the scheme having been widened to admit of the association of the Faraday Society with the enterprise. From some future date, probably January 1924, the *Journal of Physical Chemistry* will be accordingly issued under the auspices of the American Chemical Society, the Chemical Society, and the Faraday Society. The editorial board will consist of four American and four British representatives, together with an Editor-in-Chief appointed by these eight.

The following were formally admitted Fellows of the Chemical Society: J. P. Levy, F. M. Brewer, V. E. S. Swainson, and R. S. Colborne.

Certificates were read for the first time in favour of:

Robert Allanson, 10, Grosvenor Drive, New Brighton, Wallasey.
Thomas Cuthbert Allchin, M.B.E., E. C. Powder Co., Ltd., Longfield, Kent.
James Wilson Armit, M.A., The Manse, Monikie, Dundee.
Menghraj Choithram Bathija, B.A., Fitzwilliam Hall, Cambridge.
Donald Charles Broome, Disgwylfa, Penmaenmawr, Carnarvonshire.
Walter Ferguson Buist, B.Sc., 24, New Hall Lane, Clubmoor, Liverpool.
Stanley Robert Bult, 63, Addiscombe Road, Croydon.
Arthur Josiah Burford, 419, Edgware Road, Maida Vale, W. 2.
Katragadda Seshachalam Choudary, M.A., M.Sc., 71, Coral Merchant Street, George Town, Madras, India.
Elliott Martin Christie, M.Sc., 37, Lynwood Avenue, Dunedin, New Zealand.
Frederick Stanley Clarke, 64, Golders Manor Drive, N.W. 11.
Sydney George Cavigan, 22, Walker Street, Burton-on-Trent.
Edward Dance, B.Sc., Castle Inn, Sandal, Wakefield.
Milton Dewhurst, B.Sc., A.I.C., 1280, Warwick Road, Acocks Green, Birmingham.
Samuel Frederick Ford, 65, Abbotts Road, Southall.
John Masson Gulland, B.Sc., 11, Chester Street, Edinburgh.
Herbert Haigh, B.Sc., 211, Park Road, Barnsley.
Thomas Edward Hubbard, 9, Cunliffe Street, Pendleton, Manchester.
James Ernest Humphries, B.A., M.Sc., 29, St. John's Road, Newport, Mon.
John Huntley, The Villa, Burstwick, nr. Hull.
Sydney Alfred Hurren, M.C., 39, Upper Marylebone Street, W. 1.
Habib Iskander, Heliopolis, Cairo, Egypt.
Edgar Jones, 167, Upper Dale Road, Derby.
Jan Kalff, D.Chem., Nieuwe Prinsengracht 126, Amsterdam.
Shankar Nath Kapur, B.Sc., 11, George Square, Edinburgh.
William Dawson Lloyd, 42, Tavistock Road, Westbourne Park, W. 11.
Philip Patrick Lynch, B.Sc., Church Street, Timaru, New Zealand.

Francis Geoffrey Macalpine, B.Sc., Broad Oak, Accrington.
Frederick Henry McDowall, M.Sc., Knox College, Dunedin, New Zealand.
Kenneth McKenzie, Endrik, Hamilton Road, Cambuslang, Glasgow.
Archibald Roy Hammond Martin, B.A., 8, Kingsland Road, Worthing.
Dina Nath, c/o P. Lal, Esq., Vakil, Jullundhur City, Punjab, India.
Torkild Haastrup Nielsen, B.Sc., Siam Cement Co., Ltd., Bangsüe, Siam.
Hidejiro Nishikawa, 3, Hachimancho, Asakusa, Tokyo, Japan.
Joseph Edwards Pooley, 1, Margaretting Road, Manor Park, E. 12.
Nagendra Prasad, M.Sc., Ranchi, Behar & Orissa, India.
Edmund Brydges Rudhall Prideaux, M.A., D.Sc., F.I.C., 6, Arboretum Street, Nottingham.
James Robert Pound, M.Sc., 601*a*, Dana Street, Ballarat, Victoria, Australia.
Alfred Norman Douglas Pullen, The Larches, Greenham Common, Newbury.
Thomas Abraham Robertson, Sassafras, Rickard Road, Bankstown, N.S.W.
Burke Rushworth, 4, West Park Terrace, Healey, Batley, Yorks.
Gopal Singh, M.Sc., The Brij, Gawalmaudi, Lahore, India.
George Victor Smith, A.R.C.S., Westleigh, Eggington Road, Wollaston, Wellingborough.
Francis Wilbert Stoyle, M.Sc., 37, Kansas Avenue, Belfast.
Leslie Stuart Theobald, A.R.C.S., 3, Ennismore Avenue, Chiswick, W. 4.
William Thompson, B.Sc., Ravensworth, Cockton Hill, Bishop Auckland.
Laurence Barnett Timmis, M.Sc.Tech., A.I.C., 19, Trinity Marsh Lane, Waltham Cross.
Richard Truszkowski, B.Sc., Koszykowa 21, m-3, Warsaw, Poland.
Humphrey Terence Viney, B.Sc., Bramerton, Blakebrook, Kidderminster.
Eric Richard Boraman Woodward, B.Sc., The Vicarage, Herne Bay, Kent.
William James Uglow Woolcock, C.B.E., M.P., 166, Piccadilly, W. 1.

The following papers were read:

"Cupric tetrammine nitrite and the corrosion of copper by aqueous solutions of ammonia and of ammonium nitrate." By H. BASSETT and R. G. DURRANT.

"The additive formation of four-membered rings. Part I. The synthesis and resolution of some derivatives of 1 : 3-diazidine." By C. K. INGOLD and H. A. PIGGOTT.

"Rates of reduction of nitro-groups by hydrogen in the presence of colloidal palladium, especially of nitrotoluene isomerides." By W. H. PATTERSON.

"A determination of the relative proportions of the isomerides in nitrotoluene or toluidine." By W. H. PATTERSON.

Ordinary Scientific Meeting, Thursday, October 19th, 1922, at 8 p.m. Professor H. E. Armstrong, LL.D., F.R.S., Vice-President, in the Chair.

Reference was made to the loss sustained by the Society, through death, of:

	Elected.	Died.
Frederick Thomas Harry	June 20th, 1908.	Sept. 14th, 1922.
Edmond Herbert Grove-Hills	Feb. 15th, 1894.	Oct. 2nd, 1922.

Mr. C. D. Thomas was formally admitted a Fellow of the Chemical Society.

Certificates were read for the first time in favour of:

Leslie Bains, B.A., B.Sc., A.I.C., 5, Carlton Road, Stroud Green, N. 4.
George Joseph Burrows, B.Sc., Chemical Department, The University, Sydney, N.S.W.
John Hardwick Long Champion, B.Sc., 41, Triangle West, Clifton, Bristol.
Norman Evers, B.Sc., F.I.C., The Cottage, Salisbury Avenue, Cheam, Sutton.
Joshua William Farmery, M.A., A.I.C., 56, Sheen Road, Richmond, Surrey.
Philip Henry Gifford, B.Sc., Boys' High School, Salisbury, Rhodesia.
Joseph Keith Matthews, M.A., Cedric House, Rainhill, Liverpool.
John Ewart Moss, M.Sc., 298, Franklin Road, Kings Norton, Birmingham.
Harry Ward, M.Sc., A.I.C., 28, Commercial Street, E. 1.

The following papers were read:

"The polarity of double bonds. An extension of the theories of Lapworth and Robinson." By T. M. LOWRY.

"The theories of polarity in organic compounds." By J. KENNER.

"A model to illustrate the orbits of the electrons above the carbon atom." By W. E. GARNER.

NOTICES.

The next Ordinary Scientific Meeting takes place on November 2nd, at 8 p.m., and an Informal Meeting will be held on November 16th, after the conclusion of the formal business of the Ordinary Scientific Meeting at 8 p.m.

RESEARCH FUND.

A meeting of the Research Fund Committee will be held in December next. Application for Grants, to be made on forms obtainable from the Assistant Secretary, Chemical Society, Burlington House, W. 1, must be received on or before Friday, December 1st, 1922.

All persons who received Grants in December, 1921, or December of any previous year, whose accounts have not been closed by the Council, are reminded that reports must be returned by December 1st.

COLLECTIVE INDEX, VOL. VI (1913–1922).

Volume VI of the Collective Index will be published in two parts. Part I (Index to Authors) will be issued in 1923 and Part II (Index to Subjects) in 1924.

The price to Fellows who apply before *Christmas Day*, 1922, is £2 17*s*. post free. A remittance, made payable to Mr. S. E. Carr, must accompany the application in each case and should be sent to the Assistant Secretary, Chemical Society, Burlington House, W. 1. The price to Fellows who apply after December 25th, 1922, will be £3 7*s*.

Arrangements have been made by which cases in blue or maroon cloth for binding this Index in three volumes (Authors Index 1 vol. and Subject Index, 2 vols.) will be supplied for the sum of Seven Shillings. The binding will involve an additional charge of 2*s*. 3*d*. per volume. The total cost, therefore, of binding the Index in cloth will be 13*s*. 9*d*.

Fellows desiring to avail themselves of this offer should apply to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C. 4, and also inform the Assistant Secretary, so that the necessary instructions may be given for the Index to be posted direct to the Publishers.

RUSSIAN FUND.

A further appeal has been issued on behalf of Russian Men of Science. In addition to donations of money to be devoted to purchasing requisite articles, gifts of clothing (which, if used, must be in good condition) and recent chemical literature will be welcome.

The Chemical Society will act as the receiving depôt, and cheques (made payable to Mr. S. E. Carr and crossed " Russian Fund "), together with parcels of clothing, boots, books, etc., should be addressed to the Assistant Secretary, Chemical Society, Burlington House, W. 1.

List of Papers received between June 16th and October 19th, 1922 :

" Experiments on the synthesis of the polyacetic acids of methane. Part VII. The preparation of methylidenetriacetic acid and of methanetetra-acetic acid." By C. K. INGOLD and L. C. NICKOLLS.

" An instance illustrating the effect of attached groups on the ease of formation of the *cyclo*pentanone ring." By J. P. C. CHANDRASENA and C. K. INGOLD.

" The formation and stability of *spiro-compounds*. Part IX. The influence on stability of groups of high molecular weight." By S. F. BIRCH and J. F. THORPE.

"The viscosity of cellulose. Part II. The lowering of the viscosity of cellulose by various reagents." By R. A. Joyner.

"The constitution of polysaccharides. Part V. The yield of glucose from cotton cellulose." By J. C. Irvine and E. L. Hirst.

"The action of solvents on coal. Part I." By S. R. Illingworth.

"Studies in the glucosides. Part I. The constitution of indican." By A. K. Macbeth and J. Pryde.

"The alkylhydrazones." By O. L. Brady and G. P. McHugh.

"The formation of bromine derivatives of carbon without the production of hydrogen bromide." By B. M. Gupta and J. F. Thorpe.

"Limits for the propagation of flame at various temperatures in mixtures of ammonia with air and oxygen." By A. G. White.

"The molecular scattering of light in normal pentane." By R. Venkateswaran.

"Preparation and reactions of stannous oxide and stannous hydroxides." By F. W. Bury and J. R. Partington.

"Investigation of antimony metal from different sources. Indication of isotopes." By S. D. Muzaffar.

"The catalytic decomposition of formic acid on surfaces of platinum and silver." By H. C. Tingey and C. N. Hinshelwood.

"Inorganic complex salts. Crystallographic and optical study. Part I." By I. E. Knaggs.

"The formation of derivatives of tetrahydronaphthalene from γ-phenyl fatty acids. Part II." By A. Stevenson and J. F. Thorpe.

"*N*-Oximino-ethers. Part II. *N*-Aryl ethers of 2 : 4- and 2 : 6-dinitrobenzaldoxime." By F. Barrow, E. D. Griffiths, and E. Bloom.

"The nitro- and amino-derivatives of *o*- and *p*-methoxybenzoic acid and of α- and β-methoxynaphthoic acid." By V. Froelicher and J. B. Cohen.

"The addition of ethyl sodiocyanoacetate and ethyl sodiomalonate to ethyl muconate." By E. H. Farmer.

"A synthesis of pyrylium salts of anthocyanidin type." By D. D. Pratt and R. Robinson.

"The action of sodium methoxide and its homologues on benzophenone chloride and benzylidene chloride. Part III." By J. E. Mackenzie.

"On diacetylacetone." By J. N. Collie and A. A. B. Reilly.

"The explosion of acetylene and nitrogen. Part II." By W. E. Garner and K. Matsuno.

"The applicability of a linear poisoning law to the catalytic decomposition of hydrogen peroxide." By E. B. MAXTED.

"Molecular weights in alcoholic solutions from the elevation of the flash point." By R. WRIGHT.

"Selective solubility shown by aqueous alcohol when acting as a solvent." By R. WRIGHT.

"Attempts to prepare red sulphide dyes. Part II. Mercaptan derivatives of azo-dyes." By E. R. WATSON and S. DUTT.

"The isolation of muscarine, the potent principle of *Amanita muscaria*." By H. KING.

"Researches on residual affinity and co-ordination. Part IX. Cobaltammine salts of the nitro-dyes." By G. T. MORGAN and H. J. S. KING.

"The mobility of symmetrical triad systems. Part I. The conditions which confer mobility on symmetrical open-chain systems terminated by phenyl groups." By C. K. INGOLD and H. A. PIGGOTT.

"Cevadine. Part I." By A. K. MACBETH and R. ROBINSON.

"Cyclic addition. Part I. The occurrence and reversibility of reactions in which cyclic structures are formed by the direct union of unsaturated linkages. Part II. The reaction between azomethines." By C. K. INGOLD and H. A. PIGGOTT.

"*iso*Propylstannonic acid and some of its derivatives." By J. G. F. DRUCE.

"Syntheses of alkylidenecyanoacetic acids and of substituted succinic acids. Part I. Acids containing aromatic residues." By A. LAPWORTH and J. A. McRAE.

"On crystalline glucose-ammonia and *iso*glucosamine." By A. R. LING and D. R. NANJI.

"The autoreduction of sulphurous acid." By G. M. BENNETT.

"Researches on the conditions of formation of rings attached to the *o*-, *m*-, and *p*-positions of the benzene nucleus. Part I. The action of sodium on *o*-phenylenediacetic ester." By W. H. PERKIN and A. F. TITLEY.

"A method for the preparation of $\alpha\beta\beta$-trialkylated glutaric acids." By G. A. R. KON and J. F. THORPE.

"The bromine compounds of phenanthrene. Part II." By H. HENSTOCK.

"The solubility of phenanthrene in various organic solvents." By H. HENSTOCK.

"The sorption of liquids by charcoal." By J. DRIVER and J. B. FIRTH.

"The equilibria in aqueous solutions of the alkali metal bisulphites." By E. C. C. BALY and R. A. BAILEY.

"Studies in the anthracene series. Part III." By E. de B. Barnett, J. W. Cook, and H. H. Grainger.

"The solubilities of the alkaline formates and acetates in water." By N. V. Sidgwick and J. A. H. R. Gentle.

"The solubility of the alkaline salts of benzoic and the hydroxybenzoic acids in water." By N. V. Sidgwick and E. K. Ewbank.

"The mechanism of the formation of benzoylbenzoin by treatment of benzoylmandelonitrile with an alcoholic solution of sodium ethoxide." By H. Greene and R. Robinson.

"The oxime of mesoxamide (*iso*nitrosomalonamide) and some allied compounds. Part IV. The ethers of *iso*nitrosomalonanilide, and *iso*nitrosomalondimethylamide, and *iso*nitrosomalondibenzylamide." By A. G. Rendall and M. A. Whiteley.

"Researches on residual affinity and co-ordination. Part X. Salicylatotetramminocobaltic salts and the constitution of oxonium compounds." By G. T. Morgan and J. D. Main Smith.

"The cyanine dyes. Part VI. Dyes containing a quinoline and a benzothiazole nucleus. The thio*iso*cyanines." By W. T. K. Braunholtz and W. H. Mills.

"The isomerism of the oximes. Part X. Cinnam- and nitrocinnam-aldoximes." By O. L. Brady and C. D. Thomas.

"The problem of substitution in the benzene nucleus and the Thomson-Lewis-Langmuir theory of co-valence." By R. Fraser and J. E. Humphries.

"The constitution of soap solutions. Cetylsulphonic acid and other sulphonates." By M. H. Norris.

"Physical chemistry of the oxides of lead. Part VI. The anodic behaviour of lead and lead peroxide." By S. Glasstone.

"Use of paraformaldehyde (gaseous formaldehyde) and paraldehyde (gaseous acetaldehyde) in the synthesis of alcohols." By C. E. Wood and F. Scarf.

"Rotatory dispersion of the esters of lactic acid. Normal esters. Part I." By C. E. Wood, J. E. Such, and F. Scarf.

"The solubility and volatility of 1 : 3 : 5-dinitrophenol." By N. V. Sidgwick and T. W. J. Taylor.

"The labile nature of the halogen atom in organic compounds. Part V. The action of hydrazine on the halogen derivatives of some esters and *cyclo*hexanes." By E. L. Hirst and A. K. Macbeth.

"Esters of the hydroxyalkylarylamines. Part I. Acid sulphuric esters of the simple monohydroxyethylarylamines." By K. H. Saunders.

"Harmine and harmaline. Part VI. The synthesis of *n*-methyltetrahydroharmine and the constitution of harmaline and of the alkylated harmines." By W. O. Kermack, W. H. Perkin, and R. Robinson.

"Note on the decomposition of the dithiocarbazinates." By S. M. Losanitch.

"The interaction of aldehydes and ketones with thiocarbamides in the presence of acids. Part II." By J. Taylor.

"The preparation of methylguanidine, and of ββ-dimethylguanidine by the interaction of dicyanodiamide, and methylammonium and dimethylammonium chlorides respectively." By E. A. Werner and J. Bell.

"Adsorption and catalysis in Fuller's earth." By E. K. Rideal and W. Thomas.

"Quantitative reduction by hydriodic acid of halogenated malonyl derivatives. Part II. The *s*.-tetra-substituted amides of bromo- and chloro-malonic acid." By R. W. West.

"Amylases of the cereal grains—the 'insoluble' amylase of barley." By J. L. Baker and H. F. E. Hulton.

"Reactivity of hydrogen atoms in methylene groups." By T. H. Reade.

"The condensation of the aromatic *o*-amino-sulphonic acids with *iso*cyanic acid." By J. R. Scott and J. B. Cohen.

"Monothioethylene glycol." By G. M. Bennett.

"The β-chlorovinylarsines." By F. G. Mann and W. J. Pope.

"Piperitone. Part IV. The interaction of *dl*-piperitone and semicarbazide, and the isolation of pure *dl*-piperitone." By J. Read and H. G. Smith.

"The chlorination and bromination of the toluic acids and the preparation of the phthalaldehydic acids." By W. Davies and W. H. Perkin.

"The isomerism of metallic oxides. Part I. Lead monoxide." By M. P. Applebey and R. D. Reid.

"The action of the chlorides of phosphorous on chlorodimethyldihydroresorcin." By L. E. Hinkel and W. D. Williams.

"On the movements of explosion waves in tubes of different shapes." By C. Campbell.

"The chlorination of benzoyl chloride." By E. Hope and G. C. Riley.

"Ethyl α-cyano-β-methyl glutaconate and its methyl homologues." By E. Hope.

"The addition of hydrogen cyanide to derivatives of glutaconic acid. Part I. The addition of hydrogen cyanide to ethyl-α-cyano-β-methyl glutaconate and its homologues." By E. Hope and W. Sheldon.

"The velocity of reaction in mixed solvents. Part III. The influence of temperature on the velocity of saponification of esters." By H. McCombie, H. A. Scarborough, and R. H. Settle.

"The action of ferrous chloride on some organic hydrochlorides." By W. M. Cumming.

"The form of the vapour-pressure curve at high temperature. Part I. The curve for lead." By C. K. Ingold.

"The optical rotations of the sugars." By J. G. Maltby.

"Heteromorphism of calcium sulphate. Alabaster and its synthesis." By M. Copisarow.

"Heteromorphism of calcium carbonate. Marble: synthetic and metamorphic." By M. Copisarow.

"Researches on residual affinity and co-ordination. Part IX. Interaction of selenium tetrachloride and β-diketones." By G. T. Morgan, H. D. K. Drew, and T. V. Barker.

"The ignition of gases. Part II. Ignition by a heated surface. Mixtures of methane and air." By W. Mason and R. V. Wheeler.

"On the interchange of alcohol radicles in esters. Part II." By A. Shimomura and J. B. Cohen.

"Note on the reduction of thorium oxide by metallic tungsten." The Research Staff of the General Electric Co., Ltd., London (C. J. Smithells).

"γ-Methylfructoside." By R. C. Menzies.

"The ultrafiltration of soap solutions: sodium oleate and potassium laurate." By J. W. McBain and W. J. Jenkins.

"Some new derivatives of methylstannonic acid; their bearing upon its constitution." By H. Lambourne.

"Note on the hydrolysis of ββ′-dichloroethyl sulphide. Part I. Synthesis of divinyl sulphide and the preparation of a non-vesicant isomer of ββ′-dichloroethyl sulphide." By S. H. Bales and S. A. Nickelson.

"The quaternary salts of quinaldinic acid." By W. H. Mills and F. M. Hamer.

"A modified methyl-orange indicator." By K. C. D. Hickman and R. P. Linstead.

"The labile nature of the halogen atom in organic compounds. Part VI. The action of titanous chloride and of ammonia on representative halogen compounds." By I. A. Black, E. L. Hirst, and A. K. Macbeth.

"The interaction of aniline and acrolein." By F. G. Mann.

"*p*-Dithiobenzoic acid." By S. Smiles and D. C. Harrison.

"The reversibility of the reaction between nitrogen, carbon, and sodium carbonate." By C. K. Ingold and D. Wilson.

"Limits for the propagation of flame in vapour–air mixtures. Part II. Mixtures of more than one vapour and air at the ordinary temperature and pressure." By A. G. White.

"The constitution of carbamides. Part XIV. The decomposition of urea by sodium hypobromite in alkaline solution, and an improved procedure for the estimation of urea by this means." By E. A. Werner.

"The system chromium trioxide–sulphur trioxide–water." By L. F. Gilbert, H. Buckley, and I. Masson.

"The constitution of acetone derivatives of glucose and fructose." By J. C. Irvine and J. Patterson.

"The formation and properties of dithio-ketones ($R_2C{:}S{:}S$) and dithio-ether ($R_2S{:}S$). Part III." By K. G. Naik and M. D. Avasare.

"The constitution of the terpene present in the essential oil from *Andropogon Jwarancusa*, Jones." By J. L. Simonsen.

"The action of bromine water on indene." By J. Read and E. Hurst.

"Note on the dilution of ethylenebromohydrin with water." By J. Read and G. J. Burrows.

"The solubilities of the aldehydo-benzoic acids." By N. V. Sidgwick and H. Clayton.

"The solubility of the chlorophenols." By N. V. Sidgwick and S. L. Turner.

"The resolution of tropic acid and the stereochemical configuration of the cinchona alkaloids." By H. King and A. D. Parker.

"The methylation of xylose." By E. L. Hirst and A. Carruthers.

"The specific heats of gases with special reference to hydrogen." By C. K. Ingold and E. H. Usherwood.

"Purification of methyl alcohol by means of sodium hypochlorite." By R. C. Menzies.

"Cupric tetrammine nitrite and the corrosion of copper by aqueous solutions of ammonia and of ammonium nitrate." By H. Bassett and R. G. Durrant.

"The speed of the uniform movement of flame in mixtures of the paraffins with air." By W. Mason.

"Mutarotation and pseudo-mutarotation in the glucosamine series." By J. C. Irvine and J. C. Earl.

"Salicylidene derivatives of *d*-glucosamine." By J. C. Irvine and J. C. Earl.

"Perhalides of the phenyltrimethylammonium series." By H. McCombie and T. H. Reade.

"Note on the preparation of the sodium and potassium derivatives of phthalimide." By D. L. Hammick and G. H. Locket.

"The additive formation of four-membered rings. Part I. The synthesis and resolution of some derivatives of tetrahydro-1 : 3-diazine." By C. K. Ingold and H. A. Piggott.

"Derivatives of dithiophenyl-benzene." By S. Smiles and H. Graham.

"The products of fermentation of cellulose." By H. Langwell.

"The labile nature of the halogen atom in organic compounds. Part VII. The absorption spectra of the halogen derivatives of some cyclic compounds and their bearing on the question of an oxygen–halogen linking." By H. Graham and A. K. Macbeth.

"The polarity of double bonds. An extension of the theories of Lapworth and Robinson." By T. M. Lowry.

"2 : 4-Dinitrobenzil." By G. B. Bishop and O. L. Brady.

"Rates of reduction of nitro-groups by hydrogen in the presence of colloidal palladium, especially of nitrotoluene isomerides." By W. H. Patterson.

"A determination of the relative proportions of the isomerides in nitrotoluene or toluidine." By W. H. Patterson.

"The synthesis of *m*-α-benzbispyrrole derivatives." By W. Davies and E. H. C. Hickox.

"Viscosity of organic liquid mixtures and its relationship to chemical composition and vapour pressure and certain other physical properties." By M. A. Soofi.

"The system tin–arsenic." By Q. A. Mansuri.

"On the preparation of glucinum sulphate and the system: ammonium sulphate–glucinum sulphate–water at 25° C." By H. T. S. Britton.

"Aromatic sulphonic chlorides." By J. Stewart.

"The oleo-resin of *Canarium muelieri.*" By T. G. H. Jones and F. Smith.

"The conditions underlying the formation of unsaturated and cyclic compounds from halogenated open-chain derivatives. Part V. Products derived from α-halogenated β-methylglutaric acid." By C. K. Ingold.

"The behaviour of the stannic acids towards solutions of alkaline hydroxides." By G. E. Collins and J. K. Wood.

"A specific cellulose-fermenting organism." By H. Langwell.

"The mechanism of the bromination of phenol in aqueous solution." By H. Baines.

"The theories of polarity in organic compounds." By J. Kenner.

"The solubility and volatility of the nitrobenzaldehydes." By N. V. SIDGWICK and W. M. DASH.

"The action of magnesium on symmetrical tetrachloro- and tetrabromo-tetramethylmethane." By A. FAIRBOURNE.

"The triazo-group. Part XXII. Cinnamic acid chlorohydrin and its conversion into α-triazo-β-hydroxy-β-phenylpropionic acid." By M. O. FORSTER and W. B. SAVILLE.

"A model to illustrate the orbits of the electrons about a carbon atom." By W. E. GARNER.

"The labile nature of the halogen atom in organic compounds. Part VIII. The reduction of chloro- and bromo-trinitromethane and of tetranitromethane." By T. HENDERSON and A. K. MACBETH.

"The condensation of 9 : 10-diaminophenanthrene with phenanthraquinone and other *o*-quinones." By S. DUTT and E. R. WATSON.

"Studies in the β-phenylglutaric acid series. Part I. A possible basis of a new method for the determination of the relative distribution of the valencies of polyvalent elements." By J. G. JACKSON and J. KENNER.

"A simplified method for the resolution into its optically active components of *sec.*-octyl alcohol (methyl-*n*-hexylcarbinol)." By J. KENYON.

"Electro-synthesis of azelaic and thapsic acids." By M. CARMICHAEL.

"Photocatalysis. Part III. The photosynthesis of naturally occurring nitrogen compounds from carbon dioxide and ammonia." By E. C. C. BALY, I. M. HEILBRON, and H. J. STERN.

"The preparation of potassium and sodium arylsulphoniodoamides." By E. ROBERTS.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, October 26th, 1922, at 8 p.m., Sir JAMES WALKER, D.Sc., F.R.S., President, in the Chair.

Sir William H. Bragg, K.B.E., F.R.S., delivered his Lecture entitled: "The Significance of Crystal Structure." A vote of thanks to the Lecturer, proposed by Professor J. Norman Collie, and seconded by Dr. A. E. H. Tutton, was carried with acclamation, acknowledgment being made by Sir William Bragg.

Ordinary Scientific Meeting, Thursday, November 2nd, 1922, at 8 p.m., Professor J. F. THORPE, C.B.E., D.Sc., F.R.S., Treasurer, in the Chair.

Reference was made to the great loss the Society had sustained by the death, on October 28th, of Professor Alexander Crum Brown, who was elected a Fellow on December 5th, 1867. The Chairman referred to Professor Crum Brown's long connexion with the Society, of which he had served as President for two years and as Vice-President for thirty-three years, and to his many valuable contributions to the science of chemistry.

The following were formally admitted Fellows of the Chemical Society: R. A. Mallet and Owen Owen.

Certificates were read for the first time in favour of:

Leopold Louis Bacarese, 2, Stirling Road, Clapham Road, S.W. 9.
Nicholas Timothy Belaiew, C.B., 33, Elvaston Place, Queen's Gate, S.W. 7.
James Bell, 30, Trinity College, Dublin.
John Arnold Cranston, D.Sc., 14, Fernleigh Road, Newlands, Glasgow.
Hugh John Curnow, 22, Halfway Street, Sidcup.
Richard Victor Eaton, B.Sc., A.R.C.S., Lakeside, Seldown, Poole.
Roland Hall Griffith, B.A., 14, Bigwood Avenue, Hove.
Lucy Higginbotham, M.Sc., 57, Wilbraham Road, Chorlton-cum-Hardy, Manchester.
Svend Hald Lassen, Briarwood, Manorgate Road, Kingston-on-Thames.

Reginald Arthur McNicol, M.Sc., Birnam, Rotherfield Road, Carshalton.
Thomas Malkin, B.Sc., A.I.C., Golden Square, Warrington.
Thomas Trevor Potts, 60, Christ Church Square, Macclesfield.
George Clifford Riley, B.A., B.Sc., 15, Wellington Square, Oxford.
Oscar Walter Snow, B.A., Graeme's Bank, Hatch End.
Thomas John Wall, B.A., Northcote, Alexandra Road, Malvern.

The following papers were read:

"The solubility and volatility of the nitrobenzaldehydes." By N. V. SIDGWICK and W. M. DASH.

"Investigations on the dependence of rotatory power on chemical constitution. Part XIII. The spatial configuration of the unbranched aliphatic chain." By R. H. PICKARD, J. KENYON, and H. HUNTER.

"Investigations on the dependence of rotatory power on chemical constitution. Part XIV. The normal aliphatic ethers of *d*-β-octanol." By J. KENYON and R. A. MCNICOL.

"Investigations on the dependence of rotatory power on chemical constitution. Part XV. The normal aliphatic ethers of *d*-methylbenzylcarbinol." By H. PHILLIPS.

"Investigations on the dependence of rotatory power on chemical constitution. Part XVI. A new type of Walden inversion." By H. PHILLIPS.

"Investigations on the dependence of rotatory power on chemical constitution. Part XVII. The di-*d*-β-octyl esters of the acids of the general formula $(CH_2)_n(CO_2H)_2$." By L. HALL.

"Orientation of the 1 : 4- and 1 : 5-dimethylglyoxalines. Mode of fission of 5-aminoglyoxalines." By F. L. PYMAN.

"Bromo-derivatives of 2-methylglyoxaline." By L. LIGHT and F. L. PYMAN.

"2 : 5-Iminodihydro-1 : 2 : 3-triazole. Part I. Constitution of Dimroth's 5-anilidotriazole." By P. K. DUTT.

Unveiling Ceremony of the War Memorial to Lt.-Colonel E. F. Harrison, C.M.G., and other Fellows of the Chemical Society on Thursday, November 16th, 1922, at 3 p.m.

A report of the proceedings of the meeting will appear in the December issue of the Journal.

Ordinary Scientific Meeting, Thursday, November 16th, 1922, at 8 p.m., Professor J. C. PHILIP, O.B.E., D.Sc., F.R.S., Secretary, in the Chair.

Reference was made to the loss sustained by the Society, through death, of the following Fellows:

	Elected.	Died.
Edward Henry Grossmann	Dec. 5th, 1895.	Aug. 29th.
Leo Tschugaeff	Dec. 1st, 1910.	Sept. 26th.

Messrs. J. R. Green and T. Iredale were formally admitted Fellows of the Chemical Society.

Certificates were read for the first time in favour of:

Kenneth Claude Bailey, M.A., 137, South Circular Road, Dublin.
Katherine Hope Coward, M.Sc., 14, Parliament Hill, Hampstead, N.W. 3.
Allan Robert Earle, B.A., 90, Shadwell Road, Portsmouth.
Samuel Gray Fenton, 27, Somerset Road, Harrow.
Phillip Marcus Fisk, 92, Aldborough Road, Seven Kings, Ilford.
Thomas Graham, 47, Canada Road, Cardiff.
Leslie Frank Hewitt, B.Sc., A.I.C., 8, Maze Road, Kew, Surrey.
John Ingham, 19, Greyhound Road, Tottenham, N. 17.
Wilfred Herbert Linnell, B.Sc., A.I.C., 12, Highbury, Monkseaton, Whitley Bay.
Ramprasad Pitamberdas Mahta, M.A., Organic Chemistry Dept., University College, Gower Street, W.C. 1.
Jocelyn Patterson, Ph.D., M.Sc., 106, Market Street, St. Andrews.
Tara Chand Rana, M.Sc., III Bridge, Srinagar, Kashmir, India.
John Baldwin Shoesmith, M.Sc., 10, Spottiswoode Road, Edinburgh.
Reginald Ernest Tebbit, 120, Lordship Lane, E. Dulwich, S.E. 22.
Eric Wilfred Tong, B.Sc., A.R.C.S., Hollingbourne, Maidstone.
Thomas Arthur Williams, Ridgeway House, Mill Hill, N.W. 7.

A Certificate has been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of: Babu Lall Govila, Central Polytechnic Institute, Gwalior.

The meeting was then adjourned and the Informal Meeting declared open.

List of Papers received between October 20th and November 16th, 1922:

"Investigations on the dependence of rotatory power on chemical constitution. Part XIII. The spatial configuration of the unbranched aliphatic chain." By R. H. Pickard, J. Kenyon, and H. Hunter.

"Investigations on the dependence of rotatory power on chemical constitution. Part XIV. The normal aliphatic ethers of *d*-β-octanol." By J. Kenyon and R. A. McNicol.

"Investigations on the dependence of rotatory power on chemical constitution. Part XV. The normal aliphatic ethers of *d*-methyl benzylcarbinol." By H. Phillips.

"Investigations on the dependence of rotatory power on chemical constitution. Part XVI. A new type of Walden inversion." By H. Phillips.

"Investigations on the dependence of rotatory power on chemical constitution. Part XVII. The di-*d*-β-octyl esters of the acids of the general formula $(CH_2)_n(CO_2H)_2$." By L. Hall.

"Orientation of the 1 : 4- and 1 : 5-dimethylglyoxalines. Mode of fission of 5-aminoglyoxalines." By F. L. Pyman.

"Bromo-derivatives of 2-methylglyoxaline." By L. Light and F. L. Pyman.

"The oxidation of cane sugar by nitric acid." By F. D. Chattaway and H. J. Harris.

"Castelamarin—a bitter principle from *Castela Nicholsoni.*" By L. P. Bosman.

"Catalytic hydrogenation with nickel. Factors determining catalytic activity." By R. Thomas.

"2 : 5-Iminodihydro-1 : 2 : 3-triazole. Part I. Constitution of Dimroth's 5-anilidotriazole." By P. K. Dutt.

"The action of alcohol on the sulphates of ammonium." By H. B. Dunnicliff.

"Refraction and dispersion of potassium vapour." By A. L. Narayan and G. Subrahmaniam.

"The interaction of diazonium salts and phenols." By F. D. Chattaway and H. R. Hill.

"The relation between the crystal structure and constitution of carbon compounds. Part I. Compounds of the type CX_4." By I. E. Knaggs.

"Binary critical solution temperatures as criteria of the purity of acetic acid." By D. C. Jones.

"Ternary critical solution temperatures as a criterion of liquid purity." By D. C. Jones.

"Syntheses of alkylidenecyanoacetic acids and of substituted succinic acids. Part II. Preparation of acids containing saturated aliphatic residues and the constitution of the aliphatic alkylidenecyanoacetic esters." By A. Lapworth and J. A. McRae.

"Formation of γ-alkylidene derivatives from ethylidenemalonic ester." By A. Lapworth and L. Higginbotham.

"Resorcinolphenylsuccinein." By A. Lapworth and J. A. McRae.

"The preparation of α-trioxymethylene and a new polymer of formaldehyde." By D. L. Hammick and A. R. Boeree.

"The isoelectric condition of gelatin." By S. O. Rawling and W. Clark.

"The nitration of 3-chloroacenaphthene." By G. Farnell.

"The diazo-reaction in the carbazole series. Carbazole-3-diazoimine and -3-diazonium salts." By G. T. Morgan and H. N. Read.

"The oxidation of sabinene with chromyl chloride." By G. G. Henderson, J. M. Robertson, and D. C. Brown.

"Scattering of light by CO_2 and N_2O, and by some organic vapours." By A. L. Narayan.

"1 : 3 : 4 : 6-Tetramethyl fructose." By J. C. Irvine and J. Patterson.

"Researches on residual affinity and co-ordination. Part XII. Interactions of metallic salts and dimethyldithiolethylene." By G. T. Morgan and W. Ledbury.

"Researches on residual affinity and co-ordination. Part XIII. Cobaltammine and ferric lakes of dinitrosoresorcinol." By G. T. Morgan and J. E. Moss.

"Researches on residual affinity and co-ordination. Part XIV. Cobaltammine and cobaltic lakes of the azo-salicylic acids." By G. T. Morgan and J. D. M. Smith.

"Boundary lubrication and chemical constitution. The optically active carbinols of the formula $C_2H_5{\cdot}CH(OH){\cdot}C_nH_{2n+1}$." By I. Doubleday.

"The velocity of reaction in mixed solvents. Part IV. The influence of the base on the velocity of saponification of esters." By A. Cashmore, H. McCombie, and H. A. Scarborough.

"The adsorption of radium-*B* and radium-*C* by ferric hydroxide." By J. A. Cranston.

"The hydrolysis of platinum salts. Part II. Potassium platinichloride." By E. H. Archibald and W. A. Gale.

"On the reactivity of methyl groups in heterocyclic bases." By W. H. Mills and J. L. B. Smith.

"An examination of the reputed antimonious hydroxides." By C. Lea and J. K. Wood.

"The adsorption of stannous chloride by stannic acid." By G. E. Collins and J. K. Wood.

"The composition of paraffin wax. Part III." By F. Francis, C. M. Watkins, and R. W. Wallington.

"The hydrogen sulphates of the alkali metals and ammonium." By H. B. Dunnicliff.

LECTURE.

On Thursday, December 14th, at 8 p.m., at the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W. 1, Professor Cecil H. Desch, D.Sc., Ph.D., will deliver a Lecture entitled "The Metallurgical Applications of Physical Chemistry."

COLLECTIVE INDEX, VOL. VI (1913–1922).

Volume VI of the Collective Index, to be published in two parts, will be issued Part I in 1923 and Part II in 1924.

The price to Fellows who apply before *Christmas Day*, 1922, is £2 17*s*. post free. A remittance, made payable to Mr. S. E. Carr, must accompany the application in each case and should be sent to the Assistant Secretary, Chemical Society, Burlington House, W. 1. The price to Fellows who apply after December 25th, 1922, will be £3 7*s*.

Arrangements have been made by which cases in blue or maroon cloth for binding this Index in three volumes (Authors' Index, 1 vol. and Subject Index, 2 vols.) will be supplied for the sum of Seven Shillings. The binding will involve an additional charge of 2*s*. 3*d*. per volume. The total cost, therefore, of binding the Index in cloth will be 13*s*. 9*d*.

Fellows desiring to avail themselves of this offer should apply to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C. 4.

CERTIFICATES OF CANDIDATES FOR ELECTION AT THE BALLOT TO BE HELD AT THE ORDINARY SCIENTIFIC MEETING ON THURSDAY, DECEMBER 7TH, 1922.

N.B.—The names of those who sign from "General Knowledge" are printed in *italics*.

ALLANSON, ROBERT, "Oaklands," 10, Grosvenor Drive, New Brighton, Wallasey, Cheshire. British. Director of Powell & Scholefield, Ltd., Chemical Manufacturers, Liverpool, and interested in research on behalf of the chemical industry and in connexion with manufacturing chemistry. (*Signed by*) R. L. Siau, Arnold R. Tankard, Douglas Henville.

ALLCHIN, THOMAS CUTHBERT, (M.B.E.), Longfield, Kent. Works manager (chemical), E. C. Powder Coy., Ltd. Manufacturing chemistry. To receive publications and attend meetings. (*Signed by*) Edgar Neumann, Matthew J. Cannon, Herbert E. Burgess.

ARMIT, JAMES WILSON, The Manse, Monikie, nr. Dundee. Chemical research student at St. Andrew's University. M.A., St. Andrews (1920). Research student in chemistry since October 1921. (*Signed by*) Robert Robinson, J. C. Irvine, John Pryde, E. L. Hirst.

BACARESE, LEOPOLD LOUIS, 2, Stirling Road, Clapham Road, S.W.9. British. Managing Chemist. (1) Two years student at the Westminster School of Pharmacy, London, S.W. (2) Passed the qualifying exam., Gibraltar. (3) Member of the Pharmaceutical Society. (4) Member of the British Optical Association and the Institute of Ophthalmic Opticians. (5) Four years Managing Chemist to Heppell & Co., London. Keenly desirous of becoming a Fellow to keep in touch and attend lectures, receive Society's publications, with a view to improving experience in Organic Chemistry.

(*Signed by*) Robert S. Glennie, W. Bennison, P. H. Woodnoth, H. Sampson Wills.

Bains, Leslie, 5, Carlton Road, Stroud Green, N.4. British. Research Student. Natural Sciences Tripos, Cambridge: Part I (1st Class), Part II (2nd Class). Two years' research in Organic Chemistry at Cambridge; now at the Imperial College of Science, South Kensington. B.A. (Cantab.), B.Sc. (London). Associate of Institute of Chemistry. (*Signed by*) Jocelyn Thorpe, C. K. Ingold, Arnold Stevenson, G. A. R. Kon.

Bathija, Menghraj Choithram, Fitzwilliam Hall, Cambridge. British subject. Student. I have remained as a student of chemistry for the last six years at the universities of Bombay and Cambridge, respectively, and have obtained Honours degree of Bombay in chemistry and physics, and 2nd Class Honours degree of Cambridge in chemistry, physics, and botany. (*Signed by*) H. J. H. Fenton, A. J. Berry, T. M. Lowry.

Belaiew, Nicholas Timothy, Colonel, C.B., 33, Elvaston Place, Queen's Gate, London, S.W.7. Russian. Metallurgist. Formerly Lecturer in Chemistry and Metallurgy at the Michael Artillery Academy, Petrograd. Colonel, C.B., M.I.Met., M.I.Min.E., Hon. M.I.Ae.E. Honorary Corresponding Fellow of the Royal Society of Arts. Honorary Corresponding Member of the Council of the Institute of Metals. Member of the Council of the I. Aeronautical Engineers. Member of the Iron and Steel Institute, the Faraday Society, the Society of Chemical Industry, and of the Mineralogical Society. Member of the Société de Chimie Physique in Paris. In Russia member of Society of Physics and Chemistry, Imp. R. Mineralogists and others. Contributor of several papers on chemistry, physics, and crystallography. (*Signed by*) H. C. H. Carpenter, W. J. Pope, R. A. Hadfield.

Bell, James, 30, Trinity College, Dublin. British. University Demonstrator of Chemistry. Senior Moderator in Experimental Science (with large gold medal for first place and high marks), Dublin University, 1920. Demonstrator of chemistry, Dublin University, 1919–1922. Part author of two papers on original research, viz. *J. Chem. Soc.*, **117**, 1133, (1920), and *J. Chem. Soc.*, **121**, 1790, (1922). (*Signed by*) Sydney Young, Emil A. Werner, A. G. G. Leonard.

Broome, Donald Charles, "Disgwylfa," Penmaenmawr, North Wales. British. Technical Chemist. Educated at Emanuel School, Wandsworth Common, and later at Woolwich and Battersea Polytechnics. Have passed Inter. B.Sc. (London) and am studying for final B.Sc., having completed one year's work for this examination. Late chief assistant chemist at the South Met. Gas Co.'s Tar Works, East Greenwich. Now holding the post of works chemist at the Penmaenmawr works of the Penmaenmawr and Trinidad Lake Asphalt Co., Ltd. (*Signed by*) M. O. Forster, J. Kenyon, J. L. White, Herbert E. Nickels, *Wallace C. Nickels.*

Buist, Walter Ferguson, 24, New Hall Lane, Clubmoor, Liverpool. Scotch. Graduate. Awaiting teaching post. Northern Universities Matriculation 1913. Inter.B.Sc., University of Liverpool, 1914. (War service 1914–1920.) Honours chemistry, B.Sc., 1922. Desirous of keeping in touch with current literature. (*Signed by*) E. C. C. Baly, Herbert H. Froysell, I. M. Heilbron, J. S. Buck.

Bult, Stanley Robert, 63, Addiscombe Rd., Croydon. British. Chemist. At present time Curator, Institute of Hygiene, lecturing and demonstrating upon dietetic and hygienic problems. Twenty-two years' experience of chemistry (with break during the war). Seventeen years' laboratory work, oils, waxes, soaps, paints, metals, rubber, foodstuffs. Some small contributions to technical journals. (*Signed by*) Herbert J. Bult, Lawrence Briant, Julian L. Baker.

Burford, Arthur Josiah, c/o 419, Edgware Rd., Maida Vale, W.2. British. Chemist and Druggist. (1) Two years student in chemistry at the School of Pharmacy of the Pharmaceutical Society, Bloomsbury Square, W.C. (2) One year student in pharmaceutical and analytical chemistry at the London College of Chemistry and Botany, S.W. (3) Member of the Pharmaceutical Society. (4) Three years laboratories of Wands, Manufacturing Chemists, Leicester. (5) Three years chemist to Heppell & Co., London. (6) Keenly desirous of becoming a Fellow to keep in touch and attend lectures, receive Society's publications, with a view to improving experience in Pharmaceutical Organic Chemistry. (*Signed by*) William Bennison, Gabriel Cofman-Nicoresti, Robert S. Glennie.

Burrows, George Joseph, Chemical Department, University, Sydney, N.S.W. B.Sc. Sydney (1910). Lecturer in Chemistry, Sydney University. Author of various publications in *J.C.S.* since 1914. (*Signed by*) Eustace E. Turner, Charles E. Fawsitt, J. A. Schofield.

Carter, William Leslie, "Ellesmere," Bloxcidge St., Langley Green, nr. Birmingham. British. Works Chemist (in charge). Educated at the Secondary School, Oldbury (by county scholarship). Oxford Univ. local exam. honours and distinction in chemistry. 1915, Assistant chemist, Messrs. Chance & Hunt, Ltd., Oldbury, Chemical Mfrs. 1916, Assistant chemist, Messrs. J. Hardman, Ltd., Birmingham, tar distillers. 1917, Assistant chemist, H.M. factory site "B," Oldbury. 2½ years' military service (France). 1921, Board of Education higher education course in advanced chemistry. 1922, Chemist-in-charge, Messrs. Birmingham Starch & Mfg. Co., Ltd., Birmingham. Paper in preparation on "The Manufacture of Starch." (*Signed by*) J. G. Howarth, Arthur Adams, Joseph Lones.

Cavigan, Sydney George, 22, Walker St., Burton-on-Trent. Analytical Chemist. I have had five years' experience in the analysis of metals, foods, and drugs, and general experience in biological chemistry and toxicology, and am at present in charge of the analytical department of Messrs. Evans, Sons, Lescher & Webb, Research Laboratories, Runcorn. I wish to become a member in order to obtain the *Journal* to assist me in my researches, and to keep up my knowledge of modern chemical literature. (*Signed by*) Wm. P. Skertchly, James Booth, J. Turnbull, Herbert H. H. Lorenz.

Champion, John Hardwick Long, 41, Triangle West, Clifton, Bristol. Student. Bachelor of Science (Bristol). Have done eight months' research in physical chemistry under Prof. J. W. McBain. Am at present engaged as a part-time teacher of chemistry and physics. (*Signed by*) J. W. McBain, M. Nierenstein, Millicent Taylor, B. Fullman.

Choudary, Katragadda Seshachalam, 71, Coral Merchant St., George Town, Madras, India. Indian (Hindu). Leather Trades Chemist. Master of Arts of the University of Madras, Master of Science of the University of Leeds; lecturer in chemistry in the Christian College, Madras (1917–18); lecturer in chemistry in the Government Arts College, Rajahmundry, Madras; (1918–19); chemist in the Leather Trades Institute, Madras (1919–20). (*Signed by*) P. K. Dutt, Akira Shimomura, H. M. Dawson.

Christie, Elliot Martin, 37, Lynwood Avenue, Dunedin, N.Z. Secondary School Teacher. Graduated B.Sc., Victoria University College, 1920. M.Sc. (2nd Class Honours in Chemistry), 1922. Thesis on "Oxidation of Unsaturated Organic Compounds by Persulphate." Appointed Science Master, Gore High School, 1922. (*Signed by*) J. K. H. Inglis, John Williams, C. S. Hicks.

Clarke, Frederick Stanley, 64, Golders Manor Drive, N.W.11. British. Pharmaceutical Chemist. 1899, Demonstrator (chemistry and pharmacy), Manchester. From 1900, 2½ years with the late Wm. Martindale, editor, *Extra Pharmacopeia*. 1902 to 1920 on technical experimental staff, Burroughs, Wellcome & Co., London. At present works manager and chemist, Anglo-American Oil Co.'s Speciality Dept. for petroleum products. (*Signed by*) Harold King, Harold C. Sayer, Frank Lee Pyman.

Cottrell, Allin, 3, Oxford Terrace, Edinburgh. British. Lecturer in Technical Chemistry, Edinburgh University. Lately chief chemist, H.M. Factory, Gretna. (*Signed by*) James Walker, Sydney A. Kay, Leonard Dobbin.

Cranston, John Arnold, 14, Fernleigh Road, Newlands, Glasgow. British. Lecturer on Physical Chemistry, Royal Technical College, Glasgow. Doctor of Science, Glasgow University. Lecturer in Royal Technical College for three years. (*Signed by*) F. J. Wilson, Thomas Gray, R. M. Caven.

Curnow, Hugh John, 22, Halfway St., Sidcup. English. Undergraduate. Inter. Science (London). Student of the Institute of Chemistry. (*Signed by*) H. Pochin, J. R. Partington, W. H. Patterson.

Dance, Edward, Castle Inn, Sandal, Wakefield. British. Student. B.Sc. Hons. in Col. Chem., Leeds, and Diploma in Dyeing, Leeds University. Desire Fellowship in order that I may receive the *Journal* and have use of Library. (*Signed by*) R. M. Woodman, J. R. Scott, P. W. Clutterbuck, John S. Carter.

Davies, Wilfred Thomas Grey, Plas-y-Coed, Derllwyn Rd., Tondû, Glamorgan. British. Assistant, Tondû By-product Works. B.Sc., Bristol, 1920. Inter.B.Sc., 1914. Carried out research under Dr. M. Nierenstein at Bristol University. (*Signed by*) M. Nierenstein, M. Taylor, F. Francis, J. W. McBain, B. Fullman.

Dewhurst, Milton, 1280, Warwick Rd., Acocks Green, Birmingham. British. Works Chemist. B.Sc. Hons. Chemistry (Vict.). A.I.C. (*Signed by*) H. B. Dixon, Arthur Lapworth, F. P. Burt, Frederick Challenger, John Harwood.

Eaton, Richard Victor, "Lakeside," Seldown, Poole. British. Chemist, R.N. Cordite Factory. A.R.C.Sc., B.Sc. (Lond.). (*Signed by*) H. B. Baker, M. A. Whiteley, James C. Philip.

Evers, Norman, The Cottage, Salisbury Avenue, Cheam, Surrey. British. Chemist. B.Sc. (London), F.I.C. Chief chemist to Messrs. Allen & Hanbury's, Ltd., Bethnal Green, E.2. Author of numerous papers on chemical subjects published in the *Analyst* and elsewhere. (*Signed by*) F. W. Gamble, G. J. Woods, Thos. McLachlan.

Farmery, Joshua William, 56, Sheen Rd., Richmond, Surrey. British Analytical and Research Chemist. M.A. (Cantab.). A.I.C. Research paper, "Decomposition of Nitric Esters," by Lowry, Browning, and Farmery, *J.C.S.* (*Signed by*) T. M. Lowry, A. F. Joseph, Cecil H. Cribb.

Ford, Samuel Frederick, 65, Abbotts Road, Southall, Middlesex. British. Assistant Chemist. (Analysis of oils, essences, and foods.) Assistant for three years in laboratory of rubber and antimony manufacturer. Now assistant chemist in laboratory of food manufacturers. Ex-day and now evening student at Battersea Polytechnic. Studying for Science degree. Rutlish Secondary School, Merton, Old Boy. (*Signed by*) F. J. Wilson, G. S. W. Marlow, J. Beauchamp Salter.

Gardner, Roy, 91, Lincoln Rd., Masterton, N.Z. Honours Student (Chemistry), University College, Otago, N.Z. Desirous of keeping in touch with recent developments. B.Sc. (N.Z.), now doing research work in chemistry at Univ. of Otago, N.Z. (*Signed by*) Fredk. P. Worley, W. F. Short, A. H. Bowell, J. K. H. Inglis, Thomas H. Easterfield.

Gifford, Philip Henry, Boys' High School, Salisbury, S. Rhodesia, S. Africa. Science Master. B.Sc. (Vict.) (1st Class Chemistry and Physics). Assistant Science Master, Ballymena Academy, Co. Antrim (1913–14). Senior Science and Maths. Master, Edinburgh Institution (1914–17 and part of 1919). Senior Science Master and Vice-Principal of the Boys' High School, Salisbury, S. Rhodesia, from Jan. 1st, 1920. (*Signed by*) Charles A. Fogg, T. M. Nightingale, E. Boardman.

Griffith, Roland Hall, 14, Bigwood Avenue, Hove, Sussex. British. B.A. (Chemistry), Oxford. Engaged on research in organic chemistry at the University laboratories. (*Signed by*) Edward Hope, W. H. Perkin, S. G. P. Plant, Allan F. Walden, N. V. Sidgwick, M. P. Applebey, B. Lambert.

Griffiths, Reginald William, 137, Holly Road, Handsworth, Birmingham Member of Research Staff, Research Laboratory, Dunlop Rubber Co., Ltd., Fort Dunlop, Birmingham. Research student at Birmingham Municipal Technical School. B.Sc. (Birmingham), 1920. (*Signed by*) J. Newton Friend, Frederick Challenger, J. E. Coates, S. R. Carter, G. T. Morgan.

Gulland, John Masson, 11, Chester Street, Edinburgh. Chemical Research Student. B.Sc. in pure science, Edinburgh University, July 1921. Research student, Chemistry Department, University of St. Andrews. (*Signed by*) Robert Robinson, J. C. Irvine, John Pryde, E. L. Hirst.

Haigh, Herbert, 211, Park Road, Barnsley, Yorkshire. British. Student (Graduate). Alternative Matriculation for ex-service men, 1919. Inter. B.Sc., Liverpool, 1920, Maths., Physics, and Chemistry. B.Sc. Liverpool, 1922, Honours Chemistry, Class I. Desirous of keeping in touch with current literature. (*Signed by*) I. M. Heilbron, E. C. C. Baly, Herbert H. Froysell, Harold Rogerson, J. S. Buck.

Higginbotham, Lucy, 57, Wilbraham Rd., Chorlton-cum-Hardy, Manchester. British. Research Assistant in Organic Chemistry at the British Cotton Research Association, Didsbury. B.Sc., Honours Chemistry, 1st Class, 1919, at Manchester University. M.Sc., 1920. Working for Dr. Stephens at Manchester University. 1921–22 Private assistant to Professor Lapworth. Publications: "The Formation of Substituted Succinic Acid from Esters of $\alpha\beta$-Unsaturated Esters," by Arthur Lapworth and Lucy Higginbotham; "Studies in the Coumaranone Series. Part I," by Lucy Higginbotham and Henry Stephen. (*Signed by*) Arthur Lapworth, Frederick Challenger, Leslie R. Ridgway, R. G. Fargher.

Hubbard, Thomas Edward, 9, Cunliffe Street, Pendleton, Manchester. Senior Assistant Chemist to the Salford Corporation Gas Works. As a student at the College of Technology, Salford, gained numerous prizes and scholarships in chemistry. Deputised for Mr. C. E. Teasdale, lecturer on gas manufacture. Lectured on calorimetry in modern gas works practice, etc. (*Signed by*) Jas. Grant, E. Bayley, Frank B. Small.

Humphries, James Ernest, 29, St. John's Rd., Newport, Mon. British. University Assistant in Chemistry, Aberdeen. B.A. (Lond. and Cantab.). M.Sc. (Wales). (*Signed by*) W. Thomas, E. Bloom, F. G. Mann.

Huntley, John, The Villa, Burstwick, nr. Hull. Works Chemist. Chief chemist, Humber Portland Cement Co., Ltd., Melton, East Yorks. (*Signed by*) W. H. Coates, Harry Thompson, Thos. A. Nightscales, E. B. Atkinson, T. Luxton.

Hurren, Sydney Alfred, M.C., 39, Upper Marylebone St., W.1. British.

Lecturer at Northern Polytechnic Institute on Technology of Pianoforte Construction, and technical editor of *The Pianomaker*, the monthly journal of the trade. (*Signed by*) Thomas J. Drakeley, Philip Schidrowitz. Raymond R. Butler.

Iskander, Habib, Heliopolis, Cairo. Egyptian. Senior Science Master of the American University, Cairo, Intermediate Section. Graduate of Royal Training College, Cairo, with top mark in chemistry, 1915. Late Senior Chemistry Master at Victoria College, Alexandria, 1915–21. (Victoria College is an English College qualifying for the Oxford and Cambridge Schools Examinations.) Author of "Khoulasit Al Chemia," an Arabic text-book in chemistry adopted by many schools and colleges. Contributor of some articles on "Recent Advances in Chemical Science" published in *Al Moktataf*, the biggest scientific magazine in the Arabic-speaking world. (*Signed by*) A. I. Kahil, A. H. Ahmad, W. Morris Colles, R. Fleming.

Jenkin, John Watson, "Tregardock," St. Austell, Cornwall. Metallurgical Research Chemist. B.Sc. (Hons.) London (2nd Class Hons. in Chemistry). A.I.C. (by examination). Studied chemistry at King's College, London, under Professors Crossley, Smiles, and Allmand. At present engaged in research work under Professor C. H. Desch in the Dept. of Metallurgy, University of Sheffield. (*Signed by*) Cecil H. Desch, A. J. Allmand, Samuel Smiles.

Jewell, John Ernest, 34, Grove End Road, St. John's Wood, N.W.8. English. Pharmaceutical Chemist. Proprietor of Messrs. Heppell, West-end chemists. Member of the Pharmaceutical Society. Director of many well-known chemical firms. (*Signed by*) Frank Radcliffe, Stanley J. Peachey, C. S. Gibson.

Jones, Edgar, Milverton House, 167, Upper Dale Road, Derby. Technical Chemist. Chief chemist, Derby Gas Light & Coke, Co. Late chemist Gas Helmet Redipping Station, R.A.O.D., Alexandria. Inter. B.Sc. (London). Lecturer, Gas Engineering and Manufacture, Derby Technical College. (*Signed by*) Jos. Yates, Cyril H. Birkitt, Stanley Dixon.

Kalff, Jan, Amsterdam, Nieuwe Prinsengracht 126. Dutch. Assistant, University, Amsterdam. Chem. Doct. Engaged in organic chemical work. Desire to keep up with the latest English investigations in chemistry. (*Signed by*) H. J. Backer, W. A. Frederikse, F. G. Donnan.

Kapur, Shankar Nath, Amritsar, India (at present, 5, Grosvenor Crescent, Edinburgh). Distillery Chemist, Amritsar Distillery Co., Amritsar, India. B.Sc. 1st Class Honours in Chemistry from Government College, Lahore (Punjab University). Chemist to the Amritsar Distillery Co., Amritsar, India (from May 1917). Now sent by the Government of India to study "Industrial Alcohol" in England and on the Continent. (*Signed by*) John E. Mackenzie, Thomas H. Pope, B. H. Wilsdon, *Bawa Kartar Singh*, *Horace B. Dunnicliff*.

Khan, Ghulam Safdar, Veterinary College, Lahore. Lecturer in Chemistry, Veterinary College, Lahore. Passed B.Sc. examination in 1920 from Punjab University. Appearing in the M.Sc. examination 1922. Special work: (1) Separation of different qualities of turpentine oil. (2) Solubility of sulphur dioxide in sulphuric acid of different concentration at constant temperature. (*Signed by*) S. R. Khosla, N. A. Yajnik, E. T. Dean.

Lassen, Svend Hald, "Briarwood," Manorgate Rd., Kingston-on-Thames. Danish. Works Manager. Graduated at the University of Copenhagen. Assistant lecturer at the Royal Mineralogical Museum, Copenhagen, 1913–14. Participated in an Arctic expedition to North Greenland as mineralogist. At present works manager to Water Softeners, Ltd. (synthetic aluminium silicates and dyestuffs). (*Signed by*) Harald Faber, Bernard Dyer, Robt. G. Grimwood.

LLOYD, WILLIAM DAWSON, 42, Tavistock Road, Westbourne Park, W.11. Medical, Veterinary, and Pharmaceutical Representative. Fifteen years' analytical and pharmaceutical experience—manufacture of bismuth salts, urine analysis, etc. (*Signed by*) A. E. Mills, Geo. A. Pemberton Wright, Herbert A. Mills.

LYNCH, PHILIP PATRICK, Church Street, Timaru, N.Z. Medical Student. B.Sc. (N.Z.). First and second professional examinations for degrees M.B., Ch.B. (N.Z.). 1918 Asst. Chemist, Department of Agriculture, Wellington. At present assistant to C. S. Hicks, M.Sc., A.I.C., Public Analyst, Dunedin (Fellow). Engaged in biochemical research on goitre, nephritis, and diabetes under Professor of Pathology at University of Otago and in collaboration with C. S. Hicks, M.Sc. (Fellow). (*Signed by*) C. S. Hicks, Thomas H. Easterfield, Fredk. P. Worley, J. K. H. Inglis.

MACALPINE, FRANCIS GEOFFREY, Broad Oak, Accrington, Lancs. British. Managing Director of Coal-Tar Distillation and Ammonia Works. Degree of B.Sc. of Manchester University. Twelve months' study of coal carbonisation and working up of by-products at Birchenwood Collieries, Kidsgrove. I desire to join the Chemical Society so as to be kept informed of the progress of chemistry through the Transactions of the Society and its Library. (*Signed by*) B. Prentice, E. Clark, D. V. Hollingworth.

McDOWALL, FREDERICK HENRY, Knox College, Dunedin. Research Student, Otago University. M.Sc. with 1st Class Honours. Thesis on "Constitution and Synthesis of Menthol." Smeaton Research Scholar of Otago University, 1921–22. Student demonstrator and half-time assistant to Dr. Inglis in Chemistry Department, Otago University, 1919, 1921–22. (*Signed by*) J. K. H. Inglis, C. L. Carter, C. S. Hicks.

McKENZIE, KENNETH, "Endrick," Hamilton Rd., Cambuslang. Scotch. Analytical Chemist. For the past ten years engaged in the study and practice of analytical chemistry. Training: at Royal Technical College, Glasgow, and with Messrs. R. R. Tatlock & Thomson, Public Analysts, Glasgow. At present assistant chemist with Lantaro Nitrate Co., Ltd., Chile, with complete control of all analytical work. Desirous of joining Chemical Society for purpose of keeping in touch with advances in analytical chemistry. Originator of method for determination of perchlorates in small quantities in caliche, etc. Refinement of ferrous sulphate assay for nitrate in caliche, whereby experimental error is reduced from ±4% to ±0·6%. (*Signed by*) R. T. Thomson, A. R. Campbell, George Grant, Alex. W. McLaren.

McNICOL, REGINALD ARTHUR, "Birnam," Rotherfield Road, Carshalton, Surrey. British. Bio-chemist to the Jersey Tomato and Fruit Preserves, Ltd., St. Heliers, Jersey (J. Lyons & Co.). Pupil Sutton (Surrey) County Secondary School, Sept. 1912–July 1916. Student Battersea Polytechnic, Sept. 1916–June 1922. B.Sc. Lond. (3rd Class Hons. in Chemistry), Oct. 1920. M.Sc. Lond., May 1922. Thesis: "The Preparation and Optical Properties of the Aliphatic Ethers of Secondary Octyl Alcohol." (*Signed by*) Leslie Hall, J. Kenyon, Harold Hunter, J. L. White.

MALKIN, THOMAS, Golden Square, Warrington. British. Research Student in Chemistry, Victoria University, Manchester (Ph.D. candidate). B.Sc. (London), Hons. Chemistry. A.I.C. Two years' post-graduate research at College of Technology, Manchester. Part-time lecturer in chemistry at Warrington Technical Institute, 1920–22. (*Signed by*) Arthur Lapworth, Frank Lee Pyman, Leslie Randal Ridgway.

MARTIN, ARCHIBALD ROY HAMMOND, 8, Kingsland Rd., Worthing, Sussex. British. Student. At St. John's College, Cambridge, read for Nat. Sci. Tripos, Part I, for 2 years, taking the B.A. degree in June, 1921. Read for Nat. Sci. Tripos, Part II, in chemistry for 1 year, passing in Class 3. (*Signed by*) W. G. Palmer, T. M. Lowry, Charles T. Heycock.

MATTHEWS, JOSEPH KEITH, M.A. (Cambridge), Cedric House, Rainhill, Lancashire. British. Fuel Technologist (Messrs. Pearson & Knowles Coal & Iron Co., Warrington, Lancs.). 1908, 1st Class Honours in Natural Sciences Tripos, Camb. (including chemistry). 1909, 2nd Class Honours in Part II Chemistry Tripos, Camb. From 1909 the applicant has been in a responsible position in chemical industry, first with Messrs. Pilkington Bros. and later with the above-named firm. (*Signed by*) A. J. Berry, Charles T. Heycock, S. R. Adcock, W. E. S Turner.

MOORHEAD, CHARLES WILLIAM, 23, Newbridge Rd., Bath. Chemist to Meldon Valleys Co., Ltd. Twenty-five years' experience in drug and chemical trades, glass technology, manufacturing chemistry. (*Signed by*) Alan E. Gardiner, Alfred Mander, A. E. Mills.

MOSS, JOHN EWART, 298, Franklin Road, Kings Norton, Birmingham. Research Student. B.Sc. (1st Class Honours in Chemistry) and M.Sc. (Birm.). (*Signed by*) G. T. Morgan, S. R. Carter, Wm. Wardlaw, E. Ashley Cooper, C. J. V. Bews, J. D. Main Smith.

NATH, DINA, Jullundhur City (Punjab), India. At present assistant chemist to Bhatni Sugar Works, Gorakhpur (District), United Provinces, India. Graduate in Science of the Punjab University. Specialist in soap manufacture. Written a paper on soapmaking with special reference to Indian conditions. At present working on "The Action of Alkalies on Rosine under Different Conditions." Certificate from the Professor-in-Charge with regard to the ability in applied chemistry is attached herewith. (*Signed by*) Bhagwan Das Batta, N. A. Yajnik, E. T. Dean.

NIELSEN, TORKILD HAASTRUP, Knockhall Lodge, Greenhithe, Kent. Danish. Chemist at Kent Cement Works of the Associated Portland Cement Manufacturers, Limited. Bachelor of Science in chemical engineering from the Royal Technical College in Copenhagen. (*Signed by*) H. Baggesgaard Rasmüssen, Chr. Winther, J. J. Fox, S. P. L. Sörensen.

NISHIKAWA, HIDEJIRO, 3, Hachimancho, Asakusa, Tokyo, Japan. Japanese Government Research Scholar. Graduate of the section of agricultural chemistry of the Agricultural Department of the Imperial University of Tokyo, Japan. Research student of the Chemistry Department, St. Andrews University. (*Signed by*) Robert Robinson, J. C. Irvine, John Pryde, E. L. Hirst.

NOMURA, HIROSHI, Chemical Institute, Imperial University, Sendai, Japan. Japanese. Assistant Professor of Chemistry. Graduated at the Tokio Imperial University of Japan, engaged in research for one and a half years under Professor W. H. Perkin. Assistant Professor of Chemistry, Tohoku University, since 1914. (*Signed by*) W. H. Perkin, E. Hope, S. G. P. Plant, E. N. Allott, W. Davies, A. F. Titley, Thos. H. Durrans.

PAGE, ALBERT BRAMAH PEARCE, 27, Tanza Road, Hampstead, N.W.3. Research Student. Associate Royal College of Science. I desire to keep in touch with chemical progress through the *Journal* of the Society. (*Signed by*) James C. Philip, H. J. T. Ellingham, Olive Workman.

PICKLES, HAROLD, Gasworks, Kildwick, nr. Keighley. Chemist and Assistant Engineer, Keighley Corporation Gasworks. Studied chemistry (theoretical, practical, and industrial) at Keighley Trade and Grammar

School, Halifax Technical College, and Leeds University. Nine years' laboratory experience as gasworks chemist. Contributed papers to the *Gas World* on the properties of gaseous mixtures. (*Signed by*) H. Harper, Wm. Cranfield, John Wilkinson.

Pooley, Joseph Edwards, 1, Margaretting Road, Manor Park, E.12. British. Principal, "Sandringham" Central School, Forest Gate, E.7. Trained Certificated Teacher. Inter. B.Sc. (London), chemistry as a subject, Inter. B.Sc. (Econ.), London. L.C.P. (chemistry as a subject). B. of E. Certs. in P. and T. Chemistry, advanced stage. Science lecturer at Woolmore St. L.C.C. Evening Institute, Sessions 1914–18. (*Signed by*) Evan D. Griffiths, Léon E. Walling, Alfred W. J. Denney.

Potts, Thomas Trevor, 60, Christ Church Square, Macclesfield. British. Chemist to Messrs. Robert Fletcher & Son, Ltd., Kearsley Paper Works, Stoneclough, and Greenfield Paper Mill, Greenfield, Yorks Educated at Macclesfield Grammar School (science student under Fisher Advanced Courses Scheme). Matriculated 1917. Part-time student, Manchester Municipal College of Technology in Chemistry and Technology of Paper Manufacture. Held above post from August 1919, since when I have been engaged in general chemical control of processes and private research work in chemistry as applied to the manufacture of high-grade tissues, including original work on new processes of manufacture and methods of analysis. (*Signed by*) William Bacon, Alfred Holt, Julius Hübner.

Pound, James Robert, 601a, Dana St., Ballarat, Victoria, Australia. Lecturer in Chemistry, the School of Mines, Ballarat. M.Sc. (Melb., Chemistry). Author of papers on Ether and Sulphuric Acid, Trans., 1911 and 1922, and on Treatment of Wolfram Ores, *Proc. Australian Inst. Min. Met.*, 1919. Formerly research chemist at Amalgamated Zinc (De Bovay's), Ltd., Broken Hill, N.S.W., and superintendent of Magnetic Separation Works, S. & M. Syndicate, Ltd., Launceston, Tas. (*Signed by*) Orme Masson, A. C. D. Rivett, D. Avery.

Prasad, Nagendra, Ranchi, Behar and Orissa, India. Deputy Collector. B.Sc. with Honours in Chemistry. M.Sc. with Thesis and Organic Chemistry as the special subject. Joint author of "Iodination by means of Nitrogen Iodide or by means of Iodine in presence of Ammonia," published in the *Journal of the American Chemical Society*, Vol. XXXIX, 1917. Worked as a research student for some time at the Agricultural Research Institute at Pusa; has a private laboratory of his own; wants to be in touch with current literature on chemistry. (*Signed by*) Phuldeo Sahay Varma, A. S. Khan, Chandra Bhushan Roy, R. L. Datta.

Prideaux, Edmund Brydges Rudhall, 6, Arboretum Street, Nottingham. British. M.A. and B.Sc. (N.Z.), D.Sc. (Lond.), F.I.C. Lecturer in Chemistry and Research Chemist at University College, Nottingham. Research falls mainly under the following heads: The compounds of fluorine; the atomic and molecular volumes of liquid elements and their liquid compounds; electrochemical investigations of solutions by the conductivity and electromotive force methods, with special reference to acidity and alkalinity; electrolytic corrosion; the evaporation and deliquescence of salt solutions; the chemical factors controlling the alkalinity of sea water. My books deal with the arithmetical problems of physical chemistry and with the theory and control of acidity and alkalinity, with special reference to the use of indicators. (*Signed by*) F. Stanley Kipping, F. G. Donnan, A. J. Allmand.

Pullen, Alfred Norman Douglas, The Larches, Greenham Common, Newbury. English. Late Analyst to China Mining and Metal Co., Ltd., Hong Kong. In charge of smelting and refining works to above Co., 1918–22. Pharmacist to Hong Kong Government, 1914–17, and assistant analyst, 1915–16. Assistant to T. Tickle, B.Sc., F.I.C., Boro' Analyst, Exeter, 1912–13. Major Diploma, Pharmaceutical Society and silver medallist (chem.). 1912. Paper on "Iodine Ointment," *Pharm. Journ.*, Nov. 16th, 1912. (*Signed by*) A. W. Crossley, Thomas Tickle, Frank Comyns.

Riley, George Clifford, B.A., B.Sc., 15, Wellington Square, Oxford. British. Research Chemist. Works chemist on production of explosives, 1915–19. Student at Oxford University, 1914–15 and 1919–21, taking 2nd Class Honours, Final Honours Chemistry School, and B.A. 1920. One year's research work in organic chemistry and B.Sc. degree, 1921. Research assistant to Professor W. H. Perkin, M.A., F.R.S., 1921 to present date. Publication: "The Chlorination of Benzoyl Chloride" (with Edward Hope), accepted for publication in the *Journal* of the Society. (*Signed by*) W. H. Perkin, N. V. Sidgwick, E. Hope, W. Davies, A. F. Titley, D. Ll. Hammick, S. G. P. Plant.

Robertson, Thomas Abraham, "Sassafras," Rickard Road, Bankstown, N.S.W. Chemist and Manager, Austral Starch Co., Nelligen, N.S.W. Student at Sydney Technical College in Inorganic Chem. complete course, Theory and Practical. Organic Chemistry 3 years, 1907–13. Matriculated for Sydney University, 1914. Assist. in Physiological Research Lab., Sydney University, for 2 years, 1910–12. Member of Sydney Technical College Chemical Society for 8 years. Special representative of commercial firms for 2 years. At present Organic Chemist and Manager of Austral Starch Co., Nelligen, N.S.W. Paper and exhibits before Sydney Tech. Coll. Chem. Society: "Chemical Substances in Human Body" and "Glandular Secretion of Iodine in Blood Stream;" other papers in course of preparation. (*Signed by*) Richard W. Challinor, Arthur R. Penfold, Archibald D. Ollé, Robt. Grant, George Z. Du Pain.

Rushworth, Burke, 4, West Park Terrace, Healey, Batley, Yorks. English. Manager, Chemist Department, Batley Co-operative Society, Ltd. Certificate winner Army Science College, Bonn University, Germany, having studied there after the armistice. Ex-student S.W. Polytechnic Institute, Chelsea, having taken the Minor Pharmaceutical Exam. Now working for the Major and F.S.M.C. diplomas. (*Signed by*) C. Morton, F. H. Lowe, F. Arnall.

Scholefield, Arthur, Poulton Hey, Bromborough, Cheshire. British. Director of Powell & Scholefield, Ltd., Chemical Manufacturers, Edge Hill, Liverpool. Interested in the chemical industry, and desirous of keeping in touch with scientific research. (*Signed by*) Harold Rogerson, E. C. C. Baly, I. M. Heilbron.

Singh, Gopal, "The Brij," Gawalmandi, Lahore, India. Indian. Professor of Chemistry, Dyal Singh College, Lahore. B.Sc. with Honours in Chemistry, M.Sc. 1st Class First. For some time research student of the Punjab University. For about 2½ years Professor of Chemistry at the Dyal Singh College, Lahore. Joint author of the paper (*J.C.S.*, T., 1920, p. 980). Author of the paper (*J.C.S.*, T., 1922, May, p. 782) "Phototropy of Inorganic Salts, Cuprous Chloride, and Bromide." (*Signed by*) N. A. Yajnik, Horace B. Dunnicliff, Tara Singh Mahal.

Smith, George Victor, Westleigh, Eggington Rd., Wollaston, Stourbridge. British. Student. A.R.C.S. (Chemistry). Formerly Assistant Master, King Edward VI. Grammar School, Stourbridge. (*Signed by*) James C. Philip, M. A. Whiteley, H. F. Harwood, J. N. Sugden, J. G. Howarth.

Snedker, Stanley James Corrall, "The Rowans," Wood Hey, Rock

Ferry, Cheshire. Senior Assistant, Department of Organic Chemistry, University of Liverpool. Carrying out original research. I wish to keep in touch with current chemical literature. (*Signed by*) E. C. C. Baly, I. M. Heilbron, Harold Rogerson, J. S. Buck.

Snow, Oscar Walter, Graeme's Bank, Hatch End, Middlesex. British. Research Student. B.A. (Oxon.) [Part I, Final Honours School of Chemistry]. Scholar of New College, Oxford. At present engaged in research for Part II. (*Signed by*) W. H. Perkin, S. G. P. Plant, N. V. Sidgwick, Allan F. Walden, E. Hope.

Stoyle, Francis Wilbert, 37, Kansas Avenue, Belfast. British. Student. B.Sc. (1st Class Hons.), Queen's University, Belfast, 1921. M.Sc. Queen's University, Belfast, 1922. (*Signed by*) Robert Robertson, A. W. Stewart, H. Graham.

Theobald, Leslie Stuart, 3, Ennismore Avenue, Chiswick, W.4. Student. A.R.C.S. course in chemistry just completed. (*Signed by*) James C. Philip, H. F. Harwood, J. N. Sugden.

Thompson, William, "Ravensworth," Cockton Hill, Bishop Auckland. Student. Bachelor of Science, University of Durham. Degree obtained June 1922. (*Signed by*) P. Phillips Bedson, W. N. Haworth, Grace C. Leitch.

Timmis, Laurence Barnett, 19, Trinity Marsh Lane, Waltham Cross, Herts. British. Chemist. M.Sc.Tech. (Manchester), A.I.C. Employed at Messrs. Allen & Hanbury's, London, as assistant chemist in the analytical and research departments. (*Signed by*) F. W. Gamble, Frank Lee Pyman, John K. Wood.

Truszkowski, Richard, Koszykowa 21, m. 3, Warsaw, Poland. British. Research Student. B.Sc. (*Signed by*) Stanley A. Mumford, O. L. Brady, E. H. Thierry.

Viney, Humphrey Terence, Bramerton, Blakebrook, Kidderminster. British. Carpet Industry, Application of Chemical Science to. Honours B.Sc., Birmingham University. (*Signed by*) G. T. Morgan, S. R. Carter, E. A. Cooper, C. E. Wood.

Wall, Thomas John, Northcote, Alexandra Road, Malvern. British. Research Student. Took Part I of Final Honour School of Natural Science at Oxford in June last and am now doing research in Organic Chemistry for Part II. Exhibitioner of Christ Church, Oxford. (*Signed by*) S. G. P. Plant, N. V. Sidgwick, E. Hope.

Ward, Harry, Toynbee Hall, 28, Commercial St., E.1. British. Research Chemist. B.Sc. (Hons.) (Leeds), M.Sc., A.I.C. 2½ years' experience as research chemist with the General Electric Company. (*Signed by*) R. Le Rossignol, L. D. Goldsmith, William Singleton.

Watson, Stephen John, School of Agriculture, Reaseheath Hall, Nantwich, Cheshire. British. Demonstrator in Agricultural Chemistry, Armstrong College (in the University of Durham). Degree of B.Sc. in agriculture, Armstrong College, Durham University. Registered student of the Institute of Chemistry. Research on potash. Paper accepted for publication by the Society of Public Analysts. Eighteen months' experience in coal analysis. Delivered 50 lectures to Elementary Class in Agricultural Chemistry. (*Signed by*) S. Hoare Collins, Philip Buckle, Lionel Orange, Harold Scragg.

Williams, Alexander Mitchell, Shirley Institute, Didsbury, Manchester. British. Research Chemist. M.A., D.Sc. Author or joint author of over a dozen scientific papers on physical chemistry (including T., 1920, **117**, p. 844). (*Signed by*) Arthur W. Crossley, D. Clibbens, R. G. Fargher, J. C. Withers.

Woodward, Eric Richard Boraman, The Vicarage, Herne Bay, Kent. Chemist. Graduate (B.Sc. in Chemistry and Physics) of the University, Liverpool. (*Signed by*) I. M. Heilbron, E. C. C. Baly, Herbert H. Froysell.

Woolcock, William James Uglow, C.B.E., M.P., 166, Piccadilly, W.1. British. General Manager, Association of British Chemical Manufacturers. Pharmaceutical Chemist. Barrister-at-law. (*Signed by*) M. O. Forster, N. Garrod Thomas, E. V. Evans, E. F. Armstrong.

The following Certificate has been authorised by the Council for presentation to ballot under Bye-law I (2):

Govila, Babu Lall, Gwalior. Hindu. Principal of Central Polytechnic Institute, and Director of Industrial and Technical Education, Gwalior State. (1) Studied chemistry in Indian University College and Japan. (2) Graduated in Tokyo (Japan) in colour chemistry. (3) Studied weaving and spinning in Japan. (4) Worked as Professor and Demonstrator of applied chemistry. (5) Worked in dyeing, calico printing, and soap works in Japan and India. (6) Worked as Principal of the Institute of Textile Technology, Chanderi. (7) Worked in colour research and coal-tar products. (8) Working as Principal of Central Polytechnic Inst. with a department for applied chemistry, and training students in dyeing, calico printing, soap-making, coal-tar distillation, intermediate products, and coal-tar dyes, for the City and Guilds of London Examinations, for the last four years. (*Signed by*) Puran Singh.

PROCEEDINGS

OF THE

CHEMICAL SOCIETY.

Ordinary Scientific Meeting, Thursday, December 7th, 1922, at 8 p.m., Professor SAMUEL SMILES, O.B.E., D.Sc., F.R.S., Vice-President, in the Chair.

The CHAIRMAN referred to the loss sustained by the Society, through death, of:

	Elected.	Died.
Thomas William Dukes	Dec. 5th, 1889.	Nov. 8th, 1921.
David Thomas Williams	Feb. 20th, 1908.	Jan. 29th, 1922.

Mr. G. F. Underhay was formally admitted a Fellow of the Chemical Society.

Certificates were read for the first time in favour of:

Arthur John Attwood, A.R.C.S., 11, Frederick Crescent, S.W. 9.
Frederick Bradshaw, M.A., D.Sc., 78, Rothbury Terrace, Heaton, Newcastle-on-Tyne.
Charles Crossley Mann Broughton, B.Sc., 2, Upton Road, Bexleyheath.
John Southwell Bousfield, A.R.C.S., 2, Lyndale, Childs Hill, N.W. 2.
Leslie John Couzens, 101, Kensington Avenue, Manor Park, E. 12.
Ernest Cecil Craven, 59, Southern Road, Plaistow, E. 13.
James Cooper Duff, M.Sc., F.I.C., 13, Queen's Road, Erdington, Birmingham.
John Kenneth Giles, B.Sc., Hillcrest, Arkley, Barnet.
John Preedy Griffiths, B.Sc., A.R.C.S., 15, Hazelwood Lane, Palmer's Green, N. 13.
Leslie Julius Harris, B.Sc., 18, The Park, Ealing, W. 5.
John Laker, B.Sc., 8, Allerton Road, N. 16.
George Arnold Medley, 45, Hill Top Road, Dalton, Huddersfield.
William James Osborn, 12, West Square, Southwark, S.E. 1.
Francis James Paxon, B.Sc., A.R.C.S., 30, St. George's Road, Palmer's Green, N.13.
Edwin William Stanley Press, 4, Porchester Square, Hyde Park, W. 2.
Edward Ebenezer Price, The Haven, Dormans Park, East Grinstead.
Edgar Sanders, The White House, Blackwell, Worcestershire.
Hedley Archibald Sloman, B.A., A.I.C., Robinhood, Undercliff Gardens, Leigh-on-Sea, Essex.
Arthur Roy Stark, 76, De la Pole Avenue, Hull.
Frederick Vincent Tideswell, M.Sc., Dept. of Fuel Technology, The University, Sheffield.

Frederic Jenner Tritton, B.Sc., 1F, Vicarage Mansions, West Green, N. 15.
Paule Laure Vanderstichele, M.Sc., Bedford College for Women, Regent's Park, N.W. 1.
Stanley Douglas Weaver, B.Sc., A.R.C.S., 27, Hastings Road, Maidstone.
Harold Wood, B.Sc., 39, Edmund Street, Seedley, Manchester.

The CHAIRMAN announced that a circular had been sent out to Fellows with regard to the new weekly Journal entitled "Chemistry and Industry," and that the Journal for 1923 would be supplied to Fellows for the sum of 10*s*.

Mr. C. S. Grace and Dr. G. A. R. Kon were elected Scrutators, and a ballot for the election of Fellows was held. The following were subsequently declared elected as Fellows:

Robert Allanson.
Thomas Cuthbert Allchin.
James Wilson Armit, M.A.
Leopold Louis Bacarese.
Leslie Bains, B.A., B.Sc., A.I.C.
Menghraj Choithram Bathija, B.A.
Nicholas Timothy Belaiew, C.B.
James Bell.
Donald Charles Broome.
Walter Ferguson Buist, B.Sc.
Stanley Robert Bult.
Arthur Josiah Burford.
George Joseph Burrows, B.Sc.
William Leslie Carter.
Sydney George Cavigan.
John Hardwick Long Champion, B.Sc.
Katragadda Seshachalam Choudary, M.A., M.Sc.
Elliot Martin Christie, M.Sc.
Frederick Stanley Clarke.
Allin Cottrell.
John Arnold Cranston, D.Sc.
Hugh John Curnow.
Edward Dance, B.Sc.
Wilfred Thomas Grey Davies, B.Sc.
Milton Dewhurst, B.Sc., A.I.C.
Richard Victor Eaton, B.Sc., A.R.C.S.
Norman Evers, B.Sc., F.I.C.
Joshua William Farmery, M.A., A.I.C.
Samuel Frederick Ford.
Roy Gardner, B.Sc.
Philip Henry Gifford, B.Sc.
Babu Lall Govila.
Roland Hall Griffith, B.A.
Reginald William Griffiths, B.Sc.
John Masson Gulland, B.Sc.
Herbert Haigh, B.Sc.
Lucy Higginbotham, M.Sc.
Thomas Edward Hubbard.
James Ernest Humphries, B.A., M.Sc.
John Huntley.
Sydney Alfred Hurren, M.C.
Habib Iskander.
John Watson Jenkin, B.Sc., A.I.C.
John Ernest Jewell.
Edgar Jones.
Jan Kalff, D.Chem.
Shankar Nath Kapur, B.Sc.
Ghulam Safdar Khan, B.Sc.
Svend Hald Lassen.
William Dawson Lloyd.
Philip Patrick Lynch, B.Sc.
Francis Geoffrey Macalpine, B.Sc.
Frederick Henry McDowall, M.Sc.
Kenneth McKenzie.
Reginald Arthur McNicol, M.Sc.
Thomas Malkin, B.Sc., A.I.C.
Archibald Roy Hammond Martin, B.A.
Joseph Keith Matthews, M.A.
Charles William Moorhead.
John Ewart Moss, M.Sc.
Dina Nath.
Torkild Haastrup Nielsen, B.Sc.
Hidejiro Nishikawa.
Hiroshi Nomura.
Albert Bramah Pearce Page, A.R.C.S.
Harold Pickles.
Joseph Edwards Pooley.
Thomas Trevor Potts.
James Robert Pound, M.Sc.
Nagendra Prasad, M.Sc.
Edmund Brydges Rudhall Prideaux, M.A., D.Sc., F.I.C.

Alfred Norman Douglas Pullen.
George Clifford Riley, B.A., B.Sc.
Thomas Abraham Robertson.
Burke Rushworth.
Arthur Scholefield.
Gopal Singh, M.Sc.
George Victor Smith, A.R.C.S.
Stanley James Corrall Snedker.
Oscar Walter Snow, B.A.
Francis Wilbert Stoyle, M.Sc.
Leslie Stuart Theobald, A.R.C.S.
William Thompson, B.Sc.
Laurence Barnett Timmis, M.Sc.Tech., A.I.C.
Richard Truszkowski, B.Sc.
Humphrey Terence Viney, B.Sc.
Thomas John Wall, B.A.
Harry Ward, M.Sc., A.I.C.
Stephen John Watson, B.Sc.
Alexander Mitchell Williams, M.A., D.Sc.
Eric Richard Boraman Woodward, B.Sc.
William James Uglow Woolcock, C.B.E.

The following papers were read:

"The isoelectric condition of gelatin." By S. O. Rawling and W. Clark.

"Studies on metal hydrides. The electrolytic formation of stibine in sulphuric acid and caustic soda solution." By H. J. S. Sand, E. J. Weeks, and S. W. Worrell.

"Three carbon tautomerism in the *cyclo*propane series." By F. Goss, C. K. Ingold, and J. F. Thorpe.

Meeting held in the Lecture Hall of the Institution of Mechanical Engineers, on Thursday, December 14th, 1922, at 8 p.m., Professor H. B. Dixon, C.B.E., M.A., F.R.S., Vice-President, in the Chair.

Professor C. H. Desch, D.Sc., Ph.D., delivered his Lecture entitled: "The metallurgical applications of physical chemistry." A vote of thanks to the Lecturer, proposed by Professor T. M. Lowry and seconded by Dr. N. V. Sidgwick, was carried with acclamation, acknowledgment being made by Professor Desch.

Ordinary Scientific Meeting, Thursday, December 21st, 1922, at 8 p.m., Sir James Walker, D.Sc., F.R.S., President, in the Chair.

The President referred to the loss sustained by the Society, through death, of:

	Elected.	Died.
Henry Ruchet Fairweather	Dec. 4th, 1919.	Sept. 11th.

Messrs. Duncan P. Woosley and Donald C. Broome were formally admitted Fellows of the Chemical Society.

Certificates were read for the first time in favour of:

George James Alexander, B.Sc., 1, Terrace Road, Upton Manor, E. 13.
Harold Eugene Buckley, M.Sc., 273, Wigan Road, Bolton.
Robert Kenneth Callow, B.A., B.Sc., 17, Sutherland Street, S.W. 1.
Alexander Coutie, 4, Priestfield Road, Edinburgh.

Thomas Arthur Harrison, 64, Eastwood Road, Goodmayes.
Herbert Frederick Miller, B.Sc., A.I.C., Griffith John College, Hankow, China.
William Owen Murch, B.Sc., National Institute for Medical Research, Hampstead, N.W. 3.
James Herbert Oliver, B.Sc., 22, Avenue Gardens, Acton, W. 3.
Thomas Workman Orr, A.I.C., Antofagasta, Chile.
Edward Arthur Perren, 70, Denton Road, N. 8.
Frank Victor Raleigh, B.A., B.Sc., 6, Cavendish Road, Harringay, N. 4.
Helena Charlotte Randall, B.Sc., A.R.C.S., 57, Farnham Road, Guildford.
Jerry Robertson, 38, Church Street, Heckmondwike.
Douglas Rosebery Snellgrove, B.Sc., 73, Millbrook Road, Southampton.
Montague Williams, B.Sc., Cleveland Cottage, The Grove, Isleworth.

Certificates have been authorised by the Council for presentation to ballot under Bye-Law I (2) in favour of:

Donald Hatch Andrews, B.A., Stirling Chemical Laboratory, New Haven, Conn., U.S.A.
Arthur D. Little, Charles River Road, Cambridge, Mass., U.S.A.

The following papers were read:

"Benzbisthiazoles. Part II." By S. R. H. EDGE.

"Ring-chain tautomerism. Part IV. The effect of the methyl ethyl grouping on the carbon tetrahedral angle." By B. SINGH and J. F. THORPE.

ORDINARY SCIENTIFIC MEETING.

The next Ordinary Scientific Meeting will be held on Thursday, January 18th, 1923, at 8 p.m.

BUREAU FOR PHYSICO-CHEMICAL STANDARDS.

Under the auspices of the Union Internationale de la Chimie Pure et Appliqué, a "Bureau des Etalons Physico-chimiques" has been established at Brussels (Université, rue des Sols). This is intended as a centre for the preparation and collection of substances of the highest purity, the physical constants of which have been determined with the utmost possible precision, and which shall be at the disposal of research workers. An appeal is accordingly made to chemists generally to collaborate in the provision of highly purified products from which the standards may be prepared.

It is further proposed to collect the scattered literature dealing with the preparation of substances in a condition of the highest purity, and with the determination of their physical constants. With this object in view, investigators are invited to furnish the Bureau with copies of any relevant papers.

List of Papers received between November 17th, 1922, and December 21st, 1922:

"Negative hydrogen and the electronic formula of benzene." By H. S. FRY.

"Elimination of the amino-group of tertiary amino-alcohols. Part I." By A. McKENZIE and A. C. RICHARDSON.

"Studies on metal hydrides. The electrolytic formation of stibine in sulphuric acid and caustic soda solution." By H. J. S. SAND, E. J. WEEKS, and S. W. WORRELL.

"Some derivatives of methylene-diquinalide and their relationship to the carbocyanines." By F. M. HAMER.

"Dyestuffs derived from heterocyclic bases containing reactive methyl groups." By J. L. B. SMITH.

"1 : 8-*bis*-Naphthylene-indigo." By S. DUTT.

"Dyes derived from diphenic anhydride." By S. DUTT.

"The effect of metallic oxides and metals on the oxidation of vegetable oils in presence of fibrous material. Part I. The rise in temperature and the changes in iodine value." By M. B. RĀNE, P. N. ROY, and L. GUPTA.

"Synthesis of substituted thianthrens. Part I. Thianthren and nitrothianthren." By S. KRISHNA.

"The absorption of moisture by coal (and other fuels). Part I. A relation between degree of humidity in the air and moisture content of coal." By B. MOORE and F. S. SINNATT.

"The nitration of benzaldehyde." By O. L. BRADY and S. HARRIS.

"The investigation of *meso*-thioanthracene derivatives. Part I. Observations on the production of dithioanthraquinone, dithiodianthrone, and other closely related derivatives." By I. M. HEILBRON and J. S. HEATON.

"The chemistry of the glutaconic acids. Part XIII. The isomerism due to retarded mobility." By J. F. THORPE and A. S. WOOD.

"The chemistry of the glutaconic acids. Part XIV. Three carbon tautomerism in the *cyclo*propane series." By F. R. GOSS, C. K. INGOLD, and J. F. THORPE.

"The quantitative absorption of light by simple inorganic salts. Part II. The chlorides of arsenic, antimony, and bismuth." By A. K. MACBETH and N. I. MAXWELL.

"The production and reactions of 2-dithiobenzoyl." By M. McKIBBEN and E. W. McCLELLAND.

"The influence of papaverine on the optical activity of narcotine in acid solution." By H. E. ANNETT.

"The higher oxide of cobalt." By O. R. Howell.

"The calculation of the colour of monocyclic substances by assigning an absorption band to each possible tautomeric formula of the substance." By J. Moir.

"The application of the Hoesch reaction to the preparation of some dihydroxy- and trihydroxy-deoxybenzoins." By E. Chapman and H. Stephen.

"Studies on thallium compounds. Part II. The reduction of thallic compounds with ferrous sulphate and with sodium arsenite." By A. J. Berry.

"The constitution of the disaccharides. Part VII. Sucrose." By W. N. Haworth and W. H. Linnell.

"The determination of the dissociation pressures of hydrated salts by a dynamical method. Part II." By J. R. Partington and D. B. Huntingford.

"The constitution of the disaccharides. Part VIII. Sucrose." By W. N. Haworth and J. G. Mitchell.

"Benzbisthiazoles. Part II." By S. R. H. Edge.

"The upper limit of diazotisability in the benzene series. Diazo-derivatives of mesitylene." By G. T. Morgan and G. R. Davies.

"Researches on residual affinity and co-ordination. Part XV. Interactions of acetylpropionylmethane and the tetrachlorides of selenium and tellurium." By G. T. Morgan and H. G. Reeves.

"Studies in the normal butyl series. Part II. The four stereoisomeric β-γ-di-*p*-tolylamino-*n*-butanes." By G. T. Morgan and W. J. Hickinbottom.

"The formation and stability of spiro-compounds. Part X. Spiro-compounds derived from *cyclo*heptane." By J. W. Baker and C. K. Ingold.

"The sorption by carbon prepared from pure organic compounds. Part I. The sorption of iodine by carbons prepared from carbohydrates." By J. B. Firth.

"Ring-chain tautomerism. Part IV. The effect of the methyl ethyl grouping on the carbon tetrahedral angle." By B. Singh and J. F. Thorpe.

"The transition from the colloidal to the crystalloidal state. Part I. Solutions of potassium oleate." By L. L. Bircumshaw.

"Investigations on the dependence of rotatory power on chemical constitution. Part XVIII. The di-*l*-menthyl esters of the acids of the oxalic esters." By L. Hall.

"The propagation of flame in complex gaseous mixtures. Part V. The interpretation of the law of speeds." By W. PAYMAN.

"The rate of detonation in complex gaseous mixtures." By W. PAYMAN and N. S. WALLS.

"Determination of tin in wolfram. A modification of Powell's method." By O. F. LUBATTI.

"The reactivity of doubly-conjugated unsaturated ketones. Part IV. The effect of substitution on the reactivity of 4′-dimethylamino-2-hydroxydistyryl ketone." By I. M. HEILBRON and A. B. WHITWORTH.

"Studies in phototropy. The reversed phototropy of cinnamaldehydesemicarbazone and its methoxy derivatives." By I. M. HEILBRON, H. E. HUDSON, and D. M. HUISH.

"Complex metallic ammines. Part VIII. The introduction of *d*- and *tri*-basic organic acid radicles into the pentamminecobaltic complex." By J. C. DUFF.
